Diseases which are endemic in one country may also appear in others and become epidemic if the weather and other physical influences resemble those which are the causes of the endemic in the former place; the climate being for a time transferred, as it were, from one to the other. Endemic disorders in some circumstances become contagious, and thereby spread to other persons, and may be transplanted to other places, the situation and circumstances of which predispose them to receive these disorders. This is known by the migrations of diseases, the spreading of leprosy from Oriental countries to Europe, and the like.

It is favorable to the cure of obstinate disorders for the invalid to remove to a climate where his particular complaint is rare. Thus it is customary for people attacked with pulmonary complaints to remove to localities where the air is pure and dry and sunshine abundant. So it is of advantage to the consumptive to exchange unwholesome city air for pure air in the country. Modern sanitation is learning to deal with conditions which, alike in populous and sparsely peopled places, have hitherto bred diseases; so that immunity from fatal disorders may be said to show the good results of sanitary science, as do also the improved statistics of longevity.

ENDER, Eduard, Austrian painter: b. Vienna 1824. He is the son of Johann Ender (q.v.) and is noted alike for his historical and genre works, among which are ‹Francis I in the Studio of Cellini›; ‹Shakespeare Reading «Macbeth» before the Court of Elizabeth›; ‹La Corbeille de Mariage›; and ‹A Game of Chess.›

ENDER, Johann, Austrian artist: b. Vienna, 4 Nov. 1793; d. 16 March 1854. As a portrait painter he was successful at an early age. In 1818–19 he made a tour of Italy, Turkey and Greece, remaining in Rome 1820–26. Upon his return to Venice he devoted his attention to miniature and historical paintings, being professor at the Academy from 1829 to 1850. Among his works are ‹Madonna with Slumbering Christ-Child› (Vienna Museum); ‹Marcus Aurelius on His Death Bed› (1814, Esterhazy Gallery); his masterpiece, ‹The Crucifixion› (a fresco in the Vienna Cathedral); ‹Orestes Pursued by the Furies› (1815); ‹Minerva Showing Ithaca to Ulysses› (1816); ‹Assumption›; ‹Sleeping at Christ's Sepulchre› (1817); ‹Judith›; ‹Bacchus Finding Ariadne›; and many portraits.

ENDER, Thomas, Austrian artist: b. Vienna, 4 Nov. 1793; d. there, 28 Sept. 1875. He was twin brother of Johann Ender (q.v.). He also studied at the Vienna Academy, becoming a noted landscape painter. He won the grand prize at the Vienna Academy 1816. Going to Brazil in 1817, he brought back nearly a thousand drawings and water colors. He visited Italy, Palestine, Greece and Paris. In 1836 he became corrector and later professor at the Vienna Academy, filling that chair until 1849. Among his works are ‹View of Grossglockner›; ‹Castle Tyrol›; ‹Coast of Sorento›; ‹View of Rio de Janeiro› (Vienna Academy); Chapel in the Woods› (National Gallery, Berlin).

ENDERBY LAND, a region in lat. 65° 57' S., long. 47° 20' E., named by John Briscoe in 1831, when on a whaling voyage, in honor of his employer, Samuel Enderby. Briscoe could not approach within 20 or 30 miles, and was unable to say whether it was an island or a strip of continental coast. It was first discovered by Dirk Gherritoz, in 1599, and named for him.

ENDERMIC, a term designating a form of medication once much in vogue, but now almost abandoned, consisting in raising a blister upon the affected part and applying to the raw surface the remedy to be absorbed. It has been superseded by the hypodermic method. See HYPODERMIC INJECTION.

ENDICOTT, Charles Moses («JUNIUS AMERICANUS»), American historical writer: b. Danvers, Mass., 1793; d. Northampton, Mass., 1863. He contributed to the ‹New England Historical and Genealogical Register› and to the Boston *Gazette*. He wrote a ‹Life of John Endicott›; ‹The Persian Poet, a Tragedy›; ‹Essays on the Rights and Duties of Nations›; and ‹Three Orations.›

ENDICOTT, John, American colonial governor: b. Dorchester, England, 1589; d. Boston, Mass., 15 March 1665. He was sent out to this country by the «Massachusetts Company» to carry on the plantation at Naumkeag, or Salem, where he arrived 6 Sept. 1628. In April 1629 he was chosen governor of «London's plantation»; but in August it was determined to transfer the charter of the colony to New England, and Winthrop was appointed governor. Endicott was deputy-governor of the Massachusetts colony 1641–44, in 1650 and 1654; and was governor in 1644 and 1649, 1651–54 and 1655–65. He was bold and energetic, a sincere and zealous Puritan, rigid in his principles and severe in the execution of the laws against those who differed from the religion of the colony. So averse was he to everything like popery that he cut out the cross from the military standard. He was opposed to long hair, insisted that the women should wear veils in public assemblies and did all in his power to establish what he deemed a pure Church. In 1659, during his administration, four Quakers were put to death in Boston. Consult Endicott, C. M., ‹Memoir of John Endicott› (Salem 1847).

ENDICOTT, Mordecai Thomas, American naval officer: b. May's Landing, N. J., 22 Nov. 1844. He was graduated at the Rensselaer Polytechnic Institute in 1868; practised as civil engineer from 1868 until appointed civil engineer in the United States navy in 1874. He served as consulting engineer at various navy yards and in the Navy Department at Washington. In 1895 he was appointed member of the Nicaragua Canal Commission, of the United States naval armor factory board in 1897 and in 1898 became chief of the Bureau of Yards and Docks with rank of commodore. Later he was advanced to the rank of rear-admiral, and reappointed in

1902 and 1906. In 1905 he became a member of the Isthmian Canal Commission, retired in 1906, but continued upon active duties until 30 June 1909. He is a member of the American Society of Civil Engineers and was its president in 1911.

ENDICOTT, William Crowninshield, American lawyer: b. Salem, Mass., 19 Nov. 1826; d. Boston, 6 May 1900; was a descendant of John Endicott (q.v.), the Puritan governor of Massachusetts. He was graduated at Harvard College in 1847; served as justice of the State Supreme Court (1873–82); was an unsuccessful candidate for governor of Massachusetts, on the Democratic ticket, in 1884; and was appointed Secretary of War in President Cleveland's Cabinet in 1885.

ENDIVE, ĕn'dĭv (*Cichorium endivia*), an annual or biennial herb of the natural order *Compositæ*. It is an East-Indian annual or biennial, with a rosette of smooth radical leaves, more or less lobed or cut, blue axillary sessile flowers and grayish angular seeds. It has long been cultivated as a salad, for which use it probably ranks in Europe next to lettuce, but not quite so high in America. It is as easily cultivated as lettuce, but must be blanched, either by loosely tying the outer leaves up over the inner ones or by covering the plants with large drain-tiles or similar tubes. Of the numerous varieties, those that naturally are most curly-leaved, and that ordinarily develop a white centre without blanching, are the most esteemed. The leaves are also used as a pot-herb and as an ingredient in soups, stews, etc.

ENDLESS or PERPETUAL SCREW, a mechanical contrivance consisting of a screw the thread of which gears into a toothed wheel at an oblique angle corresponding to the pitch of the screw. It derives its name from the endless recurring effect its thread produces when in motion. It is in general use as a means of producing slow motion in the adjustment of machines rather than as a transmitter of great power.

ENDLICH, Gustav Adolf, American jurist: b. Alsace Township, Berks County, Pa., 29 Jan. 1856. He was educated in Germany and at Princeton; studying law and being admitted to the bar in 1877. He was elected judge of the 23d judicial district, Pennsylvania, 1879, and re-elected 1899. He was member of the United States Assay Commission in 1897, and from 1906 to 1910 was president of the board of trustees of Muhlenberg College. He edited the *Criminal Law Magazine and Reporter* 1890–94. He has published 'The Law of Building Associations' (1882); 'The Law of Affidavits of Defense in Pennsylvania' (1884); Woodward's Decisions' (1885); 'Commentaries on the Interpretation of Statutes' (1888); 'Rights and Liabilities of Married Women in Pennsylvania' (1889); and numerous articles on legal subjects for periodicals.

ENDLICHER, ĕnd'lĭн-ĕr, **Stephen Ladislas,** Hungarian botanist: b. Hungary, 24 June 1804; d. Vienna, 28 March 1849. He was destined for the priesthood, but in 1827 began botanical and linguistic studies. He became curator of the manuscript department of the Imperial Library at Vienna in 1828; and in 1836 of the botanical department of the Royal Natural History Museum there, and in 1840 became professor of botany in Vienna and director of the Botanical Garden. Much disturbed by the events of 1848, he fell into melancholy, and in 1849 put an end to his own life. His 'Genera Plantarum' (1836–40) has had great influence on succeeding botanists. His studies in Oriental philology are also important. Among them may be mentioned 'Anfangsgründe der chinesischen Grammatik' (1845); and with Eichenfeld, 'Analecta Grammatica' (1837).

ENDOCARDITIS, inflammation of the endocardium or serous membrane lining the valves and internal surface of the heart.

ENDOCERAS, ĕn-dŏs'e ras, genus of fossil cephalopods, found in the Ordovician rocks of the United States, Russia and Scandinavia. Many species have been uncovered; the conch is long, slender and either annulated or smooth. Specimens have been found in the Trenton rocks of New York, having a length of over 10 feet. See CEPHALOPODA.

ENDOCHROME, the characteristic pigment mixture of diatoms. It is apparently a mixture of a green constituent and a golden-brown constituent (diatomin). See DIATOMACEOUS EARTH.

ENDOCRINOPATHIES. Diseases or disorders of growth or adjustment due to disturbances of the endocrinous glands, or glands of internal secretion. The early mechanistic conceptions concerning the push that lies behind the metabolism of the human body have slowly and gradually undergone modification until the importance of a number of overlooked structures has forced itself, almost with a whirl, upon the medical horizon. These structures are the endocrinous glands. The study of their anatomy and functional importance now constitutes an enormous specialty.

As early as 1828 Parry called attention to the relationship between enlarged thyroid and increased frequency of the heart beat (tachycardia), since which time the works of Johannes Müller, Addison, Gull, Brown-Séquard, Marie and many others have served as starting points for the building up of a rich structure which is amply recorded in a score of monographs. The chief of these are Biedl, 'Internal Secretions' (bibliography of 4,000 titles, 1913); Falta, 'Ductless Glands' (1915); Parhon et Golstein, 'Les Sécrétions Internes' (1909); Levy and Rothschild, 'Endocrinologie' (1913); Gley, 'Les Sécrétions Internes' (1914); Sajous, 'Internal Secretions'; special articles in Lewandowsky's 'Handbuch der Neurologie' (1913), and Jelliffe and White, 'Diseases of the Nervous System' (2d ed., 1917).

Out of this prodigious development to be found in the works just cited and in current medical literature, much of which is evanescent and hastily constructed, a large amount of solid substance remains and a number of permanent acquisitions have been made. The net result has been to show much more essentially than ever before the fundamental physicochemical foundations of biological metabolic processes as they are utilized in the upkeep of the animal machine. The viewpoint has been attained that a marked degree of chemical interrelationship takes place between the different organs of the body. That this is automatically regulated through the vegetative nervous system (the old sympathetic) chiefly, apparently in some cases, though this is by no means clear, solely through chemical regulation. The disorders of this adjustment now constitute a special department of vegetative neurology, and are most conveniently grouped under the terms endocrinology, or the endocrinopathies.

In the earlier period of the study of these endocrinopathies individual disease groups, uniglandular syndromes, were isolated. Among the most accentuated of these were Addison's disease, diabetes mellitus, myxedema, cretinism and acromegaly; but of recent years it has been increasingly emphasized that whereas a certain group of symptoms, which may be linked to plus or minus activities of one or another gland may be most prominent, nevertheless other glandular modifications are bound up in them and are not to be neglected. Hence has arisen the viewpoint that most of the endocrinopathies are, strictly speaking, poly- or pluriglandular syndromes, that is, that disease or maladjustment in one gland usually induces compensatory changes in other glands.

For many years, even back to the earliest days of primitive animistic magic, it has been held that every living tissue yields a chemical product which will act upon other tissues. The early alchemistic studies, those of Paracelsus, to the later work of Hahnemann, and the isotherapists, are all attempts to co-ordinate a host of empirically observed facts. They are all worth rereading if the reader will put himself in sympathy with them through a comprehension of the now strange symbols then used.

Endocrinous glands for the present purposes are those structures which yield products termed hormones and chalones having some definite or specific action related to, yet different from, enzyme activities. These structures are developed from different embryological formations. The hypophysis (posterior lobe) and chromaffin tissues (suprarenal chiefly) are nervous; the thyroid and pituitary (anterior lobe) come from the buccal cavity; the pancreas and mucosa of the small intestine from the intestine, the parathyroids and thymus from the branchial arches (old gill slits of fishes), the gonads (testes and ovary) and the interrenal bodies from the genital ridges. Some of these, in humans, merge into one structure, as thyroid and parathyroid, as chromaffin and interrenal cells in the suprarenals, as hypophysis (posterior lobe) and pituitary (anterior lobe).

The present résumé, largely following the author's summary in Stedman's 'Reference Handbook of the Medical Sciences,' will attempt to sketch only the general outlines of the various uniglandular and pluriglandular disease pictures. The more radical French school is followed, but at the same time attention should be called to the fact that the French school presentations contain gross fallacies, and should be read *cum grano salis*. Still the clinical suggestions of these writers are so rich it is felt to be a better course to call the attention of the intelligent layman to possible relationships rather than to take the more conservative attitude of directing attention only to that which can indubitably be proved. This whole subject is still so largely empirical that the principle of putting the hypotheses to a test will be found to be more advantageous than that of recording only the obvious. The former attitude may result in gaining useful therapeutic truths, the latter becomes monotonous and frequently encourages stupidity.

The more recent suggestive and extreme summaries of Biedl, Falta, Laignel-Lavastine, Levi and Rothschild are therefore here summarized.

Uniglandular Syndromes. *Thyroid.*— Myxedema.— The chief symptoms are arrest of development, dwarfism, infantilism, infiltration of skin and mucous membranes, mental torpor, slow ideation, defective memory, apathy, laziness, slowness, sleepiness, taciturn, awkwardness. The pulse is usually small, rapid and irregular, at times increased tension. There are constipation, diminished urination, hypothermia and chilliness of the skin. Reflexes diminished. The voice is frequently nasal, slow, monotonous and raucous. Headache is frequent and at times epileptic attacks occur. These are all symptoms of diminished secretion.

Exophthalmic Goiter. —A more or less complete catalogue of findings for a lot of cases will include tachycardia, arrhythmia, anxiety, pulsations in the neck, exophthalmos, epiphora, v. Graef's, Stellwag's, Möbius' symptoms, facial paresis, cramps, tremors, neuralgias, chiefly frontal and ocular, colic, hot flashes, profuse sweats, thermophobia, engorgement of the skin, dermographism, transitory edemas, pigmentation, urticaria, alopecia, diminution of electrical resistance, albuminuria, polyuria or glycosuria, anorexia, bulimia, vomiting, ptyalism, hyperchlorhydria, diarrhœa, dyspnœa, amenorrhœa, atrophy of mammæ, loss of flesh, agitation, emotional instability, volubility, insomnia, anxiety, excessive anger or reverse, maniacal excitement, marked depression, cyclothymic variations, confusion, epileptic attacks. Eppinger and Hess have endeavored to separate a vagotonic and sympathicotonic type.

In the vagotonic type the more prominent signs are decreased lacrymation, less exophthalmos, with enlargement of the palpebral fissures, v. Graef's sign, abundant sweating, diarrhœa, mild tachycardia, no alimentary glycosuria, pilocarpine and oculocardiac reflexes positive. In the sympathicotonic types there are exophthalmos, dryness of eyes, violent tachycardia, glycosuria, oculocardiac reflex reversed or absent, increased reaction to adrenalin. Most cases are mixed in type. In all save infectious forms psychical influences are striking and psychotherapy is extremely valuable in the early stages, less so in chronic cases. Money worries are of great importance in the causation of the psychogenic cases.

Thyroid insufficiencies, other than those of myxedema, are infantilism, obesity, Dercum's syndromes, pseudolipomata, alopecia, precocious loss of hair, scleroderma, urticaria, pruritus, recurring herpes, transitory edemas, migraine, asthma, constipation, mucous enterocolitis, acrocyanosis, Raynaud's syndrome, localized erythemas, rhinorrhœa, glucose tolerance, genital instability, chilliness, mammary hypertrophy.

Thyroid Instability (Levi and Rothschild). — From dyshypothyroidism: chilliness, baldness, headaches, depression, crying, giddiness, passing edemas, neuralgic pains, suffocations, shivering hot flushes, at menstrual period. With predominant dyshyperthyroidism: thinness, increase of eyebrow development, hot flashes, palpitation, intestinal spasms, irritability, emotionalism, phobias, inquietudes, migraine, asthma, hyperidrosis, dysidrosis, tremors. Mixed cases: chilliness, shivering, migraine, frequent urination, neuralgic pains, distractable reddening of eyebrows, catamenia; neuralgias, anxiety, dilatation of palpebral fissures, swelling of feet, variations in volume of the feet, tremors, nervous crises, hysterical attacks.

Parathyroids.— Tetany.— This syndrome is unquestionably related to parathyroid loss or deficient Parkinson's syndrome(?). The viewpoint of Lundborg and of Gauthier is that this syndrome belongs here, and is a hyperfunction disorder but it rests on very unstable foundations.

Thymus.— Vagotonic Symptoms of Basedow Syndrome(?): Profuse sweating, palpitation, lymphocytosis, eosinophilia, sensation of weakness.

Myasthenia of Erb-Goldflam(?): Headache, ptosis, external ophthalmoplegia, fixed or transitory palsies principally of the face, the neck, myasthenic electrical reaction.

Thymus Loss: Idiocy of Klose and Vogt.

Tetany(?): Basch.

Suprarenals.—Addison's Syndrome and Suprarenal Insufficiency: Asthenia, arterial hypotension, morning nausea and vomiting, lumbar pains, melanoderma, white lines on the skin, amyotrophy, aboulia, depression. At times myoclonus, epileptic attacks, tetany, periodic palsies, delirium, mental confusion, sudden death.

Suprarenal-genital Syndrome: External feminine pseudo-hermaphroditism with virile secondary sexual characters; suprarenal virilism; amenorrhœa, gynecomasty, adiposis with easy bruising, all signs of feminine maturity; hypertrophy of the clitoris, hypertrichosis of masculine type, masculine voice, muscular and nervous hyperasthenia, active and violent sexual inversion; arterial hypertension, arteriosclerosis; glycosuria.

Sympathetic Paraganalia.—Chromaffine cells of the solar plexus, aortic paraganglion of Zuckerkandl, cardiac paraganglion of Wiesel and Weisner, Luschka's carotid and coccygeal glands, tympanic paraganglia. The syndromy of the affections of these glands is entirely obscure.

Pancreas.— Diabetes Mellitus: Glycosuria, polyuria, polyphagia, polydipsia; neuralgias, pruritus, impotency, constipation, dry mouth, dry skin, diminished perspiration, atrophy of the testicles, abolition of the tendon reflexes, arterial hypertension, asthenia, headache, susceptibility to cold, perforating ulcer of the foot, syncopies, comatose or apoplectiform attacks, paralyses, vertigos, asthmatic dyspnœas, pseudoangina, narcolepsy, depression, apathy, hypochondria and coma.

Hypophysis.— Froehlich's Genital Adiposity Syndrome: Adiposity, arrest of development or regression of the genital glands of the genital organs and the corresponding secondary sexual characters; somnolence.

Syndrome of Hypophyseal Insufficiency of Rénon and Delille: Tachycardia, instability of the pulse, arterial hypotension, insomnia, anorexia, distressing sensation of heat, exaggeration of sweat secretion.

Acromegaly: "A simple hypertrophy, not congenital, of the upper and lower extremities and also cephalic," headache, amenorrhœa, tendon reflexes increased, arrhythmia, syncope, perspiration, polyuria, glycosuria, sensitiveness to cold, neuralgias, acroparesthesia, cramps, lancinating pains, lassitude, irritability, depression.

Gigantism: "Acromegaly of the subjects in the epiphyseal cartilages which have not yet ossified," impotency, amenorrhœa, indolence, infantilism, aboulia, asthenia, glycosuria, polyuria.

Pineal.— Genital Macrosomia: Abnormal increase in height, premature genital and sexual development with secondary sexual characters, hypertrichosis, exaggerated mental precocity.

Pineal Adiposity: Diffuse obesity.

Choroid Plexus.— Hydrocephalus: Hypertension of the cerebrospinal fluid, rapid development, nervous and mental syndrome of ventricular hypertension, obnubilation, idiocy.

Ovaries.— Infantilism: Amenorrhœa, absence of secondary feminine characters, obesity, deficiency of hair, childishness.

Acquired ovarian insufficiency. (*a*) Peripheral vasodilatation, subjective crises of heat, sweating, continuous or paroxysmal tachycardia, palpitations, arterial hypertension, insomnia, severe headache, facial neuralgia, lumbago, neuromuscular asthenia, memory instability, irritability, enervation, hysterical crises; exaggeration of the sexual instinct(?), more often absent or inverted; obesity, restlessness, anxiety, phobias, impulsions, gastrospasm, constipation, vomiting, vertigo, syncope.

(*b*) "Vagotonic crises" before the menses and at the beginning of pregnancy, pallor, tendency to syncope, nausea, vomiting, constipation, diminished arterial tension, pulse rather slow, oculocardiac reflex positive, Samogyus's sign, psychic depression particularly connected with the development of the corpus luteum. These crises occurring before menstruation or at the beginning of pregnancy must not be confused with the reactionary dyshyperthyroidism of the menopause marked by flashes of heat, sweating, hypertension, paroxysmal tachycardia, palpitations, anxiety.

"Hyperovaria" (Dalché): Precocious puberty, copious menstruation, pain before and during the first days of the period, intermenstrual leucorrhœa, developed sexual instinct, well-marked eyebrows, thinness, pallor, small breasts, large pelvis, rounded lower limbs contrasted in size with the upper ones, arterial hypotension, craving for movement and action, enervation, tendency to loquacity, erotic crises.

Testicles.— Infantilism: Defective development of the male genital organs, absence of secondary sexual characters, obesity, deficiency of hair length of the lower limbs, small cranium, childishness.

Acquired Testicular Insufficiency: Increase in height, diminution of the pilous system, glabrous state of the body, tendency to obesity, gynecomasty, frigidity, impotency, senility, arterial hypertension(?), asthenia.

The types of testicular insufficiency according to Rebattus and Gravier are: (*a*) The sterile. (*b*) Eunuchoid gigantism, because the internal secretion of the testicle is established late. In this case there is a prolonged infantilism. (*c*) Eunuchism by castration characterized by gigantism and infantile appearance. The secondary sexual characters do not appear. (*d*) The reversive infantilism of Gandy, where simply a sort of a sexual condition is noticed, with attenuation of secondary sexual characters and a certain degree of obesity, with late testicular difficulty in the adult.

Dyshyperdiastematia: Lower limbs short and cranium very large, pilous system well developed, especially the mustache, thinness, persistence of youth, a degree of arterial hypertension, virile character, activity, moral and physical energy.

Prostate.— Prostatic Insufficiency: Asthenia, diminution of potency, neurasthenia, at times suicide.

Hypertrophy of Prostate: Arterial hypertension, retardation of the heart, cerebral hemorrhages, genital excitation.

Pluriglandular Syndromes.—Basedow's disease with thymic hypertrophy and vagotonic symptoms; scleroderma, and tetany, amenorrhea, Addison's syndrome; acromegaly, etc.

Myxedematous with Thymic Hypertrophy: Tetany, acromegaly, Addison's syndrome, amenorrhœa, infantilism, mammary hypertrophy, etc.

Acromegalic or ovarian insufficiencies with various disturbances, psychic, nervous, vasomotor, trophic, etc., connected at one time with the myxedematous, at another with the basedowian series.

Ovarian Predominance.— Thyroid Reaction to Ovarian Insufficiency: Tachycardia, palpitations, perspiration, nervous irritability, vertigo, scanty urination, trembling, anxiety, etc.

The differences between these nervous manifestations and the picture of the attenuated forms of exophthalmic goitre are very slight says Laignel-Lavastine. This pathogenic conception permits of important therapeutic results; one may ask, for example, whether the anti-basedowian therapy with hematothyroidin would not be of advantage in the nervous and psychic disturbances of the normal menopause which repeat one feature after another of the basedowian series.

Dyshyperovaria of the Hypothyroid: Anticipation, prolongation and copiousness of the menses, menorrhagia, metrorrhagia.

Thyro-ovarian Disturbances of the Same Significance.— Either ovarian insufficiency in the myxedematous series, or the dyshyperovarian in the basedowian series; in either case the nervous disturbances of the dysthyroid are modified by all factors of the ovarian rhythm, whatever they may be.

Hypophyseal Predominance.— Infantile giants, with their clinical varieties: feminism, eunuchism cryptorchidism, feminine pseudohermaphroditism, mental infantilism.

Acromegalics with deficiency syndromes, myxedema, infantilism, amenorrhœa, obesity, asthenia.

Acromegalics with syndromes of hyperactivity, more or less vicious, synergetic or substitutive: simple or exophthalmic goitre, arterial hypertension and atheroma, lacteal secretion.

Suprarenal Predominance.—Addisonian with amenorrhœa, impotence, chilliness, tetany or, on the other hand, exophthalmic goitre.

Very often basedowians, acromegalics, giants, with spontaneous glycosuria, alimentary or merely adrenal, the latter making it possible in certain cases to suppose a certain degree of suprarenal hyperactivity.

Without Marked Predominance.— The case of Claude and Gougerot is an example: Loss of sexual characters, countenance old-looking, skin thickened, wrinkled, pigmented; chilliness, absence of perspiration, asthenia, arterial hypotension, tetany; testicular, prostatic, suprarenal, thyroidal and perhaps parathyroidal atrophy. Consult Jelliffe and White, 'Diseases of the Nervous System' (Chap. III, "The Endocrinopathies"); Eppinger and Hess, 'Vagotonia, Nervous and Mental Disease' (Monograph Series, No. 20, New York).

Smith Ely Jelliffe.

ENDODERM, or **ENDODERM** (also called entoblast or hypoblast), the innermost layer of cells in the developing embryo. In man it subsequently develops into the epithelium that lines the digestive canal and its appendages, the pancreas, liver, lungs, etc. See Embryology.

ENDODERMIS, in plants, the layer of cortical cells which surrounds the vascular region and generally called the bundle sheath. In many cases there is but a single sheath surrounding a single vascular region; in others there are several vascular regions each protected by its own sheath or endodermis. See Morphiology.

ENDOGAMY, a custom among some savage peoples of marrying only within their own tribe. Opposed to exogamy.

ENDOGENS, ĕn'dō-jĕnz, a name for monocotyledonous plants, referring to the mode of growth of the stem. See Botany; Monocotyledons.

ENDOR, ĕn'dĕr, a village of Palestine, four miles south of Tabor, now a poor mud hamlet. It was the place which Saul visited (1 Sam. xxviii, 7) to consult the "woman with a familiar spirit." The word is in common use in the writings of the Philistines.

ENDORSE, in heraldry, a subordinary equivalent to one-eighth or one-fourth of a pale.

ENDOSCOPE, in surgery, a general term for an instrument for the examination of internal parts. It consists of a tube and an apparatus for lighting. The most serviceable is that devised by Nitze and Leiter.

ENDOSMOSIS. See Osmosis.

ENDOTHELIOMA, ĕn-dō-thē-lĭ-ō'ma. See Tumor.

ENDOTHELIUM, a modified form of the cells lining certain internal organs. Such are the internal lining membranes of the heart and blood vessels, the joints and other closed cavities. Endothelium is a modification of epithelium (q.v.).

ENDOTHYRA, genus of fossil. Foraminifera, the shells of one species of which (*E. baileyi*) form a large part of the oölitic limestone of the Lower Carboniferous and known as Bedford limestone. See Foraminifera.

ENDOWED SCHOOL ACTS. Acts of the British Parliament made to prevent misapplication of the foundations for the support of secondary education in England. See Great Britain — *Education*, and consult Balfour, A.

J., 'The Educational Systems of Great Britain and Ireland' (Oxford 1912).

ENDROMIS (1) a kind of boot which was first generally worn by Cretan huntsmen and then by athletes in general. It was close-fitting, reached above the ankle, with the top turned down. (2) a woolen rug or covering worn by Roman athletes, gladiators, etc., after violent exercise. They were made in Spain or in Tyre.

ENDYMION, in classical mythology, according to some a huntsman; according to others a shepherd; and according to a third account a king of Elis. One tradition is that he asked of Zeus eternal youth and eternal sleep, and that Selene (the moon) saw him sleeping and became enamored of him. Others relate that Selene herself, charmed by his beauty, conveyed him to Mount Letmus in Caria and threw him into a perpetual sleep in order that she might kiss him whenever she pleased. The legend is the subject of Keats' 'Endymion.'

ENDYMION. Keats was 23 when, in April 1818, he published his first long poem, 'Endymion.' The young poet, in love no less with the beauty of his native England than with «the beautiful mythology of Greece,» incarnated in the poem his own passionate seeking for the soul of beauty in the world. We may trace this theme through the «uncertain path» of a story which is almost lost in the luxuriant tangles and by-paths of incident and description. Endymion, smitten with strange trance at the feast of Pan, confesses to his sister the vision of an immortal loved one that has turned waking life to despair. Led on to «woe-worn wanderings» by a mysterious command, he descends «into the silent mysteries of earth.» He is succored by Diana, urged on by Venus, who foretells his happiness, and is moved to pity by the vain loves of Alpheus and Arethusa. And when at length his «fated way» leads him through the sea-depths to the rescue of spell-bound Glaucus, Endymion's awakened sympathy with suffering gives him power not only to restore «all lovers tempest-tost» to eternal love and youth, but to win Cynthia and immortal bliss. So at last his mortal love, the Indian damsel, reveals herself as the goddess; and through earthly loveliness he attains immortal beauty. And so this story of Endymion's love for the moon-goddess is the symbol not only of Keats' intense susceptibility to the loveliness of moonlight but of his life-long passion for «the principle of beauty in all things.»

The form of the poem is, like its spirit, wavering, but shot through with imaginative glory. Structure is lacking — the poet does not master his story, but is swept on by it, like Endymion on his celestial steed. Metre and diction are treated with a freedom not only Elizabethan but revolutionary. And in such lyric ecstasies as the «Hymn to Pan» and «O Sorrow,» in such perfect images as «the dancing poppies,» «tip-toe Night,» «panting light,» «rain-scented eglantine,» there speaks Keats, the magician of English poetry. Consult article «Keats,» 'Cambridge History of English Literature' (Vol. XII); and Colvin, Sidney, 'John Keats' (New York 1917).

FRANCES W. CUTLER.

ENEMATA, fluid substances passed into the rectum and large intestines for cleansing, for medication or for nutrient purposes. For the treatment of chronic constipation, enemata of cold or hot water, water and soapsuds, water and glycerine, are found to be of great service. Almost any remedial substance capable of solution and absorption may be placed in the rectum or large intestine to affect the parts locally or to exert a general action on the body. Almost all remedies that are taken into the stomach may be taken by means of enemata. The dose has to be somewhat larger in most instances. For the treatment of pinworms, diarrhœa and dysentery enemata are invaluable. In medicine the lower bowel may be used much oftener than it is. In acute colicky pains from «wind» in the bowels there is nothing better, as a rule, than a hot enema of at least two quarts, at a temperature of from 116° to 118° F. As the lower bowel is not provided with digestive juices, when nutrient enemata are to be given the insoluble food-substances should be so converted as to render them capable of absorption — hence all gruels, eggs, milk, etc., to be used should first be predigested by peptic or pancreatic ferments. A special form of enema, consisting of hot (116° to 118° F.) salt solution (1 teaspoonful of salt to 1 pint of water), allowed to pass in and out of the bowel slowly and made to ascend some distance, is of immense service in cases of surgical shock, in profuse bleeding, and in cases in which the kidneys refuse to secrete urine. This is termed enteroclysis (q.v.). Enemas for cleansing the bowel should be copious; those for nutrient purposes should be small — not over half an ounce.

ENEMY, in international law, a nation at war with another. The term includes the nation as a whole, and also individuals belonging to the latter. A state of war must exist before States assume toward each other the position of enemies. By international law the status of an enemy is regulated according as it is a combatant or non-combatant. If a combatant the opposing nation may employ its whole force toward its destruction. Non-combatants, however, in as much as they have no connection with the war but continue their ordinary avocation, are exempt from attack according to the usage of modern civilized peoples. A state of war precludes commercial relations between the non-combatants of states at war, contracts are not upheld, and the courts are closed to enemy aliens. Ordinarily non-combatants are not liable to injury in person or property arising from military operations, but it frequently happens that they suffer property losses through bombardments, etc. If attacked or robbed by troops of the enemy without authorization and contrary to international law those troops are liable to punishment by their own military superiors for violation of the rules of war. The modern tendency of civilized peoples is to limit all acts of hostility to the actual combatants in the theatre of war.

It has frequently happened, however, that modern nations while engaged in hostilities with savage peoples have been unable to observe all the rules of international law, and especially the distinction between combatants and non-combatants. See ALIEN; BELLIGERENT; INTERNATIONAL LAW; WAR, RULES OF, and consult the authorities referred to under these articles.

ENEMY ALIEN PROBLEMS. In early times it was the practice of belligerent governments upon the outbreak of war to arrest the citizens or subjects of the enemy power residing within their jurisdiction, to confiscate their property and sometimes to expel them summarily from the country. In the course of time, however, relaxations from this harsh practice began to be made and many treaties were concluded providing that such persons should either be allowed to remain in the country, or in case they were required to leave, they should be allowed a specified period within which to dispose of their property and wind up their business affairs. The policy of confiscating their property also ceased and wholesale expulsions became rare. During most of the wars of the 19th century the treatment accorded to enemy aliens was uniformly liberal and humane. During the Spanish-American War of 1898, for example, neither belligerent molested the citizens or subjects of the other, so long as they demeaned themselves peaceably and their property was not interfered with in the slightest degree. When the great European War broke out the rights of enemy aliens had not been regulated by any of the great international conventions; the treatment to which they were entitled, therefore, depended upon the customary law of nations and upon particular treaty stipulations between the opposing belligerents.

The enemy alien problem of the late war was somewhat different from that of any preceding war, partly because of the unprecedented number of enemy aliens which were found in most of the belligerent states at the outbreak of the conflict, and partly because of the enormous amount of property held by such persons in the countries where they resided. In England, for example, there were more than 50,000 German subjects; in France the number was still larger; and in the United States the number of such persons probably exceeded a million. In consequence of the German policy of universal compulsory military service large numbers of them were reservists who if they had been allowed to depart would have returned to Germany and joined the army. Many of them were of course spies, for the German historian Treitschke tells us that «in the national wars of the present day every honest subject is a spy.» The presence of such persons in so large a number in England and France, because of the close geographical proximity of those countries to Germany naturally constituted a grave danger to both countries. It was impossible in view of these circumstances to allow males of military age to leave the country and it was equally impossible to leave them to remain in complete freedom.

The treatment which was accorded to every alien by the various belligerent governments may be discussed under three heads: (1) policy in respect to their personal freedom; (2) measures in respect to their property and business undertakings; and (3) their right of access to the courts. At the outset Great Britain accorded to German subjects a period of seven days during which they might leave, but it does not appear that any considerable number succeeded in getting away. France allowed them to leave before the end of the first day of mobilization, but few were able to return to their home countries. Germany and the United States did not allow any days of grace for this purpose and Germany even went to the length of arresting all Japanese subjects found in the country at the outbreak of the war between that country and Japan. British and French nationals were summarily expelled from any German towns and cities and without being allowed to take their effects with them. On the day of the outbreak of war between France and Germany the French government as a military precaution required all enemy subjects to evacuate the region of the northwest, and also the cities of Paris and Lyons and to retire to other regions in the west. They were not, however, expelled. Portugal appears to have been the only belligerent country which went to the length of expelling all enemy persons between certain ages. In every belligerent country measures were early taken to restrict the liberty of movement of enemy aliens. In England they were required to reside in certain «approved» places; they were forbidden to reside in certain designated regions or to change their places of residence or travel more than five miles without a permit; they were forbidden to have within their possession any firearms and various other articles such as signaling apparatus, military maps, motor cars, etc.; they were forbidden to frequent clubs; to see any but English newspapers, etc. In every belligerent country they were required to register and were placed under strict surveillance by the authorities. In the United States they were forbidden to reside within a certain distance of any fort, arsenal, armory or similar place; they were excluded from residing near to or from approaching water fronts or wharves, and they were prohibited from remaining or residing within the District of Columbia. All enemy aliens including women were required to register, and in general they were subjected to other restrictions similar to those adopted by the British government. On account of the close geographical proximity of France to Germany, the French government at the outset ordered a general internment of the enemy population. They were therefore removed to concentration camps located in various parts of France, mainly in the west, behind a line extending roughly from Dunkirk to Nice. For some eight months after the outbreak of the war the British government did not go to such lengths, although considerable numbers of suspicious and dangerous characters were interned as a precautionary measure. In consequence, however, of various acts of the Germans, such as the bombardment of undefended coast towns, Zeppelin raids upon England, the use of asphyxiating gases as a means of combat, the ill-treatment of English prisoners, and the like, public opinion in England came to demand that the whole enemy population of England should be interned, and the sinking of the *Lusitania* in May 1915 greatly intensified the popular demand. This last act led to serious mob outbreaks against the Germans in England and the dominions, during the course of which many German houses and shops were wrecked and a considerable number of lives were lost. Partly, therefore, in the interest of the national defense and partly in the interest of the Germans themselves, whom it was difficult for the public authorities to protect so long as they were scattered throughout the United Kingdom, the British government in May 1915 ordered the internment in concentration camps of practically all enemy persons then left in England, although exemptions were granted in particular cases where internment would have worked a serious hardship without subserving any purpose of national defense. The order for internment, it may be added, applied not only to enemy subjects but also to British subjects (of which there were some 8,000), of enemy origin. So far as possible work was provided in the camps for such persons; classes for instruction were organized, libraries were established, and instructors in the handicrafts were furnished. Long before the British policy of internment had been decided upon, the German government, in consequence of reports that large numbers of Germans were being arbitrarily arrested and imprisoned in England, had issued an order (6 Nov. 1914) for the general internment of all British males between the ages of 17 and 55. Most of them were interned in the buildings of a race course at Ruheleben near Berlin. The United States was almost the only great power which did not resort to the policy of general internment, for there the presence of enemy aliens at large did not, by reason of the remoteness of the country from Germany, constitute the same danger as it did in England and France. Large numbers of individual Germans whose disloyalty was clearly established, others who were regarded as suspects or dangerous persons, and still others charged with espionage and other crimes were, however, arrested and confined in internment camps in various parts of the country. The members of the crews of German merchant vessels in American ports as well as the crews of German warships which took refuge in American ports were likewise interned. Other enemy persons who conformed to the regulations in regard to residence, movement and registration and who demeaned themselves peaceably were left at large, although they were subjected to close surveillance and were frequently warned against the consequences of misbehavior and disloyalty.

Subsequent to the inauguration of the policy of wholesale internment, special conventions were concluded between a number of the belligerent governments providing for the reciprocal exchange and release of women and males except those of military age. Thus in January 1917 an arrangement was concluded between the British and German governments under which all males over 45 years of age and under 17 held in either country as interned prisoners were released and allowed to return to their own countries. In pursuance of this arrangement some 7,000 Germans in England and some 600 or 700 British subjects in Germany were repatriated. Somewhat similar arrangements were concluded between the German and French governments and between the German and Austro-Hungarian governments.

The presence in many of the belligerent countries of enormous property holdings and business houses owned wholly or in part by, or under the control of, enemy persons raised a difficult problem for belligerent governments. Obviously considerations affecting the national defense made it necessary to deprive the enemy of the use and control of such property or business; otherwise his power would have been employed to increase its own strength and resources. Steps were therefore taken in every belligerent country for placing enemy-owned property and enemy business undertakings under the control or supervision of the public authorities. In England and the United States all such property was placed in the hands of a public custodian who was empowered to hold and administer it and in general to exercise over it all the powers of a common-law trustee throughout the period of the war. At first the American custodian was given only a limited right to dispose of such property by sale, as for example, when it was necessary to prevent waste or protect the rights of the United States therein, but later he was given a general power of sale and enormous German holdings aggregating many millions of dollars worth of property were sold. The proceeds were turned into the treasury of the United States with the understanding that the eventual disposition of it be determined by the treaty of peace at the close of the war. The proceeds in some cases were used to purchase war bonds. It should be remarked, however, that this somewhat rigorous policy was not enforced against the property owned by enemy persons residing or domiciled in the United States, but only against property of those living in the enemy country and who were presumably engaged in making war upon the United States. The property holdings of the former, except those interned, were not molested. The property of American citizens residing in Germany, however, was treated as enemy property on the theory that the test of enemy character is domicile rather than nationality.

In France enemy property was put under the control of sequestrators appointed by the courts and their power over such property was substantially the same as that of the English and American custodians, except that they were never given a general power of sale. Again and again it was emphasized in France that sequestrators were mainly conservators with no general power to dispose of the property placed in their custody. They were authorized to sell enemy property only when it was perishable or when it was necessary to protect it from waste or loss. Germany began by placing enemy property under supervision, but later on adopted the policy of other countries and put it in the hands of administrators who had the power to manage it and in some cases to dispose of it by sale. There was widespread complaint in France of the conduct of the German government in respect to its treatment of French property, especially in Alsace-Lorraine where large quantities were held and the proceeds of which in some cases were employed for the purchase of war bonds. As regards enemy business enterprises and undertakings, all belligerents adopted a somewhat similar policy. In England an official known as the controller was appointed to manage and carry on any enemy business undertakings the continuance of which was demanded by the public interest. Other businesses were prohibited or wound up and liquidated by the Board of Trade. In the United States this power was exercised by the alien enemy custodian. Certain enemy businesses such as insurance were prohibited; in the case of other businesses under the ownership or control of enemy persons residing in Germany the boards of directors were reorganized by the appointment of new directors by the custodian, and the business was continued by the reorganized directorate. In Germany all enemy business enterprises were put under a régime of compulsory administration and management through government appointed agents. Some of them were continued; many were wound up and liquidated. Likewise, in France administrators were appointed by the courts to operate and manage any enemy enterprise, the carrying on of which was required by the public interest; others were wound up by a liquidator, likewise appointed by the courts. In the case of that particular species of property in the form of patents, trademarks, copyrights, etc., the policy of all belligerent governments was more liberal than it was in respect to other property. In general, the policy of all of them was to suspend such rights but without confiscating them. Citizens who held patents in enemy countries were allowed to transmit money thereto in order to pay the necessary fees for the renewal of their patents or copyrights. In most of the belligerent countries enemy patents for the manufacture and sale of articles which the public interest required to be manufactured were assigned to local firms or persons, the licensees in such cases being required to pay the fees and royalties due the enemy patentee into the public treasury the same to be held for the benefit of the enemy patentee until the end of the war or to be otherwise disposed of as might then be determined, presumably by the treaty of peace.

As to the right of enemy subjects to enforce their rights by suits in the courts or to appear in court and defend actions brought against them the policy of most of the belligerent governments was fairly liberal. Under the English common law no enemy alien was allowed such a right unless he remained in England by permission of the Crown and was under the special protection of the king. During the late war, however, the English courts have not only held that an enemy alien residing in England may defend an action brought against him in the courts but that an enemy subject who was interned might bring an action as a plaintiff. Since practically the entire enemy population was interned the effect of the decision was to open the courts generally to all enemy aliens in the country. This privilege, however, did not extend to persons residing or domiciled in enemy territory. Germany allowed enemy aliens domiciled in the empire the right of access to German courts but denied it to those residing or domiciled outside the empire. In France some of the lower courts admitted enemy aliens to bring actions but others less liberal refused it. This discrimination resulted in great confusion. The Court of Appeals of Paris in April 1916, however, rendered a notable decision upholding this right. In the United States the policy of the courts was somewhat divided but in general enemy aliens residing here were allowed access to the courts on a footing of equality with citizens. Those residing in enemy country, however, were not allowed the privilege.

Professor of Political Science, University of Illinois.

ENERGETICS. In physics, mechanics and chemistry, Energetics is the science that treats of energy and its transformations — "energy" being defined as that attribute of a body, or of a material system, by virtue of which the body or system can do mechanical work; and "work" being simultaneously defined as the overcoming of resistance through distance. Any such body or system, that can do mechanical work by changing its shape, position or configuration, or its physical or chemical state, is said to possess "energy" — that is, power to do work.

The mechanical work is often performed directly and immediately by the body possessing the energy, without the intervention of any other agency. This is by no means essential, however, because the conception of energy has been extended so as to include all systems and processes, however complicated or indirect the development of the work may be. Thus a hot body is said to possess energy, because its heat can be used to actuate a heat engine; and a galvanic battery is similarly said to possess energy, because it can generate electricity and thereby operate an electric motor. We even speak of food as possessing energy, because when eaten, digested, assimilated and oxidized in the muscles it enables human beings or animals to perform mechanical work.

In view of the varied kinds of bodies and systems that exist, and the varied ways in which they may perform work, we speak of "heat energy," "electrical energy," "chemical energy" and energy of other types; but in using such expressions we merely indicate, in a rough way, the kind of source that we are dealing with and the general nature of the processes to which we may have to resort, if we attempt to utilize the energy. The energy is the same thing in every case — namely, it is the capacity of the body or system under consideration to do mechanical work. In many cases, in fact, it is hard to say in what condition the energy exists in a body. For example, a mass of hot, compressed gas certainly possesses energy, but in view of the fact that we can obtain work from it either by direct adiabatic expansion, or by keeping the volume constant and using the heat (for example) to operate a thermoelectric battery and a motor, it is scarcely logical to say that the energy of the original mass existed either in the form of heat or in the form of mechanical compression. If we try to solve this difficulty by replying that it existed in *both* forms, we are quickly made aware of the superficial nature of the answer, if we attempt to determine *how much* is present as heat, and how much is present as mechanical compression. When we increase the energy of a body or system, we say that we «add energy» to it; and when we decrease its energy, we say that we «subtract energy» from it. We can always tell what form the energy has that we add or subtract, but it is often impossible to tell what form it has, while it actually resides within the body or system with which it is associated.

For purposes of measurement and computation it is necessary to have a satisfactory unit, in terms of which we can make definite quantitative statements with regard to energy; and in view of the definition of energy, it is evident that this unit must necessarily be either the same as the one that is used for measuring work or else a mere multiple or submultiple of it. The unit that is adopted in the measurement of work depends upon the nature of the problem that is under consideration. In modern scientific investigations the unit of work is commonly the erg, which is defined as the work done in overcoming a resistance of one dyne, through a distance of one centimeter. In engineering operations, the unit of work commonly employed (at least in the United States and in England) is the foot-pound, which is defined as the amount of work done in overcoming, through a distance of one foot, a resistance equal to the weight of one pound of matter. (In countries using the metric system, the unit of work in engineering operations is the kilogram-meter). The foot-pound is not as precise and definite a unit as the erg, because the attraction that the earth exerts upon a pound of matter varies with the latitude and with the elevation above the sea and hence the foot-pound varies in the same manner. The variation is not great enough, however, to destroy the usefulness of the foot-pound as a unit of work or energy for engineering purposes, and hence this familiar unit is not likely to be superseded, for ordinary, rough purposes. To avoid the indefiniteness of the foot-pound, we might adopt the far more scientific (but exceedingly uncommon) unit known as the «foot-poundal,» which is defined as the quantity of work that must be done in order to overcome a resistance of one «poundal» through a distance of one foot — a «poundal» being the force which, when applied for one second to a body having a mass of one pound, subject to no other forces and initially stationary, will produce in that body a velocity of one foot per second.

A moving body possesses energy in virtue of its motion and work must be done by it before it will stop. Thus a railroad train, moving at high speed, cannot be brought to rest at once, because the energy of motion that it possesses must first be expended in overcoming the resistance of the brakes, or the natural frictional resistance of its axles in their journals and its wheels upon the tracks. The mechanical energy that a body possesses in virtue of its motion of translation or rotation is called «kinetic energy»; and that which it possesses in virtue of its position or its state of elastic strain is called «potential energy.»

The kinetic energy of a body having a given mass and a given speed of translation, is (by definition) the amount of mechanical work that the body must do, in order to come to rest. If the mass of the body is M and the velocity is V, it can easily be shown, from the principles of theoretical mechanics, that the work thus performed is $\frac{1}{2}$ MV². This is therefore the numerical expression for the kinetic energy of the body. If V is given in feet per second and M is given in pounds, this formula gives the kinetic energy in foot-poundals; and hence if it is desired to state the result in foot-pounds, it is necessary to divide by the acceleration of gravity, as expressed in the same fundamental units — namely, by 32.2, in a locality in which the speed of a body falling freely in a vacuum increases, each second, by 32.2 feet per second.

It is not only impossible, in many cases, to state what form the energy has, within a given body or system, but it is also usually (and perhaps universally) impossible to say *how much* energy the body or system contains in the aggregate. In other words, there is usually no absolute and natural zero from which the energy can be reckoned; and hence we have to assume an arbitrary zero point, or else confine our attention to the quantities of energy added to the body or system (or subtracted from it), without making any attempt to estimate the total amount present. In the case of ordinary kinetic energy, there is apparently a natural zero, corresponding to absolute rest; but it will be evident that this zero is only conventional, inasmuch as «rest» is a relative term and a body that is seemingly quite devoid of motion is nevertheless rushing through space, with the earth, at a considerable speed. The case is even plainer in connection with the potential energy of a raised body. The body can do work by falling, but it evidently can do an indefinite amount of work by falling through an indefinite distance. In applying the principles of energetics to falling weights it is therefore conventional to assume some arbitrary level (at least as low as the lowest point to which the weight can go) as the level of zero potential energy. In the case of a pendulum, for example, we say that the bob has no potential energy when it is at the lowest point of its swing, for the simple reason that it cannot do more work by descending further, because it is already at the lowest point to which the construction and mounting of the pendulum will allow it to go; yet we know very well that it could do more work if the supports were removed and the pendulum as a whole were allowed to fall still further.

Transformation of Energy.— It often happens that energy of some one given and distinctly recognizable type may be transformed into energy of some other easily recognizable and definite type. The simplest example of a transformation of this kind is afforded by the case of a freely-falling body. The potential energy that the body possesses in virtue of its elevated position grows less as the body descends, and the kinetic energy that it possesses increases at the same time; and it is a simple matter to show, by the aid of elementary mechanical principles, that the gain in kinetic energy is precisely equal to the loss in potential energy. In the same way, an electric current flowing through a wire causes the wire to become heated and it has been proved that the heat-energy thus produced is precisely equivalent to the electrical energy that disappears and which is not otherwise accounted for.

When energy is thus converted, it is found that there is always an exact relation between the quantity of energy of one type that disappears and the quantity of energy of the other type that appears. In fact, these two quantities are precisely equal, if they are both expressed in work-units — that is, in ergs or foot-poundals. As a matter of practical convenience, however, energy of a given special type is often measured in some special unit that lends itself, more readily than the erg or foot-poundal, to the particular measurements and approximate calculations that are associated with this species of energy. Heat is a familiar case in point, as it is commonly measured in terms of either the «British thermal unit,» or the «calorie» — the British thermal unit being defined as the quantity of heat required to raise the temperature of one pound of water by one Fahrenheit degree, at a certain specified point on the thermometric scale, and the calorie being defined as the quantity of heat required to raise the temperature of one kilogram of water by one Centigrade degree, at some specified temperature. These units and others analogous to them, which are based upon obvious, directly-observable properties of substances and which do not involve any physical theories whatever might with propriety be called «natural units.»

Owing to the fact that energy of one type may be transformed into energy of another type, it becomes exceedingly important to know the numerical relation between the «natural» units in which different forms of energy are measured; for until we possess this knowledge we cannot compare quantities of energy of different types — because we cannot express these quantities in terms of the erg, or foot-poundal, or any other common or fundamental unit. We should, in fact, be in the same position as a man who had measured one liquid with a gallon measure and another one with a pint mug, but who had no idea of the relation of the pint to the gallon.

It is especially important to be able to compare the «natural» unit of heat accurately with the erg or the foot-poundal, and many elaborate experimental researches have been conducted for the purpose of improving our knowledge of this relation. For full particulars with regard to this topic the reader should refer to HEAT and THERMODYNAMICS; but it may be said, in this place, that Rowland found that one British thermal unit of heat is the equivalent of about 778 foot-pounds of mechanical work — the «pound» here being understood to signify the attraction of the earth for one pound of matter, at sea-level in the latitude of Baltimore.

Efficiency of Conversion.— It is not always possible to convert a given quantity of energy of one type *wholly* into energy of some other given type, or wholly into mechanical work. Heat, for example, cannot be wholly converted into mechanical energy — though the reverse process, of converting mechanical energy wholly into heat, is easily performed. This fact has led to the use of the expression «available energy,» to signify that part of the total energy of a body or system, which can be converted into mechanical energy. The distinction between available and unavailable energy is arbitrary, however, because the fraction of the total energy that is available depends upon the completeness of our control over the conditions under which the transformation is attempted. Heat energy, for example, could be wholly converted into mechanical energy (so far as any theoretical limitation is concerned), if we could effect the transformation by means of a heat-engine having a condenser at the absolute zero of temperature, and in that case all the heat-energy would be «available.» Similar limitations and conditions apply to energy of other types. The fact that heat-energy is not fully convertible into mechanical energy under conditions that we can realize, or which exist in nature, while the reverse transformation takes place quite readily and completely, leads to the recognition of the fact that in the processes of nature there must be, on the whole, a tendency toward the «degradation of energy,» in the sense that there is a continuous diminution, in the universe, of the store of available energy. The supply of available energy, in other words, is tending continually to become dissipated, in the form of diffused, low-temperature heat.

For purposes of mathematical analysis, it is convenient to designate the condition of a body or system by representing, by means of algebraic symbols, its configuration, size, temperature, electric potential, and any other measurable attributes that it may have — the particular attributes or features that are selected being to a considerable extent arbitrary, though to serve the purpose of defining the condition of the body or system at every moment, they must be numerous enough, and must be selected in such a way, so that no change, essential to the problem under consideration, can take place in the body without at least one of these symbols (or defining variables) changing its value. It may be that some of the selected variables will be functionally dependent upon the others; but there will always be a certain number (small in the cases usually considered) that will be independent, so that any one of them can vary without any of the others necessarily undergoing a simultaneous variation. Then if E represents the aggregate energy (including all types) possessed by the body at a given moment, and if the body then undergoes an infinitesimal change of condition so that E increased by the theory of energetics teaches that a relation of the following form exists:

$$\Delta E = X\cdot\Delta x + Y\cdot\Delta y + Z\cdot\Delta z + \ldots$$

where X, Y, Z, x, y, z, . . . are functions of the independent defining variables — some of them being perhaps *identical* with certain of those variables. The symbols on the right-hand side may be so selected that each of the several expressions that are added together will represent the total quantity of energy of some one type that the body must take in, in order to undergo the physical change corresponding to an increase of x, y, z, . . . by the respective amounts Δx Δy, Δz, . . . The variables, moreover, may be so chosen that X, Y, Z, will be analogous to *intensities*, in the sense that they do not depend in any way upon the mass or volume of the body, but only upon its physical state; and for this reason they are called the «intensity-factors.» At the same time the infinitesimals Δx, Δy,Δz, . . . (since the dimensions of every one of the added terms must be the same as the dimensions of energy) will be proportional to the volume of the body, or to its mass, or to some other quality or attribute that would necessarily vary if the size of the body should vary, without any change in X, Y, Z, . . . The terms Δx, Δy, Δz, are therefore called the "capacity factors" of the terms on the right of the equation. Furthermore, the intensity-factor X will be of such a nature that its value within the body, as compared with its value in the environment immediately external to the body, determines whether the energy represented by $X \cdot \Delta x$ will enter the body or leave it.

By way of elucidation, let us consider the case of a "perfect gas," subject to variations such that any two of the three variables pressure, temperature and volume, will suffice to define its condition at any given moment; and let us assume that the only forms of energy to be considered are heat-energy and the energy of elastic compression. Then the foregoing equation takes the form

$$\Delta E = T \cdot \Delta \phi - p \cdot \Delta v,$$

where T is the absolute temperature, ϕ is the entropy, v is the volume of the gas, and p is the pressure to which it is subject, per unit of its bounding surface. (See THERMODYNAMICS). The first term on the right is then the quantity of heat-energy absorbed, and the second is the quantity of compression-energy absorbed. (The negative sign is affixed to the last term because we are considering the energy *added to* the system, and the internal energy due to compression increases when v decreases).

If the body or system undergoes any kind of a cyclic change, such that its final state is in all respects identical with its initial state, then the algebraic sum of all the changes of E (the internal or intrinsic energy), summed up for the entire cycle, will be zero; for if this were not the case, then by causing the body to pass around the cycle repeatedly, in one certain direction, we could obtain an indefinite supply of energy from it; and this would violate the principle of the conservation of energy. (See below). Suppose, now, that in the special case we are considering, the body undergoes the following cycle: (1) With its temperature constantly equal to T_1 it passes from the state in which $\phi = \phi_1$ to the state in which $\phi = \phi_2$; (2) with ϕ constantly equal to ϕ_2 it passes from the state in which $T = T_1$ *to* the state in which $T = T_2$; (3) with T constantly equal to T_2 it passes from the state in which $\phi = \phi_2$ to the state in which $\phi = \phi_1$; and (4) with ϕ constantly equal to ϕ_1 it returns to its initial state, so that T changes from T_2 to T_1. In each stage the heat absorbed will be obtained by integrating along the path that is followed. Thus in the first stage $T_1(\phi_2 - \phi_1)$ units of heat will be absorbed. In the second stage there will be no heat absorbed, because ϕ does not change. In the third stage $T_2(\phi_1 - \phi_2)$ units of heat will be absorbed; and in the final stage no heat will be absorbed. But as T, the absolute temperature, is essentially positive, it follows that $T_2(\phi_1 - \phi_2) = - T_2(\phi_2 - \phi_1)$ is negative, if $T_1(\phi_2 - \phi_1)$ is positive. Hence if heat enters the body during the first stage of the cycle, heat is rejected by the body during the third stage. The amount of heat that is absorbed in the course of the whole cycle is $T_1(\phi_2 - \phi_1) - T_2(\phi_2 - \phi_1) = (T_1 - T_2)(\phi_2 - \phi_1)$, and in view of the principle of the conservation of energy, this must have been converted into some other form of energy. But it is not represented by any increase in the internal energy of the body, because a complete cycle has been described, and the body has returned to its original state. Hence it has been transformed into mechanical energy. The only heat that has entered the body (in the positive direction) is the quantity taken in during the first stage of the cycle. Hence the efficiency of the conversion of heat-energy into mechanical-energy is

$$\frac{(T_1 - T_2)(\phi_2 - \phi_1)}{T_1(\phi_2 - \phi_1)} = \frac{T_1 - T_2}{T_1}$$

The cycle we have here considered is known as the Carnot cycle, being named for the distinguished French founder of the mechanical theory of heat, who first employed it. An analogous cycle can easily be applied to any other type of energy.

In the foregoing discussion we have assumed that the processes considered are *reversible,* and that any change can take place in either the positive or negative direction. The theory of irreversible changes is too involved to be considered in the present article — and in fact it has not yet been completely worked out.

Conservation of Energy.— The physical law that is known by this name asserts that the total amount of energy in any isolated system is absolutely invariable in amount. Energy may be added from without, or abstracted in a similar manner; but so long as no external influences are permitted to interfere, the total quantity of energy within the system is incapable of either increase or diminution. In a simple case like that of the pendulum this is easily admitted; but other systems are easily imagined, in which the truth of the law is by no means obvious. For example, a tightly-wound watch-spring possesses potential energy, in virtue of which it may be caused to drive a train of wheels and to do work. But suppose the coiled watch-spring is dissolved in an acid and meanwhile secured in some manner so that it cannot unwind. What becomes of the energy in the spring? This question would be best answered by experiment; but in the absence of experimental data the conjecture may be reasonably made that the two sides of the spring, being in different states of strain, act like plates of different metals when immersed in the acid and give rise to electric currents through the liquid, whose combined chemical and thermal effects correspond precisely to the potential energy that was stored in the spring by winding. The simpler case of a body falling freely in a vacuum is also somewhat confusing at first thought, because although it may be admitted that the potential energy is used up by accelerating the body while it is falling, it is by no means evident that the accumulated kinetic energy is not annihilated as soon as the body strikes the ground. But the energy of the falling body is converted into heat when the visible motion is suddenly arrested, and the body and the ground immediately around it are warmed by an amount that corresponds precisely to the kinetic energy that the body had immediately before the arrest. This explanation is not merely speculative, for it rests upon sound experimental evidence. The arrest of a

cannon-ball is accompanied by the generation of enormous quantities of heat, and the woodwork on battleships is often set afire in consequence of the mere impact of projectiles. The water at the bottom of a waterfall is measurably warmer than that at the top; and the rise in temperature that is observed when a falling mass of lead is suddenly arrested was used by Hirn with remarkable success for the determination of the mechanical equivalent of heat.

The idea that energy cannot be created appears to have been familiar to Galileo, who inferred the fact from a careful study of the simple machines that were in use in his day. There appeared to be many cases in which energy is destroyed, however, and the indications were, in fact, that all mechanical energy is gradually wasted away by frictional losses and by others of like nature. In cases in which these losses do not exist, or are negligible, the idea of the conservation of the energies of a system, and of the perpetual transformations of kinetic energy into potential energy and the reverse, proved to be of the greatest service in simplifying the theoretical discussion of many problems in mechanics, even before the modern theory of heat was formulated. The motions of the celestial bodies, for example, are much more easily discussed by the aid of the principle of conservation of energy than they could be without it. The extension of that principle so as to cover all the cases in which it had previously appeared to be violated could not be made until the fact was recognized that heat is not a substance; for, obviously, it was impossible that a substance could be converted into mechanical energy. In the first years of the 19th century Rumford made experiments tending to prove that heat is not a substance, and he appears to have been convinced, in his own mind, of the correctness of his novel views. A quarter of a century later Carnot probably reached the same conclusion, if we may judge from the note-book that he left among his papers. It was not until about 1840, however, that the great steps were taken that led to the establishment of our present views. Several eminent names are connected with these beginnings of the modern theory of heat and it is difficult to apportion the credit among them justly. Prominent among these names are those of Séguin, Mayer, Colding and Joule; but it is undoubtedly to Mayer and Joule that we are chiefly indebted for the new ideas, and the controversies that were rife at one time concerning the credit that should be given to different investigators for their work along this line were mainly confined to a discussion of the priority and the relative importance of the contributions of these two men.

Dr. Julius Robert Mayer, an obscure physician of Heilbronn, Germany, who had had some professional experience in the island of Java, had observed that the venous blood of the Javanese often exhibits the brilliant red color that is commonly observed only in the highly oxygenated blood of the arterial circulation; and after much reflection he came to the conclusion that this is because a lesser amount of oxidation suffices to maintain the temperature of the body in a hot climate than would be required in a cooler one. These observations were made in the summer of 1840. In May 1842 he published, in Liebig's *Annalen*, a paper entitled 'Remarks on the Forces of Inorganic Nature,' in which he gave a preliminary account of his discovery. Here he presents the general outline of the new theory very clearly, and the grasp of the subject that he displays at this early date is truly wonderful. The locomotive itself was then a great novelty, but he uses it to illustrate the transformation of heat into mechanical energy and back again in the following sentence, which would be a credit to the most advanced physicist of to-day: "Our locomotives may be compared to distilling apparatus; the heat beneath the boiler passes into the motion of the train, and is again deposited as heat in the axles and wheels." In 1845 he published a second and much more remarkable paper entitled 'Organic Motion in its Connection with Nutrition,' in which he gives a detailed calculation of the mechanical equivalent of heat, from the known specific heats of air.

The contributions of James Prescott Joule, of Manchester, England, to the mechanical theory of heat and the conservation of energy were the natural outcome of investigations that he had been making upon the heating effects of electric currents. His first paper that distinctly enunciated the new conception of heat as a form of energy was read at Cork, in 1843, before the British Association, and was entitled 'On the Calorific Effects of Magneto-Electricity, and on the Mechanical Value of Heat.' As first written it was very involved, and Faraday, who appears to have failed to grasp its exceeding importance, advised Joule not to submit it. He did submit it, however, and in it he gave a number of estimates of the mechanical equivalent of heat. The paper apparently did not greatly impress either the British Association or the outside world; for when Joule brought the subject up again before the same association in 1847 he had an experience that is best described in his own words: "The chairman suggested that, as the business of the section pressed, I should not read my paper, but confine myself to a short verbal description of my experiments. This I endeavored to do, and discussion not being invited, the communication would have passed without comment if a young man had not risen in the section, and by his intelligent observations created a lively interest in the new theory." The young man was Lord Kelvin, then simply William Thomson, two years out of college. In later years Joule obtained far better values for the mechanical equivalent of heat, and spent much of his time devising and executing new methods for its determination.

In England and the United States Joule is commonly credited with the discovery of the true nature of heat; but in Europe the honor is frequently given to Mayer. Tyndall compares the two very fairly. "Withdrawn from mechanical appliances," he says, "Mayer fell back upon reflection, selecting with marvelous sagacity, from existing physical data, the single result on which could be founded a calculation of the mechanical equivalent of heat. In the midst of mechanical appliances, Joule resorted to experiment, and laid the broad and firm foundation which has secured for the mechanical theory the acceptance it now enjoys. A great portion of Joule's time was occupied in actual manipulation; freed from this, Mayer had time to follow the theory into its most abstruse and impressive applications. With their places reversed, however, Joule might have become Mayer, and Mayer might have become Joule.»

In 1847 Helmholtz published his remarkable paper entitled 'On the Conservation of Energy,' in which the subject was presented with great generality and clearness, and which had a profound influence in spreading the new doctrine which taught that no energy is ever created or annihilated, but that we have to do merely with endless transformations of it from one form into another. Attempts have been made to deduce the principle of the conservation of energy from the general laws of mechanics, and in many special cases these attempts have been successful, though they cannot be in all cases, because systems are easily imagined in which the law is not fulfilled. The point is, however, that these imaginary, non-conservative systems apparently do not exist in nature. In allusion to the twofold nature of the subject (that is, the mathematical and physical aspects), it has been humorously said that everybody believes firmly in the conservation of energy, because the mathematicians believe it to be a fact of observation, while the physicists believe it to be a theorem in mathematics. It is now generally admitted, however, to be a fact of observation, the truth or falsity of which is to be established by experiment. Helmholtz proved that in any system composed of particles moving about in paths or orbits, and subject only to «central forces» (that is, to forces that act always toward fixed centres or foci, or which act, between every pair of particles, along the line adjoining their centres), the energy must be conserved, if the ordinary laws of theoretical mechanics hold true for the motions of the particles of which the system consists. Hence, if it be admitted that all matter consists of atoms that act upon one another only by forces that are central, a long step has been taken toward proving the law for all material systems. Unfortunately, however, we are not sure that central forces are the only ones that act upon the atom. It is an interesting fact that it was the study of the processes of organic nature that gave Mayer his first inspiration concerning the true nature of heat, and yet it is precisely here that the only doubt as to the entire generality of the law of conservation now exists. The most general test that can be applied to a system to enable us to judge from theoretical considerations whether it is conservative or not is this: Let the system be protected from external influences, and then, at a given instant, conceive the motion of every one of its particles to be precisely reversed in direction, without being modified in any other way. If, when left to itself, the system would then retrace its previous history so that the events of that history would recur in reverse order, the conservation of energy is rigorously fulfilled in it. If, on the other hand, the system would not so retrace its history, we cannot affirm that it is conservative, but must test the point by a direct appeal to experiment. Now, although this crucial condition is frequently fulfilled in inorganic nature, we certainly cannot assert it to be true in connection with living matter, even with respect to the meanest fungus. Hence we cannot, from reasoning based on the inorganic world alone, draw any sound conclusion whatever about the conservation of energy in the organic changes that occur in living tissues. To reach such conclusions for the living animal, we must weigh and analyze the food administered and the excreta given off; we must determine the oxygen absorbed and the carbon dioxide and other products exhaled; and we must measure the heat given out and the external work performed. When these things have been weighed, measured and analyzed for a sufficient period and with the necessary precision, then, and then only, shall we be competent to affirm or deny the truth of the conservation of energy in the animal machine. Such data are difficult to obtain, but much has been done in this direction, and while we are not yet prepared to establish it as a fact, beyond controversy, that energy is conserved in the animal body, all the data that we have point to this conclusion and it is now commonly admitted to be true.

The fact that energy (like matter) cannot be either created or destroyed has led physicists to speak of it as though it were a real thing, having an objective existence. It is useful to think of it in this way, and convenient to speak of «converting» energy from one form into another. In reality, however, it is no more a real thing than is momentum, or «action» (which figures prominently in modern theoretical mechanics). In pure mathematics the theory of transformations makes us familiar with the idea of «invariant» functions and configurations, which retain their forms or values when subjected to the given transformations. It is more logical to think of energy as being a similar invariant under the physical transformations that the existing universe and its contents can undergo. If this be admitted, then the discussions that are now often encountered, in which the possibility of energy having a molecular structure is considered, must be taken in a figurative sense only. It is quite possible that it is given out discontinuously in connection with radiation phenomena, just as the water handled by a «bucket brigade,» at a fire, is delivered discontinuously; but the question as to whether or not energy has a molecular structure, or a structure of any other kind, appears to have no physical meaning, when interpreted in any strict sense. (For the «quantum hypothesis» of Planck, see RADIATION). For an interesting expression of Planck's own view on the molecular-structure conception, after he had given it mature thought, consult his 'Leçons de thermodynamique,' Chevassus' translation, 1913, page 307.

The first systematic paper on the general theory of energetics (as distinguished from writings on the conservation of energy and on the mechanical theory of heat) was Rankine's 'Outlines of the Science of Energetics,' read before the Philosophical Society of Glasgow on 2 May 1855, although Rankine, two years before that time, had read, before the same society, a somewhat analogous paper containing the germs of the later one, and entitled 'On the General Law of the Transformation of Energy.' The phrase «potential energy» occurs in the earlier of these papers, for the first time.

See also MECHANICS; PERPETUAL MOTION; RADIATION; RADIOACTIVITY; THERMODYNAMICS.

ALLAN D. RISTEEN,
Director Technical Research, The Travelers Insurance Company.

ENERGISM, the name given by many philosophical writers to the neo-Aristotelian view concerning the chief ultimate goal of human life. It is summed up in the dictum, «the goal at which the will of every living creature aims is the normal exercise of the vital functions which constitute its nature.» Energism is opposed to Endæmonism, which puts pleasure as the chief goal of human life. Consult Paulsen, 'System der Ethik' (Berlin 1894; English trans., 1899).

ENERGUMEN, ĕn-ėr-gū'mĕn, a person controlled or «worked up» (*ἐνεργούμενος*) by evil spirits. The word is in common use in the writings of the Greek and Latin fathers; it is equivalent to the (*δαιμονιζόμενος*) (possessed by a devil) of the New Testament. In the 3d century the churches kept registers of their energumens and dealt with them much as though they were lepers; they were supported by the alms of the faithful and lodged in dwellings near the churches. The treatment of energumens and their relationship to the Church was discussed at and regulated by a number of synods, especially by that held at Orange in 441 and usually known as Concilium Arausicana. See EXORCISM. Consult Hefele K. J., 'A History of the Councils of the Church' (translated by W. R. Clark and others, Vol. III, Edinburgh 1883).

ENERGY, Conservation of. See ENERGETICS.

ENEURESIS, a symptom of many diseases of the bladder resulting in incontinence or involuntary passing of urine. It is a prevalent malady of childhood and only becomes of importance after the period of infancy, when the child should have learned to control the bladder. The control of the bladder is in part a matter of conscious effort, and has its representation in the higher brain-centres. Bladder-control is also exercised by that portion of the sympathetic nervous system found in the solar and sacral plexuses, and likewise in a number of cells in the spinal cord situated in the lumbar region. Interference with the action of any or all of these centres may result in eneuresis. Disease of the spinal cord may cause excessive irritation of the sympathetic nervous system and may result in nocturnal eneuresis, and the cutting off of the cerebral control may also bring about this condition. During deep sleep the cerebral control is usually cut off, accounting thus for the prevalence of eneuresis in deep sleep in children. Very frequently the immediate cause of eneuresis is some form of local irritation. This is particularly prevalent in young girls, and should always be removed, if possible, in the treatment. Drug medication is extremely unsatisfactory for this condition. The most efficient measures consist in building up the general nervous system of the patient by tonics, cold baths and exercise in the open air.

ENFANTIN, ŏn-fŏn-tăn, **Barthélemy Prosper,** French socialist of the Saint-Simon school: b. Paris, 8 Feb. 1796; d. there, 31 May 1864. He was the son of a Paris banker, and after studying for some years at the École Polytechnique went into business. After traveling extensively for a number of years he settled in Paris in 1823. In 1825 he first met Saint-Simon (q.v.) and became strongly interested in his political and economic theories. After the July revolution of 1830 Enfantin associated himself with Bazard for the active propagation of Saint-Simonism. They became the supreme heads of the sect. Bazard expounded it in its relations to philosophy and politics; Enfantin mainly in its relations to the social state. They established a paper, called *Globe,* in which they propagated their views. Soon, however, a schism broke out between the two on the question of marriage and the relation of the sexes, for his views on which Enfantin was, in 1832, sentenced to one year's imprisonment and to pay a fine of 100 francs. This broke up a model community, which, together with 40 of his disciples, he had founded at Ménilmontant after the break with Bazard and where he was known as «Le père.» Being released from prison at the expiration of a few months he went to Egypt. He was subsequently appointed a member of the scientific commission for Algiers, and on his return from Africa published 'Colonization of Algeria' (Paris 1843). At this time he became again actively interested in business and in 1845 was made director of the Paris-Lyon Railway. After the revolution of 1848 he founded and edited the journal *Le Crédit,* which stopped publication in 1850. He was then made administrator of the Lyon Railway, in which position he was quite successful and which he occupied until his death. His library of 1,018 volumes and 63 manuscripts he left to the Library of the Arsenal at Paris. His various writings, all on economic and political subjects, have been published together with those of Saint-Simon as 'Oeuvres de Saint-Simon et d'Enfantin' (47 vols., Paris 1865–78). Consult Howse, E. S., 'Enfantin and Saint-Simon' (in *Theological Review,* Vol. IX, p. 50, London 1872).

ENFANTS DE DIEU, ŏn-făn-dę-dyē, a name of the French Camisards (q.v.).

ENFANTS PERDUS, per-dü («lost children»), in military parlance the men appointed to perform some exceedingly hazardous duty from which their chances of returning safely are practically nil. Our English equivalent phrase is «a forlorn hope.»

ENFEOFFMENT, ĕn-fĕf'mĕnt, (1) the act of bestowing or investing with a freehold estate; (2) the instrument or deed by which such estate is conveyed; (3) the estate so conveyed. See FEE-SIMPLE.

ENFIELD, Conn., town in Hartford County, on the Connecticut River and the New York, New Haven and Hartford Railroad, 15 miles north of Hartford. Its chief manufactures are carpets, shoddy, powder, filter presses, supplies for undertakers and bicycles, and it has large brick works. A large amount of the now celebrated Connecticut tobacco is here prepared for use and shipped to different parts of the world. Shaker Station is a part of the town (see SHAKERS). It contains a Carnegie library. The government is administered by town meetings. Pop. 11,708.

ENFIELD, England, a market town in the county of Middlesex on New River, nine miles northeast of London. Enfield is the seat of the well-known government manufactory of rifles and small-arms, and the standard rifle used in the British army is made here. At Cuffley, three miles north of Enfield, the first Zeppelin to be brought down on English soil was shot down on 3 Sept. 1916 by Flight-Lieutenant Robinson, who was awarded the Victoria Cross for the daring deed. The airship fell headlong, sinking to the ground in flames, and the members of the crew burned to death. Some noted people have lived in Enfield. See BEACONSFIELD; LAMB; KEATS. Pop. 56,388.

ENFIELD RIFLE, a muzzle-loading rifle used in the British army prior to the introduction of the breech-loading system. It was also used in the United States during the Civil War by the Northern army, when Springfields could not be obtained, and by the Confederate army. In England large numbers of these rifles were converted into breech-loaders on the Snider principle and were known as the Snider-Enfield or simply Snider. The Enfield rifle must not be confused with the recent British Lee-Enfield, which is a modified Mauser.

ENFILADE, ĕn-fĭ-lād' (from the Fr. *enfiler*), in the military art, is to rake by fire the enemy's trenches or positions along the whole length. In conducting the approaches at a siege care must be taken that the trenches be not enfiladed from any part of the place besieged. To avoid this they are generally cut in a zigzag. The same principle holds true of trench warfare, where the boyaux or communicating trenches are zigzagged and the firing trenches are interrupted by traverses.

ENFLEURAGE, ŏn-flĕ-räzh, in perfume-making, the method of extracting by contact and absorption the scents of flowers used for perfumery. For this purpose wooden frames containing glass smeared with pure grease are filled with flowers, which are allowed to remain from one to six days. The grease gradually absorbs the scent, the flowers being renewed from time to time. The scent is afterward separated from the grease by soaking the latter in strong spirits of wine. Sometimes wire frames covered with cotton cloths, saturated with fine olive-oil, are used instead of glass. In this manner the most delicate odors are extracted from flowers which would be lost in the process of distillation. This process is employed especially in the south of France. It is rather complicated, and has the disadvantage of permitting the flowers to come into direct touch with the grease and imparting to it possibly some impurities. In modern perfume factories the process of enfleurage, therefore, is frequently accomplished by placing flowers and grease in separate containers. A current of air is created by means of an exhaust fan in such a manner that it passes first over the flowers and later over the grease, which latter rapidly absorbs the odors originated by the flowers. Another method consists of passing a current of carbonic acid gas through a tin box containing fresh flowers and then into a glass jar of strong alcohol cooled by water. The carbonic acid absorbs the odors of the flowers, which, in turn, is absorbed by the alcohol. Consult Askinson, G. W., 'Perfumes and Cosmetics, their Preparation and Manufacture' (translated from the German by W. L. Dudley and others, New York 1915); Rolet, A. V., 'Les Essences et les Parfums' (Paris 1907); Piesse, G. W. S., 'Chimie des Parfums et Fabrication des Essences' (Paris 1917).

ENG AND CHANG. See SIAMESE TWINS.

ENGADINE, ĕn-gä-dēn', a beautiful valley in Switzerland, in the Grisons, on the banks of the Inn, bordering on the Tyrol. The extent of the valley is 60 miles and it has an area of 653 square miles. The language generally spoken is the Ladin, a branch of the Romanic tongue. Several towns and villages are situated in the valley, which is visited by numbers of strangers on account of its picturesque beauty and its mineral springs as well as its invigorating climate. Pop. 12,193.

ENGAGEMENT. See BETROTHMENT.

ENGAGEMENT, Military, a minor battle or encounter in which all the parts or divisions of the contending armies do not have a part. Engagements or skirmishes usually occur when major forces are being manœuvred for position to secure the advantage in a pitched battle. See MILITARY SCIENCE; TACTICS, MILITARY.

ENGANO, ĕn-gä'ño, an island of the Malay Archipelago, 60 miles south of Sumatra. It is covered with forests and surrounded by coral reefs; area, including several small adjacent islands, 300 square miles. The natives are Malays.

ENGEDI, ĕn-gē'dī or ĕn'gē-dī (Heb. «Fountain of the Goat»), on the western shore of the Dead Sea, about 30 miles southeast of Jerusalem. The modern Arabic name is Ain-Jidy. The ancient name was applied also to the eastern part of the wilderness of Judah. The city in the time of Abraham was called Hazazon-tamar (Gen. xiv, 7), the tamar meaning palm tree. In 1 Samuel xxiv mention is made of David fleeing into the wilderness of Engedi to escape from Saul. There are numerous other references to the place in the Old Testament. In modern times nothing remains except the never-changing effectiveness of the scenery arising from the combination of steep cliffs, the Dead Sea, strange vegetables, balmy air and almost excessive quietness. Consult Robinson, E., 'Biblical Researches in Palestine, etc.' (Vol. II, Boston 1841); Wilson, Sir C. W., 'Picturesque Palestine' (Vol. I, London 1884).

ENGEL, Ernst, German statistician: b. Dresden, 1821; d. Berlin, 1896. After a preliminary education he took up the study of mining engineering at Freiberg and Paris. For a time he was a member of the commission investigating industrial and labor conditions in Saxony, and in 1850 was appointed chief of the Royal Bureau of Statistics at Dresden. He resigned in 1858 and was made chief of the Saxon Mortgage Insurance Company, but two years later became director of the Prussian Bureau of Statistics, from which he retired in 1882. He was one of the most efficient of modern statisticians and his investigations into the social condition of the working classes have proved invaluable. He wrote 'Die Methoden der Volkszählung' (1861); 'Land und Leute des Preussischen Staates' (1863); 'Das Zeitalter des Dampfes' (1881).

ENGEL, Franz, German explorer: b. Röbel, Mecklenburg-Schwerin, 1834. He traveled extensively in South America in the years 1857–63 and published the results of his explorations in several valuable volumes, including 'Studien unter den Tropen Amerikas' (2d ed., 1879); 'Aus dem Pflanzerstaate Zulia' (1881). From 1872 to 1896 he published the *Landwirthschaftliche Jahrbücher*.

ENGEL, Johann Christian von, Hungarian historian: b. Teutschau, Hungary, 1770; d. 1814. He received his education at the University of Göttingen, where Heyne and Schlözer were among his teachers. He wrote several historical works which in their day were treasure-houses of knowledge and scholarship. He was the first to put the history of Hungary on a sound scholarly basis. In 1812 he was ennobled. His greatest works are 'Geschichte des ungarischen Reiches und seine Nebenländer' (5 vols., 1797–1804); and 'Geschichte des Königreichs Ungarn' (5 vols., 1814).

ENGEL, Johann Jakob, German prose writer: b. Parchim, 11 Sept. 1741; d. there, 28 June 1802. On the accession of King Frederick William III of Prussia, whose tutor he had been, he was invited by his former pupil to Berlin, where he made himself exceedingly useful in the Academy of Sciences by his writings. Among his philosophical works may be mentioned his 'Der Philosoph für die Welt,' distinguished for acute observations on men and manners, enlivened by elegant illustrations. Of a similar character is his 'Mirror for Princes' (Fürstenspiegel). His 'Ideen zu einer Mimik,' full of taste, acuteness and knowledge of human nature, may be regarded as a kind of manual for actors. Anxious to make the German theatre the mirror of the national life, he wrote several plays, but they were of little merit — 'Der dankbare Sohn'; 'Edelknaben,' etc. His 'Lorenz Stark,' a novel, is a masterly picture of life and manners. A complete edition of his works appeared at Berlin (1801–06).

ENGEL, Joseph, Austrian anatomist: b. Vienna, 1816; d. 1899. He was appointed professor of anatomy at Zürich in 1844 and later the chair of physiology fell to him also. Five years afterward he was appointed to the chair of pathological anatomy at the University of Prague. In 1854 he became professor of anatomy at the Josephakademie, Vienna, in which position he remained until 1874. He made many important contributions to the systemization of anatomical science and its study. His principal works are 'Lehrbuch der pathologischen Anatomie,' and 'Kompendium der topographischen Anatomie' (1859).

ENGEL, Karl Dietrich Leonhard, German musician and writer: b. grand duchy of Oldenburg, 21 Feb. 1824. He went to Russia as a violin virtuoso at the age of 18, becoming a member of the Imperial Orchestra at Saint Petersburg at 22, and later its concert-master. He went to Dresden in 1869 and took up his residence there. Among his works are 'Deutsche Puppen Komödien' (1874–93); 'Das Volksschauspiel Doktor Johann Faust' (2d ed., 1882); 'Zusammenstellung der Faust-schriften vom 16 Jahrhundert bis Mitte 1884' (2d ed., 1884); 'Die Don Juan Sage auf der Bühne' (1887). His musical compositions include a concerto in B minor and the humorous fantasy entitled 'Jüdischer Carneval.'

ENGELBERG, Switzerland, a noted health resort, situated in Unterwalden Canton, in the Engelberg Valley, about 3,500 feet above sea-level, and 15 miles south of Lucerne. It is the seat of a Benedictine monastery, dating from the 12th century, with a library of 20,000 volumes, including incunabula and manuscripts of great value. Connected with the monastery is a gymnasium which was founded in the 11th century. Cheese-making is the main industry. Pop. 2,500.

ENGELBERT, Bohemian monastic author: b. Volkersdorf, Styria, about 1250; d. 1331. He received his education at Prague and Padua, entered the order of the Benedictines and in 1297–1327 was abbot of Admont, Styria. He is best known to scholars through his Roman history; entitled 'De Ortu, Progressu et Fine Imperii Romani,' which has gone through numerous editions. For other works of this author consult 'Thesaurus Anecdotorum Novissimus' (1721) and 'Bibliotheca Ascetica Antiquo-nova' (1723–25).

ENGELBERT, Saint, archbishop of Cologne: b. Berg, 1185; d. 1225. In 1206 he was excommunicated, but was restored to friendly relations with the Church and reinstated two years later. In 1216 he was appointed archbishop of Cologne. He was one of the most progressive men of his age; he greatly improved the administration and governmental methods of his see; patronized agriculture, the industries and art, and opposed the repressive and cruel methods of the feudal barons. He reformed the electorate and after 1220 was administrator of the empire. In 1222 he crowned Henry VII. He was assassinated by hirelings of his nephew whom he had accused of maladministration. He is commemorated as a martyr on 7 November, although he has never been formally canonized. Consult Stoffel, 'Engelbert der Reichsverweser' (Elberfeld 1893).

ENGELBRECHT, Theodor Heinrich, German geographer: b. Obendeich, Schleswig-Holstein, 1853. He acquired his education at the universities of Leipzig and Strassburg, and in 1911 received the honorary degree of doctor from the University of Breslau. In 1895 he became a member of the Free Conservative party in the House of Deputies. His works include 'Die Landbauzonen der aussertropischen Länder' (3 vols., 1899), a valuable work on the study of agriculture in Europe; 'Die geographische Verteilung der Getreidepreise' (2 vols., 1908), the first volume dealing with the United States, the second with India; 'Bodenbau und Viehstand in Schleswig-Holstein' (1905).

ENGELBRECHTZEN, ĕng'ĕl-brent-zĕn, **Cornelis**, Dutch painter: b. Leyden, 1468; d. there, 1533. He was the son of the wood-engraver Engelbert, and the teacher of Lucas, being the earliest known painter in Leyden and the first of his nation to use oil colors. Many of his works were destroyed during the Reformation, and the only two properly authenticated pictures of large size are altarpiece with 'Crucifixion' and altarpiece with 'Pieta,' Town Hall, Leyden. Doubtfully attributed to him are 'St. Leonard,' Antwerp Museum; 'Crucifixion,' old Pinakothek, Munich; 'Deposition,' Moritz Chapel, Nuremberg; 'Madonna and Child,' National Gallery, London; 'Crucifixion,' Venice Academy. The Van Leydens were his pupils.

ENGELHARD, Friedrich Wilhelm, frēd'-rĭн vil'hĕlm ĕng'ĕl-härt, German sculptor and painter: b. Grünhagen, Prussia, 19 Sept. 1813; d. 22 Jan. 1902. He studied at Hanover, at Copenhagen with Thorwaldsen and at Munich with Schwanthaler. He executed many groups, single figures and genre pieces. Among his creations are 'Love on a Swan'; 'Dancing Springtime'; 'Slinger with Dog'; 'Bacchus Conquering a Panther'; 'Cupid and Psyche'; the frieze of the 'Edda,' his chief work; 'A Child Fishing'; 'A Child Threading a Needle'; statue of 'St. Michael'; portrait medallion of Bismarck for the monument of Canossa, near Harzberg; 'Christ Blessing Little Children'; and the legendary characters of Germany, 'Odin,' 'Thor' and the Valkyries.

ENGELHARDT, Georg von, Russian statesman: b. Riga, 1775; d. 1862. He went to Saint Petersburg in 1790 and six years later secured a post in the Department of Foreign Affairs. He became Undersecretary of State in 1801 under Alexander I. He was made director of the Pedagogical Institute in 1811 and of the Lyceum at Tsarkoe-Selo in 1816. His liberalism, however, led to his removal in 1823. From 1838 to 1852 he edited the *Russische Landwirtschaftliche Zeitung*. He published 'Russische Miscellan zur Kenntnis Russlands und seiner Bewohner' (4 vols., 1828–32) and edited the manuscript journals of the explorer, Wrangel, which he issued in 'Reise längs der Nordküste von Sibirien und auf dem Eismeer' (1839).

ENGELHARDT, Johann Georg Veit, German theologian: b. Neustadt-an-der-Aisch, Bavaria, 1791; d. Erlangen, 13 Sept. 1855. In 1822 he became professor of theology at Erlangen; during the years 1845, 1847 and 1848 was the representative of his university in the diet at Munich. His most celebrated works are a translation of the writings ascribed to Dionysius the Areopagite; 'Handbuch der Kirchengeschichte' (1834); 'Richard von St. Victor und Johannes Ruysbroek' (1838); 'Dogmengeschichte' (1839).

ENGELHARDT, Moritz von, Russian naturalist: b. Esthonia, 1779; d. 1842. He received his education at Leipzig and Göttingen and the Freiberg mining school. He made a tour of Europe with Karl von Raumer and in 1811 visited the Crimea and Caucasus with von Parrot, and seven years later he traveled through Finland. He taught mineralogy at Dorpat in 1820–30, and thereafter traveled and explored Russia, discovering vast deposits of gold, platinum, etc., detailed in his reports, which were issued at Riga in 1830. His principal works are 'Geognosticher Umriss von Finland' (1821); and, with von Raumer, 'Geognostische Versuche' (1816) and 'Geognostische Umrisse' (1817).

ENGELHARDT, Vassili Pavlovich, Baron, Russian astronomer: b. Kustovitchi, Grodno, 1828. He received his education in Saint Petersburg, entered the government employ in 1847 and remained in its service for six years. He built an astronomical observatory in Dresden in 1872. He also gave valuable astronomical instruments to the University of Kazan and erected buildings there to house them. His published works include 'Observations astronomiques faites à Dresde' (3 vols., 1886, 1890, 1895).

ENGELHARDT, Zephyrin (Charles Anthony), American writer and missionary: b. Bilshausen, Hanover, Germany, 13 Nov. 1851. He came to the United States in 1852, was educated in the parish schools and Saint Francis Seraph College, Cincinnati, Ohio. In 1872 he entered the Franciscan order, was ordained to the priesthood in 1878 and in 1878–80 was teacher at Saint Joseph's College, Cleveland, Ohio. From 1880 to 1885 he was missionary to the Menominee Indians in Wisconsin and from 1885 to 1887 was stationed at Superior City, Wis. He was vice-commissary for the Holy Land and editor of the *Weekly Pilgrim of Palestine* at New York in 1887–88 and for the ensuing two years was missionary in Mendocino County, Cal. From 1890 to 1894 he was stationed at Saint Joseph's Monastery, Cleveland, and from 1894 to 1900 was superior of the missions of his order in northern Michigan and of the Indian Boarding School, Harbor Springs, Mich. In 1901 he was stationed in California. In 1895 he founded and for five years edited the *Anishinabe Enamiad*, a periodical in the Ottawa-Chippewa language. He is a member of the Texas Historical Association and of the National Geographical Society and has published 'Kachkenohamatwon Kesekoch' (1882); 'Kateshim' (1883); 'The Franciscans in California' (1897); 'Missions and Missionaries of California' (5 vols., 1908–16); 'The Holy Man of Santa Clara, or Life of Father Magin Catala' (1909). He is a contributor to *Katholische Missionen, California Volksfreund, Sankt Josephsblatt*. He writes in German under the *nom-de-plume* of "Der Bergmann" and in English of "Esperanza."

ENGELMANN, George, American botanist: b. Frankfort-on-the-Main, 2 Feb. 1809; d. Saint Louis, Mo., 4 Feb. 1884. He studied medicine at the universities of Heidelberg, Berlin and Würzburg, receiving the degree of M.D. from the last-named institution in 1831. The first half of 1832 he spent in study at Paris where he met Braun and Agassiz. In September 1832 he sailed for the United States where relatives of his had bought some land in the Mississippi Valley. In 1835 he began the practice of medicine at Saint Louis, Mo. Although he was highly successful in the practice of his profession, he had, even during his student days, become deeply interested in botany. This interest grew gradually until almost all his leisure hours were occupied with scientific investigations, chiefly in relation to botany, although some of them were devoted to meteorology. As his success in his profession increased he found it possible at times to take protracted vacations, some of which he spent abroad and all of which he devoted to botanical investigations. The results of these were some 100 papers published at various times in different scientific journals, especially in the transactions of the Saint Louis Academy of Science which were examples of the most painstaking and thoroughgoing scholarship. He soon was recognized as an authority on the botany of the North American continent. The most important of his papers were on Cuscutinæ, Cacteæ, Coniferæ, American oaks and grape vines. They together with all his other writings, hardly less important, have been collected and published, illustrated by many plates, as 'The Botanical Works of the Late George Engelmann' (ed. by W. Trelease and Asa Gray, Cambridge, Mass., 1887). This publication also contains an exhaustive biographical sketch. He was the first president of the Saint Louis Academy of Science and an active or corresponding member of many learned societies. His extensive botanical collection is in the Shaw Botanical Garden, Saint Louis, Mo.

ENGELMANN, Johannes, Russian jurist: b. Mitau, Courland, 7 July 1832. Educated at the University of Saint Petersburg he became professor of Russian law at Dorpat 1860, retaining the chair for 39 years, and delivering his lectures in Russian instead of German after 1887. These lectures covered a wide field and contributed greatly to the advancement of the science of jurisprudence in Russia. Among his works are 'Die Verjahrung nach russischem Privatrecht' (1867; in Russian, 1868); 'Die Zwangsvollstreckung auswärtiger richterlicher Urteile in Russland' (1884); and 'Das Staatsrecht Russlands' (1888).

ENGELS, Friedrich, German Socialist: b. Barmen, Prussia, 28 Nov. 1820; d. London, 5 Aug. 1895. The son of a German manufacturer he spent two years in Manchester, England, 1842–44, and took part in the revolutionary movement in Baden in 1848. He returned to Manchester in 1850, and was partner in a manufacturing business from 1860–69, after which he lived mainly in London. He was an intimate friend of Karl Marx (q.v.), and his most efficient helper in the work of organizing the International Socialist movement. In 1870 Engels was corresponding secretary of the International Workingmen's Society for Belgium, Italy and Spain. With Marx he wrote the 'Communist Manifesto' (1847); he also wrote 'The Working Class in England in 1844' (new ed., 1892); 'The Origin of the Family'; 'The Development of Socialism from Utopia to Science' (1894, a part of a large work left unfinished); and edited Marx's 'Capital.' Consult Simons, 'Friedrich Engel: his Life, his Work, his Writings' (1885), a translation from Tautsky's German text; Sombart's biography (1895); and Dawson, 'German Socialism' (1899).

ENGERTH, ĕng'ĕrt, **Eduard von**, Austrian painter: b. Pless, Silesia, 13 May 1818; d. 1897. He was a pupil of the Vienna Academy, taking the gold medal there in 1845. He became director of the Prague Academy 1854 and in 1855 professor at the Vienna Academy. He was appointed director of the Belvedere Gallery 1871 and director of the Academy 1874. He was made commander of the order of Francis Joseph 1867. Among his works are 'Haman and Esther'; 'Ladislaus and Akus' (1844); 'Coronation of Rudolph I'; 'Joseph Explaining the Dream' (1845); 'Seizure of King Manfred's Family' (1853), a masterpiece in the Vienna Museum; 'Victory of Prince Eugene at Zenta' (1865); 'Marriage of Figaro'; 'Fable of Orpheus' (1868); 'Coronation of Francis Joseph as King of Hungary' (1870); 'Death of Eurydice' (1877). Engerth frescoed the church at Alt Lerchenfeld after the cartoons of Führich, painted numerous portraits and decorated the new Vienna Opera House.

ENGERTH, Wilhelm, Baron, Austrian engineer: b. Pless, Prussian Silesia, 1814; d. 1884. He received his education in architecture at the Polytechnic Institute and the Academy of Arts, Vienna. He became professor of mechanical engineering at Gratz in 1844. He is known internationally as the inventor of the "Engerth system" for freight locomotives, which was generally adopted throughout Europe. He also designed and constructed a river gate near Nussdorf to prevent ice from entering the Danube Canal, which previously was the cause of annual inundations. In 1873 he was supervising architect of the Vienna Exposition buildings and had complete charge of the engineering department at the exposition.

ENGHIEN, än-găn, **Louis Antoine Henri de Bourbon**, Duke of, French prince: b. Chantilly, 2 Aug. 1772; d. Vincennes, France, 21 March 1804. He was the only son of Louis Henri Joseph Condé, Duke of Bourbon. From 1796 to 1799 he commanded with distinguished merit the vanguard of Condé's army, which was disbanded at the Peace of Lunéville (1801). He then married and took up his residence at Ettenheim, in Baden. He was generaly looked upon as the leader of the *émigrés*, and was suspected by the Bonapartists of being privy to the attempt of Cadoudal to assassinate the First Consul in 1804. The spies of Napoleon reported that Enghien was often absent for 10 or 12 days together from Ettenheim, and it was believed that on some of these occasions he had secretly visited Paris. Napoleon therefore invaded the neutral duchy of Baden and the Duke of Enghien was seized 15 March 1804, conducted to Strassburg, and thence to the fortress of Vincennes, where he arrived on the evening of the 20th. That same night a court-martial was assembled; his innocence being established, the ground of accusation was changed into that of compassing a new coalition against France, of which he was adjudged guilty. He requested an interview with Bonaparte, which was refused, and he was immediately led out to execution. He was shot between four and five o'clock in the morning in the ditch outside the walls, and his body was thrown, dressed as it was, into a grave dug, it is said, the day before. His execution was followed by an indignant protest and the rupture of diplomatic relations with Russia; but of the deed Napoleon never repented. He was the last representative of the house of Condé. Consult Dupin, 'Pièces judiciaires' (Paris 1823), and 'Mémoires historiques sur la catastrophe du Duc d'Enghien' (Paris 1834); Fay, 'The Execution of the Duc D'Enghien' (in the *American Historical Review*, New York 1899); Welschinger, 'Le Duc d'Enghien' (Paris 1888).

ENGINE. A motor or prime mover which is capable of utilizing natural forces, such as the pressure of steam or the expansion of a gas, and converting those forces into mechanical energy in the form of motion, which may be employed for doing mechanical work, thus distinguishing it from a «machine,» which can receive motion only from a motor or engine external to itself.

The term engine was originally used in the sense of a machine, a usage which survives in rose-engine and cotton-gin (gin being simply a short form for engine). The first textile machines were called engines, and we still speak of engines of war. But when steam engine became familiarly shortened to engine, the term was confusing, and gradually machine was substituted for the word engine in nearly all uses except for generation of power.

All heat engines act through the medium of a working substance which absorbs heat, converts a portion of that heat into mechanical energy, which is represented by the work performed by the engine, and rejects the remaining portion of the heat, still in the form of heat. The working substance may be a gas, a liquid or a solid. The various successful forms of heat engines may be conveniently grouped into three general classes — steam engines, gas and oil engines, turbines and rotary engines.

Steam Engines.— In ordinary forms of steam engines the working substance is saturated steam, a fluid consisting of a mixture of water and steam in varying proportions, the expansive energy of which is utilized to drive or impart motion to a piston working within a cylinder.

Miscellaneous Engines.— Many engines are named from some distinctive feature of their mechanism or a peculiarity of construction. Hence there is the automatic engine, one that is self-regulating, requiring little attention. In a stationary engine this would mean one that regulated its own speed or point of cut-off; in an automobile engine it would mean one that would run without attention, as long as the gasoline feed, carburetor, spark-plug, etc., were in order. A cut-off engine is one in which the steam or motive fluid is cut off before the end of the stroke. A quadrant engine is one having a piston that moves in a quadrangular chamber. A reciprocating engine is the most ordinary type, in which the piston moves back and forth. A direct-connected engine is one that has the crank-shaft extended to form the main shaft of a dynamo. A multi-cylinder engine is one having several cylinders operating on the same shaft, as a 6- or 8-cylinder automobile engine. A self-contained engine is one in which the engine and boiler are both housed in one framework. A screw or propeller engine is a marine engine for driving a screw-propeller. A series-expansion engine is one having several cylinders in which the steam or motive fluid is successively expanded. A twin cylinder engine is one having two cylinders formed in one casting or «*en bloc*.»

High-Speed Engine.— One in which the piston speed is rapid, according to some authorities exceeding 900 feet per minute. It possesses the advantages of small dimensions and small weight for a given power, and on account of the frequency of its strokes is capable of meeting variations in load more quickly than a low-speed engine. Its disadvantages consist in the greater waste of steam, the greater wear, increased danger of heating and higher cost of construction and operation.

Low-Speed Engine.— One in which the piston speed is slow, according to some authorities, less than 600 feet per minute.

Single-Acting Engine.— One in which the pressure of the steam is exerted only on one side of the piston, which is forced back again by the pressure of the atmosphere on the other side against the vacuum produced by the condensation of the spent steam. They were formerly used chiefly for pumping purposes, and in connection with steam hammers, but are now practically out of date.

Double-Acting Engine.— One in which the steam in the cylinder is exhausted into the piston, either against the pressure of the air, or against the vacuum of the condenser. Originally, all engines were made single-acting, but nearly all modern steam engines are double-acting.

Direct-Acting Engine.— One in which the action of the piston is transmitted directly to the crank-shaft. Nearly all engines are of this type.

Indirect-Acting Engine.— One in which the motion of the piston is communicated to the crank-shaft by means of intermediate levers. In the beam-engine, the connection between the piston and the connecting rods consists of a beam, the oscillating point of which is placed midway between the two rods. They are chiefly employed for pumping purposes and for driving paddle-wheel steamers. Other than in this limited field, they are becoming obsolete.

Expansive Working Engine.— An engine is worked expansively when the steam, instead of being admitted at full pressure into the cylinder until the termination of the stroke, is cut off at some fractional part of the stroke and thus caused to do work simply by its own expansion. The steam may be expanded in one or more cylinders. The amount of steam consumed is low as compared to the amount of work done. It is universally used where circumstances will permit, on account of its greater economy as compared with the engines of the non-expansive working type.

Non-expansive Working Engine.— An engine in which the steam is allowed to enter the cylinder at boiler pressure and is maintained at that pressure behind the piston during the whole of the stroke. The amount of steam consumed is disproportionately high as compared to the work done.

Condensing Engine (called also low-pressure or vacuum engine).— One in which the spent steam in the cylinder is exhausted into a vacuum and condensed into water, thus obliterating the back pressure of the atmosphere and consequently effecting a gain of pressure equivalent to 14.7 pounds per square inch in the effective working pressure of the steam.

Non-condensing Engine (called also high-pressure engine).— One in which the spent steam in the cylinder is exhausted into the air at atmospheric pressure, thus entailing the work of forcing the piston against a back pressure of 14.7 pounds per square inch, at the expense of the effective working pressure of the steam. This disadvantage is offset by using steam at higher pressures.

Simple Engine.— One in which the steam after having forced the piston through its stroke is exhausted into the air or into a vacuum or condenser.

Compound Engine.— An engine with two or more cylinders in which the steam after having expanded and performed its work in one cylinder passes into the next cylinder, of larger size, and continues to expand and perform work. The different types of compound engines are distinguished as «series-expansion» engines or by the number of cylinders employed for the expansive working of the steam, and are designated as the two-cylinder compound engine, the three-cylinder or triple-expansion engine and the four-cylinder or quadruple-expansion engine. The cylinders are usually arranged side by side or parallel with each other. Sometimes, as in the case of the «tandem-compound,» they are placed in line one behind the other, and also vertically one above the other as in the case of the «steeple-compound.» In a «cross-compound» the cylinders are placed side by side and parallel to each other, but sufficiently far apart to allow space for a fly-wheel between them. Up to the present time the quadruple-expansion engine appears to be the limit beyond which the numbers of expansions have not been carried with success. The great practical advantage of the multiple-expansion engines lies in their high steam economy.

Air (or Hot Air) Engine.— An engine in which the working fluid is air expanded by heat. It is only of experimental interest.

Horizontal Engine.— One in which the axis of the cylinder and piston rod is horizontal.

Vertical Engine.— One in which the axis of the cylinder and piston rod is vertical. Vertical engines are made in a great variety of forms and are usually arranged with the cylinders uppermost. Very few of them are constructed with the cylinders lowermost and those are only of the smallest sizes. The principal advantages of the vertical engine consist in the small space required for their foundations and the uniformity of wear on the cylinders, pistons and rods. The type includes many forms of steam hammers, launch engines, screw engines and inverted cylinder engines.

Inverted Cylinder Engine.— A vertical engine, in which the cylinder is inverted or placed above the piston rod, connecting rod and crank-shaft. It is typical of the marine engines employed to drive screw propellers.

Inclined Engine or Inclined Cylinder Engine.— A form of marine engine in which the cylinders are inclined toward each other at an angle of about 120 degrees and make a triangle with the base. They are connected by cranks to a common crank-shaft.

Beam Engine.— An indirect-acting engine in which the piston rod is connected to the connecting rods by means of a lever in the form of a beam. It is more fully described under the term Indirect-Acting Engine.

Oscillating Engine.— A marine engine of the direct-acting type, in which the cylinders are suspended upon hollow trunnions and oscillate thereon, thus allowing the motion of the piston rods to accommodate itself to that of the crank at all parts of the revolution. It occupies but little space and is peculiarly adapted for paddle-wheel steamers. It survives mainly in toy engines because of its simple construction.

Trunk Engine.— An engine having a large hollow piston open at one end and called a trunk. The connecting rod goes right into the open end of this trunk-piston and is attached directly to the piston-head, so that there is no piston rod. It is used in some forms of gas engines and toy engines.

Corliss Engine.— A very economical type of engine, in which the valves are controlled automatically from the governor and the steam supply proportioned to the requirements of the engine at each moment during its working stroke. The valve forms a segment of a circle and turns through an arc of a circle and alternately covers and uncovers the steam port. It is operated by a rod from a wrist plate, but is disconnected at every stroke of the engine and the supply valve closed instantaneously by means of a dash-pot.

Cornish Engine.—A standard type of pumping engine, originally of the single-acting type. At the present time it appears in two forms — the beam engine and the direct-acting engine. The valves of a Cornish engine are operated by a special device called a cataract, consisting of a weighted piston which works in a cylinder provided with a large inlet valve and a small discharge valve. The working stroke of the pump lifts the weighted piston and draws the water into the cylinder through the former, and the return stroke discharges it through the latter and at the same time actuates the valves of the steam cylinder of the pump so as to cause another working stroke.

Marine Engine.— Any form of engine used for propelling a vessel. They are usually of the compound or multiple-expansion type.

Stationary Engine.— An engine on fixed foundations, as distinguished from the locomotive, portable and marine engines.

Locomotive Engine.— A high pressure steam engine and multitubular boiler complete, mounted on a carriage and provided with suitable wheels to enable it to draw loaded cars upon a permanent way or railway track. See LOCOMOTIVE.

Portable Engine.— A small engine of the locomotive type, mounted on a carriage which permits of its being moved from place to place for use in connection with work of a temporary character. Portable engines are extensively used for agricultural purposes and for general traction purposes on ordinary highways.

Gas and Oil Engines.— These classes of heat engines are commonly designated as internal-combustion engines. See INTERNAL COMBUSTION ENGINE and DIESEL ENGINE.

The Slide-Valve.— The introduction of the slide-valve for operating the ports of a steam engine marked a distinct advance in economy, because it can be made at exactly the right time and also because it admits the hot steam to the cylinder through a port which has just been cooled by the exhaust. As ordinarily constructed the slide-valve is a sliding D-shaped piece in the steam-chest, moving back and forth over the three ports — the two end-ports of the cylinder and the exhaust port in the centre — and permitting the steam to pass alternately to either end of the cylinder to push the piston and opening the exhaust for the release of the used steam. There are «laps» at the end of the D whose length determines the instant at which the ports shall begin to open. These laps are known as outside or steam-lap, and inside or exhaust-lap. The slide-valve has also been developed for automobile use in the Knight type of engine.

Superheating.— Originally, saturated steam was the only sort employed in steam engines, but as multiple-expansion developed and higher pressures were carried in boilers the use of superheated or dry steam at as high as 500° C. was tried, and it was demonstrated that the hotter the steam was the more it expanded and the greater the power to be got out of it. Superheating began experimentally about 1895 and was operated in connection with an economizer. This is a mechanism for utilizing the waste heat and turning it into the feed-water, so that hot water, close to the boiling point, can be supplied to the boiler. Engines using superheated steam have been operated with as little as 1.3 pounds of coal per indicated horse power. See LOCOMOTIVE.

Steam Turbines comprise a class of heat engines in which the kinetic energy of expanding steam is utilized to drive a wheel and thus convert the natural heat energy of steam directly into mechanical energy in the form of rotary motion. The principal forms are the Parsons, De Laval, Seger and Curtis turbines, and their first field of application and development was in the marine service. Noteworthy examples of their application are the *Lusitania* and *Mauretania* ocean steamships and many of the modern «dreadnaught» type of battleships. They are now coming into use in large lighting stations and mammoth manufacturing plants. See TURBINE.

Hydraulic Engines.— Mechanical power is obtained from flowing water by its weight, pressure or impact, utilized in various forms of water wheels, turbines, hydraulic rams and water-pressure engines. In the water-pressure engine the pressure of the water only is utilized to drive a piston in a cylinder. In some forms the action of the piston is reciprocating and in others rotary. In all of them the actual amount of pressure expended is only that which is needed to impart motion to the fluid to follow the piston and escape from the cylinder, and, therefore, the greatest efficiency is obtained by making the piston as small as practicable and using a large pressure. The majority of them are of the reciprocating, low-speed type, and are particularly useful as secondary motors for operating the opening machinery of various forms of swing, draw and lifting or rolling bridges, and in connection with cranes and various forms of hydraulic lifts.

For futher detailed information relative to the construction, operation and application of the various forms of engines, consult the articles under the titles AUTOMOBILE; AEROPLANE; INTERNAL COMBUSTION ENGINE; LOCOMOTIVES; MOTOR; PUMPS AND PUMPING MACHINERY; ROTARY STEAM ENGINE; TRACTION ENGINES; TURBINE; WATER MOTOR; WATER WHEEL.

CHARLES H. COCHRANE,
Author of 'Modern Industrial Progress.'

ENGINE, Testing of. Engines are tested in order to determine the economy with which they produce a given amount of power. The economy of steam engines, as usually determined, relates to the weight of steam consumed, or to the quantity of coal used in making the steam, or to the number of heat units supplied; while in the case of an internal combustion engine, it relates to the amount of gas, gasoline, oil, alcohol or other fuel burned. Also, if the latter operate on producer gas, the determination of economy involves the amount of coal burned in the gas producer.

Factory tests are generally limited to the performance of individual engines, to determine the set of the governor relative to the proper speed and to ascertain if the valves are set and operate properly. In the case of gas engines, the factory test is extended to cover the correct timing of the igniter and to determine the correct compression.

In its broadest sense, however, testing is a form of scientific investigation conducted for the purpose of securing practical results which are very important not only to the manufacturer, but also to the owner of the engine who has to pay the expense of its operation and to those who require information showing the capabilities of the machines for the purpose of advertising and trade.

As an engine test involves the determination of two elementary quantities — (1) the amount of fuel consumed, and (2) the amount of power developed — it is necessary that these two factors should be represented by units of measurement which are susceptible of universal application.

Standard Unit of Fuel.— The most satisfactory unit for expressions of economy based on the amount of fuel consumed is the British Thermal Unit (B.T.U.), which is the quantity of heat required to raise one pound of water 1° F. at or about 39.1° F. According to Joule, it is equivalent to 778 foot-pounds of mechanical energy.

A convenient and useful subsidiary standard is that based on a «standard coal» unit, the term «standard coal» defining a coal which imparts to steam 10,000 B.T.U.'s for each pound of dry coal consumed. It is a coal which has a calorific value of 12,500 B.T.U.'s, equivalent to an efficiency of 80 per cent when used in a «standard boiler.»

Standard Unit of Power.— The unit of mechanical power which most satisfactorily expresses the power developed by an engine is the «horse power,» which represents an energy of 33,000 foot-pounds per minute, equivalent to 2,545 B.T.U.'s per hour.

Standard of Engine Economy.— Employing the given standard units of fuel and power, the expressions of engine economy which are best adapted to meet all conditions of service and for all classes of heat engine are those represented by the «indicated» horse power based on the number of B.T.U.'s consumed per hour.

Such an expression is commonly called a horse power hour and represents a heat energy of 1,980,000 foot-pounds converted into mechanical power or work by the consumption of 2,545 B.T.U.'s per hour.

Rules for Conducting a Test.— All tests should be conducted systematically under a set of standard rules, clearly defining the character of the data to be obtained and the methods which should be employed for their determination. A set of such rules may be briefly defined as follows:

1. *Object of the test.*—At the beginning, the specific object of the test should be ascertained. It may relate to the determination of highest economy obtainable; the economy under ordinary working conditions and the existing defects; the performance under special conditions; the effect of changes in existing conditions; or the fulfilment of a contract guarantee; and the preparations for the test should be made accordingly. These preparations will necessarily depend largely upon the good sense, judgment and ingenuity of the engineer making the test.

2. *Condition of the Engine.*— The engine should be carefully examined and its general condition noted, especially any points of design, construction or operation which bear upon the object of the test. Special examination should be made of all valves, by inspecting their seats and bearing surfaces and great care taken to ascertain, in the case of a gas engine, that the piston rings work freely in their grooves and are perfectly gas-tight.

3. *Dimensions.*— The cylinder dimensions should be taken whether they are already known or not, the measurements being made when they are hot and in working order. When practicable, the clearance volume or compression space of the cylinder should be measured by filling it with water previously measured, the proper correction being made for temperature.

4. *Fuel.*— When the test involves the complete plant — in the case of a steam engine including the boilers, and in the case of a gas engine including the gas producer plant — the class, name of coal mine, size, moisture, should be stated in the report — and the quality of the coal used should be of some recognized standard. This is desirable for purposes of comparison. In the case of an internal combustion engine, if the test is made to determine the maximum efficiency, the gas, oil, or other fuel used, should be the best obtainable, or one that possesses the highest calorific value.

5. *Measurement of Fuel.*— The methods of determining the amount of fuel consumed depend upon the character of the fuel used. If it be coal furnished to the furnace of a boiler, or to a gas producer, the amount consumed during a period not less than 24 hours should be carefully measured by weight. If it be oil, gasoline, distillate, alcohol, etc., it can be drawn from a tank, which can be refilled to the original level at the end of the test, and the amount required for this purpose weighed; or in the case of a small engine, it can be drawn from a properly calibrated vertical pipe. When gas is used, it should be measured by a suitable gas metre and gas bags should be placed between the metre and the engine to keep the pressure as constant as possible. The pressure and temperature of the gas and the barometric pressure and temperature of the air should be measured and in determining the quantity of the gas supplied, as given by the reading of the metre, the temperature and pressure of the gas should be taken into account.

6. *Measurement of Heat Units Consumed.* — The number of heat units consumed by the engine can be found by multiplying the number of pounds of coal or oil, or the cubic feet of gas supplied, by the total heat of combustion of the fuel as determined by a calorimeter, or from the results of a chemical analysis. In determining the total heat of combustion, usually no deduction is made for the latent heat of the vapor of water in the products of combustion, therefore, for purposes of comparison, care should be taken to state whether the higher or the lower value has been used in the determination.

The Mahler calorimeter is a type much used for determining the heat of combustion of solid fuels and oils and the Junker calorimeter for gases.

7. *Instruments and Their Calibration.*— All instruments and apparatus used in the tests should be calibrated and their accuracy verified by comparison with recognized standards. All such as are liable to undergo changes, or become broken during the progress of a test, especially gauges, indicator springs and thermometers, should be calibrated both before and after the test.

Gauges.— For measuring pressures above that of the atmosphere, the most convenient and reliable standard is the dead-weight testing apparatus, consisting of a cylinder having a close-fitting vertical piston working in oil or glycerine, by the medium of which the pressure is transmitted to the gauge. The piston is surmounted by a circular stand on which weights may be placed so as to secure any desired pressure. The total weight, in pounds, on the piston, divided by the area of the piston, in square inches, gives the pressure in pounds per square inch.

The mercury column is another reliable standard of comparison for pressures, but when it is used care should be taken to see that it is properly graduated with reference to the ever varying zero point; that the mercury is pure and that the proper correction is made for any difference of temperature that may exist at the time of using and the temperature at which the instrument was graduated.

For pressures below that of the atmosphere, the use of an air pump or some other means of producing a vacuum is required. The apparatus must be referred to a mercury gauge, which may consist of a U-shaped tube about 30 inches in length, with both arms properly filled with mercury.

Thermometers.— Standard thermometers are those which read 212° F. in steam escaping from boiling water at the normal barometric pressure of the atmosphere (29.92 inches) when the whole stem up to the 212° point is surrounded by the steam; and which read 32° F. in melting ice, when the stem is completely immersed to the 32° point; and which are calibrated for points between and beyond these two points of reference.

For temperatures between 212° and 400° F., the thermometers should be compared with the temperatures given in Regnault's Steam Tables, by placing it in a mercury well surrounded by saturated steam under sufficient pressure to give the desired temperature.

For higher temperatures, such as those occurring in gas-engine practice, which often exceed 2,000° F., some form of pyrometer or calorimeter should be used. That of Le Chatelier, which makes use of the thermo-couple, has been successfully used for accurately measuring temperatures over 2,500° F.

Indicator Springs.— For gas-engine indicating, the indicator springs used should be much stiffer and stronger than those used for steam-engine work, so as to enable them to withstand the higher and more suddenly developed pressure. When indicator springs are calibrated, the temperature of the indicator should be as nearly as possible the same as that which exists during the test. An indicator may be conveniently heated by subjecting it to steam pressure immediately before calibration and the actual work of calibration then performed by the use of compressed air or compressed carbonic acid gas. The calibration may be made under a constant pressure, or more satisfactorily by covering the whole range of pressures through which the indicator acts, by gradually increasing the pressure from the lowest to the highest point, and then by gradually reducing it from the highest to the lowest point, and a mean of the results taken for at least five points — two for the pressures corresponding to the maximum and minimum pressures and three for equally distant intermediate points. These values should be compared with a dead-weight testing apparatus, a mercury column, or a steam gauge, compared with either of the two first-named standards, and the correct scale of the spring used for calculating the mean effective pressure from the indicator diagrams taken during the test, should be the average based on this calibration.

Gas Meters.— A meter used for measuring the gas supplied to a gas engine should be calibrated by comparing its readings with the displacement of a gasometer of known volume; with a standard gas meter of known error; or by passing air through the meter from a tank containing air under pressure. In the latter case, the pressure and temperature of the air in the tank, both at the tank and the meter, should be observed at uniform intervals of time during the work of calibration; and the amount of air passing through the meter calculated from the volume of the tank and the observed temperatures and pressures.

The volume of the gas thus ascertained should be reduced to the equivalent volume at a given temperature and atmospheric pressure, corrected for the effect of moisture in the gas, which is usually at or near the point of saturation. For gas-engine work, a convenient standard is the equivalent volume of the gas when saturated with moisture at normal atmospheric pressure at a temperature of 60° F. A volume of moist gas at any other temperature may be reduced to this standard by being multiplied by the factor

$$\frac{459{\cdot}4+60}{459{\cdot}4+t} \times \frac{b-(29.92-s)}{29{\cdot}4},$$

in which b represents the reading of the barometer in inches at 32° F.; t, the temperature of the gas at the meter in degrees F.; and s, the vacuum in inches of mercury corresponding to the temperature of *t* given in the steam tables.

8. *Duration of a Test.*— The length of time devoted to a test will depend largely upon its character and the purpose for which it is made. For determining the working economy, the time allowed should be equal to the number of hours per day during which the engine is really operated. In the case of a gas engine using producer gas, the time should be sufficient to determine the amount of coal used in the gas producer. It should never be less than 24 hours, and usually it should extend over several days.

9. *Commencement of a Test.*— If the test is to determine the performance of an engine under working conditions, it should begin at the time the engine is started, and the observations continued until it shuts down for the day. If the test is for determining the maximum economy of the engine, at first it should be run a sufficient length of time to make all conditions normal and constant, then the observations may be commenced and continued for the allotted time.

10. *Measurement of Water.*— In the case of a steam engine this relates to the feed water or steam consumption. The usual method is to measure all the feed water supplied to the boilers, and deduct therefrom all the water discharged by separators and drips, and the water and steam lost by leakage from the boiler and its main and branch pipe connections with the engine. Where the engine exhausts into a surface condenser, the steam consumption can be measured by measuring the quantity of water discharged by the air pump and adding thereto the steam used by jackets, reheaters and auxiliaries as determined independently. In measuring the water, it should be carried through a tank resting on the platform of a suitably arranged weighing scales, and the water subsequently emptied into a reservoir beneath, from which the pump is supplied.

For measuring small quantities of water, about 6,000 pounds per hour, the most convenient apparatus consists of a small hogshead connected to the suction pipe of the pump or injector and an ordinary oil barrel placed on a platform scale. The barrel is filled by means of a cold-water pipe leading from the source of supply. For pressure not less than 25 pounds per square inch, this pipe should have an internal diameter of one and one-half inches. The outlet valve of the barrel is attached to the side near the bottom and should be at least two and one-half inches in diameter, so as to permit of quick emptying.

Where larger quantities of water have to be measured, the barrel can be replaced by a hogshead and two hogsheads can be joined together for the lower reservoir. With this arrangement, when the weighing hogshead is supplied through a two and one-half inch valve under 25 pounds of pressure and emptied through a five-inch valve, the capacity attained is 15,000 pounds of water per hour.

For the measurement of very large quantities, or in some cases, very small quantities, the orifice method gives the most satisfactory results, and when applied, the average head of water on the orifice must be ascertained and the discharge of the orifice should be calibrated under the conditions of use.

In the case of an internal combustion engine, the measurements of water relate to that supplied to the water-jacket provided for cooling the temperature of the cylinder. The measurements may be made by the methods already described, but care should be taken, in cases where the temperature exceeds 212° F., first to cool the water by discharging it into a tank of cold water previously weighed, or by passing it through a coil of pipe immersed in running cold water, so as to prevent the loss of evaporation which takes place when hot water is discharged into the open air.

11. *Determination of Speed.*— The speed of the engine, or the number of revolutions of the crank shaft per minute, can be determined by counting the number of revolutions in one minute with the eye fixed on the second hand of a timepiece, or by the use of some form of mechanical counter such as a tachometer, or continuous recording engine register. The use of such instruments is imperative when the speed exceeds 250 revolutions per minute.

In the case of internal combustion engines governed by the hit-or-miss method, the number of explosions per minute should be ascertained, when the engine is running under nearly maximum load, by counting the number of times the action of the governor causes a miss in the explosions.

The determination of variation of speed during a single revolution on the effect of fluctuations due to sudden changes of load should be made especially in the case of engines employed to drive electric generators used for lighting purposes.

12. *Indicator Diagrams.*— From the indicator diagrams taken during the test for the computation of the mean effective pressure, etc., sample diagrams nearest to the mean should be appended to the report.

The mean effective pressure (M.E.P.) is obtained as follows: Measure the diagram with a planimeter and divide the area, in square inches, thus obtained by the length of the diagram in inches to obtain the mean height or mean ordinate of the diagram. Multiply the mean ordinate by the scale of the indicator spring and the product will be the mean effective pressure desired. In the absence of a planimeter, the diagram can be divided by 10 ordinates and their mean length taken for that of the mean ordinate. If the indicator is specially designed for indicating internal combustion engines, the mean ordinate should be multiplied by twice the scale of the spring, unless the scale has been expressly marked for the reduced piston.

In the case of internal combustion engines, when indicator diagrams are not obtainable and the compression pressure is known, the mean effective pressure may be determined approximately as follows: For example, in gas engines the compression pressure ranges from 70 to 90 pounds per square inch, and the maximum pressure developed by the explosions is about 3.5 times the compression pressure. Therefore, if p represents the compression pressure, then for compressions of 100 pounds per square inch or less, M.E.P. $= 2p - 0.01p^2$; thus, if $p = 70$ pounds per square inch, M.E.P. $= 140 - 49 = 91$ pounds per square inch.

In the case of a steam engine, the steam accounted for by the indicator diagram may be calculated by means of the formula

$$M = \frac{13750}{\text{M.E.P.}}\left((C+E) \times Wc - (H+E) \times Wh\right),$$

which will give the weight in pounds per indicated horse power per hour. M.E.P. represents the mean effective pressure, which in the case of a multiple-expansion engine is the combined mean effective pressure referred to the cylinder in question. For example: In the case of a compound engine, the combined mean effective pressure for the high pressure cylinder consists of two items: (1) the mean effective pressure of the high pressure cylinder, and (2) the mean effective pressure of the low pressure cylinder multiplied by the ratio of the piston displacement of the low pressure cylinder to that of the high pressure cylinder. The sum of these two items is the combined mean effective pressure for the high pressure cylinder.

Similarly the combined mean effective pressure for the low pressure cylinder consists of (1) the mean effective pressure of the low pressure cylinder, and (2) the mean effective pressure of the high pressure cylinder divided by the ratio already stated. The sum of the two items is the combined mean effective pressure of the low pressure cylinder.

In the given formula, C represents the proportion of the piston stroke completed at points on the expansion line of the diagram near the actual cut-off or release; H the proportion of compression; and E the proportion of clearance; all of which are determinable from the indicator diagram. Wc represents the weight of one cubic foot of steam at the cut-off or release pressure; and Wh the weight of one cubic foot of steam at the compression pressure.

13. *Standards of Economy and Efficiency.* — The standard expression for engine economy, as already stated, is the hourly consumption of heat units divided by the indicated horse power or the brake horse power. The standard expression for efficiency is the thermal efficiency ratio, or the proportion which the heat equivalent of the power developed bears to the total amount of heat actually consumed, as determined by test. One horse-power-hour represents the consumption of 2,545 B.T.U.'s per hour, therefore,

$$\frac{2{,}545}{\text{B.T.U.'s per horse power per hour}}$$

expresses the thermal efficiency ratio.

In comparing the standard for internal combustion engines with that for steam engines, it must be noted that the former usually covers the losses due to combustion, but the latter does not, and therefore, in order to make a direct comparison between the two classes of engines as complete horse-power plants, the losses in generating the working agent must be considered in both cases not only on the basis of the fuel used, but on the basis of equivalent fuel used in each case. In comparing a gas engine plant using producer gas, with a steam plant, the producer should be included in the former, and then the fuel consumption, represented by the weight of coal in both cases, may be directly compared.

14. *Heat Analysis.*— For scientific purposes, a heat analysis of the indicator diagram, in the case of a steam engine, and a heat balance in the case of an internal combustion engine, should be made, showing the manner in which the total heat of combustion is expended in working the engine.

In the case of a steam engine, the analysis shows the interchange of heat from steam to cylinder walls, etc. For example: the amount of heat supplied to the engine in a given time is represented by the number of pounds of steam supplied multiplied by the total heat of one pound of steam. A portion of this heat is used in the jacket, if one be employed, and the remainder passes through the cylinder. The heat entering the jacket is lost partly by radiation from the outside surface, and the remainder enters the walls of the cylinder and is absorbed by the steam within it. The cycle of operations within the cylinder consists of the following phases: (1) A portion of the entering heat is transferred into a small portion of the thickness of the cylinder walls, and heats them to the temperature of the entering steam. This transference of heat is more active during the period of admission and up to the point of cut-off than during any other part of the cycle. (2) Beyond the point of cut-off, the transference of heat continues until the lower pressure due to expansion causes the temperature of the steam to fall below that of the interior surfaces of the cylinder last uncovered. At this point the interchange of heat is reversed, the metal giving up heat to the steam, and causing the re-evaporation of the particles of water condensed on the surface of the cylinder walls and piston. The radiation of heat from the small thicknesses of the interior walls, which were heated during admission to the temperature of the entering steam, commences after cut-off or after the pressure begins to lower by expansion, and continues to the end of the stroke.

A portion of the heat is also expended in the performance of work, and a loss of heat is sustained by radiation from those portions of the cylinder not protected by the jacket. The amount of heat remaining after the steam has passed through these operations is that which is rejected by it through the exhaust valve to the atmosphere or to the condenser.

In the case of an internal combustion engine, the total heat of combustion expended in the working of the engine may be divided into three parts: (1) Heat converted into work and represented by indicated or brake horse power. (2) Heat carried away by the cooling water circulated through the water jacket. (3) The heat lost in the exhaust gases, and through incomplete combustion and radiation.

15. *Heat Converted into Indicated or Brake Horse Power.*— The number of foot-pounds of work done by one pound or one cubic foot of fuel divided by 778, the mechanical equivalent of one British Thermal Unit, will give the number of heat units desired.

16. *Heat Carried Away by the Jacket Water.*— This is determined by measuring the quantity of cooling water passed through the water jacket equivalent to one pound or one cubic foot of fuel consumed, and calculating the amount of heat rejected by multiplying that quantity by the difference of the temperature of the water entering and leaving the jacket.

17. *Heat Rejected in the Exhaust Gases, or Total Heat Unused.*— The sum of the heat converted into brake horse power and the heat carried away by the jacket water, subtracted from the total heat supplied, will give the total heat rejected or unused.

In order to determine the cost of each horse-power hour in thermal units, the gas consumed and the air supplied should be reduced to the conditions of temperature and pressure corresponding to some adopted standard. This may be done as stated under gas meters in rule 7, or more conveniently by the formula

$$v = \frac{t}{p} \times \frac{v^1 p^1}{t^1},$$

in which v = volume of gas reduced to standard; $t = 461° + 60° = 521°$ F., absolute standard temperature; $p = 29.92$ inches of mercury; v^1 = volume of gas registered by meter; p^1 = pressure of gas at meter measured by manometer in inches of water; t^1 = absolute temperature of gas.

Since t and p are constants

$$v = 18.00 \frac{v^1 p^1}{t^1},$$

and as p^1 and t^1 are practically constant during a given test, $v = Ev^1$, in which

$$E = 18.00 \frac{p^1}{t^1},$$

and p^1 = height of barometer + (0.073 × reading of manometer); and t^1 = temperature of gas at meter + 461.

For example: Assume the heights of the barometer as 29.40 inches; the reading of the manometer as 6 inches; the temperature of the gas 80° F.; and the volume of the gas registered by the meter 350 cubic feet; then for determining (v) the equivalent volume of gas for standard conditions:

$$p^1 = 29.40 + (0.073 \times 6) = 29.84$$
$$t^1 = 80 + 461 = 541;$$
$$E = \frac{18.00 \times 29.84}{541} = 0.976;$$

then $v = 0.976 \times 350 = 341.6$ cubic feet.

The air supplied should be entered and reduced to standard conditions in the same manner.

If the rate method is employed to ascertain the amount of gas consumed, the number of cubic feet for a ten-minute interval may be found by dividing the number of cubic feet registered by one revolution of the small dial by the time in seconds elapsed at the completion of that revolution and multiplying the result by 6,000.

18. *Indicated Horse Power* (I.H.P.).— This factor is expressed by the formula —

$$\text{I.H.P.} = \frac{P \times L \times A \times N}{33{,}000},$$

in which P is the mean effective pressure in pounds per square inch; L the length of the piston stroke in feet; A the area of the piston in square inches; and N the number of revolutions of the engine crank shaft per minute.

$$\frac{A \times L}{33{,}000},$$

is constant for a given engine, and in the case of an internal combustion engine, N is the number of explosions per minute.

19. *Brake Horse Power* (B.H.P.).— When this factor is determined by the use of some form of dynamometer, such as the Prony brake, it may be readily computed from the formula —

$$\text{B.H.P.} = \frac{W \times N \times L \times C}{33{,}000},$$

in which W is the net weight in pounds on the scales; N the number of revolutions per minute; L the length of the lever arm from the centre of the braked wheel to the knife-edge of the brake, or the radius of the braked wheel if a rope brake is used; and C the circumference of the braked wheel.

$$\frac{C \times L}{33{,}000},$$

is constant for a given Prony brake, therefore, if L be made five and one-quarter feet, this constant becomes 0.001, and gives the simple and very convenient expression —

$$\text{B.H.P.} = \frac{N \times W}{1{,}000}.$$

20. *Total B.T.U.'s Per Hour.*— The total amount of gas consumed, in cubic feet, multiplied by its calorific value.

B.T.U.'s Per Brake Horse Power Hour.— The total B.T.U.'s per hour dvided by the brake horse power.

B.T.U.'s Per Indicated Horse-power Hour.— The total B.T.U.'s per hour divided by the indicated horse power.

Friction Horse Power.— The difference between the indicated horse power and the brake horse power.

Thermal Efficiency.— The ratio of 2,545 B.T.U.'s to the B.T.U.'s per horse-power hour.

Mechanical Efficiency.— The ratio of the brake horse power to the indicated horse power.

WILLIAM MOREY, JR., C.E.,
Consulting Civil and Mechanical Engineer, New York.

ENGINE INDUSTRY. Notwithstanding the wonderfully rapid development of water power and of the internal combustion engine, the steam engine holds its own in the industries of the world. The total steam engine horse power used in manufacturing in the United States, which was 8,139,574 in 1900, rose to 14,199,339 in the 1910 census. Seven great industries utilize 56 per cent of the horse power employed in manufacturing in this country, and 76 per cent of the power they use is based on the steam engine. The industries meant are lumber, steel works and rolling mills, paper and pulp mills, cotton factories, blast furnaces, foundries and machine shops and grist mills. In only one of the seven — the paper and pulp industry, which requires large quantities of water for dissolving pulp — is steam power less used than water power. The fourteen million horse power quoted does not by any means represent the total employment of steam engine power in the country, but only such as the census gathers as reported by manufacturers. It does not cover steam engine power used on vessels, nor used in mines and quarries, nor its vast employment in the locomotives that do most of the haulage on the railways, nor a number of minor uses. These are reported in other ways, or escape enumeration. The best way of measuring the steam engine industry is to note that 450,000,000 long tons of coal are used in the United States every year, and it is estimated that at least 350,000,000 tons of this is consumed under boilers to make steam. Evidently while the coal holds out the steam engine is going to continue the favorite power-producer, because it can be located anywhere and its cost is moderate. Even the electric railway lines around New York city and the electric light and power companies there, base their power entirely on the steam engine.

There are no complete figures of the engine industry because it is so completely interwoven with other activities that it cannot be separated. Thousands of machinery manufacturers build steam engines, which are part of this or that special industry, often being for their own use. The internal combustion engines alone are mixed up with 20 different industries from automobiles to blast furnaces and a vast number of engines are built direct-connected to dynamos and credited to the electrical industries. See INTERNAL COMBUSTION ENGINE; GAS ENGINE; STEAM AND STEAM ENGINES; LOCOMOTIVE; LOCOMOTIVE INDUSTRY; AUTOMOBILE ENGINE; AEROPLANE.

ENGINE STARTERS, or «self-starters,» auxiliary devices for the purpose of starting gasoline automobiles (or other) engines without laborious method of turning the hand crank commonly provided. Self-starters operate upon either of two principles: the crank shaft is rotated by external mechanism, causing the pistons to charge the cylinders with gas to be exploded when the spark is turned on; or the injection of gas into one or more cylinders without rotation of the crank and the production of a spark in all the cylinders simultaneously so that the charged cylinder will come into action. Mechanical starters are operated by a heavy spring, by compressed air, or by electricity. They require a considerable addition to the machinery of the car as well as to its weight, especially in the case of the electric starter and add many sources of possible trouble in an already complicated machine.

The gas injector system adds simply a small hand pump at the driver's seat or on the dash-board, two strokes of which effects the charging of the cylinders; and the throwing of a switch fires the charge. In automobiles which employ acetylene gas for lighting, an attachment is furnished by which this gas may be used in priming the cylinders for starting. The acetylene mixture is claimed to be more certain of explosion than an uncompressed charge of gasoline vapor and air. Consult Cross, H. H. U., 'Electric Lighting and Starting' (London 1915); Duryea, C. E. and Homans, J. E., 'The Automobile Book' (New York 1916); Pagé, V. W., 'The Modern Gasoline Automobile' (New York 1912).

ENGINEER CORPS, a branch of the service of the United States Navy; and of those of other countries. The first step toward the organization of an engineer corps in the United States Navy was taken on 2 July 1836, when C. H. Haswell (q.v.) was appointed chief engineer of the *Fulton;* it was not, however, until 31 Aug. 1842 that Congress passed an act providing for a regular corps, under which act chief engineers were «commissioned» and assistants «warranted.» On 3 March 1845 Congress passed an act whereby the power of appointing engineer officers was transferred from the Secretary of the Navy to the President «by and with the advice and consent of the Senate.» With the growth of the Navy the corps gradually increased till at the time of the Civil War there were 474 regulars and 1,803 volunteers.

A course of instruction for cadet engineers was established at the Naval Academy by act of Congress 4 July 1864. The original two-year course was changed to four years in 1874 and continued in vogue till 1882, when on 5 August Congress amalgamated the cadet engineers and midshipmen and they are now known as naval cadets. The cadets then took the usual six years' course at the Academy and upon completion of the third year of the course were divided into an Engineer Division and a Line Division in proportion to the vacancies that have occurred in the several corps during the preceding year. At the end of the six years' course appointments to fill vacancies in the Line and in the Marine Corps were made from the Line Division, and to fill vacancies in the Engineer Corps from the Engineer Division. If, after making assignments as above, there should still be vacancies in one branch and surplus graduates in the other, the vacancies in the former were filled by assignment to it of surplus graduates from the latter. This arrangement was in vogue until the Line and Engineer Corps were amalgamated under the act of 3 March 1899, at which time the Engineer Corps ceased to be a separate organization, the older officers now being required to perform engineering duties only, whereas the younger officers must pass examinations in navigation, gunnery, seamanship, etc. A grade of warrant machinists to perform watch duties was also established because of the lack of commissioned officers for this work. See NAVAL ACADEMY, UNITED STATES; UNITED STATES NAVY.

ENGINEERING is, in its strict sense, the art of designing, constructing, or using engines, but the word is now applied in a more extended sense, not only to that art, but to that of executing such works as are the objects of civil and military architecture, in which engines or other mechanical appliances are extensively employed. Engineering is divided into many branches, the more important being civil, mechanical, electrical, mining, military, marine and sanitary engineering.

Among the most notable of the engineering works belonging to very remote antiquity are the pyramids of Egypt. The rude stone monuments of the north, as at Stonehenge and Carnac, also testify to some engineering skill. The harbors and temples of ancient Greece are very memorable. The buildings of ancient Rome — its theatres, temples, baths and aqueducts, its roads, bridges and drainage-works — vie in extent and magnificence with the most celebrated works of modern times. From that period down to the commencement of the 18th century the most extensive works executed were the canals, embankments and other hydraulic construction used by the Dutch for the purposes of inland navigation and to protect their low lands from the sea; the canals of North Italy; and the cathedrals and fortifications of mediæval Europe.

If the question were asked as to the characteristic feature of the modern applied science of engineering, the reply would undoubtedly be: «The wholesale manner in which work is carried on.» It is not so very long ago that everything except the smallest articles and those required in great quantity were made singly, or at least in small lots; and even when standardizing and interchangeability were introduced these methods were by no means used in a way which showed a realization of their possibilities. The present tendency, on the contrary, is toward the elimination altogether of things which cannot be made wholesale; and methods which formerly applied to firearms, sewing-machines, typewriters and the like are now in general use in the manufacture of steam engines, machine tools, electrical machinery and nearly all mechanical products.

This has been brought about by a combination of two processes: (1) the standardization of methods of manufacture; and (2) the discouragement of the demand for special articles. Formerly the customer told the manufacturer what was wanted and the latter hastened to produce it. Or the plans and specifications for a certain structure were prepared by a consulting engineer and all bidders were required to conform to these documents in the minutest details; no two such specifications being alike. At the present time the customer, knowing what he wishes to accomplish, seeks to do so as best he may by means of the standard articles in the market; or if it be a great engineering structure, the engineer specifies only the general requirements to be met, leaving each manufacturer to meet these with his own standardized product. The influence of these modifications in engineering practice extends to the manufacture and supply of materials.

The result of this concentration and standardization has been to reduce costs very materially and render possible undertakings which would otherwise be prohibitory in price. While to a certain extent it has obliterated individuality in design, it has also removed much useless repetition and has prevented needless expense in the production of rival machines, differing but slightly in design, yet requiring duplications of drawings, patterns and tools. There is little doubt that it is to this wholesale development of various departments of engineering work that the rapid extension of the share of the United States in the work of the world is largely due. See CIVIL ENGINEERING; ELECTRICAL ENGINEERING; HYDRAULIC ENGINEERING; MECHANICAL ENGINEERING; ENGINEERING, MARINE; FORTIFICATIONS; MINING ENGINEERING; NAVAL CONSTRUCTION; SANITARY ENGINEERING. Also ENGINEERING TERMS; ENGINEERING INSTRUMENTS; EDUCATION, ENGINEERING; MECHANICS.

ENGINEERING, Electrical. See ELECTRICAL ENGINEERING.

ENGINEERING, Hydraulic. See HYDRAULIC ENGINEERING.

ENGINEERING, Marine, is partly military and partly civil, embracing naval architecture, building and operating of ships and naval accessories. In the military sense, it comprises the construction of war vessels and the construction and placing of torpedoes, submarine mines, etc. See NAVY; NAVAL CONSTRUCTION; SUBMARINE MINES, etc.

ENGINEERING, Mechanical. See MECHANICAL ENGINEERING.

ENGINEERING, Mining. See MINING ENGINEERING.

ENGINEERING, Sanitary. See SANITARY ENGINEERING.

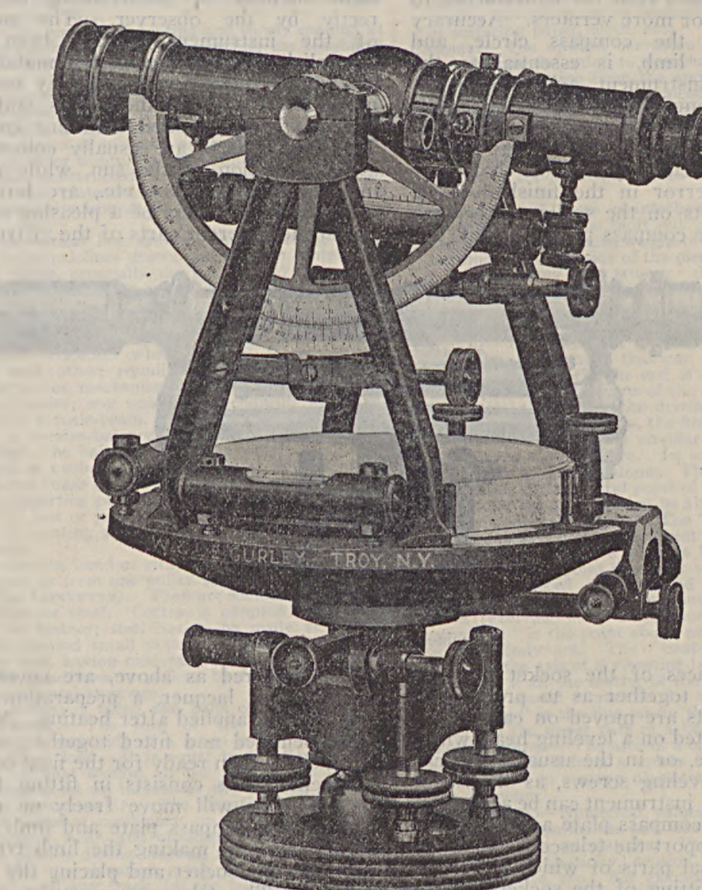
ENGINEERING EDUCATION. See EDUCATION, ENGINEERING.

ENGINEERING INSTRUMENTS. To attempt a definition of an engineering instrument is hardly practicable, as the wide range of departments into which the profession is now

divided demands so many special appliances for their requirements that no one description is possible and an extended catalogue is inadmissible within the limits of this article. The earliest known engineering instrument was the Diopter of Hero of Alexandria, 130 B.C., although rude appliances must have been used long before that time by the ancient engineers in the construction of the public works of Chaldæa and Egypt, the ruins of which even now awaken our admiration and wonder. It was not, however, until the beginning of the 19th century that the great impulse to the construction and use of engineers' instruments was given by the advance of civilization and commerce incident to the application of steam as a motive power on sea and land. Since that time great advances have been made not only in the design and accuracy of engineering instruments but also in the invention of new instruments for the many purposes required by engineers in the construction of railroads, canals, bridges, harbors, etc.

The characteristics of engineers' instruments differ in the various nations as the requirements of engineering practice and thus American engineers' instruments possess a distinct character of their own as compared with other nations, having as a rule few parts and lightness of construction combined with great strength and an adaptability of parts for the special service required. It is not the purpose of this article to attempt a description of the various instruments used by engineers — this may be found in the article SURVEYING — but to give the reader a general idea of their construction.

The metals used in the construction of engineers' instruments are principally the alloys of copper and tin with small quantities of silver, aluminum and German silver. Great care must be constantly exercised that these substances be free from iron or other materials which would affect the magnetic needle. In the construction of an instrument such a distribution of the metals is aimed at that the greatest strength consistent with light weight may be obtained and that the metals coming into contact at the bearing surface may be of such varying composition as to cause the least friction.



Engineer's Transit.

Take, for the purpose of better illustration, an American transit, illustrated herewith, as typical, as far as the construction is concerned, of nearly all engineering instruments. The plate of the instrument on which the magnetic needle is mounted, or as it is termed, the compass circle, is turned with great care so that the surface may be absolutely true and is graduated usually into 720 spaces, each representing one-half of a degree.

Compass circles are usually figured in quadrants of a circle, that is, from 0 at the point marked «N» or «North» to 90 and back again, while the figuring of the limb varies with the custom of the maker or the requirements of the engineer.

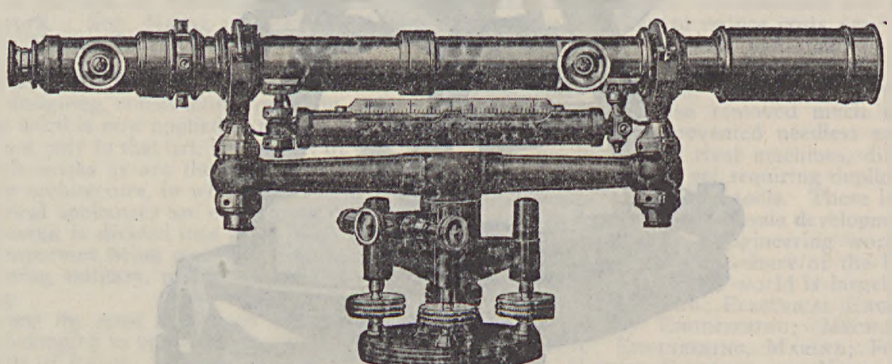
In engineers' instruments, however, the angular measurements are made usually without the use of the needle, by a telescope so mounted as to revolve in a vertical or a horizontal plane. The angular measurement of its movement is indicated on circles divided into fractional spaces of a degree and read for convenience to finer spaces by one or more verniers. Accuracy of graduation of the compass circle, and especially of the limb, is essential to the perfection of the instrument, and great pains are taken by manufacturers in perfecting and improving engines for graduating. The best machines are automatic in action and the spaces are so accurately laid off that there is no appreciable error in the finished work. The instrument rests on the socket or bearing surface to which the compass plate and limb are attached; the surfaces of the socket must be so accurately fitted together as to produce no error when the parts are moved on each other. The socket is mounted on a leveling head, which is actuated by three, or in the usual American practice, by four leveling screws, as shown, by means of which the instrument can be accurately leveled. Upon the compass plate are placed the standards which support the telescope, the preparation of the optical parts of which is next in importance to the fitting of the socket and the graduation.

The telescope consists of an eye piece and object glass mounted in a tube. The eye piece is simply a magnifier of the image produced at the focus of the object glass. Two kinds of eye pieces are used, one showing the image erect, and the other showing the image inverted. The object glass is composed of two plates of optical glass of such specific gravity and refractive index that it will magnify the image clearly without prismatic colors. To secure achromatism the two parts of the object lens are made the one of crown and the other of flint glass, the crown being a light glass of soda and silica and the flint being a heavier glass containing potash and lead. The surfaces of each are curved to such a degree that the rays of light entering the object glass may be properly refracted and concentrated at a point called the focus.

The making of the lenses is an operation requiring much skill in manufacture, as upon the accurate grinding of the curved surfaces depends the quality of the telescope.

At the focus of the object glass are placed the cross-wires, which are filaments of spider web or very fine platinum. In conjunction with these are often used two more wires commonly called stadia wires, so placed that they intercept on a rod a space proportional to its distance from the instrument, thus furnishing an efficient method of ascertaining distances directly by the observer. The metal parts of the instrument, having been prepared, are polished with some suitable material, a preparation of rouge being generally used for finishing the surface of the screws, and the larger surfaces being finished with fine emery paper. The larger parts are usually colored dark to avoid reflection of the sun, while the smaller ones, such as screws, etc., are left bright in order that there may be a pleasing contrast between the different parts of the instrument. The parts, prepared as above, are covered with a thin coat of lacquer, a preparation of shellac and alcohol, applied after heating. All the parts are assembled and fitted together, and the instrument is then ready for the final complete adjustment. This consists in fitting the sockets so that they will move freely on each other, placing the compass plate and limb in position on the sockets, making the limb truly concentric with the socket and placing the verniers in position. The telescope must be so adjusted that its parts may work freely, and having been supplied with optical parts, etc., it is then fitted to the standards or supports previously placed in position on the compass circle. The whole instrument is then tested for accuracy and if found correct is packed in its case and is ready for use.

The above description is only intended to give a general idea of the construction of a typical instrument, but the same methods will practically apply in the construction of all engineering instruments, such as levels, plane-tables, alidades, and the various kinds of compasses, etc.



Engineer's Wye Level.

ENGINEERING SCHOOL. See EDUCATION, TECHNICAL.

ENGINEERING TERMS. Engineering has spread into so many branches that it is difficult to differentiate between them and much more difficult to separate the technical verbiage of the several divisions of the profession. The more common technical terms have therefore been gathered together here for the benefit of the lay reader.

ABUTMENT.— A side support or buttressing structure to resist lateral pressure, as the abutment of a bridge-pier; anything that abuts or stands out as a support or brace.

ACTION.— The active moving parts of a machine, as a piano-action (the keys, levers and connections for sounding the strings). Also a single complete movement or stroke: used mostly in the phrases single-action and double-action, the latter being an action performed on both strokes of a reciprocating part.

ANNEALING.— The process of heating and slowly cooling, as for reducing the brittleness and increasing the toughness of glass or steel. Also fixing an enamel or color on earthenware or china by heating and cooling. The annealing-arch of the glassmaker is called a leer.

ANNULAR.—Ring-shaped.

APEX.— The top of a cone, pyramid, truss, outcropping of ore, etc.; the vertex of an angle, either plane or solid.

AQUEDUCT.— A water conduit. See AQUEDUCTS.

ARMOR.—A thing constructed for protection or defense, especially the steel plates of a war-vessel; any protecting device, as steel wire wound around a submarine cable, a diver's suit, etc.

AXIS.— The theoretical line around which a thing turns; one of the principal lines drawn through the centre of a geometrical figure, especially the longest and shortest of such lines; in early use, an axle.

AXLE.— The central fixed part on which a wheel turns, especially a rod or bar on a vehicle having a spindle on each end for a wheel. Compare, '*Shaft*' in this list.

BALANCE.— The condition when opposed forces exactly counteract each other; equality of forces; equilibrium; also any device or mechanism that secures equilibrium, as a pair of scales; any weighing mechanism whose essential part is a scale-beam. Any one of similar instruments, as a torsion-balance, electric balance (Wheatstone's bridge), the balance-wheel of a watch, etc.

BATH.—A tank or a solution in a tank, as for electroplating; also the molten mass in a reverberatory furnace.

BEARER.—A supporting part, that receives weight or strain.

BEARING.— The box or journal (or simply a hole) in which a moving or rotating part rests, holding it in position. See BEARINGS.

BELT.—A continuous band or strap, as of leather, for transmitting power, as from one pulley to another, or for conveying. (See CONVEYER). They are sometimes made of rubber, cotton or steel. Cotton is adopted as a cheap substitute for leather; steel has to be made very thin, and if bent around small pulleys is liable to fracture. The leather belt, having moderate elasticity, is generally preferred, as it adheres to pulleys by friction, and slips in case of accidental stoppage.

BELTING.—A system of belts, also belts collectively.

BENDING MOMENT.— The sum of the external forces which act upon each side of a given section of a beam bending under a load. It is equal to the "moment of resistance" of that section, or the sum of the internal forces or stresses set up therein by the bending action.

BLOCKING OR BLOCKING-UP.— The elevating and supporting of large pieces of machinery, or entire structures, by means of cranes, jacks, and blocking or short lengths of timber and planks, during erecting and constructing operations. Also the elevation given to the outer rail of the curve of a railway track, for the purpose of counteracting the effect of the centrifugal force developed by a rapidly moving train.

BOILER.— The steel tank or container in which water is boiled to make steam. (See BOILER). Also a hot-water cooking or scalding device.

BOLT.—A rod of metal for tightly securing together the parts of a structure, having usually an enlarged end called a head, and at the other end a threaded portion for holding a nut; when threaded at both ends called double-ended; when made with a ring or eye at one end called eye-bolt. (Compare 'Rivet' in this list). Also the bar or main sliding piece of a door-lock; also a block of wood suitable for cutting into shingles, staves, etc. In flour milling, a rotating sifting cylinder.

BORING.—An operation not to be confused with drilling. See BORING.

BRAKE.—A mechanism for restraining or retarding some motion or action. It may be a simple shoe of metal or wood, with a lever for pressing it against a wheel; or an encircling band of metal on a drum, as on an automobile; or a complex system of mechanism, as an air-brake (q.v.) Brake horse power is the amount of power delivered by an engine or motor at the driving pulley or pulley shaft, and actually available for doing work.

BRIDGE.— (See BRIDGES). Also one of various cross-pieces or minor mechanisms likened to a river-bridge, as a low dividing wall in a boiler; a horizontal scaffold; an electric balance used in measuring electric resistance — a Wheatstone's bridge.

BRIDGING.— Short wooden braces or struts placed between joists to secure them in position.

BRITISH THERMAL UNIT.— (Abbreviated B. T. U.) — The amount of heat required to raise the temperature of water one degree Fahrenheit, at or about 39.1°F. To convert values of energy expressed in foot-pounds to their equivalents in British Thermal Units, divide the values by 778.

BY-PASS.—A pipe arranged to pass by or around a valve and permit a fluid to take another route.

CAISSON.—A large water-tight box or casing, usually with an open bottom and shafts through the top, for carrying on working operations under water. Air-locks are placed in the shafts and the men work under air pressure. It is much used in laying foundations for piers and docks.

CALENDER.—A pair of rolls, or more usually a machine including several pairs of contacting iron cylinders, used in surfacing paper, cloth, etc.

CAMBER.— The upward curvature given to an arched bar or structure in order to compensate for the downward curvature resulting from the application of the load. In machinery, it is specifically applied to the arching of springs like those of locomotives. In structural work, it is applied to the arching of bridge trusses like the stiffening trusses of suspension bridges.

CANAL.—An artificial waterway, as for transportation of barges or for drainage. (See CANAL). Also a channel, groove or duct.

CANTILEVER.—A large counterbalanced truss-section of a bridge, that may be built out over the water, and sustained by the balancing weight of an opposite part projecting from the other side of the pier; a balanced truss. Also a bridge having such trusses. (See BRIDGES). In architecture, a bracket for a cornice, etc.

CASTING.— See FOUNDRY PRACTICE.

CEMENT.— See PORTLAND CEMENT.

CENTRE.— The middle of a thing: in various special uses. In machine designing, that one of two points in a crank motion which marks the end of a piston-stroke — a dead centre; in lathe-work, one of the conical points supporting the work, the one at the driving end being termed the live centre. In geometry, the fixed point about which the radius of a circle or a circular arc moves; the central point of a closed curve. In architecture, the centring support of an arch or dome. The "centre of buoyancy" of a vessel is the central point of compression of the forces that buoy her up. It must be above the centre of gravity or the vessel will capsize. The "centre of compression" is the line in which the resultant of the compressive forces in the lower part of a beam is located. The "centre fo gravity" is the point in a body about which the body will remain balanced when placed in any position. The "centre of gyration" is the point in which the momentum of a revolving body is concentrated. The "centre of moments" is the point about which the forces applied to a rigid body act. The "centre of oscillation" is the point in the axis of a vibrating body, such as a pendulum, in which if all the matter of the body were concentrated, the body would vibrate in the same time. The "centre of tension" is the line where the resultant of the tensile forces in the upper part of a beam is located.

CIRCULAR INCH.— The area of a circle one inch in diameter, as distinguished from a square inch. The number of circular inches in a given diameter is obtained by squaring the diameter.

COEFFICIENTS.— Numerical values deduced from data obtained by experiments and used as constant multipliers in engineering calculations. They have been determined for friction, elasticity, tension, rupture, resistance, the flow of water, etc. For example — the amount of force or weight that will elongate an elastic bar of any material and of uniform section to twice its original length is designated as the "coefficient of elasticity" of that material. Also termed "modulus" as the "modulus of elasticity," the "modulus of resistance," etc.

COHESION.— The condition of things that stick or cleave together; the union of particles, especially small particles, or the force that brings them together. Solids have great cohesion or tensile strength; liquids have little and gases none. See '*Tension*' in this list.

COLUMN.—An upright beam, shaft or truss, as for supporting a structure. The classical column is cylindrical and tapered, with a slight bulge at the centre of height. The concrete structural column may be square or rectangular. The steel column is frequently formed of several beams riveted or laced together.

COLUMNIATION.— The arrangement of columns in a building or portico.

COMBUSTION.— Burning; the continuous combination of a substance with oxygen (or chlorine, etc.) with flame and generation of heat. The best economic combustion of coal has been the subject of exhaustive experiment. The gases of combustion are the vaporous portions of smoke.

Compression.— The act or process of concentrating or condensing by pressure; the forcing of something into reduced space. Air is compressed by a machine built like a steam-pump, the piston packing and condensing the air in the cylinder at each stroke. Air so compressed is used for producing power, and for supplying workers in caissons, tunnels, mines, etc. In a gas-engine the mixture or explosive charge is subjected to pressure to heat it and increase its explosive properties. The members of a truss that are strained by longitudinal pressure are called compression members. See ' Truss ' in this list.

Concentrator.—A machine used in ore-concentration to bring together the richer portions of mineral content; a jigger or vanner.

Condenser.—Any one of various devices for condensing: (1) a contrivance for suddenly cooling and thus condensing exhaust steam. (See Steam and Steam-Engine). (2) A mutual induction apparatus. (See Condenser). (3) A lens or combination of lenses in a microscope or other optical instrument, for concentrating light rays. (4) In cotton-ginning a device for compacting lint, etc. (5) A mechanism for separating impurities by condensation from illuminating or fuel gas.

Constant.—A number deduced from data obtained by actual tests made upon the strength of a particular material, and used in calculations relative to the strength of structures built of that material. For example — having ascertained by actual experiment the weight required to rupture a steel bar measuring 3 x 2 x 1 inches, that weight can be used to estimate the stresses in structures made of the same material but differing in length, breadth, and depth.

Conveyor.— See Conveyer.

Couple.— In physics, two equal and opposite forces acting upon a body, which is therefore in a state of equilibrium. Also any two similar things joined together so as to be a pair, as two different metals joined in a thermopile.

Creeping.— Slow movement caused by conditions not easily foreseen, as the creeping of a railway track due to unusual heat and expansion of the rails. If a belt tends to work slowly out of position, or a machine through vibration gradually shifts its place on a floor or foundation, it is said to creep.

Crusher.— See Crushing and Grinding Machinery.

Cycle.— In mechanics, a series of motions that repeat.

Cylinder.—A solid bearing two flat surfaces or ends, connected by one continuous round surface; when relatively short called a drum; when relatively long a round rod, column, etc. Familiar examples of the cylinder are found in the steam-engine and the printing press.

Datum or Datum Line.—Any base line from which measurements are made, or dimensions taken, either in actual work, or in graphical calculations.

Deals.— Sawn timber which usually measures not less than 3 x 9 inches, and not more than 3 x 12 inches in cross section.

Differential.—A mechanical motion, in which the operation of some part is determined by the difference between the action of two other parts. For instance, if one part is making 10 R.P.M. and another 40 R.P.M., the differential governed by them will make 25 R.P.M.: called also Differential Motion. The most common illustration is the differential on the rear axle of an automobile. The term differential is also used to describe a double screw, having two sets of threads of different pitch, or some other mechanism embodying different double action.

Digester.—A chemical apparatus for digesting or partially dissolving something by heat and moisture.

Dock.—A wharf or pier, as on the margin of a body of water, to which vessels may tie up and load or discharge cargo. The term dock is more commonly used in England than America to describe the enclosed basin where vessels locate in a harbor. In the United States the term pier is more common, representing one of a row of long wharves with slips between which the vessels lie. In America the word dock is used mainly for the dry dock, being a basin in which a vessel can be docked, and the water pumped out, so that repairs can be made to the hull. A floating dock is an enormous structure, into which a vessel can be floated, and then by closing the gates of the dock and pumping out the water, the vessel is left dry resting on the floor of the floating structure.

Drill.— See Drills and Drilling.

Driving.— The act or process of moving or directing the motion of some other thing, especially that part of a machine that imparts power or momentum to other parts, as a driving-pulley or driving-axle. A driving gear is the combination of parts in the gear or mechanism that drives a machine; a driving-shaft is a power-shaft, usually having fixed pulleys for driving belts, or gears or clutches for communicating the power to the thing driven. When two wheels are geared together the one that is nearest the source of power and that imparts motion to the other is called the driver, while the wheel that receives motion is a driven wheel. To calculate the mechanical efficiency of a train of gearing, multiply the radii of all the drivers together, and likewise the radii of all the driven, and divide the latter by the former.

Duty.— The efficiency or useful work accomplished by an engine or motor; also the amount of such work, usually stated in footpounds. The duty of a steam engine is the number of pounds raised to the height of one foot by the burning of a bushel of coal. In the case of pumping engines, the duty was formerly expressed in millions of pounds of water lifted to the height of one foot by the burning of 100 pounds of coal; but, as the quality of coal varies greatly, the basis now employed is the work done by 1,000 pounds of dry steam, or by 1,000,000 British Thermal Units.

Dynamics.— See Dynamics; Electric Machine, etc.

Eccentric.—A wheel, gear, etc., mounted out of centre, so that its periphery has an irregular or eccentric motion, which may be used in a manner very similar to cam-motion. See Mechanical Movements.

Efficiency.— The efficiency of a machine or of a structure, or any portion thereof, is the ratio of its strength, power, or capacity, to that of some predetermined, understood, or fixed standard of reference. For example — the efficiency of a riveted joint in plate work is its percentage strength calculated relatively to that of the solid plate. The efficiency of a machine is the ratio of its actual value to its theoretical value, or the difference between the amount of work expended on the machine and the amount given out by it or obtained from it. See Efficiency Engineering.

Encastre.— The immovable fixing of the ends of a cantilever, or the ends of other forms of beams or girders in a wall or support. Beams are much stronger when encastre than when simply supported.

Energy.— Inherent capacity for doing work, as distinguished from force, which is energy in action in a definite direction, and power, which is the quantitative idea of force, without reference to direction. (See ' Force,' ' Horse Power ' and ' Power ' in this list). We speak of kinetic energy, meaning energy in motion, that is active and exhibiting motion, and which is theoretically equal to the product of half the mass into the square of the velocity. Potential energy is applied to stored energy, as in a pound of coal, which when consumed and used to make steam appears as kinetic energy. A storage battery when charged has potential energy, though it may lie idle. Electric energy is defined as molecular kinetic energy. (See Electron). Radiant energy is light, radiant heat, X rays or any form of energy transmitted through the hypothetical ether.

Ether.—A theoretical medium supposed to fill all space and pervade all substances, being that in which electricity, light, radiant heat, cathode rays and similar phenomena are promulgated. According to this theory electric phenomena are strains and pulsations in the ether. See Ether.

Expansion.— Increase of volume, especially of steam, gas or other motive fluid. Also the point in a piston-stroke at which such expansion becomes available and the period during which expansion takes place in an engine cylinder. When compound cylinders are employed it is termed double expansion, and if there are three or four steam-cylinders used in series it is termed triple, quadruple or series expansion. See Steam; Steam-Engine.

Factor of Safety.— When calculating the ultimate strength of a structure it is necessary to provide for contingencies arising from a lack of uniform quality in materials, inferiority of materials, wear and tear of parts, the unexpected application of loads, etc. This provision is made by the use of multipliers such as 4, 6, 8, and in some cases 10, which are applied to certain dimensions. For example — the application of a factor of safety of four will give a structure having four times the strength necessary to carry the load it will be ordinarily required to sustain.

Feeding.— The supplying of material to a machine or the like, as feeding of coal by a mechanical stoker, feeding of sheets of paper to a printing press, feeding logs to a sawing machine, or cotton to a breaker.

Flue.—A channel or passageway for smoke, waste gases, etc., as a subsidiary tube or smoke-duct in a chimney, or a tube carrying gases of combustion in a boiler, or a hot-air passage in a wall. It is distinguished from pipe and tube.

Fly-Wheel.—A relatively heavy wheel added to a machine for the purpose of maintaining uniform speed: called fly-wheel because it simply rotates or flies around. It resists sudden acceleration of speed by its inertia, and is useful in machines that do their work in a small fraction of a cycle, to prevent slowing up or racing.

Force.— Energy in action with reference to its direction; mechanical power as apparent in pushing, pulling, rotating, attracting and repelling; exertion that can be measured in pounds or units. Force always has direction, while energy has not, being rather the static idea. A storage battery may possess great energy, and yet exhibit no force for lack of a conductor. Compare ' Energy,' ' Power ' and ' Horse Power,' in this list.

Gas.— Matter in the aeriform state, usually invisible and apparent to the senses only by its odor or motion. Coal gas, water gas, petroleum vapor and various other gases, when mixed with atmospheric air in a proportion of about 1 to 10, readily explode when in contact with a flame, and this principle is used in the internal combustion engine. See Internal Combustion Engine.

Gear.— See Gearing and Mechanical Movements.

Governor.—A device for speed-regulation, as of an engine or motor, the most common type being the ball-governor used on steam-engines to prevent racing.

Graphic Statics.— The graphical methods employed for ascertaining the strains on structures, velocity ratios, etc., by means of lines drawn to a uniform scale and representing the direction and intensity of active forces.

Horse Power.—A theoretical unit of work, assumed to be the equivalent of what a horse can do; it equals 33,000 pounds lifted one foot in one minute. The power of engines and motors is frequently expressed in horse power units. A.H.P. is actual horse power; B.H.P. is brake horse power; I.H.P. is indicated horse power; and F.H.P. is friction horse power. Horse power is also the name of a form of tread-mill in which the traction power of horses is utilized in place of an engine or motor.

Inertia.— Resistance to change of motion due to mass or weight; persistence in a given motion or state of rest.

Ingot.—A mass of cast metal from a mold. The more valuable metals when not shaped as bars or rods are usually cast in ingots; iron is cast in pigs.

Interchangeable System.— That system of manufacturing machinery by which each part or piece is so exactly formed or machined that it may be replaced by any similar part. It originated in America and has become general. See Interchangeable Parts.

Lap.—A part that extends beyond the body of a thing over some other part, specifically, in steam-engineering, the extension on a slide-valve that determines the instant of opening or closing a steam-port. Also a piece of soft wood, metal, leather, etc., for polishing.

Load.— The weight or pressure a structure carries or sustains, distinguished as live load when moving, as of wagons on a bridge, and dead load when stationary. Live load is liable to create twice the stress of dead load, and must be provided for in the strength of the structure.

Machine Tool.—A machine for cutting, planing, drilling, turning, milling, etc., with cutters or small tools; formerly called engine-tool.

Motor.—A machine for transmitting power, as of water under head, or by electricity, as distinguished from an engine where the power is assumed to originate in the machine. See Electric Motor.

Mine.—An excavation in the ground for the purpose of obtaining some metal or mineral. Also a buried or submerged explosive.

Modulus.—A number or coefficient for the measure of a force or function. See ' Coefficients ' in this list.

Molding.— See Foundry Practice.

Oscillation.—A swinging from side to side, or short regular reversal of rotation; also vibration, as of electric waves. Compare ' Reciprocation ' in this list.

Pattern.—A model or original form of a piece designed to be cast, as for forming in iron. See Foundry Practice.

Pile.—A large heavy timber, pointed and driven small-end-first into the ground, as a support for a superstructure; commonly used in muddy places or on the edge of a body of water for securing a foundation: formerly called a spile. Now made also of concrete, or steel and concrete. Sometimes metal planks are used for the same purpose, or to form a breakwater or stout wall, and are termed sheet piles.

Pipe.—A long hollow tube, either one piece or a series of connected pieces. The distinction between pipe and tube is usually arbitrary, but when the article is made of soft, yielding material, as rubber, the correct term is tube.

Power.— Mechanical energy as viewed from the standpoint of capacity; the measurable amount of active energy; capability of performing a given amount of work Compare ' Energy,' ' Force ' and ' Horse Power ' in this list.

Pressure.— Stress such as would tend to move a body in contact; the impelling force of a load. It is usually estimated by units of weight. See ' Load ' and ' Stress ' in this list.

Prime Mover.—An engine or the like from which a power originates. The electric dynamo depends upon the steam-engine or water-wheel as its prime mover.

Racing.—Running at an excessive speed, as an engine suddenly released of its load. It is liable to burst a fly-wheel if not checked.

Reaming.— The enlarging of a hole by inserting and turning a tool termed a reamer; done to taper a hole or remove edges weakened by punching.

Reciprocation.— The act of moving back and forth systematically, as a piston. Compare ' Oscillation ' in this list.

Reducing.— Drawing to a smaller scale; also tapering in diameter; also the smelting or reduction of ore in a furnace; also the act of withdrawing fluid under pressure, as by a reducing-valve.

Revolving.— Turning around in an orbit, after the manner of a planet, or a ball in a ball-bearing. Such a ball rotates on its own centre, but revolves around the center of the bearing. See ' Rotation ' in this list.

Resistance.— That which opposes a force or movement. An electric resistance is a poor conductor, as an iron wire, placed in a circuit to impede the current.

Reverberatory.— Reflecting, or operating by reflection, as a puddling furnace, where the flame and heat are reflected from the vaulted roof to the top of the material to be fused.

Rivet.—A short metal connection for holding metal plates together, resembling a bolt, but instead of having a threaded end and nut, the tail end is designed to be upset, that is battered and spread, to keep it tight in its hole.

Rolling.— Passing between heavy iron rolls to reduce and shape, as steel rails and beams. Also calendering.

Rotation.— The act of turning around its own centre. Compare ' Revolving ' in this list.

Shaper.—A machine tool for cutting or machining small metal parts, the work being stationary, and the cutting tool mounted to reciprocate.

Spindle.—A slender rod or pin, usually for some rotary purpose, as the central rod of a bobbin.

Spinning.— In metal working, the operation of drawing out and expanding into a cup or cone form, by pressure and rotation. In textile manufacture, the drawing out and twisting of sliver to form thread.

Stamping.— The operation of forming light metal articles in the cold by a sudden blow of a die. Also the crushing of ore in a stamp-mill.

Static.—At rest or in equilibrium. See Electricity.

Stoking.— The supplying of a furnace with fuel. Mechanical stokers are common for supplying coal under stationary boilers, but are not adapted to marine use.

Strength of Materials.— The engineer is continually confronted with this problem, and elaborate tests are now undertaken to secure uniform and known strength in structural materials. The force that resists being pulled apart is termed tensile strength; that resisting crushing is termed strength of compression. There is also torsional and bending strength.

Stress.—Any force or power that tends to deform, bend or fracture a thing; especially, such a force considered with its reaction or opposing force.

Stuffing.—In steam engineering, a packing of spiral steel rings for making a fluid-tight joint for a moving part, as a piston-rod.

Switch.—A mechanism for side-tracking a thing. An electric switch is usually a jointed piece of copper with insulated handle, by which conductors can be connected or disconnected. A railway switch is a pair of jointed and pointed rails for guiding car-wheels to an adjacent track. A weaver's switch is a reversing motion for a shuttle.

Tempering.— The process of bringing steel, etc., to a certain degree of hardness by heating and sudden cooling in water or oil. Also the process of bringing clay to proper working condition by moistening and kneading.

Template.—A flat pattern, usually of metal, serving as a guide in various cutting, drilling and shaping operations. Also spelled templet.

Tension.— The force or system of forces tending to draw a body apart or lengthen it; pulling stress as opposed to compression. A tension member of a truss is a rod that is subjected to a pulling strain.

Testing.— The operation of testing materials. See ' Strength of Materials ' in this list. A testing machine pulls apart pieces of metal and measures the elongation and strain of rupture, and also determines crushing or compression strains.

Thread.—A spiral projection on a screw for enabling it to grip a softer substance, as wood, or to fit into a reverse thread in a nut.

Train.—A series of parts acting together, as a train of gears.

Transmission.— The passage of something over or through some other thing, as heat through the air, or electricity through a copper or aluminum wire. Also the sending mechanism of a telephone. Also a mechanism that transmits power in a given way, as the transmission of an automobile.

Truss.—A braced framework, calculated to resist strains in all directions, as used in bridges, roofs, etc.

Tube.— See Pipe.

Turbine.—A flanged wheel or circular structure, calculated to receive the impact of rapidly moving water, steam, etc., and deliver a large part of it as power on a shaft. See Hydro-Electric Development.

Unit.—A given minor quantity represented by 1, for calculating the quantities of things. The fundamental units are the metre and foot for length, pound and kilogram for weight, second for time. See Metric System; also Electrical Units.

Work.—The accomplishment of machinery or mechanical motion by the expenditure of energy. The work done by lifting 10 pounds 10 feet is 100 foot-pounds.

Working.—Adapted to work; accurate in operation, as a working model.

Charles H. Cochrane,
Author of 'Modern Industrial Progress.'

ENGINEERS, Corps of, a branch of the United States army which takes charge of the construction and repair of fortifications, both temporary and permanent, military reconnoitering and surveying, the selection and planning of camp sites, the construction and maintenance of roads, railroads, bridges, storehouses, etc., and divers other technical services which are not under the supervision of special branches of the army. It also superintends river and harbor improvements, the collection and preservation of documents relating to the Washington aqueduct and public buildings in the District of Columbia and the construction of bridges and roads in the Crater Lake and Yellowstone National Parks. The Panama Canal was built under engineer officers.

Engineer officers were authorized by Congress on 16 June 1775 and in the same year Col. R. Gridley became chief engineer. Many French engineers served with the United States army during the Revolution. A corps of artillerists and engineers was established by the act of 9 May 1784. In 1802 the artillery and engineers were separated and the Corps of Engineers was established. This was gradually increased in size until the present establishment is 505 officers, one band, seven regiments and two mounted battalions. In 1813 appointments were first made to the rank of topographical engineer. After various vicissitudes, the topographical service of the army was organized as the Corps of Topographical Engineers in 1838. In 1863 this corps was merged in the Corps of Engineers.

Engineer officers are appointed, in general, from West Point, although competitive examinations are held which are open to civilian engineers. Commissions in the engineers are generally given to those West Point cadets with the highest academic standing. Officers in the Corps of Engineers are considered as in the line when they are on service with engineer troops. Otherwise they are staff officers.

During the Great War the uses of engineer troops and the organizations which they form have undergone great diversification. Whereas the engineer troops of the United States army were formerly grouped into pioneer regiments, mounted pioneer battalions and pontoon battalions, there are now also labor regiments, railroad regiments, lumbering regiments and so on indefinitely, made up from men in the National Army or National Guard and under engineer officers. The technical training of officers of the Corps of Engineers is divided between the United States Engineer School at Washington and the Army Field Engineer School at Fort Leavenworth. The Royal Engineers of the British Army, the "technische Truppen" of Germany and the Engineer Corps of the French Army correspond very closely to the United States Corps of Engineers, but perform work which belongs to the American Signal Corps as well. The foreign corps also differ from the American in that they draw in general from technically trained men, whereas in times of peace American engineers receive the greater part of their training after enlistment. See Army Organization; United States, Army of.

ENGIS, ŏṅ-zhē, Belgium, on the Meuse, southwest of Liége, in the neighborhood of which there are many caves. In these, in 1832, there were discovered by Dr. P. C. Schmerling a human skull and parts of a man's skeleton together with bones of the rhinoceros, mammoth, cave-bear and hyena imbedded in deposits belonging to the Quaternary period. This discovery gave cause for much discussion among anthropologists. The skull, usually known as "the Engis Skull," though of uncertain age, is beyond any doubt very old. Similar discoveries were made in nearby caves, especially at Engihoul. Consult Avebury, J. L., 'Prehistoric Times' (7th ed., London 1913); Doudon, E., 'Nouvelles explorations dans les cavernes d'Engihoul' (in Soc. d'Anthrop. de Paris, *Bull. et Mem.*, Ser. V, Vol. IV, p. 177, Paris 1903); Dupont, E. F., 'Les Temps Prehistoriques en Belgique' (Brussels 1873); Huxley, T. H., 'Man's Place in Nature' (New York 1899); Schmerling, P. C., 'Recherches sur les ossements fossiles decouverts dans les cavernes de la province de Liége' (Liége 1833); Spring, 'Les Hommes d'Engis et de Chauvaux' (in *Bulletins de L'Academie Royale de Belgique*, Ser. II, Vol. XVIII, pt. 2, No. 12, Bruxelles 1864).

ENGLAND, John, American Catholic prelate: b. Cork, Ireland, 23 Sept. 1786; d. Charleston, S. C., 11 April 1842. He was educated in the schools of Cork and studied law for two years, but in 1803 entered the theological college of Carlow. Here his progress in his studies was so brilliant that after his second year he was selected to deliver public lectures on religious subjects. He also devoted much of the time given him for recreation to the instruction of the militia stationed in the town. He also founded an asylum for unprotected females which afterward suggested the plan of the Presentation convent and established free schools for the education of poor boys. In 1808 he was recalled by his bishop and appointed president of the theological seminary at Cork. He took a leading part in the agitation for Catholic emancipation and, with the view of helping the cause of religious liberty, founded the *Chronicle*, which he continued to edit until his departure from Ireland. When the see of Charleston, embracing the States of North Carolina, South Carolina and Georgia, was founded Dr. England was nominated its first bishop. As he had determined to become an American citizen he refused to take the oath of allegiance exacted from Irish bishops on their consecration. After some difficulty he was consecrated in Cork in 1820 and arrived in Charleston the same year. He had many obstacles to contend with. There were only two priests and two churches in the three States under his jurisdiction and his flock was made up chiefly of poor Irish emigrants and refugees from Santo Domingo. In order to provide priests for his diocese he opened a classical school in Charleston, and the success that attended his efforts in this respect enabled him to support several of his ecclesiastical students. Not only did he succeed in training a body of educated missionaries for his church, but contributed largely to the revival of classical learning in South Carolina. Several schools were reopened and the College of Charleston, which had suspended for some time, resumed its studies. He infused new life into the Philosophical Literary Association of Charleston as soon as he became a member and did much to suppress dueling, not by intemperate denunciations but by forming the most influential gentlemen of the State into an anti-dueling association. He was invited by Congress to preach in the Hall of Representatives at Washington and was the first Catholic clergyman on whom this honor was conferred. To explain and defend the doctrines of his church he established the *United States Catholic Miscellany* at Charleston. It was through the columns of this periodical that most of his writings found their way to the public. His influence was felt in every part of the Catholic church in the United States and his influence at Rome was decisive in affairs connected with the church in America. His courses of lectures, which he delivered in all the great cities of the Union, were attended by citizens of every creed. Nothing, however, endeared him to the people of Charleston so much as his heroism during the frequent visitations of the yellow fever, when he continued at his post night and day. In 1834 he visited Ireland and obtained the services of three nuns of the Ursuline Order, by whose aid he established the Ursuline schools of Charleston. He also founded orphan asylums, boarding-schools and free schools, which he placed in charge of the Sisters of Our Lady of Mercy. He conceived the plan of assembling the prelates in council for mutual aid, and has been styled "the author of our provincial councils." He visited Europe four times in the interests of his diocese, was sent twice as Apostolic Delegate to Haiti and was offered an Irish See, which he declined. On his return from Europe in 1841 malignant dysentery broke out among the steerage passengers, and Dr. England's attendance on them was incessant until he was attacked by the disease himself. He finally died from its effects, which were heightened by overwork. His principal works are 'Discourse before the Hibernian Society of Savannah' (1824); 'Explanation of the Construction, Furniture and Ornaments of a Church'; 'Letters on Slavery'; and "Works," edited by Bishop Reynolds (5 vols., Baltimore 1849).

ENGLAND, including **WALES,** the southern and larger portion of the island of Great Britain, is situated between lat. 50° and 55° 46' N. and long. 1° 46' E. and 5° 42' W. England covers 42 per cent, and Wales 6 per cent, together 48 per cent of the whole area of the British Isles. For geographical, administrative and statistical purposes Wales is usually included with England, of which it forms a western peninsula, similar to the counties of Devon and Cornwall. Bounded on the East by the North Sea or German Ocean, which separates the territory from Germany, Holland, Denmark and Belgium; on the south by the English Channel, dividing it from France, and on the west by the Saint George's Channel and the Irish Sea, its only land frontier is that irregular line of 110 miles facing Scotland on the North. As the crow flies, that border line is barely 70 miles; forming a rough triangle, the eastern side measures 350 miles in a straight line; the western 425, and the southern 325 miles — a total of 1,170 miles. But the shores within this triangle are so deeply indented by bays and estuaries that the actual coast line is more than twice that distance, estimated at not less than 2,765 miles. The length of the country, measured on a meridian from Berwick nearly to Saint Alban's Head, is 365 miles. Its breadth, calculated on a parallel of latitude, attains its maximum between Saint David's Head, in South Wales, and the Naze, in Essex, where it amounts to 280 miles. The area of England without Wales is 50,873 square miles; that of Wales, 7,366; together, 58,239 square miles. The seas surrounding the British Isles are shallow. If the waters were to subside to the extent of 300 feet, the whole of the British Islands, including Ireland, would once more be united to Continental Europe.

Geographical History.— This great island possession of Rome had been virtually abandoned by the Romans (A.D. 410) before the Teutonic settlements in it began. The invaders had therefore to struggle rather with native Britons than with Romans. Moreover they were invaders who came by sea, and from lands where little or nothing was known of the Roman law or religion. They met with a degree of strictly national resistance such as no other Teutonic conquerors encountered, and therefore, in the end, they swept away all traces of the earlier state of things in a radical way which took place nowhere else. As far as such a process is possible, they slew or drove out the older inhabitants; they kept their heathen religion and Teutonic language, and were thus able to grow up as a new Teutonic nation in their new home without any important intermixture with the earlier inhabitants, Roman or British. The conquerors who wrought this change were the forefathers of the present day English,— the low Dutch inhabitants of the borderlands of Germany and Denmark. Among them three tribes, the Angles, the Saxons and the Jutes, had the chief share in the conquest of Britain. The Saxons had already attempted a settlement here in the 4th century and were consequently the tribe first known to the Roman and Celtic inhabitants of the island. Hence it came that the Celts of Britain and Ireland have called all the Teutonic settlers Saxons to this day. But, as the Angles, or English, occupied in the end by far the greater part of the land, it was they who, when the Teutonic tribes in Britain began to form one nation, gave their name to that nation and its land. That nation was the English and their land was England. While *Britain* thus remains the proper geographical name of the whole island, *England* is the political name of that part of Britain which was step by step conquered by the English. Before the end of the 5th century several Teutonic kingdoms had been founded in Britain. The Jutes began the conquest by their settlement in Kent, and presently the Saxons began to settle on the south coast and on a small part of the east coast, in Sussex, Wessex and Essex. Along a considerable portion of the eastern coast various Anglian settlements were also made, which gradually grew into the kingdoms of East-Anglia, Deira and Bernicia. By their ultimate union the last two formed the great kingdom of Northumberland. At the close of the 6th century, however, the English had not got very far from the southern and eastern coasts. The Britons, whom the English called *Welsh*, or strangers, held out in the west, and the Picts and Scots in the north. The Scots were properly the people of Ireland; but a colony of them had settled on the western coast of northern Britain — distant at one part only 13 miles from Ireland — and in the end gave the name of Scotland to the whole northern part of the island.

The changes of boundary between England and Wales began with the great Welsh campaign of Harold in 1063. All the border shires, Cheshire, Shropshire, Herefordshire and Gloucestershire seem to have been enlarged at this period. The English border stretched to the Conwy in the north and to the Usk in the south. But part of this territory appears to have been recovered by the Welsh princes, while part passed into the great *march* district of England and Wales, under the rule of the Lords Marchers. The gradual conquest of South Wales began under the Conqueror and was continued by his sons; but it was more the work of private adventurers than of the kings themselves. The lands of Morganwg, Breheiniog, Dyfed and Ceredigion, answering nearly to the modern South Wales, were gradually subdued. In some districts, especially in the southern part of the present Pembrokeshire, the Britons were actually driven out, and the land was settled by Flemish colonists, the latest of the Teutonic settlements in Britain. Elsewhere Norman lords, with Norman, English and Flemish followers, held the towns and the more level country, while the Welsh kept up a semi-independence in the western mountains. In North Wales, meanwhile, native princes still ruled as vassals of the English king till the war of Edward I. In 1277 the vassal prince was compelled to relinquish again the territory east of the Conwy to his overlord. The final conquest followed in 1282, but complete incorporation with England did not take place until the reign of Henry VIII, 253 years later. During this long interim North and South Wales remained a separate dominion, giving the princely title to the eldest son of the English king, a dynastic custom that still exists to-day. Some shires were formed or remodeled, new towns founded, and the border districts maintained under the anomalous jurisdiction of the Marchers till the ultimate absorption in 1535. Thirteen new counties were then formed and some districts added or restored to the border shires of England. One of the new counties, Monmouthshire, was added to an English circuit under Charles II, and has since been considered an English county. Curiously enough, it frequently appears included with Wales even in official publications at the present time.

With the exception of these new creations, all the existing shires of England were in being at the time of the Norman Conquest, save those of Lancaster, Cumberland, Westmoreland and Rutland. The boundaries were not always exactly the same as at present, but the differences are commonly slight and of mere local interest. As they stood at the Conquest the shires were of two classes: some were old kingdoms or principalities which still kept their names and boundaries as shires, while others seem to have been mapped out afresh when the land was recovered from the Danes. All the shires on the Welsh border stretched further west in 'Domesday' than they do now. On the Scottish border Westmoreland and Cumberland were formed out of the Cumbrian conquest of William II and enlarged by territory which appears in 'Domesday' as part of Yorkshire. Lancashire was made up of lands taken from Yorkshire and Cheshire, the river Ribble forming the older boundary of those shires. The older divisions are marked by the boundaries of the dioceses of York, Carlisle and Litchfield or Chester, as they stood until the changes under Henry VIII. In central England the only change was the formation of the smallest shire — Rutland — out of the Domesday district of Rutland, an appendage to Nottinghamshire, enlarged by a small part of what was then Northamptonshire.

If one were to trace these changes over a series of ancient and modern maps, they would reveal but very little alteration of boundaries in the island since the 11th century. The land, as a whole has not been mapped out afresh since the 10th century. While a map of France or Germany in the 11th century, or even in the 18th, would be useless for immediate practical purposes, a map of England in the days of Domesday (1085–86) hardly differs from the map of England as we know it to-day. The only changes of any import — and they are neither many nor great — are the shires on the Welsh and Scottish borders. William the Conqueror put the finishing stroke to the work of Egbert and made England forever one. By uniting that country under the same ruler as Normandy (namely, himself), he led her into the general current of continental affairs, and gave her a European position such as she had never held under her native kings.

Although there have been but slight changes in the boundaries of England itself within a thousand years, the extra-territorial expansion of that country beyond the seas constitutes the most remarkable phenomenon in the world's history. England alone is about the size of Rumania, less than a fourth of France or of Germany, and but little larger than the State of New York. England and Wales together are not equal in area to the State of Georgia, nor a quarter the size of Texas. There are 29 States or Territories in the Union each larger than England, and several much larger than the whole United Kingdom put together. Whilst the area of the British Isles is less than one-four hundredth part of the land surface of the globe, the colonies and dependencies which England has acquired within about 300 years cover something like one-fifth of the earth, or 13,356,751 square miles, with a population estimated at 449,370,000.

Topography.— The chief indentations are: On the east, the Humber, the Wash and the Thames estuary; on the west, the Solway Firth, Morecambe Bay, Cardigan Bay and the Bristol Channel; those on the south are less prominent, though including some useful harbors. The greater part of the coast consists of cliffs, in some places clayey, in others rocky and sometimes jutting out into bold, lofty and precipitous headlands, as at Whitby and Flamborough Head on the east, Beachy Head, the Isle of Portland, the Lizard and Land's End on the south and southwest, Saint David's Head and Saint Bees Head on the west. The most extensive stretches of flat coast are on the east, in the county of Lincoln, and from the south part

of Suffolk to the South Foreland in Kent, and in Sussex and Hants on the south coast. The chief islands are Holy Island, the Farne Islands, Sheppy and Thanet on the east coast; the Isle of Wight on the south; the Scilly Isles at the southwestern extremity; and Lundy Island, Anglesey, Holyhead and Walney on the west.

The loftiest heights of England and Wales are situated at no great distance from its west shores and consist of a succession of mountains and hills, stretching, with some interruptions, from north to south, and throwing out numerous branches on both sides, but particularly to the west, where all the culminating summits are found. The northern portion of this range has received the name of the Pennine Chain and is commonly designated "the backbone of England." It is properly a continuation of the Cheviot Hills, and, commencing at the Scottish border, proceeds south for about 270 miles, till, in the counties of Derby and Stafford, it assumes the form of an elevated moorland plateau. In Derbyshire The Peak rises to the height of 2,082 feet. By far the most important of its offsets are those of the west, more especially if we include in them the lofty mountain masses in northwestern England, sometimes classed separately as the Cumbrian range. Amid these mountains lie the celebrated English lakes, of which the most important are Windermere, Derwent Water, Coniston Lake and Ullswater. Here also is the highest summit of northern England, Sca Fell (3,210 feet). The Pennine Chain, with its appended Cumbrian range is succeeded by one which surpasses both these in loftiness and extent, but has its great nucleus much farther to the west, where it covers the greater part of Wales, deriving from this its name, the Cambrian range. Its principal ridge stretches through Carnarvonshire from north and west, with Snowdon (3,560 feet) as the culminating point of south Great Britain; across the Bristol Channel from Wales is the Devonian range. It may be considered as commencing in the Mendip Hills of Somerset and then pursuing a southwest direction through that county and the counties of Devon and Cornwall to the Land's End, the wild and desolate tract of Dartmoor forming one of its most remarkable features (highest summit, High Willhayes, 2,039 feet). Other ranges are the Cotswold Hills, proceeding in a northeast direction from near the Mendip Hills; the Chiltern Hills taking a similar direction farther to the east and the North and South Downs running east, the latter reaching the southern coast near Beachy Head, the former reaching the southeast coast at Folkestone.

A large part of the surface of England consists of wide valleys and plains. Beginning in the north, the first valleys on the east side are those of the Coquet, Tyne and Tees; on the west the beautiful valley of the Eden, which, at first hemmed in between the Cumbrian range and Pennine Chain, gradually widens out into a plain of about 470 square miles, with the town of Carlisle in its centre. The most important of the northern plains is the Vale of York, which has an area of nearly 1,000 square miles. On the west side of the island, in south Lancashire and Cheshire, is the fertile Cheshire plain. In Wales there are no extensive plains, the valleys generally having a narrow, rugged form favorable to romantic beauty, but not compatible with great fertility. Wales, however, by giving rise to the Severn, can justly claim part in the vale, or series of almost unrivaled vales, along which it pursues its romantic course through the counties of Montgomery, Salop, Worcester and Gloucester. Southeast of the Cotswold Hills is Salisbury plain, a large elevated plateau, of an oval shape, with a thin, chalky soil only suitable for pasture. In the southwest the only vales deserving of notice are those of Taunton in Somerset and Exeter in Devon. A large portion of the southeast may be regarded as a continuous plain, consisting of the Wealds of Sussex, Surrey and Kent, between the North and South Downs, and containing an area of about 1,000 square miles. The southeast angle of this district is occupied by the Romney marsh, an extensive level tract composed for the most part of a rich marine deposit. Extensive tracts of a similar nature are situated on the eastern coast in Yorkshire and Lincoln, where they are washed by the Humber; and in the counties which either border the Wash, or, like Northampton, Bedford, Huntingdon and Cambridge, send their drainage into it by the Nen and the Ouse.

For the climate of England see GREAT BRITAIN — GEOGRAPHICAL ENVIRONMENT.

Rivers.— England is well supplied with rivers, many of them of great importance to industry and commerce. Most of them carry their waters to the North Sea. If we consider the drainage as a whole, four principal river basins may be distinguished, those of the Thames, Wash and Humber belonging to the North Sea; and the Severn, belonging to the Atlantic. The basin of the Thames has its greatest length from east to west, 130 miles, and its average breadth about 50 miles, area, including the Medway, 6,100 square miles. The river itself, which is the chief of English rivers, has a length of 210 miles. The basin of the Wash consists of the subordinate basins of the Great Ouse, Nen, Welland and Witham, which all empty themselves into that estuary, and has an area computed at 5,850 square miles. The basin of the Severn consists of two distinct portions, that on the right bank, of an irregularly oval shape, and having for its principal tributaries the Teme and the Wye; and that on the left, of which the Upper Avon is the principal tributary stream. The area of the whole basin is 8,580 square miles. The next basin, that of the Humber, the largest of all, consists of the three basins of the Humber proper, the Ouse and the Trent, and its area is 9,293 square miles, being about one-sixth of the whole area of England and Wales. Other rivers unconnected with these systems are the Tyne, Wear and Tees, in the northeast; the Eden, Ribble, Mersey and Dee, in the northwest. The southern coast streams are very unimportant except for their estuaries. See THAMES.

Areas and Population.— The total area of England and Wales amounts to 58,340 square miles, and the population (1921 census) aggregated — England, 35,678,530; Wales, 2,206,712, making a total of 37,885,242. The official census of the year 1911 placed the total at 36,070,492; while the National Register, taken in August, 1915, placed the civilian population at 35,360,000.

In 1901 England and Wales contained 78 per cent of the population of the United Kingdom; in 1911 it rose to 79.8 per cent, or four-fifths of the whole British Isles. The density of the population in England is greater than in any other European country (disregarding Monaco) except the Free State of Saxony (829 per square mile); 1921 it was 649 per square mile.

The first uniform census of the United Kingdom was taken in 1801. The growth of population in England and Wales from 1650 is shown by the following available statistics:

In 1650 (estimated)	5,450,000
1750 (probably)	6,400,000
1801 (census)	8,892,536
1841 (England)	15,002,443
1851 (together)	16,921,888
1861 "	18,954,444
1871 "	21,495,331
1881 "	24,613,926
1891 "	29,002,525
1901 "	32,526,075
1911 "	36,070,492
1921 "	37,885,242

During the 100 years (1801–1901) the population of the United Kingdom rose from 16,000,000 to 41,000,000. The 1921 census revealed 22,691,256 males and 24,616,345 females, an excess of 1,925,089 females. Men serving in the army, navy and merchant service abroad are not included in this calculation. In 1914 there were 879,096 births, 37,329 illegitimate births, 294,401 marriages and 516,742 deaths. The proportion of male to female births for that year was 1,036 male to 1,000 females, while of the total estimated population 17,877,052 were males and 19,083,632 females. The following table shows the areas and population of the English and Welsh administrative counties (1921):

Counties (Administrative)	Area in square miles	Population
Bedfordshire	466.4	206,478
Berkshire	721.9	202,533
Buckinghamshire	743.2	236,209
Cambridgeshire	492.5	129,594
Cheshire	1,027.8	625,001
Cornwall	1,356.6	320,559
Cumberland	1,520.4	220,437
Derbyshire	1,029.5	584,703
Devonshire	2,604.9	440,023
Dorsetshire	987.9	228,258
Durham	1,014.6	943,670
Essex	1,523.2	918,111

Under the Representation of the People Act of 1918 parliamentary seats in Great Britain were redistributed on the basis of one member of the House of Commons for every 70,000 of the population. A separate act redistributed the Irish seats on the basis of one member for every 43,000 of the population. By these acts the Commons membership was raised from 670, as established in 1885, to 707. This number was reduced to 615 in 1922 when separate parliaments were established in Ireland, leaving only 13 Irish Commoners from Northern Ireland.

Historical Summary.— The leading events in English history (which are treated more fully elsewhere), may be briefly summarized here for ready reference:

B. C. 55 — First Roman invasion under Julius Cæsar, led to Roman conquest and civilization

A. D. 410 — Roman evacuation; left Britain and her earliest civilization a prey to the barbarians.

449 — English land in Britain; birth of feudalism and local government.

597 — Landing of Augustine; conversion of English to Christianity; beginning of papal domination.

787 — Beginning of Danish invasions; inaugurated a period of anarchy and warfare, arresting progress and preparing England for conquest by the Normans.

825 — Ellandune and supremacy of Wessex; union of English kingdoms under Egbert.

878 — Ethandune and Treaty of Wedmore; England saved from anarchy and devastation; inauguration of King Alfred's reforms.

1066 — Battle of Hastings; Normans conquered Saxons; introduction of Norman civilization; beginning of England's greatness.

1086 — Domesday book and Salisbury Oath; established feudal system, and the power of the Crown; reformed central government.

1095 — Crusades began; undermined feudalism; aided the rise of the middle classes; introduced Eastern civilization.

1100 — Charter of Liberties; basis of English liberty and of Magna Carta.

1106 — Tenchebrai; conquest of Normandy; beginning of colonial empire and of English power in France.

1170 — Invasion of Ireland; inaugurated incessant misrule and anarchy in a part of the British Empire; opened a problem not yet solved in the 20th century.

1215 — Magna Carta; first written law and first real guarantee of the liberty of the subject; basis of all subsequent legislation.

1265 — De Montfort's Parliament; first representative parliament; beginning of popular representation.

1295 — Model Parliament of Edward I; first free parliament; all classes completely represented.

1314 — Battle of Bannockburn; established Scotland's independence.

1322 — Commons gain a share in legislation; the middle classes begin winning their way into first place in the government.

1346 — Battle of Crecy; definitely plunged England into a century's struggle with France; established the supremacy of yeomen and mercenaries over feudal knights and feudal levies.

1349 — The "Black Death;"— depopulated Europe; provoked a life and death struggle between capital and labor, culminating in the Peasants' Revolt.

1381 — Peasants' Revolt; revolution in the manorial system; emancipation of serfs; new era in the history of labor.

1399 — Deposition of Richard II and accession of Henry IV; overthrow of royal despotism; establishment of constitutional monarchy; its failure marked a century and a half of great misery.

1429 — Siege of Orleans; turning point in the Hundred Years' War; death-blow to English Continental Empire; caused the War of the Roses.

1430 — Disfranchising Act; lower middle classes deprived of their vote; no representative parliament for exactly four centuries.

1461 — Battle of Towton and of Mortimer's Cross; overthrow of Lancastrian rule and of the constitutional experiment; inauguration of the New Monarchy (the "benevolent despotism" of the Crown).

1473 — Caxton introduced printing; inaugurated the "New Learning" and the education of the masses.

1497 — Cabot's discovery of the American mainland; inaugurated trade with America; forerunner of British-American empire.

1529 — Divorce of Catherine of Arragon; Reformation set in motion.

1534 — Act of Supremacy; separation from Rome; King supreme head of English Church; establishment of Anglican Church.

1558 — Accession of Elizabeth; final victory of Protestantism; beginning of brilliant Elizabethan era and of England's supremacy in Europe.

1588 — Defeat of the Spanish Armada; Protestantism saved; England mistress of the seas; inaugurated great struggle between Crown and Parliament.

1604 — The name "Great Britain" given to England, Scotland and Wales.

1607 — Colonization of Virginia; began rivalry of English and French in America.

1628 — Petition of Right; first great victory of Parliament over Stuart despotism; ranks with Magna Carta as a bulwark of English liberties.

1640 — Meeting of the Long Parliament; overthrew Stuart despotism.

1641 — Root and Branch Bill and Grand Remonstrance: plunged England into the great Civil War; victory of Puritanism over Episcopacy.

1645 — Battle of Naseby; victory of Puritan army over Royalists; led to execution of Charles I.

1649 — Execution of Charles I.; overthrow of the Constitution, Monarchy, Church and Parliament; establishment of republic.

1660 — Restoration; overthrow of Puritanism; restoration of Monarchy, Church and Parliament; renewal of Stuart despotism.

1679 — Habeas Corpus Act; prevented arbitrary imprisonment; guaranteed to the accused a fair trial.

1688 — The "Glorious Revolution;" final overthrow of royal despotism; establishment of constitutional government; Bill of Rights — the third great guarantee of English liberty.

1693 — National Debt began; revolution in British finance; Bank of England founded (1694); security of investment.

1704 — Battle of Blenheim; saved England and Europe from French domination.

1707 — Union with Scotland; completed the union of Great Britain; new era in Scottish development.

1721 — Walpole Prime Minister; cabinet system; party government; inaugurated a peace policy which formed the foundation of England's future supremacy.

1757 — Battle of Plassey; conquest of India; saved England's Empire in the East.

1759 — "Annus Mirabilis"— the most wonderful year in England's history; gave her Canada; overthrew French supremacy; led to Treaty of Paris, and establishment of her great Colonial Empire.

1783 — Treaty of Versailles; Pitt Prime Minister; independence of New England colonies; overthrow of George III's absolutism.

1788 — Settlement in New South Wales; colonization of Australia, and establishment of Australasian Empire.

1789 — Outbreak of French Revolution; overthrow of Continental feudalism; inaugurated revolt of the oppressed; plunged Europe into great wars; produced Napoleon; arrested reform in England for 40 years.

1801 — Union with Ireland; Pitt's failure to solve the Irish question.

1805 — Trafalgar; finally established Britain's naval supremacy, and saved her from Napoleon's domination.

1815 — Waterloo.

1829 — Catholic Emancipation Act; triumph of religious toleration in England; put an end to religious hatred and persecution.
1832 — First Great Reform Bill; new phase in parliamentary reform; gave the franchise to the upper middle classes; added half a million voters.
1846 — Repeal of the Corn Laws; triumph of free trade; cheap food for the masses.
1854–55 — Crimean War.
1868 — Second Great Reform Bill; gave the franchise to the lower middle classes; added over a million voters.
1869 — Disestablishment of the Irish Church; gave to Ireland the religious liberty enjoyed by Great Britain; marked a new phase in the Irish question — that of reform and attempted conciliation.
1879 — Zulu War.
1882 — British supremacy in Egypt established at Tel-el-Kebir; end of the Anglo-French condominium.
1885 — Third Great Reform Bill; gave the franchise to the laboring classes; completed popular representation.
1899 — South African War.
1901 — Death of Queen Victoria.
1910 — Death of King Edward VII.
1914 — Great Britain declared war on Germany.
1918 — Representation Bill; added 8,000,000 voters, including 6,000,000 women.

Redistribution Recommendations for England and Wales.— On 4 Oct. 1917 the report of the boundary commission was published as a blue book in three volumes. The commissioners recommended the extinction of 27 English boroughs and merging them in county constituencies in order to remove the "confusion and inconvenience" caused by overlapping boundaries. It was not intended to create any new parliamentary boroughs with a population of less than 70,000, yet in several cases it would be necessary to do so owing to peculiar local conditions. According to the estimated population in 1914 (the last census was in 1911), the average population per member in the new constituencies was given as 71,005 for England and 72,099 for Wales; the two countries together, 71,078. The general effect of the scheme will be to increase the number of members for English constituencies from 461 to 485; of Welsh constituencies from 34 to 35; total increase for England and Wales, 25 members.

Some of the changes under the redistribution scheme are given below. Birmingham is allotted 12 members instead of 7; Bradford, 4 instead of 3; Bristol, 5 instead of 4; Kingston-upon-Hull, 4 members instead of 3; Leeds, 6, formerly 5; Leicester, 3 members, formerly 2; Liverpool, 11, formerly 9; Manchester, 10 members, formerly 6; Portsmouth, 3, formerly 2; Sheffield, 7 members, formerly 5. New boroughs created are Accrington, Barnsley, Blackpool, Bootle, Bromley, Kent, Ealing, East Ham, Eccles, Edmonton, Hornsey, Ilford, Kingston-upon-Thames, Leigh, Leyton, Morley, Nelson, Richmond, Surrey, Rossendale, Rotherham, Smethwick, Southend-on-Sea, Southport, Tottenham, Wallasey, Wallsend, Walthamstow, Willesden, Wimbledon.

GENEALOGICAL TABLE OF ENGLISH SOVEREIGNS, 975—

England: EADGAR, 975 — Normandy: RICHARD I, 996
AETHELRED II, 1016 = EMMA. RICHARD II, 1026
EADWARD THE CONFESSOR, 1066 ROBERT, 1035
WILLIAM THE CONQUEROR, 1081 = MATILDA
WILLIAM II, 1100. HENRY I, 1135. ADELA
GEOFFREY, COUNT OF ANJOU (PLANTAGENET) = MATILDA
HENRY II, 1189
RICHARD I, 1199. JOHN, 1216. GODFREY, 1186. MATILDA
HENRY III, 1272 RICHARD OF CORNWALLIS, 1272
EDWARD I, 1307
EDWARD II, 1327
EDWARD III, 1377
BLACK PRINCE, 1376. CLARENCE, 1368. YORK, 1402. LANCASTER, 1400
RICHARD II, 1400 PHILLIPPA HENRY IV, 1413. CHARLES VI OF FRANCE. BEAUFORT, 1410. CARD. BEAUFORT
ROGER MORTIMER, 1399 HENRY V, 1422 = CATHARINE = O. TUDOR. JOHN, 1444
EDMUND, 1424. ANNE = CAMBRIDGE, 1415. YORK, 1415. HENRY VI, 1471. EDMUND = MARGARET
EDWARD IV, 1483. RICHARD III, 1485. CLARENCE, 1478
EDWARD V, 1483. YORK, 1483. ELIZABETH = HENRY VII, 1509
JAMES IV OF SCOTLAND, 1513 = MARGARET = DOUGLASS, 1557. HENRY VIII, 1547. MARY
JAMES V, 1542 MARGARET MARY, 1558. ELIZABETH, 1603. EDWARD VI, 1557
MARY STUART = DARNLEY, 1567. CHARLES, 1576
JAMES I, 1625
CHARLES I, 1649 ELIZABETH = FREDERICK V
CHARLES II, 1685. JAMES II, 1701. MARY = WILLIAM OF ORANGE SOPHIA = DUKE OF BRUNSWICK
ANNE, 1714. THE PRETENDER, 1766. MARY, 1694 = WILLIAM III, 1702 GEORGE I, 1727
GEORGE II, 1760
FREDERICK, PRINCE OF WALES, 1751
GEORGE III, 1820
GEORGE IV, 1830. WILLIAM IV, 1837. EDWARD, DUKE OF KENT, 1820 = VICTORIA 1861
VICTORIA, 1901 = ALBERT, 1861
EDWARD VII, 1910 = ALEXANDRA, —
GEORGE V, —— = VICTORIA MARY —
EDWARD ALBERT MARY HENRY GEORGE JOHN, d. 1920.

ENGLAND'S HELICON, an anthology of 150 poems by popular writers of the period, edited by John Bodenham in 1600. It was republished in 1812.

ENGLEHEART, George, English miniature painter: b. Kew, 1752; d. 1829. He was a pupil of George Barret and Sir Joshua Reynolds. In 1773 he first exhibited at the Academy. He retired in 1813. He is reputed to have painted in all about 4,850 miniatures, mostly on ivory, but also on enamel. He was a good draughtsman and a skilful colorist. He was appointed miniature painter to George III in 1790, whom he painted 25 times. He was the most important rival of Richard Cosway for court honors. Consult Williamson and Engleheart, 'George Engleheart' (London 1902).

ENGLER, Edmund Arthur, American educator: b. Saint Louis, Mo., 23 Dec. 1856; d. —. He was graduated at Washington University in 1876, where he taught mathematics from 1881 to 1901. In 1901–11 he was president of the Worcester Polytechnic Institute and in 1911 returned to Washington University as secretary and treasurer. He was a member of the Washington University eclipse party to Norman, Cal., in 1889, served as chairman of the jury of the department of manufactures at the Buffalo Exposition of 1901, and chairman of the international jury on instruments of precision at the Saint Louis Exposition of 1904. He was Fellow of the American Association for the Advancement of Science and member of many other scientific societies, serving as president in 1898–1901 and again in 1912–15 of the Saint Louis Academy of Science. He was a frequent contributor to magazines on scientific subjects.

ENGLER, Heinrich Gustav Adolf, German botanist: b. Sagan 1844. He received his education at Breslau, held the chair of botany at Kiel in 1878–84, and at Breslau in 1884–89. In the latter year he was appointed to the chair of botany at Berlin, becoming also director of the Botanical Gardens. His work has been more or less exclusively devoted to classification and plant geography. After 1881 he edited the leading journal in this field, the *Botanische Jahrbücher*. His most remarkable publication is 'Syllabus der Pflanzenfamilien,' the classification of which has been almost universally adopted. With Prantl he issued a systematized presentation of the plant genera of the world, entitled 'Die natürlichen Pflanzenfamilien,' and of the species, 'Das Pflanzenreich.' With Drude he prepared a detailed plant geography of the different regions under the title, 'Die Vegetation der Erde.'

ENGLEWOOD, Colo., city of Arapahoe County, five miles south of Denver. It is the seat of the National Swedish Sanitarium and the Molkeray Sanitarium. The surrounding region is engaged in agriculture, dairying and stock-raising, which represent the city's principal interests. The city contains many beautiful homes, and is a favorite residential suburb of Denver, with which it is connected by trolley. Pop. (1920) 4,356.

ENGLEWOOD, N. J., city, in Bergen County, near the Hudson River, on a branch of the Erie Railway, about 13 miles north of Jersey City. It lies on the long slope toward the west from the crest of the Palisades of the Hudson. It is a beautiful residential city, contains two summer homes for working girls, a hospital and a library with over 10,000 volumes. The township of Englewood was set off from the old township of Hackensack in 1871. It was incorporated as a city in 1895, but because of error under the constitution of the State it was reincorporated in 1899. While not important in manufactures the United States census for 1914 showed within the city limits 19 establishments of factory grade, employing 135 persons; 91 being wage earners receiving annually a total of $51,000 in wages. The capital invested aggregated $257,000, and the year's output was valued at $321,000: of this, $210,000 was the value added by manufacture. Pop. 11,617.

ENGLIS, John, American shipbuilder: b. Brooklyn, 25 Nov. 1808: d. Brooklyn, 25 Oct. 1888. He was educated in the public schools of New York and learned the shipbuilding trade there. In 1837 he went to Lake Erie where he built his first steamships. A few years later he returned to New York, opened a shipyard of his own on the East River and devoted himself to the building of steamships, a science then still in its infancy and facing many difficult problems. To the solution of these he brought a keen scientific mind and a great capacity for hard work, which soon put him into the forerank of American shipbuilders. During his long business career he built a total of 89 boats, mostly side-wheelers. Amongst them were many of the most famous boats of this period, such as the steamboats *Saint John, Dean Richmond, Daniel Drew, Grand Republic* and especially the Long Island Sound liner *Newport*. The last-named boat was 340 feet long and made the trip from New York to Newport in eight hours, a record which stood for many years. In 1861 he built the *Unadilla*, the first gunboat built for the United States government. Many improvements in shipbuilding were due to him. After his retirement his son and grandsons continued his shipyard.

ENGLISCH, Joseph, Austrian surgeon: b. Freudenthal, Austrian Silesia, 1835. He received his education at the University of Vienna and in 1871 was appointed one of the chief physicians at the Rudolfstiftung. In 1892 he was appointed to the chair of surgery at the University of Vienna. He was widely recognized as an authority on genito-urinary diseases. His published works include 'Ueber Ovarialhernien' (1871); 'Zur Radikalbehandlung der Eingeweidebrüche' (1878); 'Ueber abnorme Lagerung des Hodens ausserhalb der Bauchhöhle' (1885); 'Ueber angeborene Penisfisteln' (1892).

ENGLISH, Thomas Dunn, American author: b. Philadelphia, Pa., 29 June 1819; d. Newark, N. J., 1 April 1902. He was graduated in medicine at the University of Pennsylvania in 1839. In 1842 he was admitted to the bar. From 1844–52 and 1857–59 he engaged in journalism in New York and Washington. From 1852–57 he practised medicine in what is now West Virginia. During the years 1859–79 he divided his time between New York city and Fort Lee, N. J. In the latter year he removed to Newark, N. J., where he resumed the practice of medicine. He was a member of the New Jersey State assembly in 1863–64, and of Congress in 1891–95. During all these years he was also very active in literary work. He was the author of 'Ben Bolt,' an exceedingly popular ballad (1843), which after having long fallen into obscurity was revived by its employment in Du Maurier's novel 'Trilby,' but which owed its popularity more to its sentimentality and its musical setting than to any inherent poetical merit. His published writings are 'Zephaniah Doolittle: a Poem. From the Manuscripts of Montmorency Sneerlip Snags, Esq.' (Philadelphia 1838); 'Walter Woolfe' 1842); '1844; or, the Power of the «S.F.» A Tale'; 'Developing the Secret Action of Parties During the Presidential Campaign of 1844' (New York 1847); together with C. G. Foster, 'The French Revolution of 1848, etc.' (Philadelphia 1848); 'Ambrose Fecit, or, the Peer and the Printer' (New York 1867); 'American Ballads' (New York 1880); 'The Boy's Book of Battle-Lyrics' (New York 1885); 'Jacob Schuyler's Millions' (New York 1886); 'The Rules of Order Governing Public Meetings, etc.' (under the pseud. F. M. Payne, New York 1887); 'Old Glory: A Song' (1895); 'Fairy Stories and Wonder Tales' (New York 1897); 'The Little Giant, the Big Dwarf and Two Other Wonder Tales, etc.' (Chicago 1904). During the period of his New York residence he also wrote about 20 plays for Palmo's Opera House, later Burton's Theatre, on Chambers street, New York, of which only one, 'The Mormons; or, Life at Salt Lake City, A Drama in Three Acts,' has been published (New York 1858). Consult Noll, A. H., 'Thomas Dunn English' (in *Midland Monthly*, Vol. VII, p. 3, Des Moines 1897).

ENGLISH, William Hayden, American capitalist: b. Lexington, Ind., 27 Aug. 1822; d. Indianapolis, Ind., 7 Feb. 1896. He was educated at Hanover College, Indiana, and admitted to the bar in 1840. However, he soon became interested in politics, gave up the practice of law, and successively held various local, State and Federal positions. In 1851 he was elected to the Indiana State legislature where he served as speaker. He was elected to Congress in 1852 and served there through four consecutive terms. As a member of the Committee on Territories, in opposition to his own party, he worked against the admission of Kansas to the Union. He reported from the Committee of Conference what was known as the "English bill," in which it was urged that the question of admission be referred back to the people of Kansas according to the provision of the Lecompton constitution. This was adopted and the people voted against admission. He strongly opposed secession, and warned Southern Congressmen that the North would never countenance such a policy. He also served as regent of the Smithsonian Institution for eight years. He finally refused the offer for a renomination for a fifth term in Congress and in 1863 removed to Indianapolis where he founded the First National Bank and soon made a reputation for himself as a banker. Though not taking an active part in the Civil War, he was an ardent supporter of the Union. He continued his interest in politics, and, in 1880, was unanimously nominated by the Democratic party for the office of Vice-President on the unsuccessful ticket with General Hancock against Garfield and Arthur. He was president of the Indiana Historical Society, a number of whose publications were financed by him. He also published 'Conquest of the Country Northwest of the River Ohio, 1778–83, and Life of General G. R. Clark' (2 vols., Indianapolis 1896). Consult Forney, J. W., 'Life and Military Career of W. S. Hancock, etc.' (Philadelphia 1880); Keyser, C. S., 'The Life of W. H. English' (Philadelphia 1880).

ENGLISH ARCHITECTURE. The earliest architecture of England (not including the megalithic remains at Stonehenge, Avebury, etc., whose date and history are still in controversy and which can hardly be classed as architecture) dates from the Roman occupation, which has left many remains of walls, villas and baths (Bath, Silchester, etc.), but hardly more than the foundations of these. Indeed, there is but little left of any architecture previous to the Norman Conquest (1066 A.D.), for the active building of churches and monasteries which followed involved the demolition of most of the earlier Christian or «Saxon» edifices. A few walls, crypts and fragments show that they were without exception rudely built, with little of architectural elegance in design or decoration. The tower of Earl's Barton is the most noted of these remains.

Following the Conquest, there began under the Norman kings a remarkable activity in building, especially of abbeys and castles. The imported Norman style, itself a provincial phase of the French Romanesque, was modified in English hands, developed into the Anglo-Norman, and applied in the building of great monastic churches, many of which surpassed in size those of France or Italy. This style was marked by its great massiveness; the use of the round arch of stepped section; huge piers sometimes round, sometimes clustered; square lantern-towers at the crossing of nave and transept; timber ceilings in preference to vaulting for the high central aisle; and restricted but bold decoration in which the zigzag is the most frequent motive. Interlaced arches frequently appear as a wall decoration. The original abbey-cathedral of Canterbury, St. Alban's abbey, Romsey abbey, Ely and Peterboro' cathedrals, Winchester, Southwell, Durham, Norwich, Gloucester and Hereford cathedrals, the church of Christchurch, Saint Bartholomew's at London, the Tower of London with its Saint John's chapel, and many feudal castles belong to this style, which lasted from 1070 to 1200. Most of the above churches were in part, Canterbury almost wholly, rebuilt in the following centuries.

The Anglo-Norman style passed away with the introduction from France of the Gothic style (see GOTHIC ARCHITECTURE) in the rebuilding of the choir of Canterbury Cathedral destroyed by fire in 1174. The pointed arch had been used occasionally before this date in England, but from about 1190 its use became the general rule, and with it the English adopted the ribbed vault and traceried window and less universally the flying arch and buttress. The new style they developed on independent lines, retaining more of the early massiveness than did the French, with less display of the structural framework in stone. The English cathedrals of 1190 to 1350 are longer, lower and narrower than the French, less ornate externally, more ornate internally, having often two transepts, square east ends in place of apses and apsidal chapels, and with west fronts often forming a screen of picturesque design instead of a logical expression of the form of that end of the church. As there were many cathedrals which were abbey-churches as well, the practice became general of grouping with them cloisters, chapter-houses, libraries and residences for the clergy. Nearly all the cathedrals have great square towers at the crossing, forming internal lanterns; at Ely this takes the form of a superb octagon as wide as the three aisles together. But one cathedral was built continuously in one style from end to end,— Salisbury (1220–58); Lichfield Cathedral and Westminster Abbey present internally a fairly uniform style, although their building covered in both cases a long period; most of the cathedrals were so often rebuilt in one or another part at different periods that they exhibit clearly the changes of style from one century to another. It is customary to distinguish these different phases and periods by names derived from the window designs, e.g., the *Lancet* (or Early English), 1174–1250; the *Decorated* (subdivided into «geometric» and «Curvilinear»), 1250–1375; and the *Perpendicular*, 1375–1500 or 1520. During these 346 years the vaulting was developed by the multiplying of the main and subordinate ribs into the extremely ornate form seen in Henry VII's Chapel at Westminster and other late works, and known as *fan-vaulting*. The English were consummate workers in wood, and many of the larger parish and collegiate churches and secular halls have timber ceilings with «hammer-beam» trusses of extraordinary beauty, instead of stone vaults. Many of the larger parish churches are unequaled elsewhere except by the foreign cathedrals. Among the most important of the predominantly Gothic cathedrals are Canterbury, Lincoln, Salisbury, Ely, York, Winchester; of the second rank, Wells, Lichfield, Exeter and Gloucester may be named; among the parish churches Boston, Saint Michael's (Coventry), Saint Mary-Redcliffe at Bristol, and Patrington; and among abbey-churches Westminster, Sherborne and Beverley.

During the 14th and 15th centuries secular architecture was developed in new lines in the great universities and schools, and in vast manorial residences and palaces; to this phase the name of *Tudor* architecture is often given. Under Henry VIII (1507–47) artists from Italy, Germany, Holland and Flanders were imported, by whose works the decorative details of Renaissance art were made known to the English; but the Renaissance taste made slow progress in architecture, even in the manor houses of the wealthy, which continued to display the square mullioned windows, battlemented parapets and irregular plans of the Tudor Gothic period. Under Elizabeth (1558–1603) and James I (1603–25) the use of Renaissance forms steadily increased — round arches, the classic «orders,» openwork balustrades and a peculiar fashion of flat relief-ornament, called «strapwork» and derived from Germany, became more and more frequent («Elizabethan» and «Jacobean» styles). This prepared the way for the introduction of a more purely Italian or classic style by Inigo Jones under James I and Charles I, and for its culmination in Saint Paul's Cathedral (q.v.) by the great Sir Christopher Wren (q.v.), whose 53 churches built after the Great Fire of 1666, and his works at Hampton Court, Greenwich, Oxford and Cambridge firmly established the style. It continued to be used throughout the 18th century and was the parent style of our own «Colonial» or Georgian style (see ARCHITECTURE — UNITED STATES). The 19th century was marked by attempts, partially successful, to revive the Greek and Gothic styles in modern work; but, except in church architecture, the tendency of English design has since 1880 been toward Renaissance forms very freely adopted. The most notable example of the Gothic Revival is the Houses of Parliament by Barry (1835–50). The best work of the present-day architects of England is in domestic architecture, in which, on the whole, they are unequaled or at least unsurpassed. In the design of rural buildings, of small cottages, of garden suburbs and of country churches they especially excel.

Bibliography.—The literature of English architecture is enormous in volume. Only a few leading works can be mentioned. On *mediæval architecture* the works of Sir T. G. Jackson, E. S. Prior and F. Bond, and the earlier works, now somewhat out of date, of Rickman, Pugin, Britton, Parker, etc.; also Moore, C., 'Mediæval Church Architecture of England.' On the *Renaissance developments:* Blomfield, R., 'A Short History of Renaissance Architecture in England'; Gotch and Brown, 'Architecture of the Renaissance in England'; Richardson, C. J., 'Monuments of Classic Architecture in Great Britain.' For the more recent developments one must consult the architectural periodicals. There is no single work devoted to the work of the last 50 years.

A. D. F. HAMLIN,
Professor of Architecture, Columbia University.

ENGLISH CHANNEL, or THE CHANNEL (Rom. *Mare Britannicum*, French *La Manche*), an arm of the Atlantic Ocean extending into the west coast of Europe to the Strait of Dover, by which it is connected with the North Sea. The land bodies separated by this channel are England and France. Its length from the Strait of Dover to the Atlantic Ocean is about 350 miles; its greatest breadth, from Saint Malo, in France, to Sidmouth, in England, is 140 miles; its narrowest width, called the Strait of Dover, is about 20 miles. At its juncture with the Atlantic Ocean it is about 100 miles wide. Its total area is about 30,000 square miles. The average depth of the western half is about 300 feet, the maximum about 500. In the eastern half the average is only 200, and in the Strait of Dover the depth varies from 6 to 120 feet. The length of the north coastal line, from Land's End to Dover, is 390 miles; and of the south coastal line from Calais to Ushant is 570 miles. Some of the largest indentations on the coast of England are the bays of Falmouth, Plymouth, Lyme, Weymouth, Spithead and The Solent. On the coast of France are Baie de la Seine, Baie de Saint Brieuc and Baie de Mont Saint Michel. The principal islands in the Channel are: Isle of Wight, Channel Islands and several other islands near the coast of France; Scilly Isles and Ushant at the entrance. The most important ports are: on the English coast, Falmouth, Plymouth, Southampton, Portsmouth, Brighton, Folkestone, Andover; on the French coast, Cherbourg, Le Havre, Dieppe, Boulogne and Calais. Many of these and many other towns and villages on both coasts have become famous as watering places and seaside resorts. The tides, coming both from the Atlantic Ocean and from the North Sea, possess many peculiarities and make navigation difficult at times. There are many lighthouses and light ships, the most famous of which, perhaps, is the Eddystone Light off Plymouth. The prevalent winds are most westerly. Gales are frequent, especially between October and January. Fog and thick weather are also frequent occurrences throughout the entire year. The water, most of the time, is rough and makes travel in the Channel as a rule a most unpleasant experience. This has been a chief factor in bringing forth many plans for a direct non-water connection between England and France, either by means of a bridge or a tunnel. Of the former the most important has been a project put forward by the famous French engineering firm, Schneider & Co., Le Creusot, in conjunction with English and French engineers, which provided for a bridge 24 miles long with 120 piers and permitting the passage of ships beneath it. The tunnel project was found feasible from an engineering point of view, and preliminary shafts and headways were started on both coasts. On the English side the shaft at Shakespeare's Cliff, Dover, is 164 feet deep, and a driftway, 7 feet in diameter at an inclination of 1 in 72, extends eastward under the Channel for 2,300 yards. During the borings valuable coal beds were discovered. So far, however, neither the bridge nor the tunnel projects have been able to get the final approval of either the English or the French government. Many historic naval engagements have been fought in the Channel. Consult Channel Bridge and Railway Co., 'Pont sur la Manche' (Paris 1890); Great Britain, Admiralty, Hydrographic Department, 'The Channel Pilot' (2 parts, London); Hawkshaw, J. C., 'The English Channel Tunnel and Its Early History' (in *Scientific American Supplement*, Vol. LXXVIII, pp. 18 and 34, New York 1914); Hersent, H., and Sir John Fowler, and Benj. Baker, 'Pont sur la Manche, Avant-Projets de MM. Schneider et Cie., etc.' (Paris 1889); Jukes-Brown, A. ENGLISH CHRONICLES. The writing of English chronicles begins with the 'Anglo-Saxon Chronicle,' the earliest English history written in the English language, and the earliest vernacular record of national events in modern Europe. The 'Chronicle' opens with the Christian era, combining in its earlier parts records of Roman, Christian and British events. It rapidly becomes strictly national, carrying the record of English history forward to a considerable period after the Norman Conquest. It treats in general of the affairs of all the English-speaking peoples in Great Britain, and as one of the first attempts at an expression of coherent national life and as a trustworthy source of information concerning the language, history and social manners and customs of the Anglo-Saxon period, the importance of the 'Chronicle' can hardly be overestimated. Although the work itself does not mention the name of its author, there is strong evidence to show that in its original form it was undertaken at the suggestion of King Alfred and was in part actually written by him. From this original form, now no longer extant, copies were made and carried to different sections of England, where they served as foundations of what, from that time, became separate and independent chronicles. Seven of these local chronicles, with a fragment of an eighth, have come down to us. The date at which the original parent version was made was about 892, and the place was probably Winchester, the capital of the West-Saxon kingdom. The form in which the 'Chronicle' is written is that of a book of annals, the entry for each year containing usually the record of but a single occurrence. For the early years the records, derived chiefly from literary sources, are brief and colorless, but in the later parts, particularly in the accounts of the Danish wars, when the narrative becomes more nearly contemporary with the time of the compilation of the work, they become more detailed and vigorous. At no time, however, is there an attempt to write a philosophic history, to point out the causes or the trend of events. This is in accord with the main purpose of chronicle writing, which is merely to keep the events of history in their right chronological perspective, the details centering about these events being largely entrusted to oral tradition. This annalistic purpose of the 'Chronicle' determined also its mechanical form. The scribe's method was to rule off a number of pages as though preparing a journal in which the entries were to be made by years instead of days. Each year was thus given a blank space opposite its number sufficient usually for only a few lines. The scribe then inserted whatever annals he had been able to collect, leaving the spaces for which he had no materials to be filled in later when new material should become available. This method of chronicle writing remained long in use in England, being followed by Capgrave as late as the 15th century.

Although no single model or source for the 'Chronicle' is known, there were in existence in Alfred's time a number of Latin works which were of help in its first compilation. Of these the most important were Bede's 'Historia Ecclesiastica Gentis Anglorum,' finished in 731; Bede's 'De temporum ratione,' a chronological essay containing a short epitome of the history of the world from Adam to 729 A.D.; Orosius' 'Universal History' ('Pauli Orosii Historiarum Adversum Paganos Libri VII'); and doubtless many records of national events preserved in local monastic libraries. But the 'Chronicle' was an original work in that it strove to record the life of a nation. Just as the codes of laws systematized the customs and rules of living of the people, so the 'Chronicle' fixed for them the ever-receding events of their history.

From the period of its original composition to the middle of the 11th century, the 'Anglo-Saxon Chronicle' established the form for all historical writing in England. Although we now know only seven, with the fragmentary eighth, versions of the 'Chronicle,' the number in the Anglo-Saxon period must have been much greater, copies being probably kept at every important monastery and town. Toward the end of the Anglo-Saxon period, however, the 'Chronicle' tends to become less and less national and more and more ecclesiastical in its character. In harmony with this change the language of chronicle writing changed also to Latin. The use of Anglo-Saxon as late as 1154, the date of the latest entry in that tongue, appears only in one version, and is plainly due to reasons of respect for the traditional language of the 'Chronicle.' To take the place of the English annals of the 'Chronicle,' new histories began to be written in Latin. The earliest of these was that of Ethelwerd; others from the beginning of the 12th to the 14th century were the histories of Symeon of Durham, Florence of Worcester, William of Malmesbury, Henry of Huntingdon, Roger of Hoveden, Matthew of Paris, Matthew of Westminster, Roger of Wendover, and Ralph Higden, whose 'Polychronicon' was the "standard work of general history in the 14th and 15th centuries" (Babington, ed. of 'Higden' in the Rolls Series, p. xliii). All of these Latin histories derived much of their material either directly or indirectly from the 'Anglo-Saxon Chronicle.' In the Middle English period several metrical histories were written in English, the 'Brut' of Layamon, the chronicles of Robert of Gloucester and of Robert Manning of Brunne; but these are better characterized as historical romances than as attempts at veracious history. The writing of prose histories in English begins again with Trevisa's translation of Higden's 'Polychronicon,' made in 1387, and with John Capgrave's original chronicle, written about the middle of the following century. The tone of Capgrave's work, as compared with the 'Anglo-Saxon Chronicle,' is extremely naïve. The writers of the 'Chronicle' had a most rigid sense of historical fact, but the work of Capgrave and his contemporaries is marked by an altogether uncritical and credulous mingling of legend and history. As a result, however, of this infusion of the romantic spirit into historical writing, the older annalistic method gave way to one in which greater attention was paid to a consecutive narrative interest, after the manner of modern historical writing. The national awakening accompanying the reigns of Henry VIII and Elizabeth resulted in a renewed interest in the writing of these history-chronicles. In 1516 appeared Fabyan's 'New Chronicles of England and France'; in 1562 Grafton's 'Abridgment of the Chronicles of England'; in 1565 Stowe's 'Summarie of Englyshe Chronicles'; and in 1578, the most important of the Elizabethan chronicles because of the use made of it by Shakespeare, 'The Chronicles of England, Scotland and Ireland,' written by Holinshed with the assistance of several others. The term chronicle continued to be used in the titles of historical works to the end of the 17th century, as in Sir Roger de Coverley's favorite book, Baker's 'Chronicle of the Kings of England,' 1643; by this time, however, the naïve annalistic chronicle had largely given way to the more philosophical treatment of events which is designated by the name of history.

Bibliography.— For general bibliography, consult Gross, 'Sources and Literature of English History from the Earliest Times to about 1485' (1900). Editions of most of the chronicles will be found in the Rolls Series; the best edition of the 'Anglo-Saxon Chronicle' is that of Earle and Plummer (Oxford 1892–99). The literary significance of the chronicles is discussed by Schofield, 'English Literature from the Norman Conquest to Chaucer' (pp. 29–46); and by Schelling, 'English Chronicle Plays' (New York 1902). Consult also 'Cambridge History of English Literature' (Vol. I, chap. 7, 1907).

George P. Krapp,
Professor of English, Columbia University.

ENGLISH COLLEGE AT ROME, an ancient institute in the papal city, erroneously supposed to have been founded, according to statements of mediæval chroniclers, about 816. In reality it dates from the middle of the 14th century, when the Hospice of Saint Thomas of Canterbury,— which owed its establishment to the jubilees — was founded and liberally endowed for the entertainment of Englishmen visiting the Holy See. In the time of Henry VIII refugees from England were harbored in the hostel. In the reign of Elizabeth the institution was transformed into a seminary for the education of aspirants to the priesthood who proposed to serve in the English mission, which they entered with pretty fair assurance of the martyr's crown. This seminary was placed under Jesuit control, the date of appointment of the first rector — the real birthday of the college — being 23 April 1579. Between 1578 and 1647, 40 of the alumni of the institution, serving as missionary priests in England, were executed for the high treason of exercising the Catholic ministry contrary to the laws of the realm; and when Saint Philip Neri, founder of the Congregation of the Oratorians, met any of the young English ecclesiastics in the streets of Rome, his invariable salutation was *Avete flores martyrum* — "Hail flower of the martyrs." The college was plundered and wrecked by the French republican army 1798 and its resources dissipated; it was resuscitated 1818; its president from 1831 to 1846 was Nicholas Wiseman, afterward first archbishop of Westminster, and cardinal.

ENGLISH LANGUAGE. The English language is a direct development of the Anglo-Saxon, a circumstance which makes it questionable whether the latter speech ought to be distinguished by a separate name. But although a direct development of the Anglo-Saxon, it is not a development which has been allowed to take place regularly and gradually, as the result merely of internal causes. One important external influence was brought to bear on the original form of our language, which had the double effect, first, of producing a much more sudden and complete modification of the grammatical structure than could have taken place if the language had grown up independently of foreign influences; and secondly, of giving a composite character to the vocabulary of the language by the introduction of a large number of foreign words. This external influence was the Norman Conquest, in consequence of which a new language, the Norman-French, came to be spoken in England by those who had made themselves the masters of the country, and who formed, therefore, almost the only class that had leisure and opportunity for literary pursuits. The immediate result of the Norman Conquest (1066) was thus that the language of the Normans came to be the chief literary language of England (except where Latin was used), and that the Anglo-Saxon was reduced to a very subordinate place. When the latter language again comes into notice as a written language a great change is seen to have been wrought in it. Before the Conquest it was a very highly inflected, or what is called a synthetic language, that is, one in which the substantives, adjectives, verbs and articles are subject to numerous modifications, each of which expresses a modification of the root-meaning of the word, or shows the relation of the word to the other words in the sentence. During the period when Anglo-Saxon ceased to a great extent to be a written language these inflections dropped off; and when it re-emerges as a written language about the end of the 12th century it is no longer synthetic, but analytic, that is, prepositions and auxiliaries are now used instead of inflectional prefixes and terminations to express the various modifications of the idea contained in any word, and the relations of the words in a sentence to one another. At this period, however, the language still continued to be essentially homogeneous in respect of its vocabulary: the Norman words that occur are so rare that they need not be taken into account. And it was natural that it should be so, for the Saxon language was still confined to the Saxon inhabitants of the country; and those who wrote in it addressed themselves only to that portion of the community, and accordingly had no occasion to use any word of Norman origin. This state of matters lasted till about the middle of the 13th century, which is the period at which English proper is usually regarded as having begun to be spoken and written. By this time the Normans began to experience the inconvenience of not being acquainted with the language of the people among whom they dwelt, and in learning to speak and write it they very naturally used a large number of Norman words, and these words were adopted by all such writers belonging to the subject race as wished to make themselves understood by Norman as well as by Saxon readers. A very rapid mixing of the two languages thus took place, and a second important change was wrought in the English language. It is no longer homogeneous in its vocabulary, but contains a large admixture of foreign words.

The whole of what precedes may be shortly summarized thus: From 450 to 1066 the language spoken in England was the so-called Anglo-Saxon, a dialect of Low German, very highly inflected. From 1066 to 1250 two languages were spoken in England, Anglo-Saxon and Norman-French, by two different sections of the population occupying different political positions. During this period the grammatical structure of the former language began to be broken up, chiefly owing to its being disused for literary purposes; and toward the end of the period we find a few works written in a language resembling the English of our day in grammar, but differing from it by the homogeneousness of its vocabulary. Finally, about 1250 the two languages begin to mingle and form one intelligible to the whole population, Normans as well as Saxons. This is what is usually called English proper. English is thus seen to be a composite language, deriving part of its stock of words from a German source, and part from a Latin source, Norman-French being in the main merely a modified form of Latin.

The changes that have taken place in the English language subsequently to 1250 are by no means as striking as those which took place in the transitional period between 1066 and 1250. Some few inflections which the English of the 13th and 14th centuries still retained have now been dropped, but the chief change which the language has experienced consists in its gradual growth and expansion in obedience to the requirements of advancing science, more complicated social relations, and increased subtlety of thought. This growth has been going on at all times, but there are some periods which may be pointed out as more remarkable than others for the rapidity with which it proceeded. Such a period was the end of the 16th and the beginning of the 17th century, the period of the Reformation and following the revival of learning, when numerous words of Latin origin were introduced by scholars directly from that language, instead of through the French, the channel through which most of the Latin words previously found in the language had come. Another such period is the present, when the rapid growth of the sciences already existing, and the creation of new sciences, have caused whole groups of words to be introduced, chiefly from the Greek.

It would scarcely be in place here to discuss the various excellencies and defects of the English as compared with other languages, but we may mention the following as among the qualities which the English language is generally allowed to possess. 1. Strength and expressiveness, adapting it admirably for poetical composition. 2. Copiousness, enhanced as shown under assimilation, by the extraordinary receptivity of the language, that is, its capacity for adopting new words from all sources, and of naturalizing them at once, so that they may be treated without any appearance of strangeness entirely as native English words. 3. Simplicity in form and construction. 4. Great flexibility, or adaptability to all kinds of composition, the grave and gay, the impassioned and calm, forcible and tender, sublime and ludicrous. 5. Power of assimilation, words being readily adapted from other languages, Italy, France, Spain, Holland and distinctive terms originating in the American continent, all contributing to its rich and full expressiveness. The influence of English colonizing is seen in words borrowed from India, South Africa and other colonies.

In connection with the subject of the English language, we may here further observe, that England and the United States offer the first instance in history of two great, independent and active nations having a common language, but situated at a great distance from each other, and daily developing new and characteristic features. These relations must, sooner or later, exert a powerful influence upon the common language, for no language is so stable as not to undergo continual changes, if spoken by a people in the full vigor of social and political life. This state of things has already produced some effect on the English language. The most material difference, probably, has been in the pronunciation of the language, which, however important in our daily conversation, is of secondary importance in relation to the literature and written language of the two countries. It has often been observed by English travelers and others that the pronunciation of the United States is far more uniform than that of England; and so nearly alike everywhere, that the people of any one town or district are perfectly understood in every other part of the country, which is not true of the lower ranks of England. When considered more minutely, however, there has for a long time existed a marked distinction between the pronunciation of the New England and Southern States. Only in New England States is there what may be termed a distinctive dialect. It is noted by visitors to the United States, especially to New England, that many words and turns of expressions, familiar to the England of Shakespeare, and which in their country of origin have either become obsolete or degraded into provincialisms, are living a full and vigorous life on this side of the Atlantic. The orthography of the English language has undergone no material change in America, it being the general inclination to follow that of the best English writers of the age. Under the inspiration of the Simplified Spelling Board, President Roosevelt in August 1906 authorized the adoption by the public printer of about 300 amended spellings; but so great was the storm of criticism that the order was withdrawn except in so far as related to the correspondence of the White House.

The English language may be divided into five periods:

1. First Period 450–1100 A.D.
2. Second Period 1100–1250 A.D.
3. Third Period 1250–1350 A.D.
4. Fourth Period 1350–1460 A.D.
5. Fifth Period 1460 A.D.— the present day.

In the first period (called also Anglo-Saxon or Old English), the language was inflectional; in the second it began to show a tendency to become analytic, the tendency increasing till in the fourth period inflections had virtually disappeared. Before the Norman Conquest there were two dialects in English, a southern and a northern, the former of which was the literary language. After the Conquest dialects became much more marked, so that we can distinguish three great varieties, the northern, the midland, and the southern, distinguished from each other by various grammatical differences. The midland dialect — or rather the subdivision known as the east midland — was that most widely spread, and it ultimately became the standard language, a result principally due to the influence of Chaucer, and in a less degree of Wyclif, Gower and others. See Dialect; Language, Science of.

ENGLISH LITERATURE. The Norman Conquest made a great change in the development of an English literature, as in all other forms of English life. Conditions were at first most unfavorable: the English language might be used by any who pleased, but the clergy naturally used Latin, and people of any position French, or Anglo-Norman, as it is commonly called. For three centuries, therefore, we do not find in English any striking original work, anything to compare in interest with the Skaldic poetry and the Sagas in Iceland, with the French romances and fabliaux, with the German epic and courtly poetry. During these centuries, however, we do find in England what is in its way most interesting, namely, a singularly rich representation of the different phases of mediæval thought. We may conveniently begin with the work connected with the older order of things. The 'Anglo-Saxon Chronicle' was still kept up at Worcester and at Peterborough. Of these the former is preserved only as far as 1079; the latter is a much later work; in 1121 the whole chronicle was rewritten and then carried on to 1154, being something more than a mere set of annals, with a distinct character of its own. After this, beginning indeed before, comes a stately series of Latin chronicles, though in English we find only chronicles in verse. Layamon's 'Brut' (c. 1200, after the Anglo-Norman of Wace, which itself is a paraphrase of Geoffrey of Monmouth) is most interesting as language, literature and legend, giving, among other things, the introduction of King Arthur to English readers. Much later are the chronicles of Robert of Gloucester (c. 1300) and Robert of

Brunne (1330). Layamon is hardly as much history as romance. Of this latter almost everything is from French, Scandinavian or Celtic sources: there is little native English either in form or substance. 'King Horn' (c. 1250) and 'Havelock the Dane' (c. 1275) probably go back to Scandinavian originals, though they are still regarded by some as English legend material: more purely national are the stories of 'Bevis of Hampton' (c. 1275) and of 'Guy of Warwick' (c. 1300), though the versions preserved are probably from Anglo-Norman originals. Renderings of Continental romances are numberless, beginning about 1250 with the Alexander story and going on with the tale of Troy and stories of King Arthur, the Round Table and the Holy Grail, where the material is partly Celtic, giving even some of the legends of Charlemagne, and many minor stories, as 'Floris and Blancheflor,' 'Amis and Amilon,' 'Sir Tristram.' Somewhat later (1300), and less fully, come versions of the fabliaux, 'Dame Siriz,' 'Reynard the Fox,' the 'Land of Cokayne,' the 'Lay of the Ash.' About this time appear the great mediæval collections of stories, the 'Seven Sages' and the 'Gesta Romanorum,' which latter, though in Latin, was collected in England. Beside all this epic and narrative material there is a smaller lyric element; oftenest anonymous, like 'Sumer is ycumen in' (c. 1250), 'Winter wakeneth all my care,' and other love songs, as well as many political songs, among which are the patriotic poems of Lawrence Minot (c. 1325). But generally where it is not narrative, the Middle English poetry is didactic: the so-called Proverbs of Alfred, dating from the 12th century and preserved in several versions, may have old material and certainly keep something of the old alliterative form, though there is also the Norman element of verse. And as the Anglo-Saxon priestly writers used alliteration in their didactic prose, so now much of the religious literature is put into rhyme, a fashion of the Norman. The 'Poema Morale' (1200) is a sermon in verse, though now and then with a personal element and there are many other shorter homilies. A common form is the dialogue; the 'Debate of the Body and the Soul' is known in various forms (1200 and after), the dialogue between 'Mary and the Cross,' and others including, in lighter mood from a French source, the 'Owl and the Nightingale' (1220), a poem full of popular wisdom in which the gay and the gloomy views of life are championed respectively by the two birds who refer the dispute to Master Nicholas of Guilford, generally taken as the author. Less original in substance are the versions of Scripture of which the 'Ormulum,' a metrical paraphrase of the Gospels by Orm of Lincolnshire (1220) is most important for linguistic reasons, preserved in an autograph copy (probably) with an individual system of phonetic spelling. Versions of Genesis and Exodus (c. 1225) are also to be mentioned, while much later in the north (1320) 'Cursor Mundi' reviews the whole extent of history from the creation to the day of judgment. Lives of the saints there were also, especially of Saints Katherine, Margaret and Juliana, and much devotional poetry, some lyric, like the 'Wohung of oure Loverde' (c. 1225), and others, some didactic, like 'Hali Meidenheid' (c. 1250). There are also certain larger religious treatises: the 'Ancren Riwle' (1225), a prose work of considerable merit, giving the conditions of convent rule, and in the early part of the 14th century, three books on holy living, the 'Prick of Conscience,' by Richard Rolle of Hampole; the 'Ayenbite of Inwit,' by Dan Michael of Northgate and 'Handlyng Synne,' by Robert of Brunne, the two latter from the French. Also to be noted is the very characteristic 'Bestiary' (1225), a compilation of the mediæval speculation on natural history. Such are the main elements of Middle English literature before 1350, although the number of particular works is far greater. As is common in mediæval literature the language is dialectic: no one dialect gains entire primacy till much later, although by this time the East Midland has become the most important. The second half of the 14th century was a period of great literary activity. England had been long separate from Normandy, and the English language, like the English people, had digested its different elements into an organic combination. Literature now becomes more literary. The old forms were now only to some degree preserved: Trevisa translated the 'Polychronicon' of Higden (c. 1387); Barbour in the north wrote a rhymed chronicle of Bruce (c. 1375). There are numbers of romances from the French. But didactic or allegoric poetry appears in forms which though not new have yet a certain original character. There are two great poets: one of name unknown, the author of the 'Pearl,' 'Gawain and the Green Knight,' 'Cleanness,' and 'Patience,' the other William Langland (as is most commonly thought), the author of the 'Vision Concerning Piers the Ploughman.' Fine as is their work, it is outshone by the genius of Chaucer, who gathered up and summarized the spirit of the century and whose influence was carried through the century following by companions or followers of whom the most noteworthy were Gower, Hoccleve and Lydgate. The epoch was also illuminated by Wiclif's great translation of the Bible (c. 1382). Two more popular forms of literature must be mentioned, as beginning lines of literary development still important. The ballads of Robin Hood probably go back to this period, while many of the Scotch ballads are older. The four cycles of mystery plays, those of Coventry, Chester, Wakefield (Towneley plays) and York, belong to the earlier part of the century. One remarkable book comes in no category, the 'Voiage and Travaile of Sir John Mandeville,' widely spread in England, and, though a translation, a monument of noteworthy prose. The 15th century was a period of bloody civil strife, and in literature a period of great dearth. Little can be mentioned in a summary. Sir Thomas Malory closed the period of the romances of chivalry by the 'Morte d'Arthur' (c. 1475), a collection to which he gave organic form and unity. The book was first printed (1585) at the press of Caxton, himself a writer and compiler. Some prose treatises are noteworthy, in religion Pecock's 'Repressor of Over-much Blaming of the Clergy' (c. 1450); in politics, Fortescue's 'Monarchy' (c. 1425), while of lighter interest is the treatise on 'Hawking' by Dame Juliana Berners (c. 1425), and the every-day 'Paston Letters' which belong to literature because they are so interesting.

With the 16th century new influences become powerful. The revival of classic learning stimulated English scholars under the leadership of Grocyn, Linacre, Colet, Cheke. The ideas of the Reformation stirred up clouds of controversy in which appear the great figures of Tyndale, Latimer, Coverdale. The spirit of fierce and gloomy satire which infected the whole world is seen in Skelton and Barclay, the former in a number of pieces, the latter in a translation of Brant's 'Ship of Fools' (1508). The spirit of nationality was aroused and More 'Utopia' (1515) and Elyot 'Governour,' (1531) thought deeply on questions of politics. These men wrote not so much for literary reasons as for some particular purpose; later came the impulse of the Renaissance which brought forth in England a wonderful burst of literature, generally included in the age of Elizabeth. Most important was its manifestation in the drama. To the mystery plays had succeeded miracle plays, and then moral interludes and imitations and translations from Seneca and Terence. By the latter half of the century appeared the first specimens of modern drama, 'Ralph Roister Doister,' by Nicholas Udall (1550) and 'Gorbuduc,' later called 'Ferrex and Porrex,' by Sackville and Norton (1569). The theatre was built in 1579, the Curtain not long afterward, and in the last decade of the century the Rose, the Globe, the Fortune and others. The theatre of the day demanded a drama rich in poetry, rhetoric, declamation and action. The first group of dramatists, Lyly, Peele, Kyd, Greene and greatest of them, Marlowe, were all of necessity experimentalists. They created the romantic drama, with tragedy, comedy, history, into which Shakespeare poured his inexhaustible stores of imagination, observation and wisdom. His plays are typical of the Elizabethan drama; there is little in the other dramatists that you cannot find in him. Yet there were others of great power. Ben Jonson is usually accorded second place and Beaumont and Fletcher, Marston, Middleton, Heywood, Chapman, Massinger, Ford and Shirley, besides others, had each special powers. In time a decline occurred and in 1642 the theatres were closed by order of Parliament and a great dramatic tradition came to an end. One later form deserves special mention: the masque was originally a form of private theatrical and always remained distinct from the plays presented at the public theatres. It was produced for some special great occasion and employed all the possibilities of the day in scenery and costume, music and dancing. The words were often written by dramatists of great ability, notably by Ben Jonson. The most famous and beautiful masque was written at the end of the period, the 'Comus' of John Milton. In lyric poetry as well as in dramatic was the age pre-eminent. In the reign of Henry VIII, Wyatt and Surrey had led the way, though under the influence of Italy, and in 1557 appeared Tottel's 'Miscellany,' an anthology which gathered up the verse of preceding years, while some years afterward came another, the 'Paradise of Dainty Delights.' Later collections are the 'Bower of Delights' (1591); 'The Phœnix' Nest' (1593); 'The Passionate Pilgrim,' (1599); 'England's Helicon,' (1600). Another characteristic production was the sonnet-sequence, of which Sidney's 'Astrophel and Stella' (1591, but written before), is one of the best and earliest examples. Here belong the famous sonnets of Shakespeare, as well as Daniel's 'Delia' (1592), Drayton's 'Idea' (1593), Spenser's 'Amoretti' (1595), among a host of others. One great lyric poet is pre-eminent, John Donne, whose poems, written in his earlier years, had immense influence. This form of the lyric is in the imitations fanciful and finespun, but in Donne himself it is alive and wonderful. Last among the lyrics and as important an anything else are the songs. Music had an important place in English life, and where there was so much singing, there had to be good songs. There appeared great numbers, some in the plays and others in song-books, of which many still exist. A good many are translations and more are very slight, but Shakespeare's and Jonson's among the dramatists, and Campion's among the song-writers are worthy a high place in any anthology. In the 17th century, while the drama lost power, the lyric sustained itself remarkably, though in the hands of fewer artists. They are generally followers along well-known lines in the paths of Spenser, of Jonson, of Donne, but they often produced work quite equal to their masters. The early poems of Milton, the exquisite 'Hesperides' (1647) of Herrick, the courtly and amatory poetry of Carew, Suckling, Lovelace, the religious poetry, passionate and almost sensuous in Crashaw, earnest and devoted in Herbert, these show no failure in power or in genius. One great name in Elizabethan poetry is still to be mentioned, that of Spenser. The 'Amoretti' is as beautiful as any of the sonnet cycles, the 'Shepherd's Calendar' (1579) was an immense influence for a long time, but his great title to fame is the 'Faerie Queene' (1590–96), a work which in literary form stands a little apart from its time. It is a romantic epic, akin to the Italian poetry of the preceding century, but Spenser's own, in its high idealism, its pictorial quality and its mastery of poetic expression. It had imitations and followers, but none of great merit. It is well-nigh impossible to bring the prose of this period under any series of heads. Poetry always comes first in literary development: in the 16th century prose was commonly written for some practical purpose. It is true there was some growth of style; many men labored at improving the vocabulary and elaborating the sentence-structure and the resources in figure and ornament. Yet there were hardly any well-established prose-forms, although the 'Arcadia' (1580–90) of Sidney, the 'Ecclesiastical Polity' (1592–97) of Hooker, the 'Essays' (1597) of Bacon, were each of some influence, especially the last named. Even Lyly's 'Euphues' (1578–79), which was extensively imitated for a decade, produced no permanent form. The pamphlet or the tract is the one characteristic Elizabethan production in prose; its master was Tom Nash, who poured forth numbers of these ephemeral pieces, of wonderful vigor and spirit. Of the same sort of prose the succeeding century showed much. The reign of Elizabeth had been a time for Englishmen to get together and establish their position against the world. Having made themselves a place, they turned to put in order their own house; the 17th century is a period of civil strife and contention. Literature could not avoid the effect of politics; the disturbance of opinion dragged with it into political or religious controversy many who might otherwise have found expression in literature. Even Milton for a dozen years wrote chiefly prose. We cannot, therefore, look for a varied and definite literary development. The great work of the century was in prose and the greatest and most influential single monument was the King James version of the Bible (1611). The spirit of the Bible is everywhere to be felt in the great prose of the time, transmuted into varying substance in the eloquence of Jeremy Taylor ('Holy Living,' 1650), the quaint richness of Fuller ('The Holy State,' 1642), the stately roll of Sir Thomas Browne ('Religio Medici,' 1643), the powerful vigor of Milton's prose — written during the Civil War, to answer in his own way the call of the country — and the intimate simplicity of Bunyan. A few other writers have little tincture of the struggle of the time, Overbury's 'Characters' (1614), Burton's 'Anatomy of Melancholy' (1621), Cowley's 'Essays' (1656), Walton's 'Compleat Angler' (1653), works of a widely different nature, but showing the quiet, contemplative side of the century that was so distracted by controversy. The Civil War occurred in the very middle of the century and makes a definite bar at least in the poetry of the time. Before it was the Elizabethan age; after it the Restoration. The drama and the lyric before and after are different; even the external form of poetry shows a marked change. At the beginning of the century the verse was free and fluent; at the end it had become concise and brilliant. To the blank verse of Shakespeare succeeded the rhymed couplets of Dryden, organic power giving place to elegant skill. In point of time belonging to both, John Milton in reality belongs to neither. More fully than anybody else he is the representative of Puritanism in literature; its zealous rages, its fanaticisms, its blemishes, its love of liberty and of God give life to his prose tracts on church government, on divorce, on freedom of speech, on the acts of the people: its higher dreams and ideals and aspirations, its unattained possibilities of beauty in 'Paradise Lost' (1667) and his later poems.

With the restoration of Charles II began a new period of literature, often called the classic, most immediately noticeable in the drama. The influence of France in the direction of strictness of classic art and looseness of moral life was strong: added to it was a change in stage conditions, which allowed the development of scenic effect. A realistic, if not spectacular, character, was given to the theatre and the Elizabethan plays, with all their poetry, fell out of fashion, save in versions of the day. A new set of dramatists sprang up to fulfil the conditions. Dryden was a leader, equally strong in tragedy and comedy and what he called the heroic drama, after French models. Otway had the greatest tragic genius ('Venice Preserved,' 1682), but could not so well adapt himself to the taste of the age. Congreve, Wycherley, Farquhar and many others wrote comedies depicting a brilliant social world, but of such gross immorality that Jeremy Collier launched an attack on the whole theatre (1698). His words had some effect and the drama became more decent, but as it really seems to have been quite representative of the life of the time (not artificial as Charles Lamb loved to think of it), the succeeding drama lacked vitality, and for a hundred years hardly a play was written which is now remembered. Addison's 'Cato' (1713), Rowe's 'Jane Shore' (1714), Gay's 'Beggar's Opera' (1728), Johnson's 'Irene' (1749), Home's 'Douglas' (1756), are noteworthy for various reasons, but not as constituting a powerful drama. It was in other directions that the 18th century was successful and most immediately in the periodical essay. The example of Bacon had given rise to the essay form; one particular kind called the "character" was especially cultivated. The character was like the essay, except that while the essay was usually on some idea, the character was on some person or kind of person. There was a great number of character-books in the 17th century, among the most important ones being those of Overbury and Earle. In this century too come the earliest newspapers. These were generally little more than letters with account of news usually from abroad. The earliest is the 'Coranto' of 1621 of Nathaniel Butters. Besides Corantos there were 'Mercuries,' 'Posts,' 'Gazettes,' 'Journals,' 'News.' By the end of the century the newspaper was a common form. In 1709 Richard Steele published a small paper every other day which he called the *Tatler*. This was not precisely a newspaper, but consisted of a series of essays on all sorts of subjects, sometimes by Steele, sometimes by Addison, Swift, or a number of others, who lent occasional help to the enterprise. The *Tatler* was very popular, and was brought to a close only to be continued in the *Spectator*, in which Addison took the chief part. He took up the idea of Steele and found in it a form of expression exactly suited to his especial powers. His essays were popular in the best sense; they were read with delight by all sorts of people, but they dealt with subjects of intelligent interest. Addison was a student of human nature, an observer of life and character, a genial philospher, and all these elements of his nature were exhibited in the little essays which he wrote for the *Spectator*. The success called forth followers. Addison and Steele followed their joint productions with separate publications, which were sometimes political as well as literary. Among the many 18th century periodicals should be mentioned the *World* (1752), by Lord Chesterfield and others; the *Rambler* (1750) and the *Idler* (1758), by Samuel Johnson; the *Bee* (1758), by Goldsmith. The influence of this sort of literature abroad was also very great; it continued even to the beginning of the 19th century, when a number of clever young men of New York, Washington Irving among them, joined in the production of *Salmagundi* (1807). One distinguishing element in these periodical essays was that of personal character. Some imaginary person was the means by which they were put before the public. The *Tatler* was edited by Isaac Bickerstaff, the *Spectator* by a club of the Spectator and others, including the famous Sir Roger de Coverley. This personal element was characteristic of the century, which was extremely sociable and very much interested in human nature. This interest in character for itself is paralleled by an interest in life in action observable in the stories of Defoe. Defoe was a man who lived by his pen (one of the first who had not been connected with the theatre or the court), whose great gift, so far as literature was concerned, was his power of representing life. His famous 'Robinson Crusoe' (1719) attained inordinate popularity, not only for its adventurous incident, but for its power of realistic story-telling. A little more and these books would have been novels. Addison's 'Sir Roger de Coverley' papers are sketches of life and character without a story. 'Robinson Crusoe' and the many other stories of Defoe have too much action, without attention to life and character, in spite of their realism. These elements were combined by Richardson and Fielding: 'Pamela' (1741), 'Clarissa Harlowe' (1748), 'Sir Charles Grandison' (1753), by the former, were extensively read and influenced all Europe; 'Joseph Andrews' (1742), 'Tom Jones' (1749), 'Amelia' (1751), by the latter, are quite as excellent and somewhat more modern in form. Smollett followed with 'Roderick Random' (1748), 'Peregrine Pickle' (1751), and some others which are a slight variation upon the first of Fielding's. Goldsmith's 'Vicar of Wakefield' (1766) and Miss Burney's 'Evelina' (1778) give us, the one the life of the country and the other of the town, and we have the English novel of domestic life, a form of literature which for a hundred and fifty years has lost and gained but little in essential character. The essay and the novel were new; such things had been in England before, but never the definite literary understanding necessary to constitute a true literary form. Meanwhile the older forms of literature were not neglected. There had been no such histories in England before Clarendon's 'History of the Great Rebellion' (1702) and Burnet's 'History of My Own Times' (edited by his son, 1723). These men wrote of what they had seen; later writers learned to take a larger view and handle larger material. Robertson ('Charles V,' 1769), Hume ('History of England,' 1754–61) and Gibbon ('Decline and Fall of the Roman Empire,' 1776–88), gave example of the combination of scholarly research and literary skill. Oratory also flourished in the exciting Parliamentary struggles which now took the place of court faction. Chatham, Burke, Fox, and many others created a standard and form of eloquence, which yet serves as a model for many speakers and a foundation for more. A special form of oratory becomes important in literature; sermons were widely read. Barrow, South, Stillingfleet, Tillotson, published their discourses in the last half of the 17th century and had many successors in the first half of the 18th. The interest in religion was a part of the general intellectual curiosity of the century; philosophy also became a part of literature. Locke's 'Essay on the Human Understanding' (1690) was more widely read than any other book of such a kind. Philosophy was discussed by Christian as well as by free-thinkers. Berkeley was the former: his 'Principles of Human Knowledge' (1710) has been of importance in the development of metaphysical ideas. Hume was the latter, so much of a skeptic that his 'Essays' (1746) incited Kant, in Germany, to that profound examination of the human reason that has been the foundation of modern philosophy. The 18th century was a century of reason and of prose. Prose was first simple, either graceful as in Addison, nervous in Defoe or everything in turn in the wonderful prose of Dean Swift, an unapproached master of satire as particularly in 'Gulliver's Travels' (1726). As the century continued, style became more elaborate, of great dignity and stateliness at its highest points (Gibbon and Burke) and even for ordinary purposes admirably effective as in the best of Johnson. The time was intellectual and loved the things of the intellect; hence its poetry was not such as to satisfy the more emotional periods that came after. It was too obviously didactic or satiric, for one thing. Dryden was the first great master in these directions with the 'Hind and the Panther' (1687), and the 'Religio Laici' (1682). In Pope the classic poetry (as it is called) came to perfection; the 'Essay on Criticism' (1711), and the 'Essay on Man' (1732), the 'Dunciad' (1728) and the 'Rape of the Lock' (1712), have never been equaled in English for their telling brilliancy. The followers of Pope caught something of his manner, but produced nothing great, save Goldsmith, who infused a charm into this as into every other kind of literature. Dr. Johnson wrote two strong poems, but his chief power lay elsewhere. The minor exemplars of the characteristic 18th century poetry are of far less value. Addison as a poet, Garth, Prior in 'Solomon' (1718), Young, the author of 'Night Thoughts' (1742), Blair in 'The Grave' (1743), even Akenside, the author of 'Pleasures of the Imagination' (1744), did not all write the characteristic couplet, but they are all of the classic school and all wrote that intellectual poetry that now seems so strangely unpoetic. In lighter forms of verse there were more successful practitioners, Prior and Gay and Swift, but in didactic and satiric poetry, save in the work of the greatest, the 18th century produced nothing permanent. But during the whole classic century there had existed, in its time had been growing, a feeling for other things than those which the reason could put into brilliant and elegant form. It found expression in various ways, chiefly in love for the mediæval past, before the classic conventions had been, and in a feeling for the present wherever those conventions did not exist, namely, in nature and in the heart of man. The first feeling came to expression in various ways, often imperfect, as when Thomas Wharton wrote 'Runic Odes' (1748), when Gray wrote poems inspired by the Norse, 'The Fatal Sisters,' 'The Descent of Odin' (1761), when Sir Horace Walpole imitated Gothic architecture in his house at Strawberry Hill. In 1760 Macpherson published what purported to be translations of Ossian, also 'Fingal' (1762); 'Temora' (1763), and whether they were genuine or not, the fact that they were read shows the interest that was felt in the remote past. In 1767 Chatterton found that he could gain a public for his poetry by pretending that it had been written by a monk of the 15th century. In 1765 Percy published the 'Reliques of Ancient Poetry,' a collection of old ballads, a kind of literature full of the spirit of the past, and absolutely different from the classic poetry of the day. There had been plenty of ballads printed before, even collections of old ballads Ramsay's 'Tea-Table Miscellany,' 'Evergreen' (1724); and they had inspired a few, but now they became an immense influence. In the other direction, love of nature and human sympathy existed. Thomson's 'Seasons' (1726–30) shows his fresh and charming view of nature, though his use of blank verse and the Spenserian stanza was more in keeping with earlier times. Gray produced very little poetry, but his best, the famous 'Elegy' (1751), has none of the brilliancy and intellectuality which marked the century, and it is noteworthy that in stanza 15, where he originally wrote the classic names of Cato, Tully, Cæsar, he afterward put the national names of Hampden, Milton, Cromwell. Burns was too much of a man to be bound or curbed by fashions, unless more congenial than those of the 18th century. He took inspiration from the ballads and songs of his own country and produced poetry which touched the heart at once. Cowper, though by no means like him, nor apparently of the character of a reformer at all, wrote with a sincere directness that seems like that of an earlier or a later time. The turn of the century shows the characteristic works of the Romantic movement: 'Tintern Abbey' (1798) and 'Michael' (1800), by Wordsworth, may represent the poetry inspired by love of nature and sympathy with man. Coleridge's 'Rime of the Ancient Mariner' (1798), and Scott's 'Lay of the Last Minstrel' (1805, preceded by 'Minstrelsy of the Scottish Border' 1802) stand for the delight in ballads and mediævalism. With these fine poems and others only less fine, it is plain that a new form of art had appeared quite different from the classic conventions of the 18th century. The first great excitement of romance was for strange adventure and the glowing life of the Middle Ages. Wordsworth was for the time unread, while the poetry of Scott delighted all. Scott, however, was eclipsed in the popular mind by Byron, who really was personally the very thing that Scott and the public admired. They longed to hear of men of lofty spirit and recklessness and devotion. Byron was such a man; in 'Childe Harold' (1812) he took England out of itself. In the 'Giaour,' 'Bride of Abydos,' 'Corsair,' 'Lara,' 'Parasina' (1813–15), he presented figures full of the romantic spirit. As the century continued, however, that spirit expressed itself in all sorts of different ways. Wordsworth presents the common delight in nature; Shelley, noble ideas for the regeneration of mankind; Keats, the power of beauty. Succeeding poets go in much the same directions. Tennyson is the most representative poet of the century in presenting to us in forms of great poetic beauty all the phases of the thought of the time, religious, scientific, patriotic, literary. Browning gives us a vigorous optimistic conception of life and work, presented in a wonderful series of dramatic figures. Morris, Rossetti, Swinburne (sometimes called Pre-Raphaelites) may be said to follow Keats in their love of beauty, which they seek not only in mediævalism, but throughout all history sacred and profane. Matthew Arnold's poetry has classic qualities of style and great elegiac charm of thought, but he rightly saw that his true field lay elsewhere. By the last decade of the 19th century, however, the great poets of the Victorian age were dead or silent and it had for some time been felt that they had left no successors. At about this time there was a strong feeling for realism in poetry as in other forms of literature, and by choice of realistic themes and his realistic manner W. H. Henley became noteworthy. Very different was W. B. Yeats who expressed the craving for some world quite different from current realism. Expressing both of these common feelings the poetry of Kipling ('Ballads' and 'Barrack-room Ballads') met with immediate welcome. It was evidently realistic, but it was also clearly romantic. These two lines of poetic interest and feeling may be seen respectively in John Davidson and Stephen Phillips, and are represented at the beginning of the 20th century by John Masefield and Alfred Noyes. The end of the 19th century had many minor poets, but Francis Thompson by virtue of 'The Hound of Heaven,' will probably have a higher position in the mind of posterity. He had much of the 17th century in his makeup and much of the intense imagination that is generally felt to be the most poetical possession of the poet. In the earlier years of the 20th century there was a great increase of poetic feeling which gradually took more or less definite form in the works of many writers, so that by the 2d decade of the century the «new poetry» was a common phrase. Besides Masefield and Noyes (who was hardly in sympathy with the rest) the chief names that have come to general knowledge are those of Rupert Brooke (d. 1915); James Elroy Flecker (d. 1915); James Walter Delamare, William Davies, Lascelles Abercrombie, James Stephens and D. H. Lawrence. The drama has been weak for the whole century, although all the greater poets essayed the form. Only Browning and Tennyson had even temporary success on the stage, while the works of the professional play-writers have without exception failed of a place in literature. By 1890 a new spirit became active. The comedies of Oscar Wilde made a great impression on the popular mind, by their brilliant dialogue, but the work of Arthur Pinero and Henry Arthur Jones was more representative of the moment in that their effort was usually to deal with the idea of modern social life. The leading spirit in the movement, however, was George Bernard Shaw, who though he began to write plays before 1890 and had some successes as early as 1895, did not seriously impress people till the beginning of the 20th century. When, however, he did begin to gain consideration he attracted public attention by his plays which always presented not merely interesting or amusing dramatic situations, but some discussion of general social ideas. Other dramatists of importance have been James M. Barrie and Grenville Barker, as well as the novelists Bennett and Galsworthy. By 1800 the novel had become a definite form of literature. In the early years of the century Miss Austen, Miss Edgeworth, Miss Ferrier produced pictures of life in England, Ireland and Scotland, respectively, the first of surpassing excellence. A great change was effected by Scott in the Waverley novels (1814–31). It has been pointed out that the lasting power of these novels depends on their full and vital knowledge of Scottish life and character. Scott, at the beginning, had some idea of doing for Scottish life what Miss Austen had done for English. But the real immediate effect of the Waverley novels was to give an enormous impulse to the romance of adventure and scenery and costume, a romance which found its best expression in the historical novel. The Waverley novels are great historical novels, though, of course, some have little history in them, and they gave a conception and an inspiration which was not wasted. In 1825 appeared the first works of importance of G. P. R. James and of Harrison Ainsworth, who for a quarter of a century achieved a very considerable popularity though they added but little to the possibilities of historical fiction. More powerful than either was Bulwer, whose first work appeared in 1827, and who for 40 years produced not only historical novels, but novels of every kind, works of great talent, though the judgment of time refuses them genius. At much the same time two other writers somewhat extended the field of the novel: Marryat, by sea-stories, which remind one of Smollett; Charles Lever, by stories of the army as well as of Irish life. Brilliant historical novels have appeared through the century: Thackeray's 'Henry Esmond' (1852), and 'The Virginians' (1857); Kingsley's 'Westward Ho' (1855), Dickens' 'A Tale of Two Cities' (1859), Charles Reade's 'The Cloister and the Hearth' (1861), George Eliot's 'Romola' (1862), Blackmore's 'Lorna Doone' (1869), Shorthouse's 'John Inglesant' (1880), Pater's 'Marius the Epicurean' (1885), Maurice Hewlett's 'Richard Yea and Nay' (1900), constitute a series of remarkable value. But the great successes of fiction in the middle of the century were made in the long-familiar forms. Charles Dickens had many minor characteristics, and so had Thackeray, but their novels, as well as those of George Eliot, are novels of every-day life. In the main these three are realists, striving chiefly to depict the life that they knew and saw about them. So chiefly were those who came after them. The Brontës, George Meredith, Charles Reade, Anthony Trollope, William Black, Thomas Hardy, George Gissing, these are realists also, though in only the last two cases of the consistent type developed by their contemporaries in France. Some of them sought in every-day surroundings the romance of character, like the Brontës; some could perceive the rich spirit of comedy, like Meredith. But none felt the need more than once or twice of straying from the familiar life of England. Toward the end of the century the craving for romance began again: it had never been entirely quieted, but it did not come to full expression till Stevenson and Kipling. Both sought the romance of life and character and of the soul, but both were masters also of adventure and incident and striking circumstance and interesting background. Anthony Hope, Stanley Weyman, Conan Doyle, Maurice Hewlett, have in general followed, and in some cases surpassed them. In the last decade of the century appeared several novelists who have since come to be the leading figures of current fiction. Arnold Bennett and H. G. Wells both began with work of an imaginative and even fantastic character, but in different ways turned to something more realistic. Arnold Bennett's 'The Old Wives' Tale' and the books conceived and linked as a series, 'Clayhanger,' 'Hilda Lessways' and 'These Twain,' are careful and thorough presentations of character and manners, differing chiefly from the older conceptions of the novel in their recognition of the ideas dominating modern life. Wells about 1906 began a series of studies of life of which 'The New Machiavelli' and 'Mr. Britling Sees it Through' have been the most widely read, in which the ideas of the present are embodied in the career of the individual. Besides these are Joseph Conrad, who gives a strong realistic turn to his stories of the sea and of exotic romance, and John Galsworthy, whose chief novels are ironic presentations of the conservative character of life in England. There are also many others who follow not dissimilar courses, of whom the best known are Hugh Walpole, Compton Mackenzie, Ethel Sidgwick, J. D. Beresford, Gilbert Cannan, May Sinclair and Oliver Onions. A third development of the century has been in the path of criticism, which at first found expression chiefly in the periodical. The magazine has been one of the most characteristic elements of 19th century literature. There were magazines in the 18th century — the *Monthly Review*, the *Critical Review*, the *Gentleman's Magazine* — but the chief periodical was the Addisonian essay. The *Edinburgh Review* (1802) and the *Quarterly Review* (1809) were the beginning of a new movement. *Blackwood's Magazine* (1817), the *London Magazine* (1820) and *Fraser's Magazine* (1830), together with many weeklies and dailies, were the beginning of a flood of literature that is now the form most familiar to us. The influence was at first chiefly critical. Jeffrey, the first editor of the *Edinburgh*, with Gifford of the *Quarterly*, set the style of a criticism, which though often unfairly slashing and ridiculously high and mighty in tone, had merit often in expressing sincere and definite opinions in literature and politics. A sort of gaiety and even charm was given by Wilson, who wrote under the name of Christopher North, by Sidney Smith and Lockhart. But the most important development came in the field of the personal essay. The 'Essays of Elia' (1820) by Charles Lamb, go beyond the Addisonian essay in their unfettered expression of a charming personality. 'The English Opium Eater' (1821), of Thomas De Quincey, is still farther away from the 18th century in form and spirit, and so is the 'Table Talk' (1824) of Hazlitt. All these are sincere personal utterance, and in their sincerity and personality lies their strength. In the main we may call the work of these men critical, for they were all absorbed in letters, and their view of life was essentially a criticism of literature. Something more in the way of established form were the famous 'Essays' (beginning 1825) of Macaulay, the most remarkable works of their time in the power of focusing wide reading and immense knowledge into forms of extreme brilliancy. A striking contrast is offered by Carlyle, who began by essays of the accustomed character, though not ordinary in style, but after some years produced 'Sartor Resartus' (1833), expressive of his own vigorous personality and thinking, more extraordinary in form than any of his later work, but not more original or powerful. Carlyle had by no means the immediate fame of Macaulay, but his influence on the thought of his time has been vastly greater. Both were historians as well as critics, and by their interest in life and sympathy with man they brought in a new and fascinatingly interesting kind of historical writing, which the later influence of Darwinism and of science in general, has done much to deaden. Hallam before them should also be mentioned and Green after them. John Ruskin began his career as critic with what seemed the impossible task of dethroning false masters of painting, and establishing an ethical foundation for art. About 1850, having succeeded in his earlier task, he began a struggle against a much wider range of evil, which was not so fortunate. Matthew Arnold also understood the range of the critic as extending beyond the field of art: his views on politics and religion were an influence in the history of thought, but naturally will not last as long as his conceptions on literature. Walter Pater took even a wider view of art, being at home with painting, architecture, sculpture, as well as with literature. He represents the so-called «æsthetic» position which developed from Preraphaelitism. The most noteworthy essayist of the opening century is Gilbert K. Chesterton, whose ready paradoxes cover much sound thought. In philosophy and science the century has been pre-eminent, and many great books have been produced. The last field hardly belongs to literature, although Darwin, Huxley and Tyndall were masters of style and could make the results of scientific work absorbingly interesting. More might be said of philosophy and theology, though here little has been produced that will last as literature, except perhaps John Stuart Mill's ‘Logic’ (1843), Cardinal Newman's ‘Apologia pro Vita Sua’ (1864), and parts of Spencer's ‘Synthetic Philosophy’ (1860–1900), all of which stand as representative of important movements in the history of thought.

There are many histories of English literature. The most elaborate and authoritative is the ‘Cambridge History of English Literature,’ the work of a great number of representative students. That of Garnett and Gosse is an interesting general account, richly illustrated by extracts and reproductions of manuscripts and prints. The three volumes on different periods by Saintsbury and Gosse cover the last four centuries in a convenient form. The work of Taine (translated by Van Laun) expresses his views of the development of literature from national life. That of Ten Brink (translated by Keneday) is unfinished, but covers the ground where German scholarship is strongest, namely, Anglo-Saxon and Middle English. Brandl in Paul's ‘Grundriss der germ. Philologie,’ gives a very full and convenient summary. Morley's ‘English Writers’ is a very full account in 10 volumes, but has not got beyond Shakespeare. The ‘English Men of Letters’ series provides lives of the greatest authors. Ward's ‘English Poets,’ and Craik's ‘English Prose,’ are valuable, giving a summary of facts, a criticism by a writer of note, and a number of extracts in case of all distinguished poets and prose writers.

Edward E. Hale,

Professor of English, Union College, Schenectady, N. Y.

ENGLISH LITERATURE, Middle Period. The term Middle English may conveniently be taken to include the period 1100–1500. For more than a century after the Conquest, however, the majority of works produced and read in England were written either in French or Latin. Literature in the vernacular, which had sunk to a low level by the beginning of the 11th century, did not revive materially until the reign of John. The ‘Anglo-Saxon Chronicle’ continued to the year 1154, and a few religious works, chiefly of linguistic interest, almost exhaust production in English during this era of transition. During the 13th century English began to compete with the other tongues for supremacy, and by the time of Chaucer its victory was assured, although French and Latin continued to be widely used. At first, the progress of the vernacular was greatly hindered by dialectical differences in various parts of the country. The West-Saxon and Kentish, the Mercian, and the Northumbrian of the earlier period had developed respectively into the Southern, Midland and Northern, with some changes of boundary. Of these, East Midland was most important, as the dialect of London and Chaucer, and the parent of Modern English. The language as a whole shows very marked differences from Anglo-Saxon, not only in the addition of many foreign words, chiefly French and Scandinavian, but in changes in the vowels and diphthongs, in the disappearance of inflectional endings, and in a freer use of particles and connectives. The dialectical peculiarities gradually became less marked, until at the end of the period there was practically only one literary dialect, with the exception of Scottish.

The influence of Anglo-French and Anglo-Latin upon Middle English was exceedingly important. The Normans took great interest in historical writing after their settlement in England, as the Latin chronicles of such men as Ordericus Vitalis, Henry of Huntingdon and William of Newburgh attest. About 1136 Geoffrey of Monmouth produced his fictitious ‘Historia Regum Britanniæ,’ a book condemned by serious historians, but of great significance for mediæval romance. It was later reworked in French rhymed versions by Gaimar and Wace. The Normans were fond of romantic stories, and even retold in their own tongue the deeds of various native English heroes. More serious historical work was done in French verse by such men as Garnier de Pont Saint Maxence or Jordan Fantosme. Churchmen like Lanfranc and John of Salisbury wrote on theological matters, and there was early much activity in the new English universities. Latin writing of a lighter sort is represented by the ‘De Nugis Curialium’ of Walter Map, or the ‘Speculum Stultorum’ of Nigellus Wircker. The Normans were a people of practical mind, and most of their literature consisted of utilitarian or devotional prose. Scientific facts, or supposed facts, interested them greatly. They were clever tellers of tales, both of the fabliau type and those pointing a moral. Especially noteworthy is the work (c. 1175–85) of the poetess Marie de France, who wrote a charming collection of ‘Lais,’ and a book of fables, the ‘Ysopet.’

Earlier Middle English literature is better studied by types than by authors. Originality, as a general thing, counted for little in mediæval days, and works in the vernacular during the 13th century were based almost without exception upon French and Latin models. The narrative literature is of far greater interest than the religious and didactic writing. The French metrical romances, artistic poems dealing with love and war, and chiefly intended for the higher classes, were made accessible to the

English after the middle of the 13th century. The cycle of King Arthur and his knights was the most important and popular. A smaller and less favored division dealt with «the matter of France,»— the deeds of Charlemagne and his warriors. A third group is based on native English and Germanic themes — King Horn, Havelock, Bevis of Hampton, Guy of Warwick, etc. Stories of Troy and Thebes form a fourth class. The Troy-story deserves attention because of versions of the Troilus-Cressida theme by Chaucer, Henryson, Lydgate and Shakespeare. Romances of eastern origin, with a few others not readily classifiable, complete the list. By the time of Chaucer, the metrical romances were showing signs of degeneration, and in the 15th century prose romances took their place. In strong contrast to these are the fabliaux, short, witty, rhymed tales, intended for the lower classes, usually of a satiric character, and frankly indecorous. They were never as popular in England as in France, although stories of this type form the largest genre-division of the ‘Canterbury Tales.’ Pious tales, generally representing supernatural occurrences in every-day life, and beast stories, like the ‘Fox and the Wolf’ (13th century), were popular. Noteworthy, too, are the collections of stories, often, as in the case of the ‘Gesta Romanorum,’ used by preachers as *exempla* upon which to base homilies. Many romantic narratives reappeared in altered form in the ballads. These «stories in song» differed widely from the romances, being short, stanzaic, allusive pieces of unknown authorship, perpetuated among the people by oral tradition, and dealing with a great variety of material. The popular lyric — quite a different thing — is represented by such pieces as ‘Sumer is ycumen in,’ or ‘Blow, Northern Wind.’ In the secular lyric the French influence was again predominent. Secular love-poetry was often applied to religious ends, as in the ‘Love-Rune’ of the Franciscan monk, Thomas de Hales. In the 14th century French lyrics were extensively imitated, as the work of Chaucer and Gower shows. As for metrical chronicles, three deserve especial mention. Most important is the ‘Brut’ of Layamon (c. 1205), so called because it traces British history from Brutus. Although dependent upon earlier French and Latin work, it shows imaginative power and patriotic feeling. The same love of England appears in the chronicle of Robert of Gloucester (late 13th century), which may have been written by more than one man, and in the historical work of Robert Mannyng of Brunne in the 14th century.

The devotional and didactic literature is somewhat difficult to classify, since the various types were not always clearly differentiated, and borrowed much from secular writing. A favorite form of conveying wisdom was the proverb poetry. An early collection of this sort was attributed to King Alfred, and another was put into the mouth of a personage called «Hending.» A similar purpose was served by the «debates,» the most noteworthy of which is the ‘Debate of the Body and Soul’ (12th century), in which each speaker accuses the other of being responsible for the death of the dead man. The ‘Owl and Nightingale’ (c. 1220) is the most important secular debate in English. There was much work on scientific subjects, and this was often made to point a moral, as in the ‘Bestiary’ of the early 13th century, which appends a «significatio» to each description. A vast number of homilies and devotional treatises were written. The ‘Poema Morale,’ «a penitential sermon in verse,» dates from 1170. The ‘Ancren Riwle,’ or Rule for Nuns, is an early prose monument of some importance. More celebrated is the ‘Ormulum’ (c. 1200), a set of pedestrian metrical homilies valuable to the philologist on account of a peculiar system of spelling. In the 14th century Dan Michel of Kent, the author of the ‘Ayenbite of Inwit,’ William of Shoreham, who wrote stiff didactic poems, Robert Mannyng of Brunne, who versified a French manual and gave it the title ‘Handlyng Sinne,’ and Richard Rolle of Hampole, are all noteworthy. Richard Rolle, the mystic, hermit and preacher, was more important as a personality than an author, yet his works were much esteemed in their day. Chief among Bible paraphrases are an early version of Genesis and Exodus (c. 1250), in the Midland dialect, and the ‘Cursor Mundi,’ written in the north. Legends and lives of the saints were much in demand, and huge legend collections were made for homiletic work. The Tales of the Prioress and Second Nun in Chaucer illustrate this genre.

The most important figure in Middle English literature is Geoffrey Chaucer (1340–1400). A Londoner by birth, he was brought up in the atmosphere of the court, took part in the French wars, was often employed upon diplomatic missions, and held various public offices. His work may be somewhat arbitrarily divided as follows: The first period, to about 1372–73, when he first visited Italy, reflects the influence of French poetry. Besides a number of shorter lyrical pieces, most of which are not extant, the period includes a translation of a part of the ‘Romance of the Rose,’ and ‘The Book of the Duchess,’ a lament for the death of the wife of his patron John of Gaunt. The second period, which closes about 1385, reveals him imitating Italian models, particularly the work of Boccaccio. Here belong ‘Troilus and Cressida,’ ‘Anelida and Arcite,’ ‘The House of Fame,’ ‘The Parliament of Birds’ and some stories later utilized in the ‘Canterbury Tales.’ This period shows a great advance in versatility and poetic power. The so-called English period, in which he attained the summit of his powers, has been held to include the ‘Legend of Good Women,’ but recent research puts much of it earlier and makes plain the strong influence of French. The chief work of this period, and his masterpiece, is the ‘Canterbury Tales.’ The stories were borrowed from various sources; the plan of the whole resembles that of the ‘Decameron,’ but there is no evidence that Chaucer was acquainted with it. Besides two prose Tales, Chaucer translated Boethius and wrote a treatise on the astrolabe. The chronology of his writings has not yet been determined with complete accuracy.

Four important alliterative poems of the latter half of the 14th century, written in the West Midland dialect, may be referred to one author, whose name has not been preserved: ‘Sir Gawain and the Green Knight,’ ‘The Pearl,’ ‘Purity’ and ‘Patience.’ The first of these is generally considered the finest of the metrical romances, because of its elevation of tone, descriptive power and narrative skill. It is written in a highly artificial style of verse. ‘The Pearl’ describes the appearance of a beautiful maiden in Heaven, seen in a dream. It is probably to be interpreted allegorically, although the poem has often been held to reflect the grief of a real bereavement. The other two poems, which are of minor value, exalt the virtues indicated in their titles. Alliterative verse, without end-rhyme, was employed by William Langland, whose bitter satire contrasts with the genial irony of Chaucer. 'The Vision of Piers the Plowman' attacks the evils of the day by means of various allegorical figures seen in dreams. A continuation of the same material appears in the pieces called 'Do Wel,' 'Do Bet' and 'Do Best.' The allegory is sometimes realistic and sometimes mystic. The 'Vision' appeared in three different versions in the latter part of the 14th century. It has been doubted that this is all the work of one man and too much weight has been attached to supposed autobiographical evidence in it. 'Richard the Redeless' is generally assigned to Langland.

The fame of John Gower (d. 1408) rests, apart from a series of French *ballades,* and minor pieces, upon three works, the 'Speculum Meditantis,' a moral allegory in French verse, the 'Vox Clamantis' in Latin, dealing with the social unrest of his day, and the 'Confessio Amantis' in English, his best-known poem. The 'Confessio' consists of a series of tales, strung on a thread of story. The priest of Venus is sent to «confess» the lover, and gives him instruction by means of tales illustrating the vices and virtues, with special applications to matters of love. Many of these tales are well and simply told, but the artificial and highly finished octosyllabic couplet soon becomes monotonous. The poem is too long (nearly 34,000 lines), and is far inferior to the work of Chaucer. An enormously prolific poet, too, was John Lydgate. His long poems, like 'The Troy-Book,' or 'The Falls of Princes,' are tedious versifying; his minor poems and 'Fables' show him at his best. As a disciple of Chaucer he stands with Thomas Occleve or Hoccleve, a more interesting personality, but less productive and accomplished than Lydgate. Occleve's chief work is 'The Gouvernail of Princes.'

The prose work of John Wiclif was primarily utilitarian. He was greater as a personality than as a writer, but his translation of the Bible (c. 1380) did much to fix the form of the language, and his simple and direct sermons appealed strongly to the lower classes. He was assisted in translating the Old Testament by Nicholas of Hereford, and the whole was later revised by John Purvey. An undue importance has sometimes been attached to the fictitious 'Travels' supposed to have been made by a Sir John Mandeville in the 14th century. The book was originally written in French, but the facts of its authorship are not yet fully known. Though purporting to be authentic, it is full of grotesque descriptions of the East, mostly borrowed from mediæval travel-books. See MANDEVILLE.

The 15th century was a singularly barren era. England was almost devoid of poetry of distinction; the example of Chaucer inspired little in the south, and the Wars of the Roses had a most unfavorable effect upon literary production in general. Some advance was made in prose writing, however, through the interest taken in historical, legal, controversial and religious subjects. Reginald Pecock, the great opponent of the doctrines which had been advocated by Wiclif, is remembered for his 'Repressor of Over-much Blaming of the Clergy.' Sir John Fortescue, the author of 'The Gouvernance of England,' and the chroniclers Capgrave and Fabyan also deserve mention. Perhaps the most distinguished work of the century was Sir Thomas Malory's 'Morte d'Arthur.' This collection of romantic tales dealing with King Arthur and his knights, told in melodious prose with great skill and charm, was finished about 1470, and printed 15 years later by Caxton. Malory drew most from French romances. Although he invented little, he was no mere compiler, but a great literary artist. The introduction of printing and the publications of Caxton mark a new era in English letters. Much of the material which Caxton printed he translated from other languages himself. His activity exerted a strong influence in the development of English prose.

A compensation for the dearth in English proper in the 15th century appears in the emergence of Scottish literature. The first noteworthy work in this dialect, with the exception of certain legends and romances, is the 'Bruce' of John Barbour, whose life falls within almost the same dates as that of Chaucer. The poem partakes of the nature both of a rhymed chronicle and a romance, and though lacking in finish, is full of vigor and animated by patriotic spirit. It celebrates the deeds of Robert Bruce, with occasional lapses from historical accuracy. Andrew of Wyntoun's 'Original Chronicle'—so called because he began from the very beginning—is an exceedingly monotonous piece of versifying. The exploits of William Wallace were celebrated by Henry the Minstrel, or Blind Harry, as he is often called, in a poem which takes great liberties with history. Of Blind Harry little is known. A pronounced imitator of Chaucer, and not an unworthy one, was King James I of Scotland, who celebrated his love for Lady Jane Beaufort in 'The King's Quair' (1423). In structure, language and general literary treatment it is highly artificial, but full of grace and poetic feeling. It derives additional interest from the romantic career and early death of its author. In variety and excellence of work, Robert Henryson, who flourished in the latter part of the 15th century, holds an important place. He wrote the earliest extant English pastoral, 'Robene and Makyne,' and a notable collection of 'Fables.' The influence of Chaucer is seen in 'The Testament of Cressida,' which describes Cressida's unhappy death with great dramatic power. In minor poems he was often felicitous. An elaborate though tedious and awkward bird-fable is the 'Howlat,' or 'Owlet' of Holland. The greatest poet of the period was William Dunbar (1460?–1520?), who led a wandering life in his youth, was later attached to the court of James IV of Scotland, and entered holy orders. Most of his poems are short and a large number of them are satirical. More ambitious are 'The Thistle and the Rose,' which commemorates the marriage of the king, and 'The Golden Targe,' an elaborate allegory. 'The Dance of the Seven Deadly Sins,' 'The Flyting with Kennedy,' a brother-poet, 'The Two Married Women and the Widow,' and 'Tidings from the Session' are all representative pieces. 'The Two Friars of Berwick,' a piece of vigorous Chaucerian narrative, is ascribed to him. 'The Lament for the Makers' strikes the elegiac note, but Dunbar was, on the whole, lacking in pathos and tenderness. He was a poet of great variety and originality, using both the «aureate style» then in vogue, and the rude dialect of the people with equal skill. Gawin Douglas, Bishop of Dunkeld (1475–1522), wrote rather stiff allegorical poems, 'The Palace of Honor' and 'King Heart.' His most important work is his translation of Virgil. Douglas was the most learned of the Scottish poets, and his work was designed to appeal chiefly to the upper classes. Much of the work of Dunbar and Douglas falls outside the formal boundary of this literary period, 1500, yet in the general character of their poetry and especially in their imitation of mediæval models they are properly to be considered with the earlier men. The same is hardly true of the work of Sir David Lyndsay of the Mount (1490–1545), who completes this group of Scottish poets. The reformatory tone and national appeal in his writings place them in the era following.

In English literature proper a similar distinction is to be made. Alexander Barclay's translation of the 'Narrenschiff' of Sebastian Brandt, which he called 'The Ship of Foules,' and 'The Pastime of Pleasure' of Stephen Hawes, a «belated Chaucerian,» both produced in the first decade of the 16th century, belong far more to the age that had passed than does the poetry of Skelton. Although some of Skelton's early work suggests imitation of the older poetry, his most characteristic pieces do not fall within the bounds of Middle English. Neither Hawes nor Barclay were even second-rate poets; their prominence is chiefly due to the fact that they lived in a time when little good poetry was written.

The miracle plays flourished in England from the early part of this period until the end of the 16th century. The morality play, a less important genre, arose in the second quarter of the 15th century, and, with the interlude, for a time rivaled the popularity of the miracles. For a discussion of the rise of the drama in the Middle English Period, see MIRACLE PLAYS.

Bibliography.— There is a comprehensive and detailed discussion of the earlier Middle English period by Schofield, W. H., 'English Literature from the Norman Conquest to Chaucer,' which contains bibliography and chronological tables; for individual authors consult the 'Dictionary of National Biography'; for bibliography and brief discussions, Wells, J. E., 'Manual of the Writings in Middle English'; for literary history in general, the 'Cambridge History of English Literature' (Vols. I and II, Cambridge 1913), 'Grundriss der germ. Philologie'; Jusserand, 'Literary History of the English People' (2 vols.); Morley, H., 'English Writers' (Vol. III–VII); Saintsbury, 'A Short History of English Literature'; Chambers, E. K., 'The Mediæval Stage.' For the French literature of the period, cf. Paris, G., 'La litt. franç. au moyen âge,'—'Mediæval French Literature,' in Temple Primer Series. For the Scottish poets, Henderson, T. F., 'Scottish Vernacular Literature, A History'; and chapters by Gregory Smith in the 'Cambridge History of English Literature' (Vol. II, Cambridge 1913).

Professor of English, Columbia University.

ENGLISH LITERATURE, Elizabethan Period.

THE DRAMA.

At the beginning of the reign of Elizabeth the conflict between mediævalism and humanism was rife in the drama as in other forms of literature. For the preceding half century there had been a confusion of types; miracle, morality, interlude, and farce existing side by side and exhibiting various differentiations and there had been a confusion of theatrical conditions, play-acting still remaining largely in amateur hands. Neo-latin imitations of the classics were being succeeded by academic attempts in the vernacular. 'Ralph Roister Doister,' written by Nicholas Udall for the school performance, had already in 1552 marked the appearance of comedy as a distinct form after the Plautian model, and 'Gorboduc,' by Sackville and Norton, performed in 1562 before the Queen, was the first vernacular tragedy. Two other extant plays written within the next few years and performed by amateurs, 'Jocasta' and 'Tancred and Gismunda,' were, like 'Gorboduc,' attempts by Englishmen of culture to imitate the tragedies of Seneca in accord with the practice of Italian humanists. Meantime 'Apius and Virginia' and 'Damon and Pithias,' mixtures of tragedy and comedy, exhibited the persistence of popular methods combined with classical borrowings, while 'Cambyses' and 'Horestes' were formless chronicles of atrocities without any perceptible classical decorum. The building of the first London theatre in 1576 was the sign of a speedy triumph of the professional companies as the chief purveyors of the drama. A dozen years later the advent of a group of gifted poets prepared the way for Shakespeare by determining the course of a popular drama that was to be literary though disregardful of classical restrictions.

Comedy, where the departure from mediæval forms required by the humanists was far less than in tragedy, was the first to attract literary talent to the public stage. The plays of Wilson revealed a satirical comedy of manners emerging from the morality, and the entertainments devised by Lyly for the children companies, combined lyrical and spectacular attractions with a refined wit and a certain graceful courtliness. Later Green introduced sentimental comedy with its averted tragedy and its idealization of women. Such hasty summarizing, however, does scant justice to the variety and ingenuity of the experiments that preceded Shakespeare, drawing their material from every field from classical myth to native folk lore, and essaying and amalgamating every department of comedy from the Plautian to the pastoral. Most characteristic, perhaps, of all was romantic comedy, usually based on Italian *novelle* and offering a medley of fun, sentiment and adventure.

In tragedy Kyd adapted Seneca to the conditions of the popular theatres, discarding most of his structural scheme but retaining the story of revenge, the accompanying ghost, the horrors and the moralizing; and thus in the 'Spanish Tragedy' (cir. 1587), creating a special type destined to a vigorous existence. Marlowe (1564–93) turned his back on Senecan methods and brought to the rambling and discordant structure of the current popular plays his splendid blank verse and his soaring imagination. 'Tamburlaine,' 'Faustus,' the 'Jew of

Malta,' and 'Edward II,' the chief plays of his half dozen years of dramatic activity, delighted the vulgar by their violence and spectacle, and at the same time made the public stage the abode of noble poetry and genuine passion. His genius, though never fully developed, remade tragedy and history, giving to the chronicle structure the unity of a protagonist, possessed by extraordinary ambition and engaged in tragic conflict with overpowering opposition.

In Marlowe, as in the other early Elizabethans, there is much that is fantastic, crude and absurd. The primary aim of each dramatist was to present a story so as to delight a motley audience; hence the tendency was naturally toward stories of sensational crimes for tragedy and of romantic adventures for comedy, without much care for the isolation of either species. Like Marlowe, however, the other dramatists were poets as well as playwrights, stimulated by that imaginative idealism so nobly characteristic of the national temper in the years of Elizabeth's greatness, and in their exuberant and somewhat over-fantastic verse reflecting the audacity, adventurousness, emotional extravagance and undaunted aspiration of the age.

Shakespeare's apprenticeship was served in this period, and his early plays naturally follow the forms then current and exhibit the qualities most prominent in other dramatists. The 'Comedy of Errors' is an adaptation of Plautus; 'Love's Labour's Lost' follows Lyly; the 'Two Gentlemen of Verona' recalls the sentimental comedy of Greene; 'Titus Andronicus' is a melodrama of atrocities after the fashion of Kyd; 'Henry VI' is dominated by Marlowe, and 'Richard III,' following the Marlowean formula, surpasses the master in the vigorous delineation of the villain protagonist and in the stage effectiveness of his part. But Shakespeare soon left his fellows far behind. The 'Midsummer Night's Dream' and the 'Merchant of Venice' transcended the romantic comedies that had made them possible on the London stage, and 'Romeo and Juliet' as completely surpassed the prevailing tragedy of blood. By 1600 Shakespeare had created his great series of comedies and in the Falstaff plays had wrought a union of comedy and history such as the early chronicle plays had only dimly foreshadowed.

By 1600 new forces were manifest in the drama. A young poet, Marston, was following his successful satires by a series of plays, in part tragedies of blood on the Kydian model, and in part satirical tragi-comedies, which aimed to be searching studies of evil. In 1599 Ben Jonson's 'Every Man in His Humour,' acted by Shakespeare's company, was prefaced with a declaration of war on the absurdities of chronicle history and romantic plays, and with the promise of the creation of a comedy dealing with contemporary manners. Jonson, indeed, continued a powerful force in the drama for the next 25 years. His preaching was all directed toward the establishment of a more conscious and painstaking art, and its regularization by classical examples, while his practice resulted in a noteworthy series of satirical comedies, presenting with powerful humor and realism the follies and vices of the day. Chapman and Middleton were also writing comedies of domestic manners, and the whole trend of the drama from 1600 to 1608 was away from romance and sentiment, resulting in a satirical and realistic treatment in comedy and a more searching analysis of evil in tragedy. Under these circumstances Shakespeare's great series of tragedies was produced. This is not the place to speak of their lasting significance, but merely to note that his genius, now in the full maturity of its powers, was still engaged in transforming the prevailing types of drama. Narratives from chronicle and *novella*, so often the sources of formlessness of structure, resulted in the splendid dramatic concentration of 'Macbeth' and 'Othello'; the absurd tragedy of blood, popular again through the efforts of Marston and others, became 'Hamlet' with its infinite suggestiveness of human tragedy; the grotesqueness characteristic of mediæval as well as Elizabethan drama had its final justification in 'Lear.'

By 1607–08 the success of the heroic plays of Beaumont and Fletcher had brought the romantic and idyllic again into favor and perhaps given the suggestion for Shakespeare's return to romantic tragi-comedy in 'Cymbeline,' a 'Winter's Tale,' and the 'Tempest.' Heroic romances, such as 'Philaster' and the 'Maid's Tragedy' succeeded not only because of their poetry and their sensational contrast of sentimental love and sensual passion, but even more because of the telling theatrical effectiveness of their situations and the clever alternations of suspense and surprise with which their ingenious plots were complicated. The comedy of Beaumont and Fletcher, especially in its later development by Fletcher, like their heroic plays, had a long continued influence on the drama. Possessing ready wit, great poetic facility and an abundant invention, but without moral taste or any serious criticism of life, Fletcher marks a stage in the drama that may fairly be called decadent when we recall the sound moral sense and the artistic aspiration of the early plays. Yet the last decade of Shakespeare's life was the time of Jonson's greatest comedies, of the masterpieces of Beaumont and Fletcher, and of some of the best work of Chapman, Tourneur, Webster and Middleton.

The very existence of these masterpieces was of itself a factor in the drama's decline. Webster, writing in 1612, made the first avowal of obligations to his great contemporaries; and henceforth the increasing recognition of the greatness of the immediate past seemed to stifle rather than to inspire innovation and experiment. Webster himself, borrowing freely from others, carried the tragedy of blood to its final development in the powerful and gloomy 'White Devil' and 'Duchess of Malfi.' Middleton in collaboration with Rowley created scenes of powerful tragic interest in 'A Fair Quarrel' and the 'Changeling.' Massinger, collaborating often with Fletcher and to a considerable extent borrowing Fletcher's methods, produced a body of tragedy and tragi-comedy, morally didactic, and rhetorically excellent, but in characterization and poetry somewhat deficient. These are only a few of the writers of tragedy during the reign of James I; in the development of comedy, where less poetical excellence is demanded, the number of important contributors was much larger. Middleton's most characteristic work was a group of lively comedies that exposed contemporary manners with the frankest realism. Massinger, though on the whole deficient in humor, produced in 'A New Way to Pay Old Debts' the noteworthy character of Sir Giles Overreach that has attracted many great actors, including Kean. Dekker and Heywood, writers without great literary pretensions, wrote a large number of successful plays. Dekker ranged from the romantic idealism of 'Old Fortunatus' and the sentiment and merriment of the 'Shoemaker's Holiday' to the painful realism of the 'Honest Whore.' Heywood, always a skilful and inventive playwright, likewise wrote plays of every kind, achieving a real masterpiece in his 'A Woman Killed with Kindness.' This play may be classed as a sentimental tragic-comedy or as a domestic tragedy, a class which includes a number of plays depicting current crimes and goes back at least as far as 'Arden of Feversham' in Marlowe's day. One other dramatic form, extremely popular in the court of James I, must be mentioned, the court mask. For these scenic and musical entertainments many dramatists, and notably Jonson, wrote libretti; and the spectacles and dances in turn had an important influence on the popular theatres. The dramatic product of the reign of James I (1603–25) was indeed fully as large as that of the reign of Elizabeth, and, including as it did the last nine years of Shakespeare's career, vastly greater in value. But the enthusiasm and earnestness of the days of the Armada were succeeded by a time of immorality, corruption, and national weakness. The people were turning more and more to Puritanism, but the drama, following the court, grew less serious, more licentious and gradually forgetful of its high calling.

During the reign of Charles I the drama offered little that remains notable, outside of the continued work of the older writers and the plays of Ford and Shirley. Ford, a poet of original and lofty genius, ranks with the great dramatists in the intensity of his tragic crises, but he sought themes and motives, abnormal and decadent. The great dramatists of the preceding generation stimulated Shirley, who was their last worthy follower and who often recalls but never quite equals their best work. Of comic dramatists Brome, of "the tribe of Ben," and Davenant, who belongs to the Restoration, are possibly the most noteworthy. But the great majority of the many plays produced were mediocre. The drama no longer represented the nation; nor in the approach of the civil conflict could it longer command the interest and energy of great intellects or imaginations. It had little virility left when the Puritans closed the theatres in 1642.

Within a few years Chapman, Dekker and Jonson, the last surviving dramatists of Elizabeth's time, had died. Their lives had spanned the entire course of the drama's development, its rapid rise and its splendid culmination as well as its decline. The 30 years from Marlowe's first play to the death of Shakespeare include, in fact, all that is great in this amazingly rapid development. Incomparable as this period is because it contains the career of Shakespeare, it is hardly less astonishing because of the variety and range of the work of his fellows. Lacking, as even Shakespeare's plays lack, in the symmetry and unity of the Athenian drama; faulty, as his plays are often faulty, in the over-exuberance of language and the violence and extravagance of scenes; suffering, as his genius suffered, from the crudity of a bare stage and an immature dramaturgy; these Elizabethan plays, taken as a whole, reveal in however inferior measure, his great excellences, the untrammeled play of wit, sentiment, fun and fancy; a splendid energy of diction and of dramatic treatment; a searching revelation of human character, and an abounding grace and power of poetic expression. NON-DRAMATIC POETRY.

Elizabethan poetry is the product of the Renaissance,— the flowering of the English stock under the fertilizing power of European thought. English literature at all points — in Alfred's time, in Elizabeth's, in the 18th and 19th centures, — has owed its great moments to foreign inspiration, but this is true of no age so conspicuously as of the Elizabethan. The period is short, if it be measured strictly by Elizabeth's reign, 1558–1603; and even if the limits be broadened to include Wyatt and Surrey at the beginning and all of Shakespeare's work at the end, it is still but narrow room for the development of the crude religious play into the drama of Shakespeare and Jonson, — of the clumsy sonnets of Wyatt into the great sequences of Sidney, Spenser and Shakespeare,— of the stiff Tudor music into the noble harmonies of the madrigals and the sweet melodies of the airs.

Perhaps because of this swiftness of development, the age illustrates with unusual clearness the transference of life to books. The rush of genius draws into its vortex most of the experience about it; Spenser's friends enter the 'Faerie Queene' unchanged, and in spite of the allegory, undisguised; Sidney's passion takes over the incidents of his wooing with an immediateness that the occasional bookishness of his inspiration cannot smother; history, scarce made, is subject for a play; the gossip of a shipwreck becomes the 'Tempest'; and — perhaps most interesting of all — those first poets themselves, the type of the age, Surrey, Sidney, Greville, Raleigh, are caught up as they drop from life, and continue immortal in Shakespeare's young men — Biron, Valentine, Romeo. The contrast here suggested between the mass and power of its literary inheritance and the directness of its foundation upon life, is the distinction of Elizabethan poetry, and perhaps the source of most of its problems.

In this swift drawing-in of Continental Renaissance thought with English history and character, the age is set off by three great names — Spenser, Shakespeare and Milton — for though Milton stands well outside the Elizabethan period, he is the last term in its development. The apparent remoteness of Spenser, his un-English quality, is due probably to the fact that he is nearest to the great wave; he takes over a larger quantity of unnaturalized material; he represents the early school of wholesale colonizers of Italian thought on English soil. Yet he takes over into his writings quite as much of English life, even of English incident, and quite as much of English character, as Shakespeare. The great dramatist, at first glance so natural, so near to his race, so untouched by the tyranny of books, is indeed all these things, yet his imagination starts always in some foreign suggestion. Aside from the different scale of genius, he is as English as Spenser — no more so; but he represents a more complete blend of the foreign themes with the native mind. So Milton also, heir to the assimilated learning of the Renaissance — to humanism, yet draws on the most English sources of life — English experience, English character, English landscape. These three poets illustrate the Elizabethan age in that they are typically individual, typically English, and typically children of the Renaissance mind.

It is usual to take as the beginning of Elizabethan poetry the book in which the Elizabethans themselves saw the herald of their day — 'Tottel's Miscellany' (1557). This book, a publisher's venture, contained the work of several courtly poets, notably of Sir Thomas Wyatt (1503–42) and of Henry Howard, Earl of Surrey (1516–47). Though the selections were written before Elizabeth's reign, they unfolded already the characteristics of the new age. The sonnets, modeled after Petrarch or translated from him, foretold the later sonnet fashion, with its heavy draughts upon the Italian spring; the imitations of classical poetry showed that the English writers had found the feeding root of the Renaissance itself; and the translations as a whole pointed in the direction of the more notable transferrings of the world's imagination to English, Golding's (1536?–1605) Ovid, 1567, and Chapman's (1559?–1634?) Iliad, 1598, and Odyssey, 1616. So also the lighter lyrics, the best of them by Wyatt, foretold the song-books; Surrey's sonnet to Clare and his poem on Windsor witnessed the vitality of the Elizabethan theme of friendship — the nearness of the living incident in his verse; and Grimald's (1519–61?). 'The Garden' prophesied at long range the love of English country life that was to find noble expression in Marvell and Walton.

The fame of Tottel's book made the miscellany a fashionable vehicle of publication throughout the Elizabethan age, though the growing habit of general publishing tended to diminish its importance. 'The Paradise of Dainty Devices' (1576), is interesting for the work it preserves of Richard Edwards (1523?–66), of Edward de Vere, Earl of Oxford (1550–1604), and of Sidney's friend, Sir Edward Dyer (——?–1607), whose fine "My mind to me a kingdom is," appears in this anthology. 'A Gorgeous Gallery of Gallant Inventions' (1578), illustrates the fashion of translation, and bears witness, in the names of tunes for the poems, to the growing invasion of poetry by music. 'A Handful of Pleasant Delights' (1584), is a weaker anthology, of practically no merit, but 'The Phœnix Nest' (1593), is noteworthy for the elegies on Sidney — one by Sir Walter Raleigh (1552?–1618), and for other poems by Raleigh and Thomas Lodge (1558?–1625). 'England's Helicon' (1600) includes selections from Sidney, Spenser, Breton, Lodge, Peele and Barnfield the great writers of the first Elizabethan period, strongly marked by the pastoral vein; the book would be notable for one poem alone, Marlowe's "Come live with me and be my love." 'England's Parnassus' and 'Belvidere, or the Garden of the Muses' (1600), are mere collections of quotations; 'Davison's Poetical Rhapsody' (1602), is of little more importance, though its selections reflect the sonnet vogue. An earlier and more important book, 'The Passionate Pilgrim, by William Shakespeare' (1599) is clearly a miscellany, as only part of its contents, some songs from 'Love's Labour's Lost' and some sonnets, are by Shakespeare.

In subject matter the earlier part of the Elizabethan age was pastoral, following the tone set by Sidney's 'Arcadia' (1590). This Elizabethan pastoral, literary and artificial as in Sanazzarro and other Italian models, left its impress on the incidental songs in the prose romances. Sidney himself was the most zealous experimenter in classical metres, in the general attempt that Gabriel Harvey fostered, to bring English verse under the laws of Latin prosody. Green and Lodge, the great writers of prose romance after Sidney, were less pedantic in their lyrics, yet their songs have the idyllic method of the pastoral, the method of painting.

The best representative of this pastoral period is Edmund Spenser (q.v.). His first book, 'The Shepherd's Calendar' (1579), was an imitation of the Virginian eclogue, with the same bookish flavor — here increased by Edward Kirke's commentary — and with the same allegorical treatment of contemporaries and events under the pastoral mask; but with an English setting and with English ideals that stamp the book as native. In 'Th Faërie Queene' (1590–96) and the 'Amoretti' (1595), Spenser speaks also through the pastoral convention — that subduing of all things to loveliness, which is the mark of the world of the Sicilian Muses. The 'Faërie Queene' especially, as might be expected from its ancestry in the Italian romantic epics, has the irresponsibility of pastoral romance — the arbitrary management of the facts of life as if those facts themselves were a flexible language. The paradox of the Renaissance, of Elizabethan literature, is illustrated here on the largest scale, in the gorgeous, archaic language, the unreal, un-English world of the story on the one hand, and on the other the stern English fibre of the ground theme. This same blending of Italian imagery and expression with English spirituality is seen in the 'Epithalamion' (1595) and in the 'Prothalamion' and the 'Four Hymns' (1596).

The pastoral convention, molded by Spenser, remained popular, though less characteristic, in the succeeding decades. Michael Drayton (1563–1631), remembered now for his splendid 'Battle of Agincourt' (1605), and for his great sonnet, 'Since there's no help' (1619), wrote much in the Spenserian pastoral, as did William Browne (1591–1643). In another way also the pastoral habit of beauty was transferred to poems not strictly pastoral, such as Shakespeare's Venus and Adonis' (1593), 'Lucrece' (1594), and Marlowe's 'Hero and Leander' (before 1593), where the convention of old-world beauty blends with the Elizabethan zest for a story, evidenced more popularly in the broadside ballads. The tradition of narrative poetry was strong throughout the Tudor period, from the 'Mirror for Magistrates' (1559) to Drayton's 'Barons' Wars' (1603).

As the first period of Elizabethan poetry is

pastoral, so the second period, roughly from 1590 to 1600, is marked by the sonnet fashion. The Italian sonnet had been introduced in detached imitations and translations by Wyatt and Surrey but the fashion of sonnet sequences was set by Sir Philip Sidney's (1554–86) 'Astrophel and Stella,' published in 1591, but known much earlier. Sidney here followed Petrarch, after the example of the innumerable French sonneteers. His sonnets, however, derive vital and individual interest from the circumstances of his own love for Penelope Devereux, a passion as famed among his contemporaries as Petrarch's love for Laura. His poems have had the not unprecedented fate of being called merely literary in their inspiration, and it cannot be denied that his borrowings were probably many; yet in the mediæval way he considered himself sincerely original, and much in his work supports the claim. The amount of actual incident that he takes over from his own life is large, especially in the noble sonnets that deal with horsemanship and knightly exercise, and his story in one point was radically different from Petrarch's or Dante's. His love was known and returned; the bar between Penelope and himself was one of honor, since she was married to another; this lofty sense of this kind of honor was Sidney's characteristically English contribution to the world-theme of love.

In most cases the "love passionings" of Sidney's imitators were of the head rather than of the heart. This undeniable note of artifice has led to serious doubts as to the sincerity of the greater sequences — Sidney's, Spenser's and Shakespeare's. With due allowance for the undoubted imitations in all three poets, it remains true that their sonnets, as distinguished from others, have the very tone of sincerity. It would be an interesting question, though hard to answer, whether through the impress of similar ideals of love and courtly behavior, the poets in England and their fellows in France had not acquired for the moment the same channels of thought — whether the similarities in their work are not frequently coincidences rather than borrowings.

Sidney's 'Astrophel and Stella' had been preceded by Thomas Watson's 'Hekatompathia' (1582), a series of pedantic poems on love themes, which had the respect but not the imitation of his contemporaries. In 1592 appeared Samuel Daniel's (1659–1731) 'Delia,' in honor of the Countess of Pembroke, Sidney's sister — a finely written series remembered for some charming lines and for the oft-imitated "Care-charmer Sleep," itself an imitation from Desportes. 'Parthenophil and Parthenophe' (1593) by Barnabe Barnes (1569–1609), though it contains in its enormous mass some poems of charm, is clearly literary in inspiration. Lodge's 'Phillis,' in the same year, reverts to the pastoral background of the romances; the sonnets have the same charm as Lodge's incidental lyrics.

Spenser's 'Amoretti' (1595) record his own love story, and should be read with his beautiful wedding song, the 'Epithalamion.' The sonnets exhibit almost in excess his sweetness of language and his idyllic, picture method; there is an all but fatal smoothness of surface that makes the thought elusive. But the noble tone, the Platonic emphasis on beauty of soul, indicates the true Spenser, and the sonnets rank third among Elizabethan series.

Shakespeare's 'Sonnets,' printed in 1609 but written much earlier, mark the supreme reach of this kind of writing. Some of the attention they have received comes from the poet's greater fame as a dramatist; some of it comes from the mystery that still on many sides envelopes the sonnets; but the story itself, the conflict of the two angels of friendship and of dark love, is the most striking of the sonnet themes, and the powerful directness with which the subject for the most part is treated places the series above anything else of its kind in English. Natural as the sonnets seem, however, and spontaneous as the themes appear, yet comparison with other sequences shows that Shakespeare assimilated much of his predecessors; how much of his own life is in the story remains the puzzle of his biographers.

In the years immediately following the sonnet-writing, the characteristic vehicle of Elizabethan non-dramatic poetry was the song-book. The manuscript miscellanies of Henry VIII's time had contained the notes as well as the words of songs, and the Elizabethan period was rich in musicians as well as poets. In 1588 Nicholas Younge published his 'Musica Transalpina,' a collection of Italian madrigals with English words. The madrigal was a strict musical form, a contrapuntal part song, built up on many repetitions of a musical theme, and so needing few words — only a short poem, or part of a longer one. With the development of the lute and the growing popularity of lute music, came the song built on a melody, with harmonized accompaniment — what the Elizabethans called an Air. John Dowland, the greatest of the lutanists, introduced this new kind of song in 1597, in his 'First Book of Songs or Airs,' and the form was perfected, in both words and music, by Thomas Campion (——?–1619) in several books of Airs. As the Air was but a short melody, repeated without change, it needed for words a short lyric of several stanzas. This need encouraged the composition of short, finely wrought songs, frequently in the lighter vein, such as Campion himself wrote, and such as became a model for Herrick (q.v.).

Beginning with Wyatt, there had been a vein of satire in Elizabethan poetry. Gascoigne (1525–77) in his 'Steel Glass' (1576), Lodge in his 'Fig for Momus' (1595), Joseph Hall in his 'Virgidemiarum' (1597), and Marston in his 'Satires' (1598), and many lesser writers, kept the tradition alive. One other minor strain, which was destined to flower later into larger expression, was religious verse — often crude and moralizing, as in the miscellanies, often fantastic, as foreshadowing Donne (q.v.), but often devout. In Robert Southwell (1561–95), this writing becomes passionate and of the first quality. His 'Saint Peter's Complaint' (1595) contains that one poem, "The Burning Babe," that Ben Jonson preferred to all his own work.

These are the main forms of Elizabethan non-dramatic poetry. If we except the 'Faërie Queene,' the genius of the age is perhaps best seen in the drama. But in these other forms the Elizabethan mind preserved for us a broad and varied record of its amazing power to absorb the literary past, and to feel deeply its own experience. Adjunct Professor of English, Columbia University.

PROSE.

Elizabethan prose has neither the significance nor the splendor of Elizabethan poetry. The greatest masters, Sidney, Lyly, Hooker, have no supreme interest of matter or style; and Bacon belongs in spirit to another age with other ideals and another *ethos*. But the shaping of English speech as an instrument for the science and thought of the 17th century was the result of the efforts of Elizabethan prosemen. Before the period itself commences, the work of More, Elyot and Latimer, of Coverdale, Tyndale and the editors of the English Prayerbook, had already brought a simple and vigorous vernacular into being; but the ancestors of Augustan prose were the group of Cambridge scholars, Cheke, Wilson and Ascham, whose writings, with the exception of the 'Scholemaster,' antedate the accession of Elizabeth. This group devoted considerable attention to the study of English rhetoric; they aimed at plainness and purity of speech and the formation of a literary vernacular in emulation of the classics; they objected to archaisms and affectations of all sorts, and Wilson's condemnation of «ink-horn terms» is one of the significant *loci* of English criticism. The introduction of classical studies as a result of the revival of learning had necessitated a complete revision of the mediæval curriculum, and Ascham's 'Scholemaster,' published posthumously in 1570, follows the fashion set by the humanists of Italy, France and Germany, in a very large number of pedagogical treatises. Like these humanists, it was his purpose to indicate the education necessary to a cultivated gentleman. His own prose style is simple and direct, borrowing the more inconspicuous excellences of Latin prose. But his mood is in some respects that of the Puritan; and in his suspicion of romance and of the growing Italian influence, he is at odds with the whole spirit of Elizabethan life and letters. Prose and poetry alike were to be saturated with the Italianate spirit which he contemns.

Ascham is in some measure the father of that whole school of Elizabethan stylists, whose model was «eloquence» in the classical and humanistic sense, and who disregarded the ornate and «aureate» tendencies of Continental prose. The full and rich notes of Hooker are the final culmination of this manner. The first four books of the 'Ecclesiastical Polity' were published in 1594: several schools of *Novella Elocutio* had intervened since the composition of the 'Scholemaster,' but they have not affected the purity and directness, the calm and judicious argumentation of Hooker's style and manner. In this great book, moderation and passion temper each other after the fashion of the best Latin prose; and Hooker realizes the ambitions of the earlier English humanists who had made this their ultimate goal. Other models and other ambitions could alone make it possible to arrive at a higher standard than that which Hooker achieves at his best. Much of the book is unreadable to-day, like the technical arguments of the Attic orators; but its soaring passages, like theirs, are monuments of the race and religion whose ardor and conviction they express.

Directness and vigor were also put to far different uses both in secular and in religious polemics. Of the latter, the Martin Marprelate Controversy relating to the problem of church discipline, which raged between 1587 and 1590, gave opportunities which secular pamphleteers only too soon made use of. The significance of 'Hay any work for Cooper?' and 'Pap with a Hatchet' has been greatly overrated; in them the instrument which the Cambridge group had prepared for use was blunted and used as a cudgel. Nor can much more be said of the controversial writing of Nash, Greene and Harvey, in which is illustrated the nearest Elizabethan approximation to modern journalism, but with manners and morals untempered by a wholesome or cultivated public opinion. Other miscellaneous writings of these men, and of Dekker, Breton and others, are concerned with every variety of subject, and their models include Aretino, Rabelais, Dedekind, as well as other Continental writers of a wholly different type.

Literary criticism began in this period and employed for the most part the prose style whose tradition goes back to Ascham. In content and structure its models were Italian, either directly or through the French; and its significance consists in the fact that it was the means of introducing literary ideals which had been current in Italy for nearly a century. The group of the Areopagus, which parallels the Pléiade of France in a few more or less important respects, found its highest critical expression in the 'Defence of Poesy' of Sir Philip Sidney, written about 1580, and published posthumously in 1595. Sidney's ideals of prose style are not those of Ascham, but his practice here is without those excesses and affectations which in the 'Arcadia' furnish the model for a whole school of imitators. His book is an impassioned apology for the poetic art against the onslaught of the Puritans; but the objections which it refutes are universal, and its answers to these questions have in themselves, too, the temper of universality. There are parallels for all its ideas in the almost contemporary works of Frenchmen and Italians. They, too, from the dawn of the Renaissance, as in Boccaccio's 'Genealogy of the Gods,' which Sidney doubtless knew, had written defenses of poetry; but Sidney's is an English book, and in its passion, unity and general spirit seems the native product of Elizabethan genius. Puttenham's 'Arte of English Poesie' conforms more to the model of the formal treatises which the Italians devoted to the theory and practice of poetry. Its purpose, like theirs, is to consider the whole range of criticism; it deals with the history, dignity, forms, metre and ornaments of poetry, continually illustrating the theory both by example and by anecdote. The critical work of Jonson belongs to the Jacobean age, and its ideals and its style indicate the great changes that had taken place since the 'Defence of Poesy.' It is impossible to date the 'Discoveries' with any degree of certainty, but no word it contains antedates the death of Elizabeth. Jonson, despite the fame of this work, enunciates no single original idea in regard to the art of literature; but the luminous utterances of the later Latin rhetoricians, and the rational classicism of the Dutch critics, are alike embedded in his robust prose, and become an influence on English criticism even after the Restoration.

The formal treatise or preface was the vehicle of criticism in the Elizabethan Age; the chief vehicle which it was to use in future was introduced into England by Bacon at the very end of the 16th century. Montaigne is the father of the modern essay; and to him Bacon owed the name and a number of definite ideas. But in everything else no two works could differ more than theirs. The air of loquacity, the personal anecdote, the amused curiosity, the vivid imagery of Montaigne are not to be sought for in the essays of Bacon. The statesman utters his brooding thought in curt and clipt sentences; Seneca and Pliny here speak English; and the sententious manner enters our speech, destined to saturate prose and verse, and resulting after many changes in the pointed couplets of Pope. Each sentence is its own world and has its own message. Bacon, even in his scientific work, has been called a mere phrase maker by a modern scientist whose distinction in this respect is not unlike his own; in the essays this power is unrestrained by the need of argument and experiment. Emerson is the great American example of this dogmatic use of the disjointed sentence, and like Bacon he, too, has fed deeply on the thought of Montaigne.

A wholly different ideal of prose style, disdaining directness and simplicity, was current throughout the Elizabethan Age, and found its most natural expression in the novel. Fenton's version of Bandello, adapted through the French, and the varied collection of Painter's 'Palace of Pleasure,' introduced the Italian *novella* into England. Their interest is almost wholly in the story, and Herodotus and Boccaccio are made to speak the same language of fiction. In Pettie's 'Petite Pallace of Pettie his Pleasure,' which is modeled on the work of Painter, a new element intrudes itself, and the style which culminates in Lyly may be said to have been inaugurated. The sources of Euphuism have been sought in individual works of Continental literature, notably in those of Guevara; but modern scholarship finds in it simply one manifestation of a disease which was rife throughout Europe at this period, as a result of the disintegration of Humanism. The excesses of the Ciceronians find a parallel in the antithetical balance of Lyle's sentences; and the absurd imagery was a natural result of a literature which had exhausted its content and sought for originality in affectation of manner. This explains the kindred writings on the Continent; and although English prose was young, it could not fail to be affected by these influences. The well-known marks of euphuism, the so-called «parisonic antithesis,» the «unnatural natural history,» and the like, may all be explained on these grounds. 'Euphues' itself is in some senses a novel of psychology and character rather than of incident; but its chief purpose is the fashioning of a perfect gentleman after the manner of Castiglione's 'Courtier.' Here Lyly's purpose meets Spenser's; and 'Euphues' may be considered as the connecting link between the purely pedagogical treatise like the 'Scholemaster' and the final poetic idealisation of Renaissance education in the 'Faërie Queene.' The vogue of Euphuism is indicated by the number of its imitators; but it is unnecessary to consider the forms which Euphuistic romance assumed at the hands of Lodge, Greene and others.

Sidney is credited by his contemporaries, notably Drayton, with having put an end to this fashion; but if the 'Arcadia' is referred to, it can only be said that one affectation has succeeded another. The 'Arcadia,' which has come down to us as a large, posthumous fragment, is the chief representative in English of the pastoralized romance. It owes much to Herberay des Essarts's French version of the 'Amadis of Gaul,' and something to the 'Diana' of Montemayor; in it the Renaissance transmutations of Greek romance find a climax. The mannerisms of Sidney's style are not those of the archaic or affected word, nor of «unnatural natural history,» nor of alliterative antithesis; but the exaggerated imagery, the pomp, the prettiness of the Spanish romances are mingled in the 'Arcadia' in an inextricable jungle of sentence and paragraph. Its vices are those of *conceptismo* rather than of the parallel Spanish vice of *culteranismo*. The mild and modulated Ciceronianism of Hooker, and all of Latin *eloquentia* that Cheke and Ascham had hoped to introduce into English speech, are wholly absent. The 'Unfortunate Traveller' of Nash may be mentioned as an indication of a tendency antipodal to the chivalric pastoralism of Sidney; it introduces in a racier style a picaresque experiment in English fiction between the period of 'Guzman' and 'Lazarillo.' But the novelist and the preacher in general succumbed to the temptations of the ornate style: the novel throughout the period of its origins was tainted with Euphuism or Arcadianism, and pulpit oratory acquired a definite mannerism, which persisted until Eachard, Glanvill and other pamphleteers ridiculed it out of existence.

With the accession of James I Jacobean erudition and science superseded the creative impulse of the Elizabethans. Bacon and Jonson represent the new sententious manner at its best; other writers lose themselves in a sea of detail; still others add a hectic fervor to thought or feeling. But these things do not properly belong to the Elizabethan spirit. The opposition of the vernacular and ornate styles; the inauguration of formal criticism and prose fiction; the passion for controversy; these are the main impulses of Elizabethan prose.

ENGLISH LITERATURE, Victorian Period. The name "Victorian" is popularly given in honor of the late Queen Victoria (1819–1901), and the literature designated by that adjective is roughly coincident with her reign (1837–1901), and is limited to England. The death of Scott (1832) is commonly taken as the most convenient date for fixing the term to the brilliant literary movement of the last years of the 18th century and the early decades of the 19th: and, from this point of view, Victorian literature stands for the new literary impulses that succeeded the decline of the great work of Burns, Cowper, Wordsworth, Coleridge, Byron, Shelley, Keats, Scott and their contemporaries. The literary movement of the Victorian period may best be defined by the main tendencies in poetry, prose and the drama.

POETRY AND PROSE.

Poetry.—The first, the most popular, and the most prolific poets of the period were Alfred Tennyson and Robert Browning. Three main interests may be observed in their work and that of their contemporaries and successors. The ideal interest in humanity, best represented in the preceding epoch by Shelley, found its most vivid expression in Browning, whose work, at first written under the spell of the great lyric poet, early took on those traits of vigorous interest in the experiences of mankind which are the source of its originality and popularity. Browning's poems are distinguished for their pervasive feeling for the moods and the experiences of many people of all ages and for the dramatic vigor of their expression. In these respects he represents a very important movement of the century, and many of the same characteristics inform the poetry of his wife, Elizabeth Barrett Browning.

In the second place, the serious moral poetry of Wordsworth, the poetry "of man, of nature and of human life," justly celebrated as one of the chief glories of English literature, had a legitimate successor in the grave, reflective poetry of Matthew Arnold and Arthur Hugh Clough. They began writing a few years later than Tennyson and Browning. Like many of their contemporaries, of whom they are the best mouthpieces, they were oppressed by the melancholy of life, and, to a greater degree than their literary prototype, they deal with morals, with duty, with the vanity of human effort and with "the eternal note of sadness." Their poetry, particularly that of Arnold, is brilliant in style and finely finished, and a high place is accorded to them as exponents of the graver and more solemn side of the poetry of the century. Their temper is expressed in a more sentimental strain in such poets as Arthur O'Shaughnessy.

Contemporaneous with the decline of this impulse, which spent itself in the endeavor to express some solution of the enigma of existence, there arose the third school of poets, who, foregoing this quest, gave themselves up to the search for beauty of form and sentiment, who busied themselves with the retelling of old tales, who were concerned with romance, and who strove, for the most part, to recreate a picturesque and ideal world. Three names stand out conspicuously; the painter-poet, Dante Gabriel Rossetti; William Morris, poet, story-teller, socialist and manufacturer; and Algernon Charles Swinburne. With them is to be named Christina Rossetti, sister of D. G. Rossetti.

In some respects, Tennyson more than any other poet of the century is representative of these three groups. Beginning, in his first volume (1827), under the spell of Keats, he had within a decade produced much original work and by 1860 established his reputation as the best-beloved poet in England. In much of his earlier work, he treated subjects from human life not unlike those of Browning, though with more calm and repression and less lively vigor. The ethical ideas of his time found, as in Arnold and Clough, a current and lasting expression in many of his shorter lyrics, such as 'The Two Voices' and 'Locksley Hall,' as well as in the longer 'In Memoriam' (1850) and as 'Idylls of the King' (1858–). Throughout his poetical career, Tennyson was a most distinguished and careful workman, and in this respect he is akin to the poets who were spoken of in the third group, as, like them, he is, in some respects, a reteller of tales. Unlike them, however, an ethical and not chiefly an æsthetic motive is dominant in him.

Besides these chief poets, there should be mentioned William Barnes, the painter of the homely life of Dorsetshire; two distinguished writers of *vers de société*, Frederick Locker-Lamson and Charles Stuart Calverly; Tennyson's own less celebrated brothers, Frederick Tennyson and Charles Tennyson Turner, Coventry Patmore and many other poets who have written in a touching way of simple things; and above all, Edward Fitzgerald, whose translation of the 'Rubáiyát' of Omar Khayyám is not only classical in its finish but also not unrepresentative of much of the melancholy of the poetry of the century. Of contemporary English poets, the greatest amount of popular fame has fallen to Mr. Rudyard Kipling.

Prose.— Important as is the poetry of the era, it is many ways surpassed by the amount and richness of the prose. During the period the great popular form of imaginative literature was the novel. Sir Walter Scott, in the preceding part of the century, did more than any one else in the history of English literature to establish the widespread vogue of fiction, and in the field of historical romance he remains an object of the detracting envy and real despair of his successors. The main development of the novel in the Victorian period was, however, along a different line from that established by Scott, whose more immediate successor, Edward Bulwer-Lytton, a prolific writer, marked a decadence of the romance from the standard of the great master. Rather the novel developed according to the principles laid down and exemplified by the great writers of the 18th century, Richardson, Fielding and Smollett, and brilliantly carried on in the early 19th century by Maria Edgeworth and Jane Austen. Accordingly the great fiction of the Victorian period is largely realistic in tendency. The most brilliant and most popular, as well as the earliest of the men of the period, was Charles Dickens, who, in the type of story and the method of narrative, followed the school of LeSage and Smollett, but added to the English novel, considered as a whole, a new kind of buoyant humor and a warm and polemic hatred of wrongdoing and oppression. Almost contemporary, though flowering later and declining earlier, was William Makepeace Thackeray, often spoken of as the chief of English novelists. Like that of Dickens, his material was largely drawn from contemporary life, but he wrote of higher social strata, and viewed his world more as a panorama, calmly and with less personal intensity and less polemic sense. Almost contemporary with the finest work of these masters, was represented a very different and highly original impulse in Charlotte Brontë, whose 'Jane Eyre' (1847) is the prototype of the intense personal novel from time to time in vogue.

Of the types of material furnished by these novelists, that represented by the humanistic novels of Dickens was the most conspicuous in the group of slightly less great novelists of this early Victorian period. The purposeful spirit found a very interesting expression in the religio-historical, and modern ethical, novels of Charles Kingsley, the gist of whose teaching is that no earthly happiness exists, save in the surrender of self to the faith of Christianity (understood in an Anglican sense); in Elizabeth Gaskell, whose classic and charming 'Cranford' (1865) is less representative of her interest in social questions than such earlier novels as 'Mary Barton' (1848); and in the vigorous and voluminous Charles Reade, who, besides being a writer of historical fiction, was also a vehement champion of the oppressed and a challenger of injustice. These writers were, in many respects, akin to Dickens. The most distinguished representative of the more realistic school, in many respects a follower of Thackeray, was Anthony Trollope, a writer of pleasant stories of English life, and one of the most consistent of the realists.

Charlotte Brontë and her sisters may be called specialists in representing emotional intensity. The term "specialist" may also be applied to several writers of the early Victorian period. Frederick Marryat was a specialist in the writing of sea-stories, and some of his nautical creations are famous. Charles Lever dealt chiefly with the military hero. An interesting picture of the out-of-the-way life of peasants and gypsies is to be had in the works of George Borrow. A popular writer on school and college life was Thomas Hughes. There may be named also Benjamin Disraeli, G. P. R. James, Samuel Lover, and of a somewhat later period, contemporary with George Eliot, Richard Doddridge Blackmore and Margaret Oliphant.

Since the time of the great panoramic novelists of the early Victorian period, the novel has tended to specialization, such as has been described, though of a larger kind. Among writers belonging to the so-called later Victorian period, stands out the name of the great specialist in states of the human mind, in questions of duty, in ethics, "George Eliot" (Marian Evans Cross). Though in one or two novels, as 'Middlemarch' (1871–72), she attains the panoramic view and produces classical types, her interest was chiefly centred in the problems mentioned, which she illustrated, for the most part, in the lives of people of humble and rural circumstance. Her artistic aim was to make interesting the life of the lowly. Contemporary with her, but continuing his production down to a much later date, was Mr. George Meredith. In a series of powerful novels, he exhibited various phases of human temperament, and has tried to express what is most native and fundamental to human action. He was the foremost living English novelist of the day with the possible exception of Mr. Thomas Hardy, who is still with us; the latter however, has, in a long series of brilliant novels, been less concerned with the problems of the individual soul and the expression of types of human temperament, than with the workings of an external and unaccountable chance and caprice in human destiny, and in this respect, as in his beautiful pictures of rural life, Hardy also is a great specialist. With them, in a totally different field, that of the romance built on the tradition of Scott, but embodying more allegorical and figurative elements, is Robert Louis Stevenson. The most brilliant and popular work of Mr. Rudyard Kipling also belongs to this period.

Quite as important and striking as either the poetry or the fiction of the Victorian period is the large body of humanistic, critical and scientific prose that is regarded by Victorian writers as among the chief glories of English literature. During the period, the essay form, owing largely to the growing prevalence of magazines and reviews, was, and still is, in vogue, but it was used more and more widely for other than strictly literary purposes. There have been practically no important successors of such essayists as Lamb, Hazlitt and DeQuincey (who, like Landor, falls also within the early Victorian period). The ancestry of the literature of 1830–1900 is rather to be traced back, in humanism, to Burke and the French Revolution, with some diffusion and dispersion; in criticism, to Coleridge; in history, to Gibbon; in economics, to Adam Smith and Bentham; in science and philosophy, to Hume and Bentham; with the infusion, from time to time, of ideas from Germany.

This last was the initial source of inspiration of one of the greatest humanists of the century, Thomas Carlyle. Beginning with translations of German writers and essays and excursions into German ideas, Carlyle, not far from the opening of the reign of Victoria, became at once the prophet and the scourge of his countrymen. Moved by the same spectacle that had stirred Dickens and Kingsley, he proceeded somewhat illogically but very eloquently to demonstrate the futility of contemporary institutions, to decry the impotence of the democracy, and to point out the one way of salvation, the dominance of the "hero" whom he illustrated in several important works, as 'Heroes and Hero-Worship' (1841); 'Cromwell' (1845); and 'The History of Friedrich II' (1858–65). It would be wrong to say that the mantle of Elijah fell upon the Elisha of John Ruskin, for the careers of the two overlap by many years. But Ruskin continued vehemently the task of upbraiding his countrymen for their failure to observe what was of good report. Starting his career as a critic of art, and trying to reform the taste and the æsthetic manners of the time and to lead his readers back to a true idea of the beautiful and the good, he, by the middle of his career, 'Unto This Last' (1860), broadened the scope of his interests so that they included economic and social, as well as literary and artistic, questions. His influence has been very widely diffused, like that of Carlyle, and their contemporary humanist, Emerson. A third great chastiser of the evil which men do and think was Matthew Arnold, already mentioned as a poet. From about 1870 to 1880, his literary energies, originally devoted to poetry and next to literary criticism, were directed toward trying to make his stubborn island countrymen think rightly on political, literary and religious matters in accord with that formula which he continually characterized as "culture."

With these spiritual guides is to be named the great humanist, the friend and contemporary of Carlyle, John Stuart Mill, who, besides being an admirable technical student and expounder of logic and political economy, attempted to disseminate the principles of moderation, of justice, of right reason, and in all his works, as in his famous essays 'On Liberty' (1859) and 'The Subjection of Women' (1869), sowed the seed of righteousness. For a discussion of Mill's work as an economist and a philosopher, the general articles and the special article on Mill should be consulted, since it is out of the province of the present article to touch on scientific studies of the century except in so far as they relate to literature.

The humanistic movement in its earlier phases is often regarded as an aspect of what is called, for the purposes of classification, the romantic movement, the impulse, that is, which expressed the desire for individual expansion rather than the submission to the limits imposed by authority, and which implied the manumission of the human spirit and intellect from current and traditional bonds. In the religious field, the so-called Oxford Movement of 1833–41 is sometimes called romantic in that it was the work of a few young men who revolted at the religious custom of the time and endeavored to re-establish an earlier, and as they conceived it, a purer form of belief and worship. The Oxford Movement received at once its best exposition and severest criticism in the controversial autobiography of the originator of the movement, 'The Apologia Pro Vita Sua' of John Henry Newman, written in defense of his conversion to Catholicism. Newman stands in English literature as one of the great masters of finished prose of a formal but winning cast and as a specialist in somewhat technical religious controversy. The orthodox Anglican feeling of the time is best represented in the sermons and writings of Frederick Denison Maurice, Frederick William Robertson and Charles Kingsley, the novelist.

The more strictly critical movement, as related to literature, goes back to Coleridge and Germany. The dogmatic manner and air of finality which distinguished the pronouncements of the Edinburgh and Quarterly reviewers, found its descendant chiefly in the common-sense criticism of Macaulay. Most of the critics of the early decades of the century, Lamb, Hazlitt, De Quincey and others, were, in one way or another, frankly personal or deliberative rather than ex cathedra in their attitude, and in Coleridge criticism tended to the ascertaining and expounding of principles rather than the assertion of dogmas. The early work of Carlyle, the next important critic after the group just named, was largely critical, and it busied itself with the exposition and interpretation of Schiller, Goethe, Richter and other contemporary German writers, for the benefit of his countrymen. Carlyle, however, was too busy exploiting the doctrine of the "hero" and sounding the sins of his fellow men to become a literary critic of lasting influence. The main stream of critical tendency, up to the time of the modern scientific and philological schools, had sprung from the stimulating power of the German-derived Coleridgeianism. The chief tenets of that influence were the casting aside of authority in favor of appreciation: any work of art contained in itself the reason why it was good: and consequently an author's purpose, his range, his total production and his vogue were things to be taken into consideration. This principle passed naturally in the later Victorian period to the criticism of types, wherein criticism tended to become characterization rather than censure or commendation. Two great critics are illustrative of the tendency: Walter Bagehot (1826–88), unexcelled for the vigor and brilliancy of his characterizations of types of mind and art, and Walter Pater (1839–94), the polished expounder of artistic personality. The same tendencies, with different material and different emphasis, are to be observed in the work of such distinguished modern critics as Leslie Stephen, John Addington Symonds, Viscount Morley (1838–), and others. Matthew Arnold, poet and humanist, second to none in importance as a critic, represents a reaction in favor of a more abstract and ideal standard. Historically important as having done much to enlarge the confines of English criticism and to rid it of insularity, he, nevertheless, was at variance with his contemporaries (as in matters of religion and politics) in asking for more authority and standardization of judgment, which standard is largely a matter of his own predilection.

Much of the critical study of literature during the period was dominated by the historical and the scientific method. That aspect of criticism, except in such invaluable work as Stephen's 'Dictionary of National Biography' and other excellent biographical works, is, however, less important in the field of literature proper than that of history and science. Though these subjects do not properly enter into the present article, they are so important that mention of them cannot be wholly ignored. In history, besides such men as Carlyle, who wrote histories, and Symonds, the historian of the 'Renaissance,' there were, in the Victorian period, since the time of Hallam, such distinguished names as Milman, Grote, Macaulay, Harriet Martineau, Kinglake, Froude, Buckle, Freeman, Gardiner, J. R. Green, Lecky and Viscount Bryce. In philosophy and science the names of Lyell and Spencer are eminent, and the theory of natural selection as presented by Darwin and expounded by Huxley has profoundly influenced the whole train of 19th century thought since the publication of 'The Origin of Species' (1859).

Bibliography.— References are so numerous that it is impossible for the preceding and the following section to make more than a general reference to the lists contained under the articles on the writers specifically named, though such books as Saintsbury's 'History of Nineteenth Century Literature'; Stedman's 'Victorian Poets'; Stopford Brooke's 'English Literature'; Palgrave's 'Golden Treasury' (second series), and G. K. Chesterton's 'Victorian Literature' may be cited.

WILLIAM T. BREWSTER,
Professor of English, Columbia University.

DRAMA.

At the beginning of the Victorian period, the English stage was still contentedly supporting the traditions of two preceding centuries. The objects and methods of both actors and plays were practically the same as they had been at the Restoration. In both, the rhetorical style prevailed. The two Patent theatres created by Charles II still had the sole privilege of playing the legitimate drama, and Macready was striving to perpetuate the histrionic tradition which went back through Edmund Kean and John Kemble, to Garrick and to Betterton. The plays themselves still kept, with slight modifications, notably in the direction of morality, to the Restoration models, of comedy which derived from Molière with a slight infusion of Jonson; and of tragedy which was either Elizabethan simple or Elizabethan Restorationized. Since Goldsmith and Sheridan, literature had showed a widening separation from the stage which almost to their time had been its chief mouthpiece. This had been mainly brought about by the great extension of journalism and, later, by the signal success of the novel in the hands of Scott. These two forms of literary endeavor were offering larger and securer returns than play-making, and thus naturally drew away from the theatre men of mark and left only the adapters and the hacks. Such was the position at the outset of Victoria's reign. Dramatic history during her reign is, until the very latter end of it, one rather of movements than of men. The changes which were to take place during her occupation were brought about by social, economic and physical, as well as literary forces; for more than any other artistic activity, the stage is responsive to the conditions under which it exists. These changes embraced the decay of the old traditions, the even wider separation of the stage from literature, the birth of a new drama followed by a partial return of literature to the stage, and finally the growth of a serious conception of the drama as a criticism of life, a conception already achieved by other European nations.

London, during the first 40 years of the century, had more than doubled its population, and, as a result, the Patent theatres were on all sides encroached upon by minor theatres which, in spite of their legal disabilities, proved formidable rivals. When the Act of 1843 abolished the privilege of the Patent theatres, an era of more active competition began. This competition naturally relied upon display as its best means of advertisement; and the invention of gas and lime-light about the same period—inventions of great significance to the stage—confirmed the universal tendency toward the spectacular treatment of plays. Inevitably there set in the decline of the rhetorical drama, the appeal of which, on a poorly-lighted stage, was primarily to the ear and not to the eye. Meanwhile another cause was contributing not only to destroy the rhetorical tradition but to widen the gap between literary men and the theatre. What small demand there was for original work would doubtless have in time recalled writers from the novel and the newspaper, but unfortunately the demand, just beginning to be felt in the early Victorian period, was checkmated by an outside influence. The Romantic revival in France had suddenly broken away from the frigid classicism, so unattractive to English audiences, and Hugo had ushered in a kind of play which the English found more to their taste. These new plays proved easily imitable and adaptable in London, but the habit of importation did not become wholesale until the advent of Scribe. Scribe perfected the mechanics of story-telling in dramatic form, and in so doing largely deleted everything else from a play — witty dialogue, atmosphere, locality, and characterization. Thus his plays, being simply stories, could be given anywhere with equal effect, and as London managers could get them for nothing, his output and that of his school became an inexhaustible storehouse for adaptation.

The result upon the home product was twofold. It reduced to a minimum the meagre band of English writers, and those that remained no longer even attempted to represent English life and thought. Instead, they provided for the public an impossible *mélange* of French ideas and emotions served up in British dishes. In the second place, the adaptation and imitation of Scribe's methods proved the finishing blow to the moribund rhetorical conception of comedy by bringing in a French realism of mounting and stage-setting. When a stage room had three sides, a ceiling and real doors, many conventions of action and dialogue, unnoticed when an interior consisted only of wings and a back-drop with painted chairs, became ridiculous and unendurable. Thus gradually a new ideal was developed, by which the play was forced to move a little nearer to the life now in a material way presented with considerable reality. Internally, however, the plays remained as artificial as they had been before, their characters puppets impelled by theatrical and absurd sentiments and exhibiting the crudest of psychologies. The main dramatists of the period which this development closes were Bulwer, Tom Taylor and Charles Reade, and Dion Boucicault. Bulwer, under the influence of the Romantic revival in France, produced 'The Lady of Lyons' and 'Richelieu,' and his comedy 'Money' shared the distinction of being the last representation of rhetorical comedy with Boucicault's 'London Assurance' and 'Old Heads and Young Hearts,' with Taylor and Reade's 'Masks and Faces,' and with Taylor's 'Still Waters Run Deep.' Boucicault, the arch-adapter and plagiarist of the period, had the good fortune to hit upon a type of his own in his series of very successful Irish plays, but they are no nearer real studies of life than the others of the period. The predominance of Scribe and his school had paralyzed native authorship.

Into this lifeless world came T. W. Robertson — a dramatist whose pleasant work has no great intrinsic value, although he possessed a strain of original genius — to create a new form of drama. It ignored not only the old rhetorical tradition but the new French-English mongrel species. It was merely the comedy of manners clothed in natural speech and realistic setting, but it seemed absolutely original and spontaneous. It viewed the commonplace social relations from the outside, with a naïveté and humor which disguised to an unsophisticated public the insipidity of its characters and the shallowness of their sentiments. Though he brought new life to the drama, fortunately his school, represented by H. J. Byron and Albery, did not long survive him, else the stage would have found itself in almost as lifeless a way as when he rescued it and with an artificiality different from, yet as great as, that against which he effectively protested.

Though W. S. Gilbert could not be called a follower of Robertson, he made the same protest against the fustian of the stage, and carried on the verbal flippancy which had vied with sentimentality in the latter's plays. So thoroughly original was he that only the adjective Gilbertian can cover the precise blend of wit, delicate fancy, satire and extravaganza, which achieved some brilliant successes on the legitimate stage and which finally secured the aid of musical accompaniment in a long series of comic operas that stand, like their author, in a class apart.

In spite of Robertson and Gilbert, however, the theatre lapsed again into a period of adaptation from France. But there, meanwhile, had sprung up a larger type of social drama than that of Scribe,— a type of which 'Diplomacy' is an illustration,— and imitation of this wider species was less deadening than the former had been. When, however, international copyright was at last secured and French works could no longer be adapted for nothing, the effect of fair play for the English dramatist was seen almost immediately. A group of young writers arose who, beginning as imitators, were soon applying French methods to original and native purposes. Of this group, Mr. A. W. Pinero and Mr. H. A. Jones were pre-eminent. They sought their material at home and, observing carefully, reproduced sincerely. Another decade had to pass in experiment before these men really undertook a drama which evinced anything like a serious psychology and a vital relationship with life. Not until 1890 did they dispense with elementary love-idylls and the kind of story which had been up to that time inevitable to every play, or set out definitely for a more thoughtful and virile drama covering the field of social intercourse. Following their lead, Oscar Wilde and Mr. Bernard Shaw developed the social comedy into a more serious content. Wilde's pyrotechnic brilliance of dialogue and inverted epigram concealed at first his genuine dramatic quality and adroit constructiveness as a playwright. Mr. Shaw took up the stage as a lively form of presenting himself and his social propaganda, but, though his brilliant plays hardly succeed as drama, there can be no question of their success with the public and as literature. These men with Mr. Pinero and Mr. Jones have once more elevated the English drama not only to the level of Continental drama but of the literature of their own land.

The poetic drama during the reign is represented by Westland Marston, Talfourd, Browning and Tennyson. The formal dramas of the first two are long forgotten. Masterly as are some of Browning's plays, they seem remote from the purpose of the stage, and when some of them got there it was discovered that they could be only recited, not acted: at any rate, they can be successful, if at all, only in the manner of the rhetorical tradition for which they were conceived. Tennyson's plays, although loosely constructed in the loosest of Elizabethan formulas,— the chronicle history,— have been acted with considerable success. This was due, no doubt, to the circumstances of their production, for his fine verse lacks vigor and he has not seized upon the essential moments of his stories, the crucial parts of most of his dramas taking place behind the scenes. In 'Queen Mary' and 'Harold,' however, he presented genuine dramatic material. If the taste for the poetic play can be revived in the future, it must be as drama first and poetry afterward, and drama conceived in a modern rather than Shakespearian type.

Algernon Tassin,
Lecturer in English, Columbia University.

ENGLISH MAIL COACH, The. Thomas De Quincey's 'The English Mail Coach' consists of three sections, the first of which appeared in *Blackwood's Edinburgh Magazine* in October 1849, with the added title, 'On the Glory of Motion,' and with no intimation that more was to follow. In December appeared what the author subsequently, in the collective edition of his writings, called 'Section II, The Vision of Sudden Death,' and 'Section III, Dream-Fugue, Founded on the Preceding Theme of Sudden Death.' It would seem that the 'Dream-Fugue' was composed in 1844 (when De Quincey had virtually conquered the opium habit), and the two introductory sections five years later; these are, then, subordinate to the 'Dream-Fugue,' which is a specimen of De Quincey's rhythmical, «impassioned» prose — the medium which, for his special purpose, he preferred to metre. 'The English Mail Coach' being a kind of sequel to 'The Confessions of an English Opium-Eater,' the 'Dream Fugue,' as the author would have us believe, constitutes one of the poetical dreams, full of beauty and terror, which arose from his indulgence in opium, though based upon actual occurrences in his life. Accordingly, in Section I, his experiences while a student at Oxford, traveling to and fro by coach during the time of the Napoleonic war, are related, with much circumstance and digression, in a less impassioned style; in Section II is recounted an accident on the high road, in which a young man and girl in a frail carriage narrowly escape destruction from the flying mail coach; and in Section III suggestions from these themes are elaborated in a highly ornate style, the «music» of which is indeed beautiful, though the value of the content is slight. The allusions to Waterloo, and to the way the news of the battle spread through England, give the document an interest for the historian. Consult Hart's edition of 'The English Mail Coach' (New York 1893); and Cooper, 'The Prose Poetry of Thomas De Quincey' (Leipzig 1902).

ENGLISH MERCURY. See Chenopodium.

ENGLISH PALE, the name formerly applied to extraterritorial districts in Ireland, Scotland and France, staked off by pales or poles from the surrounding country, marking definite boundaries, these districts being governed by special laws. The pale in Ireland was established in the reign of Henry II; its extent varied under different kings; from the time of Henry VIII until the subjugation by Cromwell, it comprised most of the modern counties of Dublin, Louth, Meath, and Kildare. In 1558 the «English» or «Calais Pale» in France extended from Gravelines to Wissant. An English Pale also existed in Scotland, for a short period under the Tudors. See Pale.

ENGLISH POETRY, Spasmodic School of, an epithet first applied to Byronic verse by Carlyle, and subsequently by Professor William Edmonstoune Aytoun to a group of minor poets of the middle 19th century. The school was said to include Philip James Bailey, Sydney Thompson Dobell, Alexander Smith, George Gilfillan, John Stanyan Bigg, and according to some critics, Gerald Massey and even Swinburne. The Byronic «weltschmerz,» world-pain or cosmic agony, spasmodic strivings after unattainable ideals, discontent with life and its mysteries, sceptical disquietude, vain effort and resentment against unrewarded labors, characterized their writings, which, however, were frequently marked by passages of considerable merit, and were a faithful reflection of a struggling phase of contemporary thought. In 'Firmilian: A Spasmodic Tragedy,' Professor Aytoun in 1854 attacked and parodied the writings of the school with considerable success, ridiculing their subjects and imitating their ponderous style, especially the works of Bailey, Dobell and Alexander Smith. See biographical articles of the writers mentioned and consult Martin, (Sir) T., 'Memoir of W. E. Aytoun' (London 1867).

ENGLISH SNIPE, a name frequently used for the common American snipe or Wilson's Snipe (*Gallinago Delicata*). There is, however, an English snipe proper (*Gallinago Gallinago*), which is almost indistinguishable from the former and has its habitat in the north of Europe. See Snipe.

ENGLISH SPARROW. See House Sparrow.

ENGLISH TAPESTRIES. See Tapestries.

ENGLISH VERSIONS. See Bible.

ENGLISHRY, or ENGLESCHERIE, an old Norman law term, which originated after the invasion of England by William the Conqueror to designate the identity of a person found slain, as a native. If the body was unidentified, the law presumed that the person was a Norman, vindictively slain, and where found, the community of 100 was fined. If the Englishry of the victim was established, the fine was remitted.

ENGRAFTING. See Graftage.

ENGRAILED, a heraldic term used to designate a line made up of concave semi-circles. See Heraldry.

ENGRAVINGS. For humanity's great indebtedness to the art of pictorial reproduction it would be difficult to claim too much. Next in importance to the art of printing, as an aid in the history of the advance of civilization, certainly comes that of illustrating. The growth in the art of the manifold reproduction of pictures is one of great interest, as well as importance, and many books have been dedicated to an exposition of our best engravers and their productions, known to the connoisseur as «prints.» And among connoisseurs of art their collections of *prints* hold a very favorable position.

Etching.— This process is carried out on a copper plate having its upper surface highly polished. This plate is heated and then coated with an acid-resisting substance, usually a mixture of burgundy-pitch, asphaltum and beeswax. Cold applications of certain pastes composed of materials dissolved in oil of lavender or chloroform are sometimes used. The plate next receives a coating of lamp-black. This prepared plate has the drawing scratched through the surface coating by means of etching-needles. All work is drawn in reverse (*negative*) of the actual desired impression. The back of the plate is next coated with varnish (the process is termed «stopping-out»). Now the plate is immersed in an acid for the process of «biting in.» Those lines which are to remain the finest are *stopped out* by varnish early, then the plate is returned to the acid bath to attain the deep black lines. When the process has been carried on till the artist is satisfied with the condition, the varnish and wax are cleaned off and the plate is ready for the press. Next the entire upper surface of the plate is coated with ink, the channels made by the acid being also filled; then the ink on the upper surface is cleaned and a copper-plate press takes an impression (called a «print») on damp paper. *Dry-point Etching* is done by engraving the design directly into the metal with a needle (using no acid). This scratching of a furrow leaves a «burr» (or raised ridge of the erased metal) on either side of the channel; the effect of this burr on the impression is characteristic of a dry-point print. Etching, unlike engraving with a «burin» (graver) is done as rapidly as the genius of the operator permits, and therefore is a process frequently used by painters. Among the early painter-etchers were Albert Dürer, Lucas van Leyden, Vandyck, Rembrandt, Agostino, etc. Rembrandt was the first exponent of the art of etching (17th century) besides producing the grandest work known. Among other well-known early etchers were Van Vliet, Ostade, Paul Potter, etc. In England were Barlow, Gaywood, Hollar, Place; and in France, Callot, Bosse, etc. In the 18th century were Hogarth, Claude Gelée, Guido Reni, Canaletto, etc. In the 19th century were such masters as Ingres, Corot, Méryon, Jacquemart, Seymour Haden, McNeil

Whistler, Joseph Pennell. Most noted of etchings are, probably, those from the drawings of Claude, reproduced by Richard Earlom in the great 'Liber Veritatis' (1740–1822).

Wood Engraving.— Here the technique is just the reverse of etching, inasmuch as the parts to appear in black or color are left the height of the surface, while the background (white) is cut away. Our earliest woodcuts are German (middle 15th century) and the practice grew up with the sister art of printing. Albrecht Dürer and Hans Holbein greatly aided the advancement. To the early school of wood engravers belong such names as Lucas Cranach, the Behams, Lucas van Leyden, Altdorfer, Burgkmair, Baldung, Ammon, etc. The 17th century witnessed the decadence of wood engraving, but in the 18th century it was revived. The early workers had engraved on the plank or with the grain; in the revival a modern method of engraving across the grain on boxwood blocks was used. The «white line» now appears, produced by means of making cuts into the wood surface. Thomas Bewick (1758–1828) was one of its earliest exponents. The prints of this period show clearly the merits of the changed system, allowing such delicate treatment. Among its exponents are Whymper, Baxter, Thompson, Linton, Harvey, etc., in England; Vogel, Ungelmann, Kretchner, Pfnorr, Weber, etc., in Germany; the Pannemakers, You, Pisan, Colin, Valloton, etc., in France; Veldheer, Nieuenkampf, etc., in Holland. But another process of wood engraving was brought about by the fact that wash drawings on the block permitted light and shade effect to be engraved through the painting. This soon put the original work in the hands of draughtsmen to be engraved by what soon became an artisan engraver class. Decadence set in and the first half of the 19th century found its art work done in the metal (steel). Periodicals (started by the *Illustrated London News*, in 1842) brought back work again to the engravers as wood engravers, because they could put wooden engravings on the press with the type, whereas the metal plate engraving had to be printed from separately. The Victorian School of wood engravers arose from illustrated volumes on India paper for which such artists as Rossetti, Millais, Hughes, etc., did drawings on the block and «facsimile» work was done by such geniuses of interpretation as the Dalziel brothers and Swain. Birket Foster did fine drawings as did also North, Lawless, Small, Boyd, Houghton, Sandys; even Burne-Jones and Whistler did a few. Noted 19th century wood engravers were Roberts, Thomas, Babbage, Comfort, Cooper, etc. Furnishing drawings from artists quickly led to photographing the picture on the block and reproducing directly (in positive). But wood was not adapted to stand the heavy wear in producing prints on a large, popular scale, hence metal casts were invented to preserve the original (*clichés* they were termed). In America, *Harper's Magazine* and, later, the *Century* helped the cause of the wood engraver and they did better justice to the artists' originals, bringing out the tones displayed in chalk or wash drawing.

Line Engraving.— Here the engraving is done by a graver (*burin*) of prism form which scoops out a strip of the metal nearly free from «burr,» and easily scraped. After cutting out all the lines that go to make up the picture, ink is applied, filling up the lines. Then the surface is cleaned and an impression (called a print) is taken on damp paper on the press. Line engraving is a 15th century invention of the Italian goldsmiths, who themselves were artists, and did fine line engravings. In Florence were Botticelli, Baldini, Fra Lippi, Robetta. Andrea Mantegna worked in Padua; Marc Antoni in Bologna; Francesco Francia in Venice; Raimondi in Rome, etc. Clever line engravers in Germany were Albrecht Dürer, the van Mechens, Schöngauer, Aldegrave, Altdorfer, the Behams, Pencz, etc.; and in Holland Rubens and Vandyck, with their pupils. In England were Holl, Pelaram, Payne, Cecil, the Audrans, Nanteuil, Roullet, etc. Also numerous 18th and 19th century engravers did fine work all over Europe.

Stipple Engraving.— This process consists of producing a series of dots so related to one another as to size and distance that the combination produces the desired picture. The usual method is to produce the marks by etching, to be further manipulated with a specially prepared graver. While a pure stipple engraving consists of dots solely, the line engraver frequently used the stippling method to obtain softness in flesh shading. Crayon drawings were in vogue late in the 18th century so that stipple engraving (best suited) was quite common then in reproducing the crayon cartoons of Fragonard, Watteau, etc. The greatest exponents of this style were Francisco Bartolozzi (1725–1815) and his school. Stippling never found much favor on the Continent. Wynne specialized largely on Angelica, Kaufmann on drawings and portraits; other noted names are Bond, Bromley, Cheesman, Blake, Picart, Stoddart, the Holls, Heath, etc.

Steel Engraving.— The introduction of soft steel (1822) by Thomas Lupton for engraving mezzotints brought with it two changes. Commercially the plate was more profitable, producing about three times as many impressions as the copper; and the harder metal permitted much more minute and delicate work to be done. To the untrained eye the difference in ordinary line work is very slight. The incision of the tool is less deep in the harder metal forbidding the bold gradations of line that copper permits. In etching the ink does not produce from steel as artistic an impression as from copper and is easily recognizable. In mezzotints the steel medium produces a «thinness» not seen in copper work. Most steel engravings are done by etching and later improved by the graver. The stages («trial states») through which a steel engraving progresses to a finish are so widely apart that the work was frequently divided among several engravers, each having his special part. This commercialization soon brought decadence, the work becoming mechanical. Work of good merit was done by the following, among others, engravers: Fittler, Heath, Smith, Bromley, Danforth, Doo, Goodall, Raimbach, Holl, Le Keux, Finden, Greatbach, etc. The later invention of giving a steel coating to a finished copper plate engraving made the old medium as commercially productive as the steel, and soon ended the career of the latter.

Turner Prints.— The great engravings «after Turner» are generally treated to a special classification. The great painter Joseph Mallord William Turner (1775–1851) did entirely finished engravings himself but in most cases confined himself to outlines of the reproductions of his own drawings, and left the continuation (always under his close supervision, however) to other engravers. «Turner prints» range from 1794 to 1856 (five years after his death. The most noted collection is a series of 71, engraved for his great 'Liber Studiorum.' Assisting him were such engravers as Basire, Pye, Dunkarton, Clint, Lupton, etc. Turner's medium was mezzotint. Another noted series is his 'Southern Coast,' Whitaker's History of Richmondshire,' etc.

Mezzotints.— In this process the plate is given an immeasurable number of small «burrs» or sharp projections. This work is termed «grounding» and is done with a «cradle» or «rocker,» an instrument consisting of a curved blade similar to a cheese cutter. This is *rocked* from one side of the plate to the other and its teeth create a jagged line (termed «way»). Starting at the top the «ways» are made in parallel till the last one reaches the bottom of the plate. Next these rough lines are made from top to bottom, at right angles to the last ones, then others are done diagonally at every possible angle gradation. The picture is produced on this roughened surface by tooling away the burrs for the lights with a «scraper»; the high lights being next brought out by polishing parts with a «burnisher.» The method allows great delicacy in «tones» closely similar to those of a painting. The process was invented by Ludwig von Siegen (1640). Noted mezzotint engravers were Sherwin, Place, Blooteling, Vandervaart, Beckett, Faithorne, Lutterel, Simon, Pelham, Beard, McArdell, Houston, Miller, Spooner, Purcell, Frye, Green, Earlom, etc.

Aquatints.— In this process the surface of the plate is prepared with a «ground» of resin of finely granulated consistence. The drawing is done with the penetration of the etching needle exposing the plate to the acid. The beauty of the aquatint depends upon the various depths to which the acid bites into the metal. Certain parts are «stopped out» with the resisting substance (where only shallow lines are desired) early in the bath, the plate being again immersed for deeper lines, then other lines «stopped out,» and the plate returned to the acid. This process is continued for perhaps a dozen bitings, each application creating another tone. When finished the work resembles an Indian ink drawing. Noted workers in this method were Le Prince, Malton, Stadler, Lewis, Sutherland, Turner (C.), Metz, Havell, Prout, F. Goya, Delacroix, etc.

Clement W. Coumbe,
Technical Art Expert.

ENGROSSING, in law, an act which, on statute books, when the natural laws of trade were little understood, and political economy not even guessed at, was set down as a crime. It consisted in something similar to what nowadays is known as «cornering the market» by buying up the crops or the herds wholesale (Fr. *en gros*) before they were fit for use, in order to retail them at a great profit when they matured and were available for consumption. The offense was not only a statutory offense in England, but a crime in common law, and from the time of Edward VI to that of Queen Anne laws were repeatedly passed for its repression. Even in the last century a prosecution for engrossing was witnessed in an English law court. In 1844 all English, Irish and Scottish statutes, in respect to the offenses known as forestalling, engrossing and regrating, or retailing at a profit, were repealed. In more recent times there has been a good deal of litigation in the United States, and much discussion all over the civilized world with regard to the legality of corporations formed for the express purpose of monopolizing the trade in certain necessities or luxuries of life. (See Combination; Monopoly; Restraint of Trade; Trusts). Consult Cunningham, W., 'The Growth of English Industry and Commerce' (3 vols., Cambridge 1903–12); Girdler, J. S., 'Observations on the Pernicious Consequences of Forestalling, Regrating and Ingrossing, etc.' (London 1800); Illingworth, W., 'An Inquiry into the Laws, Ancient and Modern, Respecting Forestalling, Regrating and Ingrossing, etc.' (London 1800); Marwick, Sir J. D., 'On Forestalling, Regrating and Engrossing, etc.' (in Society of Antiquaries of Scotland, *Proceedings*, Session 1902–03, Vol. XXXVII, pp. 145–159, Edinburgh 1903).

The term is also used to denote the careful transcription of a deed, statute, or other legal document in large hand; and is often applied, in the United States, to the final and certified copy of a statute, which is ready to be signed by the President, or the governor of a State.

ENHARMONIC (from Gr. εναρμονικος in accord). In modern music a general term to denote a difference in degree but not in pitch, though specifically there is a slight variation of pitch, which the same note takes according to its adjustment to a fundamental *tonic*. Thus C ♯ and D ♭ are practically the same note on keyed instruments, yet strictly speaking, the former should be produced by 15–16 of the whole string sounded, the latter by 9–10. An enharmonic change of key, that is shifting from one scale to another, as in transposing C ♯ to D ♭, often enables a composer to write more easily by avoiding recurrent accidentals. In ancient Greek the enharmonic mode was distinguished by the use of small intervals or quarter tones, such as the tetrachord of which the first two steps were quarter steps and the third a major third. See Mode.

ENHUBER, ĕnhoo'bĕr, **Karl von,** German painter: b. Hof, Bavaria, 16 Dec. 1811; d. Munich, 6 July 1867. He studied at Munich, at first being known as an animal painter and later applying himself to romantic and humorous themes, being especially felicitous in depicting the peasantry of Upper Bavaria. Among his works are 'The Dying Gunner'; 'Poachers'; 'Smoking Boy'; 'Interrupted Game of Cards';

'Munich Burgher Guardsman'; 'Grandfather's Delight'; 'Wood Carver in His Shop'; and 'Stage Coach at the Tavern.'

ENID, the wife of Geraint in Tennyson's 'Idylls of the King' (q.v.). She is upheld as a model of conjugal fidelity.

ENID, Okla., city and county-seat of Garfield County, 36½ miles north by east of Kingfisher and 88 miles by rail west by north of Oklahoma City, on the Chicago, Rock Island and Pacific, the Atchison, Topeka and Santa Fe, and the Saint Louis and San Francisco railroads. It is a banking city; owns its waterworks, and adopted in 1909 the commission form of government. It contains a College of Fine Arts, Saint Francis Institute, Phillips University, a business college, a State institution for the insane, an excellent high school, a Carnegie library, courthouse, two hospitals, Federal buildings, opera house, etc. Among the industrial establishments are tile and iron works, sash and door factory, electric supplies, nursery, marble works, washing machine factory, metal silo factory, planing and flour mills, bottling works, manufactories of binders, candy, bricks, corn-seeders, steel posts, boilers and rugs. The United States census of manufactures for 1914 showed within the city limits 45 industrial establishments of factory grade, employing 383 persons; 276 being wage-earners receiving annually a total of $175,000 in wages. The capital invested aggregated $1,667,000 and the year's output was valued at $2,611,000: of this, $563,000 was the value added by manufacture. There are two parks. Enid is situated in a rich agricultural section and is one of the largest poultry centres west of the Mississippi, shipping in 1913 more than $3,000,000 worth of poultry and eggs. Underneath the city from 35 to 45 feet flows a subterranean river, with an inexhaustible supply of pure soft water, which is pumped to the reservoirs at a cost of less than six cents per 1,000 gallons. Pop. (1920) 16,576.

ENIMÁGAN, a linguistic stock of Indians in South America, inhabiting the northern half of the Gran Chaco. It includes the Angaite, Enimá, Guaná, Sanapana, Sapuki, Sújen, Toosle and other lesser tribes. Consult the works of Boggiani, Hawtrey, Kersten, Schuller and other anthropologists who have written on these tribes.

ENKHUIZEN ĕnk'hoi-zĕn (Lat. *Enchusa*), Holland, town on a projection in the Zuyder Zee, 29 miles northeast of Amsterdam. Its most important public building is an elegant town house with a lofty tower, and mural decorations by Johan van Neck. In the 17th century it had a population of upward of 40,000 and sent a fleet of 400 vessels to the herring fisheries, but the herring trade has died away. Its chief industries now are ropemaking and shipbuilding. The town is the birthplace of the painter Paul Totter. Pop. 7,748.

ENLIGHTENMENT, Philosophy of, the name popularly given to much of the philosophical thought of the 18th century, which cut loose from superstition and attempted to establish reason as the foundation of all belief and of all rules of conduct. It included the empiricism and deism of the English school, the sensualism of the French as well as the ultra-nationalism of Germany. Individualism was a strong figure in its teachings. Locke, Bayle and Leibnitz, Hume, Voltaire, Lessing, Tom Paine and Benjamin Franklin were the most representative of the school, if school it may be called. Consult Hibben, J. G., 'Philosophy of the Enlightenment' (New York 1910) and any standard work on the history of philosophy.

ENLISTMENT, a contract between a government and an individual, in accordance with which the latter voluntarily assumes the duties of a soldier in return for which the government assures him a soldier's rights, pay and allowances. It differs from ordinary contracts for services in that it involves a change of status, so that the contract cannot be broken with impunity at the will of the enlisted man. Enlistment is the method of obtaining soldiers to which those nations resort that do not favor conscription. Accordingly before the European War, it was best exemplified by the armies and navies of the English-speaking peoples. In the United States army, recruits to be enlisted must be of good moral character, i.e., must never have been convicted of a felony nor imprisoned — and must be able-bodied, and between the ages of 18 and 35, if it is their first enlistment. They must be citizens or have taken out their first papers, and must be able to speak, read and write the English language. The physical standards vary somewhat with the different branches of the army and the need for men, but in time of peace are very stringent. The enlistment of recruits is part of the duty of the adjutant-general's department. The period of enlistment is seven years, of which the first three or four, as the case may be, are spent with the colors, and the remainder with the Army Reserve, which is only on duty in time of war. Extra pay is allowed for re-enlistments within three months.

In the navy, candidates for enlistment must be of sound physique, not subject to fits, and able to read or write; or otherwise of satisfactory general intelligence. In general, only citizens of the United States and its possessions are accepted. They must be of good character and must not have been convicted of a crime. Enlistments in the grade of apprentice seamen are made among those between the ages of 17 and 25. The term of enlistment for those under 18 is until they become of age; for those over 18, four years. For those under 18, the consent of the parent or guardian is necessary. All those enlisted after they are of age serve for four years, but the term may be extended for from one to four years by the voluntary agreement of the enlisted man, if he is not undesirable. The upper limit of age for enlistment is 35, but not all ratings have the same limit. Enlistments are made at naval rendezvous, on board receiving ships, on board cruising ships which are short of their complement at a port where there is no rendezvous or receiving ship, on board vessels of the Bureau of Fisheries and at naval stations to fill up the complement of their yard craft. Finger-prints are taken at each enlistment. As in the army, extra pay is given to those who re-enlist, but the period within which this re-enlistment may take place is four months.

In the British army, since the law of 1907, the army consists of the regulars and the territorials. The regular army comprises the permanent army, the army reserve and the special reserve. The period of enlistment is 12 years, of which three, five or nine years may be spent in the reserve. The maximum service permitted to good service men is 21 years, after which they are pensioned. On the average those men who serve in the colonies or in India serve from 12 to 16 years. Enlistment in the special reserve is for six years, in the territorial army for four.

In the active force of the British navy, the majority of the enlistments are made between the ages of 15 and 16½. After two years of preparation, the term of service with the fleet is 12 years. Re-enlistment for 10 years is permitted. See ARMY ORGANIZATION.

ENNA, August, Danish composer: b. Nakskov, Laaland, 1860. He was entirely self-taught. In 1880 he became violinist of a traveling troupe and in 1881 settled at Copenhagen, where he eked out a living as a violinist and produced the operetta, 'A Village Tale.' Later he was made conductor of a provincial company. During this time he produced several compositions which brought him to the notice of Gade. Through the latter's instrumentality Enna was enabled to spend one year in study (1888) in Germany. He produced 'The Witch' in 1892, an opera which at once brought him success and fame. Other works since then have been received more or less favorably but none has equaled his premier. These works include 'Cléopatra' (1894); 'Aucassin and Nicolette' (1896); 'Lamia' (1900); 'Ib and Little Christina' (1902); 'The Death of Antony' (1903); 'Golden Slipper of St. Cecilia' (1904); 'Gloria Arsena' (1913); 'A Mother's Love,' a legend for chorus and orchestra.

ENNA, or HENNA, Sicily, the ancient name of the town now known as Castrogiovanni. It is situated at about the centre of the island, was renowned in antiquity as one of the principal seats of the worship of Demeter. See CASTROGIOVANNI.

ENNEACRUNOS (Gr. «nine springs»), a famous fountain at Athens (q.v.).

ENNEKING, John Joseph, American painter: b. Minster, Ohio, 4 Oct. 1841; d. 17 Nov. 1916. He studied at Munich and Paris under Bonnat and of Daubigny. He painted chiefly landscapes and figure paintings. He received honorable mention at the Paris Exposition of 1900 and among his works are 'Moonlight on the Giudecca, Venice' (1876); 'Freshly Picked'; 'Drove of Cattle on a November Day' (1878); 'The Obersee'; 'Farmyard Scene in France'; 'November Twilight' (1881); 'Summer Twilight' (1883); 'Indian Summer' (1885); 'The Coming Storm'; 'Springtime'; and 'Autumn in New England' (Worcester Museum).

ENNEMOSER, ĕn'ĕ-mō-zĕr, **Joseph**, Austrian medico-philosophic writer: b. Rabenstein, Tyrol, 15 Nov. 1787; d. Egern, Bavaria, 19 Sept. 1854. He fought in the rising of the Tyrolese against the French in 1809, acting as secretary to its famous leader, Andreas Hofer. Previous to this he had begun the study of medicine at the University of Innsbruck and at the universities of Erlangen and Vienna. During 1813–14 he fought against Napoleon as an officer in the famous Luetzow Corps. After the Peace of Paris he went to Berlin, where he finished his studies and in 1816 took his degree in medicine. In 1819 he became professor of medicine at the new University of Bonn. From 1837–41 he practised medicine in Innsbruck. In 1841 he went to Munich, where he obtained great reputation by the application of magnetism as a curative power. He had become interested in this subject while studying at Berlin and published a number of works relating to it. The most important of these is 'Geschichte des Thierischen Magnetismus' (Leipzig 1844), which has been translated by W. Howitt as 'The History of Magic' (2 vols., London 1854). Others of his writings are 'Historisch-Psychologische Untersuchungen über den Ursprung und das Wesen der menschlichen Seele' (Bonn 1824); 'Anthropologische Ansichten, oder Beiträge zur Besseren Kenntnis des Menschen' (Bonn 1828); 'Der Magnetismus im Verhältniss zur Natur und Religion' (Stuttgart 1842); 'Der Geist des Menschen in der Natur' (Stuttgart 1849); 'Anleitung zur Mesmerischen Praxis' (Stuttgart 1852); 'Das Horoskop in der Weltgeschichte' (Munich 1860).

ENNERY, ĕn-nĕ-rē, **Adolphe Philippe D.**, frequently called **Dennery**, French dramatist: b. Paris, 17 June 1811; d. there, 25 Jan. 1899. He began life as a clerk, but later turned to the drama; he studied scenic effects, the quick change from the tragic to comic, and the contrast between the serious and ludicrous characters. He subsequently became the master of modern melodrama, producing alone and in collaboration some 200 plays. During the 50 years of his active life he accumulated a large fortune. In 1896 he was made a Commander of the Legion of Honor. His most successful plays include 'The Grace of God' (1841); 'Mary Jane' (1845); 'If I Were King' (1852); 'The Taking of Peking' (1861); 'Two Orphans' (1875); 'Martyrdom' (1887). He also wrote, in collaboration with others, the librettos for Gounod's 'Faust' (1856); Gounod's 'Le Tribut le Zamora' (1881); and Massenet's 'Le Cid' (1885). During the latter years of his life he also wrote a number of novels, most of them based on plays of his, which were published serially in Paris newspapers.

ENNES, ĕn'nās, **Antonio**, Portuguese dramatist: b. Lisbon 1848; d. 1901. He was for some years prominent in journalism, and in 1886 was appointed chief librarian of the National Library and in 1890 Minister for Marine and the Colonies. His first play, 'The Lazarists,' had extraordinary success in Portugal and Brazil and long held the stage. It was followed by the comedy 'Eugenia Milton' (1874) and the dramas 'The Troubadours'; 'The Mountebank'; 'The Emigration'; 'A Divorce.' The last was translated into Italian and French.

ENNIS, Ireland, town in county Clare, on the Fergus, 25 miles northwest of Limerick by rail. It contains a Roman Catholic college and Ennis College, founded by Erasmus Smith. The ruins of a 13th century Franciscan abbey is one of its attractions and a notable monument has been raised to Daniel O'Connell. A considerable trade in grain, flour and agricultural produce is carried on and large fairs and markets are held. Pop. 5,472.

ENNIS, Tex., city of Ellis County, 35 miles south of Dallas, on the Houston and Texas Central and the Texas Midland railroads. It has extensive agricultural and stock-raising interests and contains cotton compresses, gins, railroad repair shops, cottonseed-oil mill and a flour mill, etc. Since 1914 it has been under the commission form of government. The waterworks are municipal property. Pop. 7,224.

ENNISCORTHY, Ireland, town, in the county of Wexford, situated on the river Slaney, 77 miles south of Dublin. There is an old castle erected by one of the early Norman conquerors, and in the neighborhood is Vinegar Hill, the scene of a skirmish in 1798, when the town was stormed by the rebels. The river Slaney is navigable and there is a considerable trade in provisions. Pop. 5,495.

ENNISKILLEN, Ireland, a borough and market town of county Fermanagh, 37 miles northeast of Sligo, on an island in the narrowest part of Lough Erne. Suburbs are on the adjoining mainland. In its town hall are kept the flags of the battle of the Boyne. The battle of 1689 between the forces of James II and William III, in which William's forces were victorious, took place here. The noted regiment called Enniskillen Dragoons was first formed from the defenders of the town at this battle. The manufacture of cutlery, straw hats, shirts and collars and the tanning of leather are carried on here, and there are several steam sawmills. Pop. 4,847.

ENNIUS, Quintus, Latin poet: b. Rudiæ, near Brundusium, 239 B.C.; d. 169 B.C. When he was 38 Cato the Censor brought him to Rome, where he soon gained the friendship of the most distinguished men and instructed the young men of rank in Greek. With an extensive knowledge of the Greek language and literature he united a thorough acquaintance with the Oscan and Latin tongues and exerted great influence on the last. He wrote an epic poem in hexameters, 'Annales,' describing the history of Rome from the arrival of Æneas in Italy to the poet's own times; tragedies and comedies, satires, epigrams, precepts, etc., but nothing now remains except fragments given as quotations in other ancient authors, many of them mere citations by grammarians and other insignificant extracts. A few larger fragments have been preserved, which give a favorable impression of his genius. His success in his own day was great. His poems were for a long period read aloud to admiring multitudes, and they were often quoted and referred to by the great writers of antiquity. Fragments of his works have been edited by Müller, L. (Saint Petersburg 1885); Ribbeck, O., in 'Scaenicæ Romanorum Poesis Fragmenta' (Leipzig 1897); and Vahlen, J., (Leipzig 1854 and 1903). Consult Duckett, E. S., 'Studies in Ennius' (in *Bryn Mawr College Monographs,* Monograph Series, Vol. XVIII, Bryn Mawr 1915); Knapp, C., 'Vahlen's Ennius' (in *American Journal of Philology,* Vol. XXXII, p. 1, Baltimore 1911); Müller, L., 'Der Dichter Ennius' (in *Sammlungen Wissentschaftlicher Vortraege,* edited by R. Virchow, N. F. Ser. VIII, Heft 185, Hamburg 1893); 'Die Entstehung der Römischen Kunstdichtung' (ib. N. F. Ser. IV, Heft 92, Hamburg 1889); Postgate, J. P., 'Corpus Poetarum Latinorum' (Vol. VI, London 1894); Ribbeck, O., 'Geschichte der Römischen Dichtung' (2 vols., Stuttgart 1887–89); Vahlen, J., 'Bemerkungen zum Ennius' (in Königl. Preuss. Akad. der Wiss., *Sitzungsberichte* 1899, p. 266, Berlin 1899); 'Über Ennius und Lucretius' (ib. 1896, Part I, p. 717, Berlin 1896); 'Über die Annalen des Ennius' (in Königl. Preuss. Akad. der Wiss. Philos.-Hist. Klasse, *Abhandlungen* 1886, Part I, Berlin 1886).

ENNODIUS, Magnus Felix, a Latin Church father: b. at either Arles or Milan about 473; d. Pavia, 17 July 521. He early became an orphan. When the Visigoths invaded Italy he was sent to an aunt in Milan who educated him. After her death he married a wealthy woman and lived in lavish fashion. A severe illness made such a deep impression upon him that he entered the priesthood and his wife became a nun. In 496 he went to Rome and soon became a noted man. He was the first to give the Bishop of Rome the name of Pope. In 511 he succeeded Maximus as Bishop of Pavia. Twice he was sent as a messenger to the Emperor Anastasius with the plan of reuniting the Eastern and Western Churches. His writings include a 'Life of Epiphanius' and several theological treatises. He is said to have written in favor of the freedom of the will. His writings have been published in Basel 1569, Tournay 1610, Paris 1611, and also in Migne, 'Patrologia Latina' (Vol. LXIII).

ENNS, ĕns, river in Austria, has its rise in the Alps of Salzburg, flows east-northeast and then takes a northwesterly course, discharging into the Danube near Mauthausen. Length about 160 miles. Through part of its course it forms the boundary line between Upper and Lower Austria.

ENOCH, Hebrew patriarch. He became the father of Methuselah at the age of 65 years; and we are told that he «walked with God» and at the age of 365 years «God took him». The words quoted are generally understood to mean that Enoch did not die a natural death, but was removed as Elijah was. The book of Hebrews (xi, 5) confirms this view. Enoch is the name of three other persons in the Bible, one of them being the eldest son of Cain (Gen. iv, 17). Saint Enoch, associated with the city of Glasgow, is a corruption of Saint Thenaw, the name given by Saint Serf to Saint Kentigern's mother.

ENOCH, Books of. According to Gen. v, 21–23, Enoch lived 365 years, and he walked with God and disappeared, for God took him. He is supposed to be identical with the seventh of the 10 antediluvian kings in Berosus (Euedorachus), the Enmeduranki of K 2486, 4364, the seventh king in the Sumerian list discovered by Pœbel (Babylonian Publications of the University of Pennsylvania, VI, Philadelphia 1913). Enmeduranki, like Enoch, was called into communion with the gods and initiated into the mysteries of heaven and earth. If the number 365 indicates the original solar character of Enoch, the story is likely to have been derived from a Babylonian or Amorite version in which the regnal years had not been brought into the chronological system found in Berosus. The opportunities of this world-wanderer for observing celestial phenomena, reading the heavenly tablets and foreseeing the future naturally invited speculation. He became the inventor of writing, mathematics and astronomy, and the forerunner of Dante as an explorer of heaven and hell. Alexander Polyhistor in the time of Sulla found him referred to by a writer as having learned astronomy from the angels (Eusebius, 'Præparatio evangelica' ix, 17, 8). With the growth of angelology the interest centred on the fate of the «sons of God» who had married the «daughters of men» (Gen. vi, 1ff.), while the concern about the future of sinners and saints on earth and in the other world demanded authoritative revelations. None was better fitted to impart information on these things than the translated patriarch.

The writings ascribed to Enoch do not seem to have been generally accepted as canonical at any time, either by Jews or Christians. In some circles, however, they have been regarded as authentic and cherished as sacred books. From references in the book of Jubilees and the earlier stratum of the Testaments of the Twelve Patriarchs it may perhaps be inferred that some of them belonged to the 70 hagiographa, mentioned in 4 Ezra xiv, 46, which were not included in the finally adopted Palestinian canon. There is one direct quotation in the New Testament: The epistle of Jude (vs. 14) cites a passage from one of the books of Enoch in such a manner as to show that it was considered a genuine utterance of the patriarch and an inspired prophecy. In the epistle of Barnabas another passage is quoted as «Scripture.» Tertullian defended the authenticity and sacred character of the book known to him and maintained that the Jews rejected it because it referred prophetically to the Lord, having probably in mind the passage cited by Jude. Clement of Alexandria also quotes the book with confidence. Origen charges Celsus with not having read the book of Enoch whence his statement concerning the angels was taken, and not being aware that the books ascribed to Enoch were not universally accepted as divine in the churches. Anatolius of Laodicea quoted a passage simply to show the character of the Jewish calendar, but Zosimus of Panopolis refers to the books as «ancient and divine scriptures.» Jerome rejected the book of Enoch as apocryphal; Augustine took the same position; and it is counted among the Apocrypha by the Apostolic Constitutions (5th century), Pseudo Athanasius, Nicephorus' 'Stichometria' (1500 or 4800 stichi), and the 'Index LX librorum.' The parts copied by George Syncellus (c. 790) may have been drawn from Pandorus of Alexandria; but the manuscript found at Panopolis seems to have been written later than the 8th century. Many writers, from 4 Ezra and 2 Peter to George Cedrenus in the 11th century, who do not mention the name of Enoch, show an acquaintance either with the book itself or with its characteristic ideas, notably that of the fall and punishment of the angels.

In Abyssinia the book of Enoch has maintained its position in the canon before the book of Job to the present time, not only among the Christians, but also, according to the testimony of Bruce, among the Jews whose Ethiopic text, however, has not yet been examined. To what extent another book ascribed to Enoch, preserved in the Slavonic Church, was regarded as canonical cannot be determined. The Hebrew Enoch, though quoted by many mediæval Jewish writers, does not seem to have been considered by them as a part of the canon. Venerable Bede (died 735) thought that the book of Enoch merited to be counted among the sacred scriptures because of its authority, age and use, but especially because of the testimony of Jude. William Whiston defended the canonicity of the book known to him through Syncellus, and William Murray regarded the nucleus of the Ethiopic Enoch as genuine and inspired. The Roman Catholic Church reckons the books ascribed to Enoch among the Apocrypha of the Old Testament, while many Protestant scholars, who give this name to the deutero-canonical books of the Old Testament, designate them as Pseudepigrapha, a term first used by Jerome in regard to the Wisdom of Solomon and the Epistle of Jeremiah. Unidentified quotations indicate that all the Enoch literature has not yet been discovered. The three extant works are generally called the Ethiopic, Slavonic and Hebrew Enoch, because of the languages in which they first became known, in their full extent, to modern scholars.

Ethiopic Enoch.— Whether Pico della Mirandola possessed a manuscript of this book is still uncertain. According to Fabricius, it was stated by many, on the testimony of Reuchlin, that he had purchased a copy of it for a large sum of money. In Reuchlin's treatise, 'De arte cabalistica' (1517), Simon does not question the possible survival of some such books as that of Enoch, but declares that he cannot afford, like Mirandola, to buy at great expense the 70 books of Ezra. Mirandola himself speaks of his purchase and indefatigable study of these books, both in his 'Apologia,' written in 1489, p. 178, and in 'De hominis dignitate,' p. 330. A description of his cabalistic codices was given by Gaffarel in 1651 (reprinted in Wolf, 'Bibliotheca hebraica,' I, 1715); in the first manuscript, ascribed to Recanati (13th century), there are some extracts from the Hebrew Enoch. This may have given rise to the rumor. But Reuchlin refers directly to the book of Enoch in 'De verbo mirifico,' written in 1494 (Lyon 1552, pp. 92f). Here Sidonius lashes the gallows-birds who place splendid titles in front of the volumes they offer, falsely declaring that one is the book of Enoch, another the book of Solomon. It would seem, therefore, that Reuchlin had heard of a separate book of Enoch being offered for sale. Since Ethiopic texts were published as «Chaldæan» by Potken already in 1513 and Reuchlin knew in 1515 that Benignus had studied the «Chaldic» letters used by Prester John, it is not altogether improbable that the book to which he referred 20 years earlier was the Ethiopic Enoch and that such a work may have drifted into Mirandola's library; but it may have been a Hebrew Enoch. There can be no question that Guillaume Postel before 1553 was shown a copy of the Ethiopic Enoch at Rome by an Abyssinian priest and had its contents explained to him, as he refers to the Noachic interpolations. Gilles de Loches, a Capuchin missionary, who spent seven years in Egypt, reported to Peiresc that he had seen (c. 1630) this book in Ethiopic script and language, and gave the title correctly. Gassendi relates that Peiresc purchased another manuscript. This was afterward found by Ludolf not to be the book of Enoch and it has not been published yet, though it contains the story of Enoch's birth. James Bruce secured a copy of Ethiopic Enoch in Abyssinia in 1769 and brought to Europe three manuscripts. A brief account appeared in Michaelis 'Orientalische und Exegetische Bibliothek' (1774); a fuller account was given by Bruce himself in 1790. The text has been edited by Laurence (1838) on the basis of one manuscript; by Dillmann (1851) who had five manuscripts; by Flemming (1902) who used 15; and by Charles (1906) who had at his disposal 23. Charles consulted 29 in his translation of 1912. None of these is earlier than the 16th century; even the oldest of them inspire no very great confidence, and all have manifestly suffered much in transmission. Of the Greek text the fragments preserved in Syncellus, viz., vi–x, 14; xv, 8–xvi, 1, and viii, 4–ix, 4 in duplicate, were first published by Scaliger (1609), then by Goar in the editio princeps of the Chronographia (1652), by Fabricius (1713), Dindorf (1829) and recent editors of Enoch. A fragment, containing lxxxix, 42–49, was published by Mai (1844) and Gildemeister (1855). A larger part, including i–xxxii, 6 and xix, 3–xxi, 9 in duplicate, was discovered at Panopolis (modern Akhmim) in 1886–87 and published by Bouriant (1892–93), Lods (1892) with a French translation, Dillmann (1892), Charles (1893) and Radermacher (1901). A fragment of a Latin translation, cvi. 1–18, was published by Charles (1893) and James (1893).

Already Grotius, familiar only with the Syncellus fragments, expressed the opinion that the book of Enoch originally was small, but grew gradually by expansion. Laurence (1821) pointed out some of the more obvious Noachic sections, and de Sacy (1822) suspected Christian interpolations. Murray (1836), who contended for a genuine nucleus, recognized among the extensive later additions several distinct books and assigned a separate authorship to lxxii–lxxxii. Bruno Bauer (1841) maintained that there were several authors and especially that xxxvii–lxxi formed a book inserted in the larger volume. Dillmann (1853) assumed a different authorship for cvi–cvii and cviii and a number of interpolations. Sieffert (1867) argued a distinct origin for lxxxiii–xc. Through the studies of Krieger (1845), Ewald (1854) and Hilgenfeld (1857) the marked difference between xxxvii–lxxi and the rest of the work became generally recognized; and through the analytic work of O. Holtzmann (1888) and Charles (1893) wide currency was given to the view that the volume is made up of five distinct books by different authors, viz., 1, i–xxxvi; 2, xxxvii–lxxi; 3, lxxii–lxxxii; 4, lxxxiii–xc; 5, xci–cv, and two shorter appendices, cvi–cvii and cviii. This division is indeed largely suggested by sub-headings in the text itself. But within each of these books a lack of unity has also been felt by critics and it has been explained either by accretion or by compilation. It is thought that an original work has been expanded in the course of transmission, or a compiler is supposed to have pieced it together from various sources. The earlier and more widely accepted theory is that of accretion, but in recent years several scholars have favored a documentary theory similar to that now in vogue in Pentateuchal criticism. It is therefore proper to consider the composition as well as the date and original language of each book separately.

Book I unquestionably contains some disparate elements. It is likely to have begun originally in vi, 1, since i–v seems to be a general introduction to a larger volume which, however, did not as yet include xxxvii–lxxi. While xvii–xix and some other passages appear to be interpolations, the attempt to explain the seemingly identical rôles of Semyaza and Azazel by the compilation of two documents is less convincing. The idea of a Greek original has no defender to-day in the case of this or any other part of Ethiopic Enoch. Those who have made a special study of the subject are substantially agreed that Book I was written in Aramaic from which it was translated into Greek. As the descriptions of the fall of the angels, Enoch's mediation and his celestial journey give no clear indications of date; the relation to Book IV, which evidently is somewhat younger, must decide. Some scholars have thought of the period preceding the Maccabean uprising, the majority, on what would seem more adequate grounds, of the reign of John Hyrcanus (135–104 B.C.).

In Book II the outlines of a ground-plan are clearly discernible; inserted excerpts from a book of Noah are equally unmistakable in liv, 7–lv, 2; l; and lxv–lxix, 25. That the remainder is not a Joseph's coat without seams, as it was once called, is now universally admitted. But while some recent critics, like Appel and Gry, assume a compilation of different documents, one designating the celestial guide as «the angel who went with me,» another as «the angel of peace,» and a third being particularly interested in wisdom, most scholars have resorted to the theory of more or less extensive interpolations. Some have been satisfied with indicating as such xli, 3–8; xliii; xliv; lix; lx; lxx, lxxi. Others, like Bruno Bauer, Böttcher, Drummond, Pfleiderer, De Faye and Bousset, have looked upon all the passages referring to the Messiah as Christian interpolations. In the case of these Schmidt thinks of successive expansions, first by Jewish, and then by Christian hands. The idea of a Christian origin of the Parables, held by Hilgenfeld, Vernes, Kuenen, Tideman, Stanton, König and Cornill, is no longer advocated. As to the original language there is still a decided difference of opinion between the two scholars who have published the results of special investigation upon this point; Charles thinks that it was Hebrew, Schmidt that it was Aramaic. The former assumes that the Ethiopic was made from a Greek version, in which the New Testament term for the «Son of Man» was uniformly used, by an Aramaic-speaking Jew who rendered it in three different ways, corresponding to three Aramaic expressions. The latter thinks that the absence of even the slightest sign of acquaintance with this particular book in patristic literature throws doubt upon the existence of a Greek version, and in any case deems it probable that the translation was made by an Aramaic-speaking Jewish Christian who used two other terms besides the one uniformly employed in the New Testament, because he found three expressions for «Son of man» in the Aramaic original before him. In regard to the date, the most widely accepted view at the present time is that this book was written not long before 63 B.C. «The kings and the mighty,» who are often mentioned as persecutors, are

supposed to be Alexander Jannæus and the Sadducees. It is difficult, however, to see how they could be charged with putting their «faith in the gods they have made with their own hands» (xlvi, 7); and many scholars have considered it more natural to understand the phrase as referring to pagan rulers. If Roman emperors and governors are meant, the time of Gaius Caligula (37–41 A.D.) is more likely than that of Herod the Great. A Jewish expansion in the time of Domitian is not improbable; and it is significant that those ideas and expressions which have their closest counterparts in the Gospels and present the Messiah in a more transcendent character than is found anywhere in Jewish literature, fit very loosely in the context and are connected with a title which even in the Gospels appears to be a translation, not of a Greek, but of a Christian Aramaic original.

Book III, dealing with astronomy, has no doubt a few interpolations. The endeavor to prove that it is a compilation of four documents dovetailed into one another does not seem to be called for by the facts. If Jubilees was written in Hebrew, as is probable, this book may have been written in the same language. Like Jubilees and Slavonic Enoch, it advocates a solar year of 364 days; it is quoted in the former work (iv, 17, 21) and may be dated c. 110 B.C. The author makes the longest day of the year 16 hours, which led Laurence and Murray to infer that his home was near the Caspian or the Black Sea; and Martin thinks that it may indicate the use of a document written in the latitude of Constantinople. It is possible that the writer reflected upon the length of the day in the region where he supposed the antediluvians to have lived. In Book IV there are some obvious additions. The original language is supposed to be Aramaic. In the historic vision the 70 shepherds are no longer conceived of as either native or foreign rulers, but as angels; yet it is admitted that the four periods of their domination represent the Chaldæan, Persian, Ptolemaic and Seleucid kingdoms, and the great horn in xc, 9, is assumed to refer either to Judas Maccabæus or John Hyrcanus. The latter is more probable, and the date is likely to be c. 108 B.C. Dislocations and interpolations are also found in Book V. It may have been written in Hebrew in the 1st century B.C. Not much later the two appendices seem to have been penned in the same language. The first of them has been assigned by some scholars to the Noachic stratum; others have surmised for it an independent Essene origin. Recent critics have been inclined to ascribe to the 2d century B.C. the book of Noah, from which excerpts have been copied in the book of Enoch; this is doubtful, and some of the appropriated passages may have been interpolations in the Noah apocalypse.

The influence of Babylonian, Persian and Greek speculation, mythical and scientific, upon this literature is unmistakable, though it has occasionally been exaggerated. It reveals the growing conceptions of angels and demons, heaven and hell, the Messiah and his kingdom, the last judgment and the resurrection, in the generations immediately preceding the appearance of Jesus. If the original of the Parables could be found, or the later accretions removed with a high degree of certainty, the actual approach to the Christology of the New Testament might be determined with greater assurance than now is possible. The eschatological notions seem to have been in a fluctuating state. There is nowhere a clear allusion to a resurrection of the body; immediately after death spirits pass to their destiny of joy or suffering and appear to be clothed with a spiritual body; yet a final judgment is emphasized, and at least in Book I a return to terrestrial life seems to be contemplated. The work as a whole presents numerous problems that cannot be solved until the Semitic original is recovered.

Slavonic Enoch.— This book was first published by A. Popov in 1880 from a manuscript written in 1679 in a South Russian dialect under the title 'The Book of the Secrets of Enoch.' In 1886 Sokolov found at Belgrade a Bulgarian manuscript of the 16th century representing the same recension. Novaković published in 1884 a Serbian manuscript of the 16th century, found at Belgrade, representing a different recension. Of the same type are a manuscript in Vienna of the 16th century, one of the 17th owned by Barsov in Moscow, and a number of fragments, some as old as the 14th century, published by Tichonravov, Pypin, and Popov. It has become customary to designate the former recension, which is longer, as A, the latter as B. Of A an English translation was made by Morfill (1896); Bonwetsch gave a German version of both A and B (1896); excerpts of A were rendered into Latin by Székely (1913); and both A and B were translated into English by Forbes (1913). Charles, Bonwetsch, Harnack, Schürer and Székely have looked upon A as a faithful translation of the Greek text and B as an abbreviated copy of the Slavonic translation, and have therefore concluded that the author was an Alexandrian Jew writing his work in Greek. Charles indeed maintains that some parts may originally have been written in Hebrew, since he thinks they are quoted in the Testaments of the Twelve Patriarchs, but deems it impossible to separate them from their context. Unfortunately, none of the nine passages in that work in which Enoch is quoted can be regarded as having come from this book, as Schürer has shown. But Schmidt has pointed out that practically every passage cited to prove either familiarity with the Greek version of the Bible or acquaintance with Hellenistic thought is absent in B. He does not consider it possible that a Christian Slav, living in the 10th or 11th century, could have possessed such a marvelous knowledge of the tendencies of thought among the Alexandrian Jews, or could have had any motive for exercising his skill in the removal of every touch of Greek influence. But if A represents an Alexandrian expansion of a Greek text still free from the peculiarities indicating a local origin, the latter may well be a translation of a Hebrew or Aramaic book written in Palestine at some time between 50 B.C. and 70 A.D. Other books of Palestinian origin are equally silent concerning the Messiah and a physical resurrection. The interest in a solar year of 364 days (xvi, 5 B) may point to a period not very long after Eth. Enoch lxxii–lxxxii and Jubilees; the later Greek recension A has a year of 365¼ days (xiv, 1; xvi, 5). A few Christian interpolations have been suggested, especially by Schürer and Székely. Those worthy of consideration, such as the statement concerning the pre-eminence of the eighth, i.e., the first day (xxxiii, 1, 2), the prohibition of oaths in very nearly the words of Jesus (xlix, 1, 2) and the condemnation of sacrifices (xlv, 3), are found in the longer recension. The counsel not to requite evil (l, 4) need not be Christian. But in the ethics of the original work there is an unmistakable approach to the teachings of Jesus. Origen knew this work as a part of his Greek book of Enoch, and refers to the descriptions in xxiv, 2, and xlvii, 3. It reveals no acquaintance with Eth. Enoch xxxvii–lxxi.

Hebrew Enoch.— During the Middle Ages a book of Enoch written in Hebrew was quoted by many Jewish writers. It may have been of this work that Pico della Mirandola and Reuchlin had a vague knowledge through excerpts or some longer manuscript. Drusius called attention to two quotations in the book of Zohar (13th century). A list of quotations in Menahem Recanati, Hekaloth, Maase Bereshith, Pirke de Rabbi Eliezer, and Rasiel has been given by Jellinek. This scholar published in 1873 from a Munich codex the 'Sefer Hekaloth or Book of Enoch.' It was an incomplete edition, but could be supplemented by the 'Sefer Hekaloth of R. Ishmael,' published at Lemberg, in 1864. An unedited manuscript is in the Bodleian Library at Oxford. A critical edition and a translation are needed. Brief descriptions have been given by Buttenwieser and Charles. The book tells of the ascent of Rabbi Ishmael to heaven where he receives a series of revelations from the angel Metatron (Lat. metator = guide), with whom Enoch has been identified. Various parts of Ethiopic and Slavonic Enoch are used by the author, though there is no trace of the characteristic ideas of the Parables. An apocalyptic fragment, preserved in the 'Siddur' of R. Amram Gaon (9th century), and apparently written at the time of the Hadrianic persecution, seems to furnish a link connecting Slavonic Enoch with Hebrew Enoch, which is likely to be earlier than the 4th century, as it is quoted in Babylonian Talmud, Berakoth 7a. What the language of any earlier Enoch book may have been cannot be inferred from this work; for when Aramaic ceased to be the vernacular many books were translated into Hebrew, among them even the Aramaic parts of Daniel.

Bibliography.— I. Translations, with commentary, in Latin, by Silvestre de Sacy, in *Magasin encyclopédique* (Paris 1800, Chaps. i–xvi, xxii, xxxi); Gfrörer, A. F., in 'Prophetæ Veteres Pseudepigraphi' (Stuttgart 1840); and Stephan Székely, in 'Bibliotheca Apocrypha' (Freiburg 1913, extensive excerpts); in English, by Richard Laurence (Oxford 1821; later editions 1833, 1838, 1883); Schodde, G. H. (Andover 1882); Charles, R. H. (Oxford 1893; 2d ed., 1912); in German, by Hoffmann, A. G. (Jena 1833–38); Clemens, Richard (Stuttgart 1850); Dillmann, A. (Leipzig 1853); Beer, G. (Tübingen 1900); Flemming, J., and Radermacher, L. (Leipzig 1901); in French, by Brunet, G., in Migne 'Dictionnaire des Apocryphes' (Paris 1856); Lods, A., of the Greek text (ib. 1892); and Martin, François (ib. 1906); in Russian, by Smirnov, A. (Kasan 1888); and in Hebrew, by Goldschmidt, L. (Berlin 1892). Introductions by Zöckler (1891); König (1893); Cornely (1894); Cornill (1896); Strack (1898); Bertholet (1906); Steuernagel (1912); Sellin (1914); Mirandola, Pico della, 'Opera Omnia' (Basel 1572); Reuchlin, J., 'De arte cabalistica' (Hagenau 1517; appended to Galatin, 'De arcanis catholicæ veritatis,' Ortona 1518, and to Mirandola, op. cit.); Postel, G., 'De originibus' (Basel 1553); Scaliger, 'Thesaurus temporum' (Geneva 1609); Drusius, J., 'De patriarcha Henoch' (Frankfort 1615); Gassendi, P., 'De vita Peirescii' (Paris 1641); Ludolf, J., 'Historia æthiopica' (Frankfort 1681); Fabricius, J. A., 'Codex pseudepigraphus Veteris Testamenti' (Hamburg 1713); Calmet, A., 'Dissertation sur le livre d'Hénoch' (Paris 1720); Whiston, W., 'A Collection of Authentick Records' (London 1727); Bruce, J., 'Travels to Discover the Source of the Nile' (London 1790); Sacy, S. de, in *Journal des Savans* (Paris 1822); Murray, E., 'Enoch Restitutus' (London 1836); Bauer, Bruno, 'Kritik der evangelischen Geschichte' (Leipzig 1841); Krieger, E., 'Beiträge zur Kritik' (Nürnberg 1845); Lücke, F., 'Einleitung in die Offenbarung Johannes' (2d ed., Bonn 1852); Ewald, H., 'Abhandlung über des äthiopischen Buches Henokh Entstehung' (Göttingen 1855); Hilgenfeld, A., 'Die jüdische Apokalyptik' (Jena 1857); Sieffert, F., 'De apocryphi libri Henochi origine et argumento' (Königsberg 1867); Philippi, F., 'Das Buch Henoch' (Stuttgart 1868); Halevy, J., in *Journal Asiatique* (Paris 1867); Vernes, M., 'Histoire des idées messianiques' (Paris 1874); Tideman, A., in *Theologisch Tijdschrift* (Leiden 1875); Drummond, J., 'The Jewish Messiah' (London 1877); Deane, W. J., 'The Pseudepigrapha' (London 1891); Bousset, W., 'Die Religion des Judentums' (Berlin 1903); Appel, H., 'Die Komposition des äthiopischen Henochbuches' (Gütersloh 1906); Burkitt, J. C., in *Journal for Theological Studies* (Cambridge 1907); Schmidt, N., 'The Original Language of the Parables of Enoch' (Chicago 1908); Gry, L., in *Le Muséon* (Louvain 1908–10); Lagrange, J., 'Le messianisme' (Paris 1909); Schürer, E., 'Geschichte des jüdischen Volkes' (4th ed., Leipzig 1909); Charles, R. Nathaniel Schmidt,
Professor of Semitic Languages and Literature, Cornell University.

ENOCH ARDEN. Tennyson's 'Enoch Arden,' a narrative in 911 lines of blank verse, is one of the most popular poems of modern times. Sixty thousand copies of it were sold soon after its publication in 1864 and translations appeared in seven foreign languages. The story itself was such as to make a wide appeal, but the poet enhanced its power. He describes the life and scenery of an English fishing village and a sailor's exile on a tropic island with elaborate, vivid detail and genuine feeling. He shows also the strength and purity in humble English folk, as he imagines them; of certain simple, universal, if restricted, ideals of family life as seen in his hero's aspirations for his children and in his self-sacrifice when, returning from long absence to find that he has been thought lost at sea and his wife happily remarried, he refrains from disclosing himself. The story, as distinct from the setting, is presented with studied, almost prim, simplicity, but with narrative effectiveness, to be seen, for instance, in Enoch's silent, self-effacement after beholding Annie at the hearth with Philip and her children. False sentiment appears, perhaps, in Enoch's making sure that his wife shall know of his return after his death and in the author's emphasis upon the costliness of his hero's funeral. There is weight too in Bagehot's criticism that the poem is an example of ornate rather than pure art, concealing lack of truth to facts under beautiful but irrelevant details. Nevertheless, 'Enoch Arden' holds its place as one of the loveliest descriptive and idyllic poems in English.

William Haller.

ENOCK, C. Reginald, English mining expert and author: b. 23 Nov. 1868. He has spent many years in various countries in professional work and in the investigation of natural resources, especially in North and South America, and of the British empire. He has carried out scientific work for the governments of Peru and Mexico; has given papers and lectures before the Royal Geographical Society, the Royal Society of Arts, etc. He has taken an active interest in the work of economic reform. His publications include 'The Andes and the Amazon' (4th ed., 1910); 'Mexico'; 'An Imperial Commonwealth'; 'Life and Travel in the United States' (1910); 'Pioneering and Map-making'; 'The Republics of Central and South America' (1913); 'Human Geography and Industry Planning'; 'The Tropics, their Resources, People and Future'; 'The Need for a Constructive World Culture.'

ENOMOTO, Buio, boo'ō, Japanese statesman: b. Tokio 1839; d. 1909. He was educated in Europe, and returning to Japan in 1867 became the first president of a republic which he established in the island of Yego, but was ousted by the Japanese army in 1869. After imprisonment for two years he was appointed vice-admiral in the Japanese navy 1874. He served as Minister Plenipotentiary to Russia and became a member of the Council of State and Minister of Education 1888, Minister of Foreign Affairs 1891 and Minister of Agriculture and Commerce 1892, which office he held for four years.

ENOS, ā'nōs, Greece, town on the north coast of the Ægean, 70 miles south by west of Adrianople. Its harbor is commodious, but much neglected and too shallow for deep-sea vessels. The trade, formerly of importance, has greatly decreased, Enos having been superseded as an export centre by the adjacent seaport of Dedeagatch. The town is the see of a Greek archbishop. Homer attests its antiquity by alluding to it the 'Iliad' (IV, 519). Pop. 7,000, principally Greeks.

ENRIQUEZ GOMEZ, ĕn-rē'kĕth gō'mĕth, **Antonio** (properly Enriquez de Paz), Spanish poet; son of a converted baptized Portuguese Jew: b. Segovia early in the 17th century. He entered the army in his 20th year and rose to the rank of captain; but in 1636 fled to Amsterdam, and, having there professed the Jewish faith, was in 1660 burned in effigy at a Seville auto-da-fé. The date of his death is not known. Besides 22 comedies, some of which passed as Calderon's (q.v.), he wrote a number of other works, both in prose and verse: 'La Vida de Don Gregorio Guadaña' (1644); 'La Culpa de Primer Peregrino' (Rouen 1644); 'El Siglo Pitagórico' (Rouen 1647); 'El Samson Nazareno' (Rouen 1647); 'Las Academias Morales de las Musas' (Madrid 1660). The first of these, his lyric poems, and two of his dramas have been republished in 'Biblioteca de Autores Españoles' (Vols. XXXIII, XLII, XLVII, Madrid 1846–80). Consult Fitzmaurice-Kelly, J., 'A History of Spanish Literature' (London 1898); Ticknor, G., 'History of Spanish Literature' (3 vols., Boston 1872).

ENROLMENT, an entry on a public register. In England this term denotes the registration of recognizances, deeds of sale, etc., on the rolls of chancery or of the ordinary courts, or by a clerk of the peace on the records of a court of Quarter Sessions. The term in this sense dates from the enactment in 1536 of the Statute of Enrolments, designed to prevent the practice of secret conveyances and requiring as a condition of their validity that they be enrolled or recorded, within six months of their date, in the manner prescribed by the act. See Conveyance; Registration of Property Titles.

ENS. See Enns.

ENSCHEDÉ, en-skā-dā', **Johannes,** Dutch printer: b. Haarlem 1708; d. 1780. He received his education at Leyden and in due time became head of the printing firm which his father had established. He introduced the type known as Holland Gothic and did much to further the art of printing. In 1768 his firm issued the 'Proef van Lettern,' specimens of printing types. His firm is still in business in Haarlem.

ENSCHEDE, Holland, town in the province of Overyssel, 30 miles east-northeast of Zutphen. Rebuilt since its destruction by fire in 1862, it has large yarn- and cotton-mills, iron products, print goods and electrical machinery. Pop. 35,448.

ENSEMBLE, all the parts of a thing taken as a whole, or the general effect produced by them. Thus the word is used to designate the general effect of a drama, opera or picture.

ENSENADA, ĕn-sā-nä'dä (Spanish, a creek, cove or bay). (1) Seaport of Argentina, in the province of Buenos Aires. It is the port of La Plata and is about 40 miles southeast of Buenos Aires. (2) Seaport of Mexico, in the northern part of Lower California, on the Pacific coast, at the head of the Bay of Todos los Santos, about 50 miles south of the border and 70 miles southeast of San Diego, Cal. It has some few local manufactories and is the seat of a United States Consul. Pop. 2,170.

ENSIGN, Orville Hiram, American electrical and mechanical engineer: b. Ithaca, N. Y., 8 July 1863. He was educated at Cornell University. From 1882 to 1890 he served as machinist at Ithaca, Schenectady and New York, after which he was engaged as consulting engineer to several public service companies in Los Angeles and vicinity. In 1897 he became superintendent and chief engineer of the Southern California Power Company, and in this capacity planned and constructed the first successful 30,000-volt long-distance transmission in the world, and when this company was merged with the Edison Electric Company he became superintendent and chief electrical and mechanical engineer until 1904, when he was appointed chief electrical and mechanical engineer of the United States Reclamation Service and of the Los Angeles Aqueduct.

ENSIGN, the flag or colors of a regiment, in England, consisting of a field of white, blue or red, with the union in the upper corner, near the staff. Of naval ensigns the white flag is confined to the royal navy, the red to the merchant service, the blue to the naval reserves. In the American navy the ensign is the national flag, and it is also flown by the merchant service. In England, up to 1871, the lowest grade of commissioned officers in a regiment of infantry, by the senior of whom the regimental ensigns or colors were carried. The corresponding rank in a cavalry regiment was cornet. The name is now abolished, the title of 2d lieutenant being substituted for it. Also the title of the lowest grade of commissioned officers in the United States navy, which they receive on graduation from the Naval College. In the 16th century ensign was corrupted into ancient and is so used in Shakespeare, and was at that time applied in the two senses of a flag and the bearer of a flag. See FLAG.

ENSIGN STAL'S TALES (Fänrik Ståls Sägner). The best known work of Johan Ludvig Runeberg, the greatest Swedish poet of Finland; appeared in two parts, the first in 1848 and the second in 1860. Most of the poems are narratives and relate incidents from the war of 1808–09, when the Finns tried in vain to stem the Russian invasion. The poems celebrate the heroes of this struggle and present scenes of great dramatic power. The first poem, entitled 'Vårt land' (Our Country), is highly lyrical and has become the national hymn of Finland. The tales form a connected whole, even if the person of the ensign often steps behind the scenes. Although arranged rather loosely and without strict chronology they all refer to the war, and they all have the same general theme. This theme is love of country. Runeberg was inspired with a profound love for his native land and for its history, and was charmed by its natural beauty. In his poems he lauds the patriotism, the self-sacrifice and devotion of the men and women who suffered and died for Finland. 'Ensign Stål's Tales' are imbued with sound humor. While the background throughout is the deeply tragic struggle in a hopeless cause, humorous touches, artistically interwoven, relieve the strain. Consult Estlanderg, C. G., 'Runeberg's Skaldskap'; Wrangel, Ewert, 'Om Fänrik Stål's sägner'; Lagus, Ernst, 'Förklaringar till Fänrik Ståls sägner.'

J. ALEXIS.

ENSILAGE, ĕn'sĭ-lāj. See SILAGE.

ENSTATITE, Mg Si O_3, a silicate, chiefly of magnesium, but also containing more or less iron and aluminum. The mineral commonly occurs in massive or fibrous forms, but distinct crystals, prismatic in habit and belonging to the orthorhombic system, are also occasionally found. Its color varies; it may be white, greenish or brown. Its hardness is 5.5, and its specific gravity about 3.2. Enstatite is a common constituent of peridotites, crystalline schists and meteorites, and is also associated with certain serpentines. It belongs in the pyroxene group, is insoluble in hydrochloric acid and before the blow-pipe it fuses only along its thin edges. The name (Greek, «adversary») refers to these refractory qualities. It is found in Putnam County, N. Y., Bavaria, the Harz Mountains, Moravia and Tyrol.

ENTABLATURE, in architecture, the horizontal, continuous work which rests upon a row of columns and belongs especially to classical architecture. It consists of three principal divisions, the epistyle or architrave immediately above the abacus of the column, next the frieze, and then the cornice. In large buildings projections similar to and known also as entablatures are often carried round the whole edifice or along one front of it. Consult Boetticher, K. G. W., 'Die Tektonik der Hellenen' (Berlin 1874); Hirt, A. L., 'Die Baukunst nach den Grundsätzen der Alten' (Berlin 1809); Kohte, J., 'Die Baukunst des Klassischen Altertums, etc.' (Braunschweig 1915); Marquand, A., 'Greek Architecture' (New York 1909); Uhde, C., 'The Architectural Forms of the Classic Ages, etc.' (edited by R. P. Spiers, Berlin 1909).

ENTADA, a genus of leguminous plants containing about a dozen species of climbing tropical shrubs, remarkable for the great size of their pods. *E. scandens* has pods which measure from six to eight feet in length. The seeds have a hard, woody and beautifully polished shell, and are often made into snuff-boxes, scent-bottles, etc.

ENTAIL, the settlement of an estate so that it shall pass according to a certain rule of descent. In England after the Norman Conquest estates were frequently granted to a man and the heirs of his body, but in time the law courts interpreted such grants as conferring a fee-simple conditional, so that when the condition, namely, the begetting of an heir, was fulfilled, the estate became a fee-simple absolute and could be alienated by the grantee. The statute «De Donis Conditionalibus,» passed in 1285, declared that this interpretation was contrary to the intention of the grantors, and enacted that in all future grants of this nature the grantee should have no power to alienate the estate, and that on the failure of issue the land should revert to the grantor. The effect of this statute was to prevent the free conveyance of land, but gradually the lawyers created a series of proceedings known as fines and recoveries, by means of which a tenant in possession could bar the entail and convert his estate-tail into a fee-simple, that is, into his absolute property. (See FEE). These remedies created by the courts were abolished by the Fines and Recoveries Act, passed in 1833, and a direct means of barring entails was introduced. This statute enacts that every actual tenant-in-tail shall have full power to dispose of, for an estate in fee-simple absolute, or for any less estate, the lands entailed; but a tenant-in-tail in remainder, expectant on an estate of freehold, cannot bar the entail, though he may bar his own issue, without the consent of the «protector of the settlement,» who is usually the tenant for life.

ENTASIS, ĕn'tā-sĭs, in architecture, the delicate outward curve of a column, found in perfection in the Doric column, by which an arc is described whose highest point is about midway between capital and base. This swelling of the column is intended to counteract the optical error by which a rigidly straight perpendicular line has a tendency to appear concave. The entasis is also calculated to suggest life and motion in the column under the superimposed weight of the entablature. Consult Goodyear, W. H., 'Greek Refinements' (New Haven 1912); Penrose, F. C., 'An Investigation of the Principles of Athenian Architecture' (London 1851).

ENTELECHY, ĕn-tĕl'ĕ-kĭ, a Greek word meaning «the bringing to completion,» in the peripatetic philosophy of Aristotle is the transition or connecting action between what he calls δύναμις, potentially and ἔργον, actuality; that which, among the schoolmen, is conceived as intervening between the *posse* and the *esse*, for example, between the infinite possibilities of omnipotence in the Supreme Being and their manifestation in creation and active providence.

ENTELLUS MONKEY, a book-name for the langur (*Semnopithecus entellus*), the sacred monkey of Hindustan, representative of the god Hanaman. See LANGUR.

ENTELODONTS, a group of split-hoofed, swine-like animals of early Tertiary time, the giant pigs, represented in both the Old and New Worlds. In North America their fossil remains are found in rocks from Eocene to Lower Miocene age from New Jersey to the Rocky Mountains. The head was very long, the neck short, the body compact, the long spines of the dorsal vertebræ forming a decided hump on the shoulders, and in some the legs were very long and slender, giving a stilted appearance to the animal. The teeth were large and strong, especially the incisors and premolars (sharp cutting-teeth) and the canines were large but not developed in formidable exterior tusks as in modern wild boars. The brain-case was «absurdly small,» says Scott; and «evidently these great pigs were profoundly stupid.» Beneath each eye was a long, descending, bony process, and the lower jaw had in its under side two pairs of bony protuberances, which Osborn believes were for the attachments of the great muscles needed in tearing up roots, which there is reason to believe formed their principal food (Brackett). The genus *Dinohyus*, of the Upper Oligocene of Nebraska, contained species six feet or more in height, and others were scarcely less. Consult Scott, 'Land Mammals in the Western Hemisphere' (New York 1913).

ENTENTE CORDIALE (Fr., cordial understanding), a term commonly applied to the reconciliation, in 1904, between France and Great Britain after many years of enmity. In diplomatic language the phrase signifies a close friendship between two or more nations, though without any formal alliance existing between them. See ALLIANCES; TRIPLE ALLIANCE; TRIPLE ENTENTE.

ENTERALGIA, ĕn-tĕ-răl'jĭ-ȧ. See ENTERITIS.

ENTERIC FEVER. See TYPHOID FEVER.

ENTERITIS, an inflammation of the small intestine, the most important symptom of which is diarrhœa. Different varieties of enteritis are described as catarrhal enteritis, the acute enterocolitis of children, or cholera infantum, croupous enteritis, and enteritis due to tuberculosis, carcinoma, and other malignant diseases. In primary enteritis the symptoms may be acute or chronic, the most important single symptom being diarrhœa. The stools are thin and watery, and particles of undigested food may be found in them. There is usually colicky pain with gas, and occasional vomiting. Loss of appetite, thirst and dry tongue are usually present, but fever is not common. The general causes of catarrhal enteritis are improper food, particularly in children, unripe fruit, toxic substances, changes in the weather, and nervous influences bringing about changes in the character of the secretions and in the muscular activities of the walls of the intestines. Infectious diseases may also be the cause of acute enteritis. Rest in bed, following a mild laxative such as calomel or castor oil, together with milk diet, will usually be sufficient treatment for the simple cases.

Acute enteritis of infants, known as cholera infantum (q.v.), is a much more serious disease. This is a form of dysentery, in which not only the small intentine but the large intestine also is involved, and the most active cause of this disease is a specific micro-organism called the bacillus of Shiga. Treatment of acute enteritis of infants requires trained medical advice. The most important feature, however, in infants is to cut down the feeding, giving practically nothing but water for at least 24 to 36 hours. Horses, cattle and sheep, too, are subject to enteritis, and, unless properly and promptly treated, are apt to succumb to it. See CHOLERA INFANTUM; COLITIS; DYSENTERY; INTESTINES — *Diseases of*.

ENTEROCLYSIS, a form of intestinal hydrotherapy of much importance. It consists in lavage of the intestines. The ordinary hot-water enema is the simplest form of enteroclysis, but true enteroclysis consists in continuous irrigation with large quantities of solution, either with a single or a double tube. The effect of the introduction of large amounts of hot salt solution (a dram of common table-salt to a pint of water at a temperature of from 110° to 118° F.) is very marked. There is much increase in the tension of the pulse, and pronounced stimulation of the heart-action, both of prime importance in the treatment of hemorrhage, shock, asphyxiation from drowning or from coal-gas poisoning, and of many forms of drug and industrial poisoning. Enteroclysis has also a marked effect in augmenting the secretion of the kidney, and proves of immense importance in the treatment of chronic uræmic poisoning, such as is seen in Bright's disease, and also in the treatment of diabetic coma. It is likewise of importance in bladder troubles, in colitis, in peritonitis, septic endocarditis, and in ulcerative conditions of the large intestine, such as are found in dysentery and in cholera.

Enteroclysis is also an excellent mode of treating collapse in chronic alcoholism.

ENTERPRISE, The, the name of a number of American and English boats, the most famous of which was an American 12-gun schooner with such a brilliant career that she became known as the «Lucky Little Enterprise.» Built 1799 to deal with the French privateers in the West Indies, she had an extraordinary cruise in 1800 under the command of Lieut. John Shaw: in a six months' run she took eight privateers, some of them much heavier than herself, and aggregating 47 guns, and also recaptured four American merchantmen. In 1801 she was sent under Lieut. Andrew Sterett with Captain Dale's squadron to the Mediterranean against the Barbary pirates, captured a 14-gun Tripolitan after a fierce engagement, and later was at the bombardment of Tripoli. In December 1801 she returned to the United States, but went back to the Mediterranean in 1802 under Lieut. Isaac Hull. In 1803 she was under the command of Lieut. Stephen Decatur (q.v.), who in December of that year captured with her the Tripolitan *Mastico* which later became famous in connection with Decatur's recapture of the *Philadelphia*. Between 1805 and 1809 the *Enterprise* was in home waters. From 1809–11 she was once more in the Mediterranean, this time under Lieutenant Trippe. Her most memorable battle was during the War of 1812 and was fought with the English brig *Boxer*, Captain Blythe, on 5 Sept. 1813, off the Maine coast, toward Monhegan Island. By that time she had been converted into a brig, carried 16 guns and was under Lieut. William Burrows; the *Boxer* had 14 guns. The crews were about 100 each. The fight began at 3:20 P.M., and was ended at 4 by the surrender of the *Boxer*, literally cut to pieces in hull, masts, rigging and spars, several of her guns dismounted, boats and quarters shattered; the *Enterprise* was almost uninjured, with but one shot in the hull and one in the main-mast. Both commanders were killed and were later buried side by side at Charleston. Burrows who had received his mortal wound during the progress of the fight was succeeded by Lieutenant McCall. After this heroic battle the *Enterprise*, together with some other boats, cruised for some time in southern waters under Lieut. James Renshaw and there, even though she had lost much of her former speed by the structural changes made upon her, escaped at a number of occasions from English boats which were attempting to capture her. She then served until the end of the war as harbor guard at Charleston. From 1816–19 she was again attached to the Mediterranean squadron, this time under Lieut. Laurence Kearney. In 1821 she cruised in the West Indies and successfully broke up the pirates then swarming in those waters. In 1823 she was wrecked on Curaçoa, but all hands were saved. A famous English boat bearing the name *Enterprise* was one of three masts which, under the command of Capt., later Adm., Richard Collinson, made, from 1850–55, one of the many unsuccessful searches for Sir John Franklin's ships in the Arctic. Consult Collinson, Sir R., 'Journal of H. M. S. *Enterprise*' (London 1889); Hill, F. S., 'Twenty-Six Historic Ships' (New York 1903); 'The Romance of the American Navy' (New York 1910); 'The «Lucky Little Enterprise»; etc.' (Boston 1900); Maclay, E. S., 'A History of American Privateers' (New York 1899); 'A History of the United States Navy' (3 vols., New York 1902); Morris, C., 'Heroes of the Navy in America' (Philadelphia 1907); Speers, J. R., 'The History of Our Navy' (4 vols., New York 1897); 'A Charmed American Warship' (in *Harper's Magazine*, Vol. CIV, pp. 927–936, New York 1902).

ENTFUHRUNG AUS DEM SERAIL, ent-für'oong ous dăm sä-rīl', **Die** (Il Seraglio). An opera by Mozart, which was produced for the first time at Vienna on 13 July 1782 and at New York in October 1862.

ENTHYMEME, in logic, the technical name for a syllogism of which either one premise or the conclusion is not expressed. For example, «The *Lusitania* must have been steaming under 20 knots for it was torpedoed»— the unexpressed premise being «A steamship steaming over 20 knots cannot be torpedoed.» See LOGIC.

ENTOMBMENT, The, a favorite subject of the painters of all the centuries has been this representation of the placing of Christ's body in the sepulchre. Of all perhaps the most famed is that by Raphael (1507), now in the Palazzo Borghese, Rome. The finest is that in the Louvre by Titian (1523). The Madrid Gallery has another Titian but it is inferior in conception to that of the Louvre. Other representations of this subject are those by Caravaggio, Tintoretto, Ferrari (Turin), Carracci (Louvre), Donatello (a sculpture group in the South Kensington Museum, London), and Van Dyck (in Antwerp).

ENTOMIS, a genus of fossil ostracods, having a vertical furrow along their shell valves. It is found in the Ordovician and Carboniferous and all intermediate strata, especially the Devonian. See OSTRACODA.

ENTOMOLOGICAL SOCIETIES. Half a century ago a single entomological society was all that had been organized in the United States, but at present there are probably upward of a score of organizations devoted to this science. The first entomological society of which we have record was formed in 1842. This was The Entomological Society of Pennsylvania, which has long been out of existence. The American Entomological Society of Philadelphia, founded in 1859 under the name of The Entomological Society of Philadelphia, and incorporated in 1862, published 'Proceedings' until 1868, when the society name was changed and the publications became known as 'Transactions.' This, as well as some of the other societies that will be mentioned, is supported by a permanent endowment fund, owns very extensive and valuable collections and a library, which are deposited with the Academy of Natural Sciences of Philadelphia, of which institution its members are associate members of the entomological section. Under the combined auspices of these organizations there is now published *Entomological News*. The Entomological Society of Ontario publishes the *Canadian Entomologist* which began publication in 1868, though the society had a previous existence under the name of The Entomological Society of Canada. It is supported by an annual government grant and the sale of its publications. The Brooklyn Entomological Society was organized in 1872 and in 1888, while retaining a corporate existence, became merged in the Brooklyn Institute, forming the department of entomology of that institution. It published seven volumes of a 'Bulletin' and six volumes of 'Entomologica Americana.' The Cambridge Entomological Club, founded at Cambridge, Mass., in 1874, publishes *Psyche*, a quarterly originally devoted largely to bibliographical and biological entomology. The same year The Entomological Club of the American Association for the Advancement of Science was formed. In 1884 The Entomological Society of Washington was organized, publishing 'Proceedings.' The Association of Economic Entomologists, as has previously been mentioned, was established in 1889. Its 'Proceedings' are published in the general series of bulletins of the Division of Entomology of the United States Department of Agriculture. In 1881 The New York Entomological Club began the publication of 'Papilio,' but at the end of its 4th volume its members joined the Brooklyn Entomological Society. In 1892, however, another society was organized in New York as The New York Entomological Society. It was incorporated in 1899.

In addition to these principal publishing entomological associations there are several other entomological sections of larger scientific societies in Canada and in the United States. There are also local clubs or societies in various sections, for example, in Newark, N. J.; at Williamsburg, N. Y.; at Chicago, Pittsburgh and in San Francisco, the home of the California Entomological Society.

There are many foreign societies, nearly all of the largest cities of Europe supporting one or more, usually holding titles significant of an entire nation, for example, there are entomological societies of Belgium, France, Switzerland, Russia, Italy and Germany, and others representing the cities of London, Berlin, Vienna and Stockholm. See also AMERICAN ENTOMOLOGICAL SOCIETY and consult Skinner, H. (ed.), 'Entomologists' Directory, containing the names, addresses, special departments of study, etc., of those interested in the study of insect life in the United States and Canada' (Philadelphia 1904).

ENTOMOLOGY, the science which deals with insects. See INSECTS.

ENTOMOLOGY, Economic. Attacks by insects upon useful plants doubtless began with the first cultivation of plants; but it was not until the end of the 18th century that any means for mitigating their ravages were employed beyond hand methods and other purely mechanical measures. A few crude efforts were made among the ancient farmers and fruit-raisers on the shores of the Mediterranean toward the suppression of insect pests and Pliny even advised the use of white hellebore, one of the modern insecticides; but it was at about the middle of the 19th century that insecticides (q.v.) or insect poisons began to be generally adopted, and the migration of the Colorado potato beetle from its native home in the Rocky Mountain region to the potato fields of the East was the indirect means of the employment of arsenical preparations as a means of destroying insects; so that this insect, while an apparent curse, has proved, indirectly, of the greatest value to the agricultural community at large. Prior to the use of Paris green, which appears to have first been applied to this potato pest in Michigan in 1867, knocking the beetles from the infested plants into a pan of water was the only method of treatment and was used for many other insects as well. The discovery of the value of this poison as a remedy for the codling moth was made in 1878, by Prof. A. J. Cook, who used Paris green as a remedy for canker-worms and found that the trees treated with it were free from codling moth. To Professor Cook also is probably due the first use of kerosene mixed with soap, although the kerosene emulsion, which is now a standard remedy for all sucking insects, was the joint product of Messrs. Barnard, Hubbard and Riley, and first used in 1877. White arsenic was employed as an insecticide as early as 1871 and London purple was put to practical use in the destruction of the cotton worm in 1878. London purple has since been displaced by various other insecticides, as it has proved inferior to Paris green, which, in turn, has been replaced by arsenate of lead, because the latter, while poisoning the insects, does not scald or otherwise injure the plants. In the same manner the discovery of Paris green as a remedy for the Colorado potato beetle was made through the migrations of this insect, the ravages of the cotton cushion scale (*Icerya purchasi*) of the orange orchards of California led to experiments conducted by Mr. D. W. Coquillett, of the United States Department of Agriculture, in 1886, to the finding of hydrocyanic-acid gas as the best medium for extirpation of scale insects (q.v.), and to its general use in fumigation for all insects which can be treated with it. In 1895 Messrs. A. F. Woods and P. H. Dorsett, also of the Department of Agriculture, began experiments which led to the adoption of a perfected system of fumigation with the same gas of plants grown under glass and injured by scale and other insects.

Our best remedies for insects, then, arsenical mixtures and kerosene emulsion and other preparations, and hydrocyanic-acid gas, are the product of American research. The bisulphide of carbon as an insecticide, however, though the discovery of a foreigner, has doubtless received greater attention in our country than elsewhere. It was first employed by M. Doyère, as early as 1856, as a remedy for weevils in stored grain, which is still its principal use; but its cost when first employed was so excessive as to preclude its general employment on a large scale. Subsequently a high grade of this chemical, known as «fuma-bisulphide,» was made for sale at 10 cents a pound. It supplements the use of hydrocyanic-acid gas in that the former is used for the fumigation of plants above ground, while the latter destroys insects affecting the root-system. Both gases are used for the treatment of indoor insects in granaries and mills and in dwellings and warehouses. Although these are the main insecticides, there are others, nearly all of which owe their discovery and perfection to economic workers in America. They include pyrethrum, better known as Buhach, Persian and Dalmatian insect powders, the extensive use of which has resulted in the establishment of a considerable industry in the growing of the principal plants which produce these powders (*Pyrethrum cinerariæfolium* and *Pyrethrum roseum*); and whale-oil and fish-oil soaps, originally used against the hop aphis in 1886, and later against scales.

In more recent years lime-sulphur combinations have been used as washes and sprays against scales and other sucking insects with good results. Still more recently nicotine sulphate standardized at 40 per cent purity has come into general use as a contact insecticide for the same class of insects, and is now a standard remedy in combination with soap for the control of aphides or plant-lice, the onion and pear thrips and related species, leafhoppers, plant-bugs and many others. Prior to this time tobacco preparations were used but with indifferent success except on a restricted number of insect pests.

Quassiin is the subject of investigation as a contact insecticide. Of arsenical poisons arsenite of zinc and arsenate of calcium are effective but not superior to arsenate of lead. Adhesives, such as whale-oil (fish-oil) and other soaps, are also in general use under the name of «stickers.» Repellents, to prevent such insects as the parent flies of root-maggots from depositing their eggs, are being successfully employed and in some cases odorous substances are being used to attract insects from their natural foods where they can be destroyed.

As fumigants, hydrocyanic-acid gas generated from sodium cyanid is in general use for the destruction of mill and granary insects, greenhouse and household pests. Carbon tetrachloride and para-dichlorobenzene are excellent fumigants, but too costly for general use. Insects affecting stored products and pests in households may also be controlled by heat — an old remedy which is now employed in many mills and warehouses where steam-heating plants are installed.

During the early years of work in spraying for various insects the principal dependence was placed in American insecticide machinery, but after the invention of different forms of nozzles by M. Vermorel, of France, various other nozzles, pumps and other machinery were invented in America and have gone into general use.

An almost incredible number of spraying machines and appliances are being manufactured and constant improvements are being made adapted to special purposes.

Prevention of Insect Injuries by Farming Methods.— It would be difficult to detail step by step the wonderful progress that has been made in means of subduing insects by simple farming methods which, as a rule, necessitate little or no extra labor or monetary outlay. Some of our principal pests, with which we cannot cope successfully by means of insecticides or by mechanical methods, may be controlled by the judicious use of ordinary methods of tillage. The seed, nursery or other stock for planting should be selected with a special view to securing immunity from attack by the insect most feared or most prevalent in the region where the crop is to be planted. By planting different immune varieties of wheat the ravages of the Hessian fly are reduced to a minimum. Certain forms of trees may be selected for planting for shade in some regions without danger of injury, because the insects which elsewhere do greatest damage to them are not present. The selection of a suitable location on the farm for a crop should be made with the same end in view. Where injury is feared by an insect which does not travel freely, immunity can be secured by planting in that part of the farm where the insect is known not to exist. The prompt destruction of crop remnants and the pulling up and burning over of weeds and other rubbish is a preventive applicable to all crops. Another measure is the use of «trap crops.» Thus part of an old crop may be left to attract insects which usually remain in the field after the crop is made; similar or more attractive plants may be grown for the protection of the main crop; or of early varieties of the same plants, as lures for the insects until the main crop can obtain a good start. On the lure plants the congregated insects must be destroyed by poisons or by fire. Trap crops are of considerable value in the treatment of several of the worst enemies of cucumbers, melons, squashes and similar vines. The stimulation of a plant by means of fertilizers and the maintenance of healthy, vigorous growth by cultivation, the suppression of diseases and the prevention of injury by insect pests other than those which it is specially designed to circumvent, are helpful aids. Crop rotation or the planting of alternate crops which are not injured by those insects which ravage the staples assists in the warfare; as also do fall and spring plowing, which, in proper combination, result in the destruction of nearly all forms of the many insects which pass one or more stages in the earth in hibernation. The use of water by irrigation or submersion, if practised at the right time, will result in the temporary extirpation of nearly all insects in the fields thus treated, particularly in cranberry bogs. The reclamation by drainage of land subject to more or less complete submersion, such as swampy tracts, river bottoms and the like, and the destruction of the weeds and other plants and the insect life which remain by burning over, are of great value in suppressing many pests. If, to the methods above outlined, we add the strict observance of timely harvesting of crops with a view to the prevention of further attack and the destruction of insects which might reproduce the following year; the utilization of natural enemies, such as parasitic and predaceous insects, poultry and live stock, to destroy the insects in the field after the crop is off; the systematic inspection of the farm for the first appearance of insect attack, and, finally, the co-operation of neighboring farmers having a community of interests in growing the same crops, there is comparatively little use for insecticides save in the case of insects such as grasshoppers and the caterpillars of moths and butterflies, which are strong fliers and cannot be successfully controlled by mechanical methods.

Economic Entomologists.— Dr. T. W. Harris is credited with having been the first economic entomologist of America, but in reality the honor is due to W. D. Peck, who began writing on injurious insects late in the 18th century (1795–1819). His writings, however, are few, in comparison to those of Harris, whose labors began in 1831 and whose greatest work appeared in 1841, his classic treatise on ‘Insects Injurious to Vegetation.’ In the year

1853 the New York State legislature appropriated $1,000 for the study of economic entomology and Dr. Asa Fitch was appointed to perform the work specified. Fitch's work continued until 1871 or 1872, when his 14th and last report was published. Afterward different States, Illinois in 1866–67, and Missouri about a year later, appointed State entomologists, the latter State obtaining the services of Dr. C. V. Riley, who wrote a series of nine reports which, for originality, scientific accuracy and practical value, have received recognition the world over.

When Dr. Riley assumed the duties of entomologist of the United States Department of Agriculture, economic entomology received a new impetus, his work and that of his assistants marking a new era in practical entomological work. Upon his death in 1894, he was succeeded by Dr. L. O. Howard, under whose direction the Bureau of Entomology continues to issue reports, bulletins and circulars of the highest practical and scientific value. See AGRICULTURE, DEPARTMENT OF.

Prior to 1888 Massachusetts, New York, Illinois and Missouri were the only States which maintained officially appointed economic entomologist. During that year the State agricultural experiment stations (q.v.) were organized under the Hatch Act and several official entomologists were appointed in connection with them. In 1889 was formed an Association of Economic Entomologists which held annual meetings in various cities subsequently and had in 1916 a total membership of about 470.

Bibliography.— Harris, 'Insects Injurious to Vegetation' (Flint ed., 1852); Treat, 'Injurious Insects of the Farm and Garden' (1882); Saunders, 'Insects Injurious to Fruits' (1883); Cooke, 'Injurious Insects of the Orchard, Vineyard, etc.' (Sacramento 1883); Smith, 'Economic Entomology' (1896); Weed, 'Insects and Insecticides' (Hanover, N. H., 1891); Sanderson, 'Insects Injurious to Staple Crops' (1902); Chittenden, 'Insects Injurious to Vegetables' (New York and London 1907); Sanderson, 'Insect Pests of Farm, Garden and Orchard' (New York and London 1912); Slingerland & Crosby, 'Manual of Fruit Insects' (New York 1914); Essig, 'Injurious and Beneficial Insects of California' (2d ed., Sacramento 1915). Also the serial publications of the United States Department of Agriculture and of the entomologists of the State agricultural experiment stations and of State entomologists, including Fitch, Riley, Forbes, Lintner, Felt, J. B. Smith, Webster and others.

F. H. CHITTENDEN,
Entomologist, in Bureau of Entomology, United States Department of Agriculture, Washington, D. C.

ENTOMOPHTHORALES, en-tō-mŏf″-thō-rā'lēs, group of parasitic fungi, which is highly destructive of insects. In germination the spore emits a tube which penetrates the insect's body, which is thereupon filled with the mycelium of the fungus.

ENTOMOSTRACA, one of the two great sub-classes of crustacea (the other is Malacostraca), including minute forms; the «water-fleas,» having a horny shell of many pieces, a well-developed cephalo-thorax, mandible and three pairs of maxillæ, five pairs of thoracic feet but no abdominal feet and no gills, breathing instead by specialized organs. They have a great variety of shapes and of means of locomotion. The young is a nauplius and developed by numerous molts. The group includes many thousands of species, divided into four orders,— Phyllopoda, Ostracoda, Copepoda and Cirripedia (barnacles). They abound in stagnant fresh waters and also in the sea, and furnish an immense quantity of subsistence for fishes that are used for human food. They exist and increase in innumerable millions. The descendants of a single cyclops may in one year number over 4,000,000,000. At one time they render the surface of the sea-water phosphorescent by their vast luminous congregations. At another time the Atlantic Ocean is colored red over a space of hundreds of square miles by the assembly of these minute creatures, attracting multitudes of fishes, even of whales, which feed upon them. On the other hand, some forms are equally injurious as parasites. Those belong chiefly to the copepod group — siphonostomata, having mouths fitted for suction. Some are commensal, entering the gill-sac or digestive cavity and feeding upon the food, not upon the tissue, of the host. Some attach themselves long enough to suck the blood of their victim and then pass on, while others enter the body as permanent residents and embed themselves in the tissue. Thus they are the pests of starfish, jellyfish, worms, ascidians, fishes and whales. See BARNACLE; COPEPODA; CRUSTACEA; FISH-LICE; OSTRACODA; PHYLLOPODA.

ENTOZOA, formerly employed as the name of a subdivision of radiate animals, has passed out of use as a term of systematic classification, because it fails to indicate or signify any ideas of structure and only hints at the habitat and occupation of great numbers of living creatures. Following the strict meaning of the word entozoa, denoting «animals within» (i.e., internal parasites) other animals, not only brings together many genera that belong with the different subdivisions of the same general division, but also imports those which are included under classes morphologically distinct. Even this use of the word is obsolescent. See BOT FLY; DISTOMA; ELEPHANTIASIS; FILARIASIS; GUINEA-WORM; HOOK-WORM; OXBOT; PARASITISM; PLATYHELMINTHES; ROUND-WORMS; TAPEWORMS; TREMATODA.

ENTRE-DOURO-e-MINHO (*i.e.*, between the Douro and Minho), ĕn'trē dō'roo ē mēn'yoo, a province of Portugal, more generally known by the shorter appellation of Minho. The surface is broken and partially occupied by high mountains, but the soil in the valleys is well cultivated and the province the most densely populated in the country. Area 2,808 square miles. Pop. 1,289,066.

ENTRE MINHO e DOURO, name frequently employed by the Portuguese for the province Entre Douro e Minho or Minho (qq.v.).

ENTRE RIOS, ĕn'trā rē'ōs, Argentine Republic, a province bounded on the north by Corrientes, on the east by the republic of Uruguay, on the south and west by the provinces of Buenos Aires and Santa Fé. As its name indicates its territory lies «between the rivers» — Rio Paraná and Rio Uruguay. Area 29,241 square miles. Agriculture and immigration were encouraged by the provincial government, which sold land to settlers in portions of 82½ acres, to be paid for in three years, at prices ranging from $600 to $2,000, according to location. A considerable amount of land has been taken up by the Jewish Colonization Association. Until the building of the Entre Rios Railway this province was the "poor sister" of the republic; but since then it has made very rapid strides. It is second in the production of oats and grows large quantities of wheat of excellent quality, other products being maize, lucerne, barley, flax, grapes, tobacco, fruit and (on a very large scale) cattle, sheep and horses. Its capital, the city of Paraná (pop. 65,000), was the capital of the republic from 1852 to 1861; it has a national college, a normal school and several elementary schools, a charming park, tramway service, and is an important port for the traffic on the Paraná River. Pop. of the province estimated 423,100.

ENTRECASTEAUX, dŏṅtr-kas-tō, **Joseph Antoine Bruni d'**, French navigator: b. Aix 1739; d. at sea, near the island of Java, 20 July 1793. He entered the French naval service in 1754, gradually rose to the position of commandant of the French fleet in the East Indies (1786), and in 1787 became governor of Mauritius and the Isle of Bourbon. In the same year he made a voyage to China. In 1791 he was sent by the French government in search of La Pérouse (q.v.), who had not been heard from since February 1788. For this purpose he was given the command of two ships, the *Recherche* and *L'Espérance*. He failed in detecting any trace of the lost navigator, but ascertained with great exactness the outlines of New Caledonia, the west and southwest coast of New Holland, Tasmania and various other coasts. The D'Entrecasteaux Archipelago was named in his honor. Other reminders of his visit to Tasmania are D'Entrecasteaux Channel, Bruni Island, Recherche Bay, Port Espérance, all names given by him to these various localities and still in use to-day. The journal of this voyage has been edited by de Rossel, 'Voyage de Dentrecasteaux' (2 vols., Paris 1808). His maps and other topographical drawings have been published as 'Atlas du Voyage de Bruny-Dentrecasteaux' (Paris 1807). Consult Cordier, H., 'La Mission de M. le Chevalier d'Entrecasteaux à Canton en 1787' (Paris 1911); Goepp, E., and Cordier, E. L., 'Les Grands Hommes de la France: Navigateurs' (Paris 1873); Labillardière, J. J. H. de, 'Relation du Voyage à la Recherche de la Pérouse' (2 vols., Paris 1800), and its translation into English, 'Voyage in Search of la Pérouse' (2 vols., London 1800); Marriott, I. L., 'Commodore Sir John Hayes, His Voyage and Life' (London 1912).

ENTREMONT, dôn-tr-môn', **Comte d'**. See L'Hopital.

ENTRENCHED MEANDERS. See Meanders.

ENTRESOL, ŏñ tr-sŏl or ĕn'tĕr-sŏl (Fr. "between the floors"), a low story between two of greater height, generally the ground and the first stories. It is of frequent occurrence in modern French architecture, especially in city houses. It is called also the Mezzanine.

ENTROPION, or **ENTROPIUM**, inversion or turning in of the edge of the eyelids, in consequence of which the lashes rub on the eyeball, causing annoyance and pain.

ENTRY, Right of, in the common law, the right of taking possession of lands or property by entering or setting foot on the same. This may be done either by the claimant personally, or through his agent or attorney.

ENTRY, Writ of, a formal declaration made by one exercising the right of entry in recovering property of which he has been disseized that he claims full possession of the said property. The common-law action of Writ of Entry has for some time been obsolete in Great Britain, but is still in use in a modified statutory form and generally for special purposes in a few jurisdictions in the United States.

ENTWISTLE, James, American naval officer: b. Paterson, N. J., 1837; d. 23 March 1910. He entered the engineering service, United States navy 1861, became commander in 1888, and in 1899 was made captain and rear-admiral and placed upon the retired list. He first served on the *Aroostook* under Farragut in the Western Gulf squadron, and on 21 other vessels; was inspector of machinery at the Bath (Me.) Iron Works 1890–95 while the ram *Katahdin* and the gun-boats *Machias* and *Castine* were in process of construction, and assistant to the general inspector at Mare Island Navy Yard in 1895. He joined the Asiatic squadron at Yokohama during that year, being appointed fleet engineer 1897 and assigned to the *Olympia*. He took part in the battle of Manila Bay, 1 May 1898, being advanced in numbers for meritorious services upon that occasion.

ENTWISTLE, Joseph, English clergyman: b. Manchester, England, 15 April 1767; d. Tadcaster, 6 Nov. 1841. In 1787 he was called into the Wesleyan ministry by John Wesley and spent 54 years of his life in preaching the Gospel. He was twice president of the British Conference and was connected with the Theological Institution at Hoxton 1833–38. His last years were spent at Tadcaster. Consult 'Memoir of Rev. Joseph Entwistle' by his son (1st ed, 1845, 5th ed. 1861).

ENURESIS. See Urine, Incontinence of.

ENVELOPE, a paper case, sealable by means of an adhesive flap or other means, and used for enclosing letters or other matter. It has not been established definitely by whom and where envelopes were invented, but they seem to have been used first in France, possibly as early as the middle of the 17th century, though in very limited quantities. They were not in general use in any country prior to 1839–40, when, after the passage of the penny postage bill, they became common in England. Until about 1845 nearly all letters in this country were folded so that an unwritten portion came on the outside, and the address was placed there, though even then there was a certain demand for envelopes, all of which, however, were made entirely by hand. Gradually the use of envelopes spread and by 1850 practically all letters were enclosed in them. The first maker of envelopes in New York is believed to have been a Mr. Pierson who, as early as 1843, made envelopes by hand in his store on

Fulton street. In 1846 he sold his business to an Englishman named Dangerfield who was soon succeeded, first by Jacob Berlin, and then by W. G. West. At that time only 2,000 or 3,000 could be made in a day, as machinery was not yet used. The blanks were cut out by means of a sheet of metal, placed on top of a pile of paper, around the edges of which a sharp knife was run. They were then folded and pasted by hand. Machines were invented in England, probably as early as 1840, though they were not patented until 1849, by Warren de la Rue and Edwin Hill, the latter a brother of Sir Rowland Hill (q.v.), the father of the penny post. These machines were one of the chief attractions of the Hyde Park Exposition, held in London in 1851. The first machine used in this country was a French model. It had been purchased in 1847 for $600 by H. C. Berlin, son of Jacob Berlin, who had gone into the envelope business with his father's successor, W. G. West. This machine, however, was not very successful. The first patent for an envelope-folding machine was issued in the United States 23 Jan. 1849 to J. K. Park and C. S. Watson of New York, the second on 26 April 1853 to E. Coleman, Philadelphia. Neither of these was accompanied by commercial success. The third patent was issued to Dr. Russel L. Hawes, a physician of Worcester, Mass., in 1853. This machine was quite successful, but was used exclusively by the concern founded by its inventor, which, after many changes in ownership, is still in existence as the W. H. Hill Envelope Company, Division of the United States Envelope Company. Not until just before the outbreak of the Civil War was a machine patented and placed on the open market. The inventor was George H. Reay, and his machine was for many years one of the most successful. It gave a tremendous impetus to the envelope industry. At this period many others invented envelope machines or attachments to them none of which, however, could be purchased in the open market. From then on the development of envelope machinery made rapid strides. Improvements gradually provided for self-feeding, gumming, automatic counting, etc. The men chiefly responsible for these improvements were J. M. D. Keating, T. V. Waymouth, H. D. and D. W. Swift, J. G. Arnold, D. Whitcomb, and others. Many of these early inventors went into business for themselves and quite a number of these comparatively old concerns were included in the consolidation of the 10 leading envelope companies accomplished in August 1898, and thereafter known as the United States Envelope Company, Inc. Modern machines have been improved to a point where it is possible for one machine to turn out as many as 55,000 envelopes a day. The variety of envelopes, too, has rapidly increased. They are used now not only to enclose letters, but a great deal of printed matter and for many other purposes. Recent innovations are especially the so-called window-envelope, with a transparent front through which the address at the head of a letter can be read, saving thereby the separate addressing of the envelope; envelopes with special sealing devices, such as metal hooks and eyes, threads, etc.; and the envelope with a wire or thread attached to its inner edge, facilitating its opening. Since 1853 the government supplies stamped envelopes, which are purchased in ever increasing quantities, the total issue to postmasters in 1922 amounting to 2,364,-372,708 of a gross selling value of $47,287,454. About two-thirds of these are issued with printed return cards in the upper left hand corner. Practically every government, having a postal service, issues stamped envelopes. The remarkable growth of the envelope industry can be seen from the following figures, based on 'The United States Census of Manufactures of 1919' (Washington 1923): In 1849, the first year for which figures are available, the total value of products in the envelope industry was $45,000. In 1919 there were 106 establishments with 8,129 operatives, capitalized at $24,755,000 and producing goods valued at $39,664,000. These figures indicate increases during the 10-year period, 1909–19, of 14.4 per cent, 16 per cent, 50.8 per cent and 112.2 per cent, respectively. Envelope factories were located in 1914 in 15 States of the Union, especially in Massachusetts, Illinois, Ohio, New York, Connecticut, Pennsylvania, Missouri. Consult Logan, J., 'The Story of the Envelope' (in *The Red Envelope*, Hartford 1915–17); House of Representatives, Committee on United States Post Office and Post Roads, 'Stamped Envelopes' (Hearings during April 1910, Washington 1910).

ENVER PASHA, Turkish soldier and war minister: b. Constantinople about 1880. Of aristocratic descent, he was educated for the army and saw his first active service in Macedonia against the Serb and Bulgar komitadjis. He was one of the prime movers in the Young Turk revolution of 1908. Stationed at the time in Salonica, his activities were known at Constantinople. In a friendly letter he was invited to return to the capital and promised promotion. But Enver Bey — as he then was — knew better than to accept the invitation. He disguised himself as a peasant and fled to the mountains, traveling rapidly from place to place, spreading the doctrine of revolt and putting the final touches to the preparations. The speedy success of the revolution, the revival of the dormant constitution of 1876, and the subsequent fall of Abdul Hamid, raised Enver to the height of a popular national hero. He was "lionized" in Paris and London; at the latter place he was introduced to both houses of Parliament. Under the new régime he was sent as military attaché to Berlin, where he learnt German, studied the Prussian military organization, and became a close friend of the Kaiser. According to competent observers, the mighty emperor and the humble attaché had much in common, especially dreams of boundless ambition. Fired with admiration for all things German, Enver returned to Constantinople an ardent apostle of Teutonism and heartily threw himself into the work of assisting the German Generals von der Goltz and Liman von Sanders to build up the Turkish army. That army, however, failed of its purpose in the Tripolitan and Balkan wars, in both of which Enver played a prominent part. Of youthful, almost boyish, appearance, poetical imagination and undoubted courage, though entirely unscrupulous, he became the most picturesque figure in Turkish politics. Those who stood in his way he simply shot down. In January 1913 he shot the Commander-in-Chief, Hussein Nazim Pasha and two aides-de-camp who attempted to stop him from entering the council chamber. (Prince Yussuf-ed-din, the heir to the throne, was murdered in February 1916 by order of Enver Pasha). In January 1914 Enver was appointed Minister for War and created a pasha. At the beginning of the European War six months later, Turkey declared her neutrality. Although, apparently, most of the ministers opposed entering the War, they were overborne by Enver Pasha, who not only had the whole Turkish army at his back, but had also adopted the German view that Turkey's salvation was bound up with the success of German arms. He was blamed for the Armenian massacres and at the close of the war was adjudged a war criminal and was condemned to death. Enver, however, escaped and many stories were current as to his fate. His last effort was to arouse the Moslems of mid-Asia and so recover the Ottoman Empire. He failed in this as in other designs. On 25 July 1922 he met his end near Raljivan in Turkestan where his forces were fighting a superior contingent of Bolshevists. See TURKEY; WAR, EUROPEAN: TURKISH CAMPAIGN.

ENVIRONMENT, a modern scientific term applied to the modifying influences of an organism or surroundings. Neither plant nor animal can be understood as a rounded-off unity; the whole life or function is made up of action and reaction between the organism and its environment. Streams of matter and energy from without preserve the relative constancy of the organism, as of a special wave-crest in the sea; while changes in the streams have their corresponding changes within the organism. The plant or animal has obviously a strong unity of its own, but even that is in part due to ancestral welding under the hammers of the environment. It may seem, too, to vary of itself like a fountain in the air, but throughout all its rises and falls there blows the wind of the environment.

The influence of outside conditions has been recognized by most naturalists from the time of Hippocrates, and is taken for granted in our everyday speech and action. There is considerable difference of opinion, however, as to the importance and degree of this influence. Thus Buffon, Treviranus and Geoffroy Saint Hilaire regarded the surroundings as directly hammering changes on the organism; while to Erasmus Darwin and Lamarck internal changes arose as indirect functional results of new environment. Charles Darwin allowed a measure of truth in both these positions, but emphasized the independent action of the organism itself in the direction of natural selection. These three positions are still held, some emphasizing one, others another, the majority combining the three. See DARWINIAN THEORY; EVOLUTION; HEREDITY.

ENVOI, ôṅ-vwä', the last stanza of a ballad (q.v.).

ENVOY, originally envoyé, the French translation of the Latin word «ablegatus,» a person deputed by a sovereign or government to negotiate a treaty, or transact other business of a diplomatic nature with a foreign ruler or government. In its general use we usually apply the word to a public minister sent on a special occasion or for one particular purpose; hence an envoy is distinguished from an ambassador. Envoy extraordinary and minister plenipotentiary is a permanent resident abroad, usually in one of the less important countries officially representing his government, but of inferior rank to an ambassador. His ranking, next to ambassadors, dates back to the beginning of the 18th century, though the term was in use as early as the 17th century at which time envoys belonged to the second class of diplomatic agents together with agents, residents and ablegati. Consult Foster, J. W., 'The Practice of Diplomacy as Illustrated in the Foreign Relations of the United States' (Boston 1906); Garcia de la Vega, D., 'Guide Pratique des Agents Politiques, etc.' (Bruxelles 1873); Krauske, O., 'Entwickelung der Ständigen Diplomatie, etc.' (Leipzig 1885); Satow, Sir E., 'A Guide to Diplomatic Practice' (2 vols., London 1917).

ENZINA, Juan de la. See ENCINA, JUAN DEL.

ENZINAS, ĕn-thē'nạ, **Francisco de** (also known as DRYANDER), Spanish translator of the New Testament: b. Burgos 1520; d. 1553. He was educated at Louvain and at Wittenberg. During his stay in the latter place he resided at the house of Melanchthon. He translated the New Testament from the Greek in 1543 and presented a copy to Charles V. His heretical views caused his imprisonment at Brussels; he escaped after a year's confinement and made his way to Wittenberg. Cramner made Enzinas professor of Greek at Cambridge in 1548. Thereafter his life is obscure and according to some accounts he died at Strassburg in 1553 of the pestilence, according to others he was last heard of at Geneva in 1570. He wrote 'History of the State of the Netherlands and of the Religion of Spain' (1558, republished as 'Mémoires de Francisco de Enzinas' (3 vols., Brussels 1863). Consult Menéndez y Pelayo, 'Historia de los Heterodoxos españoles.'

ENZIO, king of Sardinia: b. about 1220; d. 14 March 1272. He was a natural son of Frederick II, the German Emperor, with whom he fought at Cortenuova against the Lombards in 1237. In 1238 he married Adelasia, and was made King of Torres and Gallura and later King of Sardinia. In 1241 while in command of the fleet Enzio inflicted a great defeat on the Genoese. In the years following he added renown to his name by his exploits in Lombardy. He laid siege to Parma in 1248 but was compelled to withdraw; he next besieged Colonna, took the castle of Arola in 1248, but on 26 May of that year he was made prisoner at Fossalta by troops of Bologna and sentenced to life imprisonment. Consult Blasius, 'König Enzio' (Breslau 1884) and Jordan, 'Les origines de la domination angevine en Italie' (Paris 1909).

ENZOÖTIC, ĕn-zō-ŏt'ĭk, a disease which appears to have secured a permanent lodgement in the animals of a region. It is used of animals as the term *endemic* is used of diseases which affect man in certain localities.

ENZYME (Gr. «leavened»), any of the unorganized ferments, such as diastase, cytase, trypsin, etc., which induce fermentive changes in organic substances. It was formerly thought that these «unorganized» ferments might be essentially different in their action from the so-called «organized» ferments, such as the yeasts, molds and bacteria; but it is now known that the fermentive action of the «organized» class is due chiefly, and perhaps wholly, to the enzymes that they secrete. The chemistry of the enzymes is very imperfectly understood. According to some authorities they act merely by catalysis, being capable of effecting the fermentive change of indefinite quantities of the substances upon which they act, without being themselves used up, nor exhausted in any way. According to other authorities, they are gradually destroyed by their own activity, so that a definite mass of any given enzyme can produce only a definite (though surprisingly large) amount of fermentive transformation. See FERMENTATION.

Chemical ferments, elaborated in the cells of plants and animals and capable of bringing about a peculiar series of biochemical reactions, which are produced without the intervention of physical factors or mineral substances. Under some conditions they have the properties of facilitating chemical interchanges between certain bodies without entering into the composition of the different products that result. These enzymes, or ferments, zymases, or diastases, as they are frequently called, play an important rôle in the digestive processes, as well as being of vital importance in the general life-history of nearly all plants. A knowledge of enzymes dates back to very remote periods. In the beginning of the 16th century observations on the phenomena of digestion called attention to this class of bodies; but it remained for Dubrunfaut and Pasteur to place the science of fermentation on a stable basis. Enzymes are for the most part soluble in water, being thrown out of solution by a large number of chemical substances, such as alcohol, tannic acid, etc. They usually lose their activity at a temperature above 100° F. Most of them decompose hydrogen peroxide and they act largely in proportion to their quantity. With reference to their chemical composition, it would appear that they belong to the proteid class. There is usually a large proportion of inorganic salts, particularly calcium phosphate, in their composition. A few, however, do not contain nitrogen. Although closely related to proteids, they do not give proteid color-reactions. As to their formation, it is considered by some that they are oxidation products of albuminoid substances, or zymogens. The transition of the zymogen into the ferment is termed zymogenesis. Destruction of enzymes is termed zymolysis. As to the manner of action of this interesting class of bodies, a vast variety of phenomena may be observed. They may bring about molecular changes either by hydration or by oxidation. They appear to occupy the position of intermediaries, as it were. Many theories are put forward in attempting to explain the action of enzymes; but as they present many analogies to living protoplasm, explanation of the phenomena of their activities is almost as difficult as to explain the phenomena of life. Attempts have been made to classify the various enzymes, but any classification must be of a transitory character, since knowledge concerning this group of bodies is increasing daily. The classification of the soluble ferments suggested by Effront is shown below.

Those enzymes secreted by plants and animals in the course of their digestive processes, such as invertin, which breaks up cane-sugar into a mixture of glucose and fructose, diastase, which has an analogous action on starch, ptyalin, found in the saliva, which also acts on starch, pepsin and trypsin, which decompose proteids in the acid medium of the stomach and the alkaline medium of the intestines, respectively, are not difficult of isolation, while almost none of the intracellular enzymes, which perform a far more important function in the life of the animal or plant, have yet been isolated.

The enzymes have many applications in the arts. Consult Effront, 'Enzymes and Their Applications' (New York 1902); Greene, 'Soluble Ferments.'

EOBANUS, Helius or **Hessus** (Eoban Koch), German philosopher: b. probably at Halgehausen 1488; d. 1540. He wandered about to different places in which he taught and lectured like so many teachers of the period. He espoused the Reformation, participated in the 'Epistolæ Obscurorum Virorum,' and translated Ecclesiastes and the Psalms. Consult the life by Krause (Gotha 1879).

EOBASILEUS, the latest-known species of the Uintathere (q.v.) fossil in the Bridger Stage of the Middle Eocene in the western United States. It was an immense, rhinoceros-like animal with a remarkably long and narrow head, with very large, shovel-shaped nasal protuberances from the skull and long, backward-curved tusks in the male.

EOCENE, ē'ō-sēn, a subdivision of geological time. Lyell in 1833 first used the term Eocene (dawn of the recent) for the earliest of his three subdivisions of the Tertiary. The term found favor quickly since early Tertiary life differed greatly from late Cretaceous. Toward the close of Cretaceous time, the sea receded from a large part of North America and by the end of Eocene time the continent had nearly its present form. The climate continued warm, Greenland and Alaska being temperate. Of Cretaceous animals the reptiles suffered most, the ichthyosaurs, dinosaurs and plesiosaurs passing away as well as many peculiar mollusks. Eocene fishes were mostly of modern character (teleosts), birds were more numerous and highly developed than in the Cretaceous Age; while mammals developed wonderfully. True carnivorous mammals appeared, as also the ancestors of the horse, rhinoceros, tapir, pig and the ruminants, besides bats, primitive camels and monkeys. A study of organic types indicates that Asia, North America and Europe were connected in Eocene time; and, by the Antarctic continent, South America, and Australia; while South America was separated from North America, and Africa and southern Asia from Europe and northern Asia.

The Eocene rocks of the Altantic border are nearly all loose sands and clays of marine origin and contain in New Jersey beds of greensand once of some economic importance as a source of phosphate of lime for agricultural use. The rocks of the Gulf border were partly laid down in fresh or brackish water and partly in salt water. They comprise shales, sandstones and limestones. In Florida are valuable deposits of phosphate rock, and in Texas are extensive beds of lignite, of workable size, but poor quality. The interior province formations, mostly clays and sands, were laid down as alluvial fans and cones (q.v.), in brackish or fresh water lakes which stretched, though not contemporaneously, from Mexico to Alaska. The largest of these lakes covered eastern Utah and western Colorado, and must have been 450 miles long and 250 miles wide. In Utah are lignite deposits of some importance. In the Pacific border province the Lower Eocene stages are wanting and the epoch is represented by a single series, the Tejon shales and sandstones, partly marine and partly terrestrial, with workable deposits of lignite in California and Oregon. See CENOZOIC ERA; GEOLOGY; TERTIARY SYSTEM.

EOHIPPUS, the earliest known progenitor of the horses, found fossil in the Lower Eocene (Uinta) formations of the West, four-toed and about the size of a house-cat. See HORSE.

EOLIAN DEPOSITS, accumulations of wind-blown material. In some regions, particularly in deserts, such deposits may be of considerable importance. Most conspicuous are sand dunes, which occupy large areas in many parts of the world. Sand dunes sometimes become buried and consolidated to form sandstones, often strongly cross-bedded. Loess, fine wind-blown dust, accumulates to great thickness in some regions. Important deposits are known along the Mississippi and Missouri rivers in the United States, but the most extensive loess beds known are in China. Buried loess deposits would ultimately form shales. Eolian limestones are rare, but are known in Bermuda, where great dunes have accumulated, composed of the ground-up fragments of shells from the beaches. These dunes are consolidated in places to form limestones. See DUNE; LOESS; ROCKS.

EOLITH, one of the rudely chipped pebbles, regarded as a relic of the earliest dawn of human industry. The adjective «Eolithic» is sometimes used to designate the period of human history preceding the paleolithic stage of culture. See STONE AGE.

EOLITHIC. See PALEOLITHIC PERIOD.

EON, ā'ôṅ', or **EUDO DE STELLA,** also **EON DE L'ETOILE,** a religious fanatic of the 12th century, born in Brittany. He claimed to be the final judge of mankind and derives his name from the pronoun *eum,* in the formula «per eum qui venturus est judicare vivos et mortuos.» He was opposed to the hierarchy and sent forth his followers to plunder ecclesiastical property. He showed the inconsistency of his opposition to a hierarchy by putting himself at the head of a church and ordaining bishops and priests. The Legate Alberic and Hugh, archbishop of Rouen, were his principal opponents. He was captured in 1148, was tried at Rheims and, being considered insane, escaped execution. However, he was kept in prison for the remainder of his life; numbers of his followers perished at the stake and his sect soon disappeared. Consult Döllinger, 'Beiträge zur Sektengeschichte des Mittelalters' (Vol. I, Munich 1890), and Lea, H. C., 'History of the Inquisition of the Middle Ages' (New York 1888, and subsequent editions).

EON DE BEAUMONT, ā-ôṅ dē bō-môṅ, **Charles Geneviève Louis Auguste André Timothée d'** (called till 1777, CHEVALIER D'EON), French writer, military officer, diplomatist and publicist: b. Tonnerre, 5 Oct. 1728; d. London, 21 May 1810. His brilliant qualities enabled him to act a conspicuous part in the world, but he gained a greater notoriety by the mystery long kept up in regard to his sex. In 1755, by some other accounts in 1757, he was sent as envoy on a difficult mission to the Russian court. Here he gained the favor of the Empress Elizabeth, and for about five years was the medium of a secret correspondence between her and the King of France. In 1762 he went to London as secretary of a special legation, under the Duke de Nivernais, sent there for the purpose of arranging peace between France and England. In April 1763 he was made French Resident Minister and chargeé d'affaires. From then on, though soon officially superseded in his diplomatic office, he lived for years in London as a kind of informal representative of his sovereign. In 1777 he returned to France, but Louis XVI, for what reason has never been satisfactorily explained, imposed on him the obligation of assuming female attire and he now styled himself La Chevalière d'Eon. Even before this, however, doubts and discussions as to his real sex had arisen. He returned to England in 1785. After the French Revolution broke out, he styled himself Citoyenne Geneviève Déon. He now attempted to support himself by giving lessons in fencing (still dressed as a woman), but was not very successful and depended for subsistence mainly on his friends. He was a voluminous writer and his works appeared in 1775 under the title 'Loisirs du Chevalier D'Eon' (13 vols., London). He also wrote the memoirs of his life, covering especially the years of his residence in England, 1762–77. They have never been published; the manuscript is in the archives of the French Ministry of Foreign Affairs in Versailles. Consult, Broglie, J. V. A. de, 'Le Secret du Roi' (2 vols., Paris 1878; translated into English as 'The King's Secret' London 1879); Christie, R. C., 'Selected Essays and Papers' (London 1902); Gaillardet, F., 'Mémoires sur la Chevalière d'Eon' (Paris 1866); Ross, O. C. D., 'The Chevalier d'Eon and Peter the Great's Will' (in *Gentleman's Magazine,* n. s., Vol. XVIII, p. 159, London 1877); Telfer, J. B., 'The Strange Career of the Chevalier d'Eon de Beaumont' (London 1885); Vandal, A., 'Louis XVI et Elizabeth de Russie' (Paris 1882); Vizetelly, E. A., 'The True Story of the Chevalier D'Eon, etc.' (London 1895).

EOS, ē'ŏs. See AURORA.

EOSCORPIUS, a fossil scorpion, known by its slender form, hand and pincers. It included about four separate species and abounded in the Carboniferous period. Many fine specimens have been uncovered at Mazon Creek, Ill. See SCORPION.

EOSIN. See COAL-TAR PRODUCTS.

EOSINOPHILES, ē-ō-sĭn'ō-fīls, one of the types of leucocytes or white blood-cells found in the circulating blood and characterized by its specific reactions to acid stains, such as eosine, whence its name — «a lover of eocine.» Eosinophiles are present in the proportion of one-half to 2 per cent of the white blood-cells. Their increase above 2 per cent is termed eosinophilia, and it has an important relationship to some forms of parasitism.

EOSINOPHILIA, a condition in which there is an excess of eosinophile white blood-cells in the circulating blood. The exact causes of eosinophilia are not thoroughly understood. But is seems to be an almost constant accompaniment of certain diseases, notably of infection by intestinal parasites. So it is in trichiniasis, in anchylostomiasis and in infection by the ordinary tapeworm. Consult Ewing, 'Pathology of Blood' (1902).

EOSTRA, the Teutonic goddess of spring. The festival in her honor is believed to have given its name to our Easter.

EOTHEN. Alexander William Kinglake, later known as the historian of the Crimean War, made about 1835, three years after his graduation from Cambridge, a tour through Turkey, Egypt and the Holy Land. In 1844 after he had twice rewritten his manuscript he published a narrative of his Eastern experience under the title 'Eothen,' a Greek word signifying «from the early dawn» or «from the East.» In an interesting preface he explains that he has deliberately avoided the virtues of the ordinary book of travel. What he has sought to impart is not statistical and geographical information but the tang and color and thrill of his own personal impressions amid those alien scenes and peoples which he discovered when he slipped out at the back door of Europe. As Kinglake's impressions were extraordinarily fresh, vivid and intense, and as his style corresponded to his impressions, he added to the golden treasury of travel literature an enchanting little volume which takes its place with 'Child Harold's Pilgrimage,' 'The Bible in Spain,' and 'Travels with a Donkey.' In reading books of this sort one's interest passes back and forth between the traveler and the lands through which he travels. Kinglake as he presents himself is the typical, self-contained, independent, resolute young English gentleman, concealing his occasional moments of poetical rapture beneath an imperturbable exterior and smiling inwardly to perceive how his mere presence and bearing extort from Turk and Bedouin the deference due to a natural lord of creation — a modest incarnation, in short, of that spirit which has made it impossible for the sun to set on British soil. The most amusing illustration of this English spirit is to be found in the 29th chapter, in which Kinglake relates how he and a Russian officer forced a landing at Satalieh in defiance of the quarantine officers, marched through the streets to the residence of the Pasha, entered his audience chamber, seated themselves on the divan at his side and bullied him through an interpreter into open-armed hospitality. Another wonderful chapter, «Cairo and the Plague,» depends partly for its effect upon the stunning contrast between the wailing pestilence-stricken city and the nonchalant Englishman going about his business and his pleasure undeterred by the universal terror of contagion. Superb, too, as a representation of the traditional English reserve, is his account of his meeting in the desert with another solitary Englishman traveling westward from India, whom he would have passed with a silent nod but for the friendly interposition of their respective camels. The passages in 'Eothen,' however, which are unforgettable and which raise the terse, brilliant, narrative almost to the level of poetry, are those commemorating the not infrequent occasions when the magic of the East broke through the traveler's guard and laid its spell upon him in some lonely bivouac by the Dead Sea, or in the Sanctuary of Nazareth, or on a dromedary's back in some sun-smitten wilderness of sand, or in a curious throng of dark-eyed Jewish girls, or when the sharp vision of an abandoned English garden flashed into memory and mingled with the splash of fountains and the fragrance of Eastern roses in some old garden of Damascus. Consult Tuckwell, 'A. W. Kinglake' (1902).

STUART P. SHERMAN.

EÖTVÖS, ĕt'vĕsh, **Joseph,** BARON VON, Hungarian statesman and author: b. Ofen, 13 Sept. 1813; d. Pesth, 3 Feb. 1871. He was educated by private tutors, especially the well-known Hungarian patriot and liberal Pruzsinsky, who gained a powerful mental influence over him and was primarily responsible for the liberal ideas and ideals which Eötvös displayed later in life. He completed his studies in philosophy and law at the Univesity of Pesth in 1831. Even before leaving the university he produced three plays — 'Kritikusok,' 'Házasulók' and 'Boszú' — the last a tragedy, all of which were well received. From 1832–37 he traveled extensively in Europe and occupied a number of minor governmental offices. After 1838 he devoted himself exclusively to literature and politics, joining the Young-Hungarian Reform party. In the same year he published an important work on the reform of prisons (Pesth 1838); he became a friend of Kossuth and distinguished himself as a journalist and as a speaker in the Diet. A collection of his early political writings was published in Leipzig in 1846. His literary work of this period resulted in a succession of novels giving vivid pictures of Hungarian life during his own times and in more remote epochs: 'The Carthusian' (Pesth 1838–41); 'A Falu Jegyzöje' (Pesth 1844–46; translated into English as 'The Village Notary' by O. Wenckstern, New York 1850); 'Hungary in 1514' (3 vols., Pesth 1847–48). After the March revolution of 1848 he became Minister of Public Instruction under Batthany, but the September revolution of the same year made him lose hope in the cause of liberalism in his country and he retired to Munich, remaining in voluntary exile for three years. During this period he published several works, among which was 'The Influence of the Ruling Ideas of the 19th Century on the State' (2 vols., Pesth 1851–54), which is considered his most important work. About the middle of 1851 he again returned to Hungary and was made vice-president of the Hungarian Academy in 1856 and president in 1866. After his return he was a staunch supporter of Deák (q.v.) and of his efforts to arrange the famous Austro-Hungarian Composition (Ausgleich) of 1867. In that year he again became Minister of Public Instruction in the Andrassy cabinet. From then on until his death all his energies were devoted with considerable success to the improvement and liberalization of the Hungarian school system. In 1879 a bronze statue by Huszár was erected in his memory at Pesth. A collection of his writings was published in Pesth in 14 volumes

(1870), and still another in 17 volumes (1891). His political speeches were collected in two volumes in 1875 and 1886. Consult Berzeviczy, A. v., 'Baron Josef Eötvös als Kulturpolitiker' (in *Ungarische Rundschau*, Vol. III, p. 78, Munich 1914); Ferenczi, Z., 'Baron Josef Eötvös' (Budapest 1903); Ringwald, W., 'Beiträge zu einer Kritischen Würdigung der Staatslehre des Barons Josef von Eötvös' (Zürich 1908).

EÖTVÖS, Roland, Hungarian scientist and statesman: b. Budapest, 27 July 1848. He is a son of Joseph Eötvös (q.v.). He studied at Königsberg and Heidelberg, receiving an appointment as lecturer at Budapest 1871 and as professor of experimental physics there 1875, being made a member of the Hungarian Academy of Sciences 1873, and becoming its president in 1893. Much of his attention has been given to the problems of gravitation and capillary attraction. He was made a life member of the Hungarian House of Magnates and was Minster of Public Worship and Education 1894–95.

EOZOIC (ē-ō-zō'ĭk) **ERA** (dawn of life), one of the early names applied to the Geologic Pre-Cambrian or Algonkian period, during which life first appeared on the earth. The eozoic rocks, though often showing traces of organic origin, have in general been greatly metamorphosed and contain few, if any, fossils. Stratigraphically they are separated from the Archæan (or Azoic) rocks below and the Cambrian (or earliest Palæozoic) rocks above by unconformities. See ALGONKIAN SYSTEM; GEOLOGY; HURONIAN SERIES; KEWEENAWAN SERIES.

EOZOÖN, ē-ō-zō'ŏn. Sir J. W. Dawson (q.v.) in 1864 described certain curious aggregates of calcite and serpentine in the Laurentian limestone of the lower Saint Lawrence Valley as the remains of a foraminiferan which he called Eozoön Canadense. The so-called fossil was thought to represent the earliest known form of life on the globe. The evidence of organic origin is, however, not conclusive. Similar forms have been found in Bavaria. Moebius, who investigated Eozoön thoroughly, concluded that the serpentine in the calcite had infiltrated along a very regular system of fine fissure and most geologists now believe that Eozoön is of inorganic origin. An extensive literature has sprung up as a result of this discussion. A list of most of the important papers, almost all published in scientific journals of Europe and this country may be found in the bibliography of Sir J. W. Dawson, attached to a memoir of his life by F. D. Adams and published in the Bulletin of the Geological Society of America (Vol. II, New York 1899). Consult Dawson, Sir J. W., 'The Dawn of Life' (London 1875); 'Review of the Evidence for the Animal Nature of Eozoön Canadense' (in McGill University Paper, Department of Geology, Nos. 1–2, Montreal 1896); Hauer, M., 'Das Eozoön Canadense' (2 vols., Leipzig 1885).

EPACRIDACEÆ, ĕp-a-krĭ-dā'sē-ē, a small order of heath-like shrubs or small trees, usually reckoned as the Australian sub-order of *Ericaceæ*, from which they are chiefly distinguished by the epipetalous stamens destitute of the peculiar specializations of anther dehiscence or appendages. The flowers are red, white or purple, generally in leafy spikes. Many species are cultivated in greenhouses along with the heaths proper. Among the most attractive of these is *E. grandiflora*, which has blossoms nearly an inch in length, of a brilliant reddish purple at the base and pure white at the apex. A few species produce edible berries resembling the American huckleberry, and which are known as Australian cranberries.

EPACTS (Gr. «additions»), in ecclesiastical chronology, a set of 19 numbers used for fixing the date of Easter and other Church festivals, by indicating the age of the moon at the beginning of each civil year in the lunar cycle. At the reformation of the calendar in 1582 it was found that the Golden Numbers could no longer by themselves serve the purpose of adjusting the double reckoning by lunations and by the tropical or true year; and thus, instead of adopting the more rational computation, the Roman Church devised the artificial and involved method of epacts. The main point to determine is the age of the moon (in entire days) at the beginning of each civil year, or the number of days between the end of the ecclesiastical year in December and the first January succeeding. Thus, subtracting 354 days (12 lunations) from 365, we should have 11 days for the first annual epact, then 22 for the year following, then 3, 14, 25, 6, 17, 28, 9, 20, 1, 12, 23, 4, 15, 26, 7, 18 and 29; the series of 19 numbers being obtained in succession by adding 11, and when the sum exceeds 30, subtracting that number. This illustration, however, is simpler than any actual case, by reason of the leap-years, which require 12 to be added for the following epact, and of the fact that no lunation is exactly 30 days long. When the lunar cycle of 19 years is completed, the epacts recur again in the same order. In the Anglican reckoning, as distinguished from the Roman, it is noteworthy that the Gregorian epact for any year is the same as the Julian epact for the year preceding, owing to the coincidence that 11, the number of days lost on the Julian account before the English Parliament adopted the reformed calendar (q.v.), is also the number of days between the lunar and the solar years. The epact determines by subtraction the date of the first new moon in January; then by adding 29 and 30 alternately the successive new moons throughout the year are assigned to their respective dates. Consult Clavius, C., 'Romani Calendarii a Gregorio XIII P. M. Restituti Explicatio etc.' (Rome 1603); Butcher, J. G., and Butcher, S. H., editors, 'The Ecclesiastical Calendar: Its Theory and Construction' (Dublin 1877); De Morgan, A., 'The Book of Almanacs' (London 1871); Seabury, S., 'The Theory and Use of the Church Calendar in the Measurement and Distribution of Time' (New York 1872); Kennedy, Thomas, 'Epacts' (in 'Catholic Encyclopedia,' Vol. V, p. 480, New York 1909).

EPAMINONDAS, ē-păm"ĭn-ŏn'dăs, Theban general and statesman: b. about 418 B.C.; d. Mantineia, Arcadia, Greece, 362 B.C. He was distinguished for the friendship existing between him and Pelopidas, whose life he had saved in 385 at Mantineia. He was sent to Sparta 371 B.C. to represent Thebes in negotiating a peace with the Athenian envoys. As the Spartans refused to recognize Thebes as the

representative of Bœotia, the Thebans were excluded from the peace. Cleombrotus was sent by the Spartans to invade Bœotia, but was defeated at Leuctra (371 B.C.), chiefly through the tactics of Epaminondas. Two years after Epaminondas and Pelopidas were made Bœotarchs. They detached several nations from the alliance of Lacedæmon, and delivered the Messenians, whose capital they rebuilt. Epaminondas then marched with his army to Sparta; but this city was so bravely and skilfully defended by Agesilaus that the Theban hero retreated. An accusation was brought against him on his arrival in Thebes, because he and Pelopidas had kept the Bœotarchate beyond the legal time; the accusation was literally true, but the infringement of the law was justified by his services, and after having pleaded his own cause, he was acquitted. In 368 he compelled Sicyon and Pellene to relinquish the Lacedæmonian alliance, and in the same year served in a Theban army sent into Thessaly to rescue Pelopidas, who was kept a prisoner at Pheræ. In the following year he commanded an expedition with the same object which was successful. In 362 he was compelled to make head against a formidable coalition of states, including Athens and Sparta. His tactics were never more brilliant and successful than in this campaign, but in the battle of Mantineia he was killed at the moment of victory. Consult Colcroft, J. W., 'Epaminondas of Thebes' (in *Dublin University Magazine*, Vol. XL, p. 34, Dublin 1852); Cornelius Nepos, 'Vita Epaminondae'; Pomtow, L., 'Das Leben des Epaminondas' (Berlin 1870); North, Sir T., ed. and trans., 'The Lives of Epaminondas, Philip of Macedonia, etc.' (in 'Plutarch's Lives of the Noble Grecians and Romans,' London 1656); Yonge, C. M., 'A Book of Worthies' (New York 1882).

EPAPHOS, the son of Zeus and Io, who, according to Ovid, caused Phaëton's destruction by denying his divine descent. Epaphos, according to Greek mythology, became the ancestor of the Egyptian race and the first lord of their country whither his mother had fled before the jealous wrath of Hera and where he had been born. There are comparatively few references to him in the Greek writers; only Pindar, Æschylus, Euripides, Herodotus, Ovid and a few less important writers of later date mention him. Herodotus claims that his name was the Greek equivalent to the Egyptian deity Apis. Consult Berens, E. M., 'A Handbook of Mythology' (New York, n. d.); Gruppe, O., 'Griechische Mythologie und Religionsgeschichte' (in 'Handbuch der Klassischen Altertums wissenschaften, etc.,' Vol. VII, Munich 1897–1903); Linforth, I. M., 'Epaphos and the Egyptian Apis' (in University of California Publications in Classical Philology, Vol. II, No. 5, Berkeley 1910).

EPARCHY (ἐπαρχία), originally the name of one of the divisions of the Roman Empire, being a subdivision of a diocese. Both of these terms were adopted by the Church. Ecclesiastical eparchies were under a metropolitan to whom the first Council of Nicæa (325) gave the power to appoint the other bishops in his eparchy. Later this term was applied to mean the diocese of any bishop. It is now in common use only in the Russian Church, where it still applies to all subdivisions of the Church corresponding to the western diocese. There were, before the Russian Revolution of 1917, 86 eparchies of which three were administered by metropolitans (Kiev, Moscow and Petrograd), 14 by archbishops and the rest by bishops.

EPAULEMENT, ĕ-păl'mĕnt, in fortification, a term originally employed to denote a mound of earth, raised to protect a body of troops at the extremity of their line; or a screen or rampart erected, as a sort of shoulder, to defend the flank of a battery from enfilading fire, which would dismount its guns. In modern artillery, the word is applied to the whole mass of earth, stone or fascines raised to protect a battery both in front and at the flanks. It is also used of the breastwork set up to shelter reserve artillery. See FORTIFICATIONS.

EPAULET, ĕp'ā-lĕt, an ornamental badge consisting of a fringe hanging over the shoulder, worn in the English army up to 1855, and still worn in the English navy by all ranks above lieutenant. Epaulets were not partially discarded by the United States army until 1872, when none but general officers continued to wear them. In the United States navy the epaulet is worn by all officers above the rank of ensign. The French private soldiers wear epaulets of worsted.

EPÉE, ā-pā', **Charles Michel, Abbé de l',** French instructor of the deaf and dumb: b. Versailles, France, 25 Nov. 1712; d. Paris, 23 Dec. 1789. Taking orders, he became a preacher and canon at Troyes, but later lived in retirement in Paris. In 1765 he first began to occupy himself with the education of two deaf and dumb sisters; and, as he asserted, without any previous knowledge of Pereira's efforts in the cause, invented a language of signs, by which persons thus afflicted might be enabled to hold intercourse with their fellow-creatures. He determined to devote his life to the subject. At his own expense he founded an institution for the deaf and dumb, which was first publicly examined in 1771, and from 1778 received an annual subsidy. It was not, however, converted into a public institution till two years after his death. He published 'Institution des Sourds et Muets, etc.' (Paris 1774); 'Instruction des Sourds et Muets par la Voie des Signes Methodiques' (Paris 1776); 'La Véritable Manière d'instruire les Sourds et Muets' (Paris 1784). Consult Arnold, Thomas, 'Aures Surdis. The Education of the Deaf and Dumb' (London 1872); Arrowsmith, J. P., 'The Art of Instructing the Infant Deaf and Dumb, etc.' (London 1819); Berthier, F., 'L'Abbé de l'Epée, sa Vie, etc.' (Paris 1852); Bouilly, J. N., 'The Deaf and Dumb; or, the Abbé de l'Epée. An Historical Play in Five Acts' (Paris 1800; London 1801).

EPEIRA, ē-pī'ra, a genus of spiders, typical of the family of *Epeiridæ*, comprising some of the largest and best-known spiders, those building orb-webs. They occur in all parts of the world, and are usually handsomely marked. See ORB-WEAVER; SPIDER.

EPEIROGENIC MOVEMENTS. These are such geological movements as have to do with the uplift and depression of continents and oceanic basins, as distinguished from orogenic movements, which form mountain ranges. Their causes are only imperfectly understood. Among the factors which are thought to have played a part in inducing them are the expansion of strata in which the escape of heat has been blanketed by superincumbent deposits, the weight of these superincumbent deposits, the wrinkling of the earth's crust due to cooling and the tidal effect of the moon on the earth's lithosphere. Epeirogenic movements are usually measured from sea-level, but it is highly probable that they are all in the strictest sense movements of depression, as there is strong evidence that the radius of the earth's crust is steadily diminishing. See EARTH; GEOLOGY.

EPENCEPHALON, a term used to designate that part of the embrionic brain from which the cerebellum and pons Varolii are formed. In the fully developed brain the term is used for that part containing the cerebellum, pons Varolii and the medulla oblongata. See BRAIN.

EPERIES, ā-pār'yēs (Slovak *Pressova*), Czechoslovakia, an old town on the Tarcza, 190 miles northeast of Budapest by rail. The city was destroyed by fire in 1887. It is the seat of a Greek Catholic bishop, and has a Lutheran college. It manufactures earthen-ware, linens and woolens, and has some trade in corn and Tokay wine; in the vicinity are the Sovar saltworks. The Reformed Church made great headway here and the city played a considerable part in the religious wars of the 16th and 17th century. It is celebrated as the scene of the «butchery of Eperies," when the Austrian general Caraffa in 1687 instituted a series of Protestant persecutions and martyrdoms. Pop. 16,323.

EPERNAY, ā-pĕr-nā, France, in the department of Marne, in the midst of a rich vine-growing district, 19 miles northwest of Chalons. The earthen-ware called terre de Champagne is made in Epernay. It is an entrepot for Champagne wines, which are kept in vaults in the chalk rock on which the town is built. There are large railway workshops. Pop. 21,811.

ÉPERNON, dā-pār-nôn', **Jean Louis de Nogaret, Duc d',** French courtier: b. 1554; d. 1642. About 1573 he became a partisan of Henry III, whose fortunes he followed and whose chief favorite he became. In return the king enriched him, made him Duke of Epernon in 1581, and admiral of France. He was appointed governor of Normandy in 1587, but through the influence of the Catholic League he was exiled to Loches in 1588. Henry IV made him governor of Limousin in 1596 and he was transferred to Guienne in 1622. In the early period of his ascendancy Epernon was a defender of absolute monarchy, but later he urged the independence of the nobility. His opposition to the policies of Cardinal Richelieu caused the latter to banish him to Loches in 1641. Consult the life by Montbrison (Paris 1874).

EPERVIER, The. See PEACOCK AND EPERVIER, BATTLE OF.

EPHAH, e'fa, a dry measure of capacity among the ancient Hebrews, corresponding with the liquid measure bath. The ephah contained about 37 litres, equal to about 10 gallons of the United States or 8 gallons British. There were, however, two measures called ephah, of which the above estimate applies to the smaller, and this contained about one-tenth less than the other. The ephah had 18 cabs or 72 logs. Consult Nicholson, E., ‹Men and Measures› (London 1912).

EPHARMONY. See ECOLOGY.

EPHEDRA, ĕf'ĕ-dra, a genus of shrubs used for decorative purposes in landscape gardening. In general appearance they resemble the horsetails. The flowers are small and inconspicuous. The species occur in all parts of the world, but are not hardy and need protection from frosts. They flourish best in dry or rocky soils and are easily propagated. Their fruit is said to be mucilaginous, eatable, sub-acid and slightly pungent. The branches and flowers of the Asiatic species were formerly sold as styptics.

EPHEMERA, e-fem'e-rā, the typical genus of the insect family *Ephemeridæ* (q.v.).

EPHEMERIDÆ, ĕf-ē-mĕr'ĭ-dē, a family of neuropterous insects characterized by the slenderness of their bodies; the delicacy of their wings, which are erect and unequal, the anterior being much the larger; the rudimentary condition of the mouth, and the termination of the 10-jointed abdomen in 3-jointed filiform appendages. The adult May-flies, or day-flies, as they are called, emerge from the chrysalis on the banks of the running streams in which the eggs are hatched, and, appearing usually toward sunset, when they throng about street-lamps, lighthouses (where sometimes they obscure the light) and the screens of lighted windows, are no less remarkable for their great activity than for their enormous numbers, and the brief period of their existence. The eggs, which are shed in a mass, drop into the water. The larvæ have elongated depressed bodies; setose antennæ, and long caudal filaments; and lamellar or tufted gills, symmetrically disposed on either side of the abdomen. They remain in the water for a year or two before undergoing further change, lying beneath stones, and leading a predaceous life, for which their strong jaws fit them. The rudiments of wings mark the commencement of the nymph stage, at the close of which they crawl out of the water and cast the nymph integument. Their sexual immaturity prior to the second molt has led to their being named, at this stage, subimagos or pseudimagos. The larvæ, which are very similar throughout the family, are largely used as bait. There are many species in various parts of the world, divided into various genera. *Ephemera* and *Cænis* have three caudal filaments; *Palingenia* and *Cloë* only two, but the larvæ have three. The posterior wings are absent in *Cloë* and *Cænis*. Consult books mentioned under INSECTS.

EPHEMERIS, an astronomical almanac. The plural Ephemerides is applied to tables showing the places where the planets and heavenly bodies are found at noon of every day. It is from these tables that eclipses, conjunctions, etc., of the planets are determined. An especially exhaustive and very carefully compiled bibliography, covering some 280 columns, is to be found under the heading ‹Ephemerides› in the ‹Catalogue of Printed Books,› published by the British Museum (London 1887, 1902, etc.). Consult Newcomb, S., ‹Sidelights on Astronomy› (New York 1906). See ALMANAC.

EPHESIACA, or EPHESIAN TALES, a romance in Greek from the pen of Xenophon of Ephesus. It is occupied with the loves of Abrocomas and Anthia, and is the primary source of the story of Romeo and Juliet.

EPHESIANS, Epistle to the. Addressed to «the saints that are at [Ephesus]» by Paul the Apostle when a Roman prisoner (i, 1; iii, 1; iv, 1; vi, 20), linked in time and place of composition with «Colossians» and «Philemon» by the mention of the same bearers, Tychicus «of Asia» (Acts xx, 4; Eph. vi, 20; Col. iv, 7) and Onesimus of Colossæ (Col. iv, 9; Philem. v, 12) and the same five persons sending salutations (Col. iv, 10–14; Philem. 23–24). As the words «at Ephesus» are wanting in our oldest MSS. (Sinaiticus and Vaticanus), a fact known to Origen (A.D. 186–254), Basil of Cæsarea (329–379), and probably to Marcion (150?) who named the epistle assent to another city of Asia, Laodicea, the original may have borne the address: «to the saints that are in Asia» (1 Cor. xvi, 19; Acts xix, 10), like «the saints that are in the whole of Achaia» (2 Cor. i, 1) so as to include the province as well as the capital. That «the epistle» which Paul in Col. iv, 16 asks to have brought «from Laodicea» for public reading was our «Ephesians» is a common and plausible conjecture. Its suitability in form and contents to serve thus as a circular letter has been recognized since the time of Beza (1589) and Archbishop Ussher (1673). Personal greetings and messages, like those in Col. iv, 10–17 (to be given orally, Eph. vi, 21–22), and controversial matter like Col. ii, 8–23, would necessarily be omitted. There would remain, however, a large residue of apostolic teachings, having vital and common significance to all «the churches of Asia.»

Origin and Content.—Answering to their simultaneous origin, the phenomenal parallelism between Colossians and Ephesians in thought and diction presents a psychological and literary problem of exceptional interest, as no fewer than 78 of the 155 verses of the latter epistle contain phraseology which occurs in the former. The prevailing penchant of the 19th century for literary dissection, however, has failed to produce, even with the critical acumen of a Holtzmann, anything better than a complicated and preposterously artificial theory of secondary imitation and compilation. Here is no patched garment, but a seamless robe. In its profundity, sublimity, spiritual and ethical intuition and in structural symmetry, Coleridge's eulogium is well-nigh justified: «the divinest composition of man.» In the background of both epistles there looms the august person of the Cosmic Christ (Col. i, 14–16; Eph. i, 22–23); supreme in the heavenly realm (Col. i, 16; Eph. i, 10–16); vitally and creatively present everywhere in his Church (Col. i, 6, 18–19, 27; Eph. i, 22–23); the living bond of union between Jew and Gentile (Col. i, 20; Eph. i, 10; ii, 15f); the perennial source of transcendent spiritual knowledge (Col. i, 9; Eph. i, 17), and ethical vigor (Col. iii, 12–13; Eph. iv, 2, 32). If the mood of Colossians is that of discussion, that of Ephesians is meditation. Actual residence in Rome (Phil. iv, 22) the ruling capital of «all the world» (Col. i, 6), sets «the kingdom of Christ and God» (Eph. v, 5) in age-long and world-wide perspective. Calm meditation upon the cosmic implications of the Gospel message, unvexed by controversial stress, leaves its impress upon the vocabulary and style of one who could speak of having been «caught up into Paradise» (2 Cor. xii, 4). Thus in i, 3–iii, 21 the greater elaboration of the conventional epistolary divisions of Address, Thanksgiving and Prayer, foreshadowed in passages like Rom. i, 1–15, flowers forth in full luxuriance, and in like manner the effort (manifest in Col. ii, 8–23) to gain greater fulness of expression by means of lengthy sentences built up of many subordinate clauses, and the employment of an ampler vocabulary, has freer scope. The resulting superficial aspect of aimless discursiveness is apparent rather than real; for faith and love, the dominant elements of all of Paul's Christological teaching, form the obvious warp and woof throughout.

Theme.— The subject of the epistle is: The Reincarnation of the Cosmic Christ in his Church through faith (chs. i–iii) and through love (chs. iv–vi). Following the characteristic opening salutation of «grace» and «peace» from God and Christ (i, 1–2) an elaborate Doxology (in place of the usual Thanksgiving) develops God's pre-mundane plan: the gift to Jewish and Gentile believers through Christ of salvation, spiritual wisdom, faith and love (i, 3–16a). The Prayer, which forms the subject of the remainder of the first three chapters, is for the revelation to the readers' faith of God's redemptive purpose for the whole human race (i, 16b–iii, 21). After the substance of the prayer is briefly introduced in i, 16–19, three facts are developed as stimulating to faith: God's power already exhibited in the Head of the Church by his resurrection and enthronement and reproduced in the spiritual life of the members of his body, the Church (i, 21–ii, 10); in the spiritual union in his Church of the two mutually hostile divisions of the human race (ii, 11–22), and in the revelations of divine power and grace vouchsafed to the apostle in his Gentile ministry (iii, 1–13). The way is thus prepared for the triumphant da capo repetition in iii, 14–19, with full organ tones, of the initial *motif* of i, 16–19. The exquisite summarizing cadence (iii, 20–21) in the form of a doxology, like the opening one in i, 3–14, is an appeal to faith such as appears in the whole underlying motive of i–iii. The complementary theme of chs. iv–vi is love, the organic principle of the life of God and Christ in his Church (iv, 1–16) and a regenerating and unifying force in all of the believer's social and domestic relations (iv, 17–6, 9). The concluding section (vi, 10–24) strikes once more the dominant notes of «faith» and «love.» The life of faith in Christ and God is shown to be the Church's sole defense against superhuman spiritual foes (vi, 10–18). The closing personal references, after bespeaking such a loving interest in the prayers of the readers as the writer has for them, and repeating the initial salutation (i, 2) of «grace» and «peace» from God and Christ, end on the two high notes of «faith» and «love,» and with characteristic Pauline stress on the «greater» (1 Cor. xiii, 13) of these.

Bibliography.— Discussions of the problems of authorship, vocabulary, style and relation to Colossians may be found in New Testament Introductions: T. Zahn (Eng. trans. 1909); J. Moffatt (1901); B. Weiss (1897); H. J. Holtzmann (1892); A. Juelicher (1904); A. S. Peake (1910); F. J. A. Hort (1895) and detailed exegesis in the commentaries of C. J. Ellicott (4th ed., 1868); H. A. W. Meyer (Eng. trans., 1880); J. A. Robinson (1904); H. von Soden (Handcommentar, 2d ed., 1893); E. Haupt (8th ed., 1902).

MARCUS D. BUELL,
Professor of New Testament Greek and Exegesis, Boston University School of Theology.

EPHESUS, ĕf'ē-sŭs, Asia Minor, a Greek city of Lydia; one of the 12 Ionian cities; near the mouth of the river Caystrus, now called Kutshuk Mendre. Ephesus is now represented by the village of Ayasoluk, about 36 miles from Smyrna, on the railroad to Aïdin. After belonging to the Ionians, it fell successively under the dominion of the Lydian and Persian kings. Its importance as a commercial city dates chiefly from the time of Alexander the Great, and it was the starting point of one of the great trade routes into Asia Minor. The apostle Paul lived for two years at Ephesus and established a Christian Church there, to which he addressed one of his epistles. Timothy succeeded Saint Paul, and Saint John is said to have had charge of the Church after Timothy, and to have died at Ephesus. Its bishop was the first of the seven to whom the Apocalypse was addressed. It was long famous for its temple of Artemis (Diana), called Artemision, reckoned one of the seven wonders of the world. The temple was of the Ionic order, and was adorned with many pillars, each 60 feet high, and with numerous statues and paintings by the most celebrated Grecian masters. It had been destroyed seven or eight times before Pliny wrote, particularly by the notorious Herostratus, 356 B.C. The temple, however, was rebuilt by the Ephesians with more magnificence than ever, whose women contributed their trinkets to the general fund raised for this purpose. There were also many other temples here, a theatre, a stadium or racecourse, gymnasia, odeum, etc. The site of the temple had become lost when it was discovered by Mr. Wood in 1867–69. In his excavations he found that the building measured about 343 feet by 164, and stood on a raised platform measuring 418 feet by 239. Important excavations have since been carried out here by the Austrian Archæological Institute and the theatre, important buildings connected with the gymnasium, and a splendid semicircular marble portico round the east side of the harbor have thus been disclosed. In the double church of Saint Mary the Virgin the Council of Ephesus was held in 431. The Great Mosque or Church of Saint John, the cave of the Seven Sleepers, and other interesting objects are to be seen here. Consult Wood, 'Discoveries in Ancient Ephesus' (1877).

EPHESUS, Council of, the third general council of the Roman Catholic Church, held at Ephesus in June 431, principally to oppose the heresy of Nestorius, patriarch of Constantinople. It was convoked by the Emperor Theodosius II at the instance of Pope Celestine I and many Catholic bishops. Cyril, bishop of Alexandria, presided on behalf of Pope Celestine I. The number of bishops in the Council was about 200. Nestorius, adopting the teaching of Theodorus of Mopsuctia, denied the Church's doctrine of the incarnation, and held that instead of the Word being made man, he (the Word) simply had his special abode in the man Jesus Christ; and that hence Mary the Virgin was not θεοτόκος God-bearing, mother of God, but only χριωτοτόκος, mother of the Christ. The Council declared that Mary is θεοτόκος, *Deipara*, and that Jesus Christ is God and man. (See COMMUNICATIO). Nestorius was deposed and excommunicated. It was not, however, until some years afterward that his supporters acquiesced in this finding. Nestorius himself was ordered by the emperor to retire to his monastery near Antioch. Another Council was held at Ephesus — the «robber synod,» as it is called — in August 449 convoked by the same emperor to deal with questions of faith connected with the teachings of Theodorus and Nestorius. The presiding bishop, Dioscurus of Alexandria, backed by a rabble of monks, soldiers and servants overawed the 135 bishops, compelling them to sign blank papers on which he wrote what decrees he pleased. EPHIALTES. (1) The Malian who conducted the Persians over a mountain path and enabled them to surprise Leonidas and his Spartans at Thermopylæ with a rear attack. (2) The son of Poseidon and Iphimedia.

EPHOD, commonly believed to have been a species of vestment woven of gold, blue, purple, scarlet, and fine twined linen, worn by the Jewish high-priest. According to Exodus xxviii, 6 ff. and xxxix, 2 ff. it consisted of two main pieces, one covering the back, the other the breast and upper part of the body, fastened together on the shoulders by shoulder straps. On each shoulder was an onyx stone set in gold, on which were engraved the names of six tribes according to their order. A girdle or band, of one piece with the ephod, fastened it to the body. Just above the girdle, in the middle of the ephod, and joined to it by little gold chains, rested the square breastplate or pouch with the Urim and Thummim. The ephod was originally intended to be worn by the high-priest exclusively, but a similar vestment made of linen was worn in later times by priests of lower rank. In more recent times considerable discussion has been carried on in regard to the true nature and appearance of the ephod. Some investigators claim that it was a shrine, some that it was just a pouch somewhat on the order of a loin cloth, and still others that it was an instrument of divination. However, inasmuch as all the evidence on which these investigations are based is more or less circumstantial and indefinite the question is still unanswered and is likely to remain so. Consult Elhorst, H. J., 'Das Ephod' (in *Zeitschrift für die alt-testamentliche Wissenschaft*, Vol. XXX, p. 259, Giessen 1910); Foote, T. C., 'The Ephod' (in *Journal of Biblical Literature*, Vol. XXI, p. 1, Boston 1902); Macklenburg, A., 'Über den Ephod in Israel' (in *Zeitschrift für Wissentschaftliche Theologie*, Vol. XLIX, n. F. Vol. XIV, p. 433, Leipzig 1906).

EPHORS, ĕf'ôrs, or **EPHOROI**, magistrates common to many ancient Greek communities. The most celebrated were the Ephoroi of Sparta. The origin of the office is uncertain and it is very doubtful that they were instituted by Lycurgus. They were five in number, and in historical times were elected by the people annually, their authority being designed as a counterpoise to that of the king and council. They superintended the morals and domestic economy of the community; scrutinized the conduct of all officials, and even summoned the kings before their tribunal. The judicial authority and executive power eventually fell almost entirely into their hands; they became autocratic, opposed the extension of popular privileges, and arousing the antagonism of the kings and people, were suppressed by Cleomenes III, the latter murdering the Ephors 225 B.C. After his fall in 221 B.C. the office was revived, but never regained its influence. There is a very extensive literature on the subject, almost entirely in German. Besides articles in the various 'Histories of Greece' (q.v.), there is a very exhaustive, but rather technical article by Szanto in Pauly-Wissowa 'Real-Encyklopädie der Klassischen Alertumswissenschaft' (Vol. V, Stuttgart 1907). Consult Dum, G., 'Die Entstehung und Entwickelung des Spartanischen Ephorats' (Innsbruck 1878); Kuchtner, K., 'Entstehung und Ursprüngliche Bedeutung des Spartanischen Ephorates' (Munich 1897); Stein, H. K., 'Das Spartanische Ephorat bis auf Cheilon' (Paderborn 1870); Stern, E. von, 'Zur Entstehung and Ursprünglischen Bedeutung des Ephorats in Sparta' (Berlin 1894).

EPHORUS, Greek historian, flourishing in the 4th century B.C., from about 400 to 330 B.C.; was born at Cyme, in Aeblis, Asia Minor. Little is known concerning his life, but it is related that he studied under Isocrates and that the latter, after training him in rhetoric, persuaded him to abandon oratory for history, and that it was upon his suggestion that he prepared his universal history. This work Ιστορίαι, in 30 volumes, was the first history ever written in Greece and was remarkable for its wealth of material and also for the fact that each book, containing a compact portion of the history with an introduction, was complete in itself. The history deals with the Greeks (outside of the mythical age) from the return of the Heracleidæ to the siege of Perinthus (340 B.C.), covering a period of over 700 years. His style of writing was loose and feeble, well meriting the alleged remark of Isocrates, that he needed the spur, as Theopompus the bit. The history was used and praised, however, by Polybius, Diodorus and Strabo. The main portions of the manuscripts have perished, only a few fragments remaining, which were published in 'Fragmenta Historicorum Græcorum' (C. Muller, ed., Vol. I, p. 234–277, Vol. IV, p. 641, Paris 1841). An older collection, 'Ephori Cumæi Fragmenta,' (Karlsruhe 1815) was edited by M. Marx. Consult Bury, J. B., 'The Ancient Greek Historians' (New York 1909); Schwartz, E., 'Ephorus' (in Pauly-Wissowa 'Real Encyklopädie der Klassischen Altertumswissenschaft,' Vol. VI, p. 1, Stuttgart 1907); id., 'Die Zeit des Ephoros' (in *Hermes*, Vol. XLIV, p. 481, Berlin 1909).

EPHRAEM SYRUS, ē'fra-ĕm sī'rŭs, **SAINT EPHREM**, or **EPHRAM** (the Syrian), Syrian theologian: b. Nisibis, Mesopotamia, about 306; d. Edessa, Mesopotamia, 373. He lived in Nisibis till 363 and played an important part in defending his native city against the various sieges to which the Persians submitted it. When the Emperor Jovian gave up the town to the Persians in 363, he, together with its other Christian inhabitants, left. He finally settled in Edessa where he continued to reside till he died, except for intervals which he spent in prayer and meditation in the desert and except for a journey to Egypt and a visit to Saint Basil, Archbishop of Cæsarea in Cappadocia. He held humble rank in the hierarchy, that of deacon, but as a preacher attained high celebrity. He refused to be ordained a priest because he thought himself unworthy. His writings were very numerous, and many are extant. He used a poetic form in his homilies and harangues; and Saint Jerome tells us that his homilies (translated into Greek, for he wrote in Syriac) were wont to be read in many of the churches of Greece immediately after the Scripture lesson. He was a valiant defender of Catholic orthodoxy against the heretics of his time — Bardesanes, the Gnostic, the Arians, and the Sabellians, the Manichæans and the Novatians. Some of his lyrics are remarkable for their simplicity and genuine poetic spirit. Even his homilies are of a poetic cast and form. His works have been collected and translated into Latin, Greek, German and English. There are also Armenian, Arabic, Coptic and Ethiopic versions of the original Syriac. The most important translations and collections, many of which are preceded by accounts of his life, are: 'Omnia Opera S. Ephræmi Syri' (G. Vossius, ed., 3 vols., Rome 1589–98); 'Greek Text of 156 Writings of Saint Ephrem' (E. Thwaits, ed. Oxford 1709); 'S. P. M. Ephræm Syri Opera Omnia Quæ Extan Græce, Syriace, et Latine' (J. S. Assemanus and S. E. Assemanus, ed., 6 vols., Rome 1732–46); 'Ausgewählte Schriften des Heiligen Kirchenvaters Ephram' (F. Zingerle, ed., 6 vols., Innsbruck 1831–46); 'Saint Ephrem's Commentaries on the Epistles of Saint Paul' (Latin text, Aucher, ed., 4 vols., Venice 1836); 'Select Works of Saint Ephrem the Syrian' (J. B. Morris, transl., Oxford 1847); 'Repentance of Nineveh' (H. Burgess, transl., London 1853); 'Select Metrical Hymns and Homilies, etc.,' (H. Burgess, transl., London 1853); 'S. Ephræmi Syri, Rabulæ Episcopi Edesseni, Batæi, Aliorumque Opera Selecta’ (Syriac text, J. J. Overbeck, ed., Oxford, 1865); ‘S. Ephræmi Syri Carmina Nisibena, etc.’ (Syriac and Latin texts, G. Bickell, ed., Leipzig 1866); ‘Commentaries on the Concordance of the Gospels’ (Latin text, Moesinger, ed., Venice 1878); ‘S. Ephræm Syri Hymni et Sermones’ (Syriac and Latin texts, T. J. Lamy, ed., Malines 1882); ‘S. Ephræm Syri Commentarii in Epistolas D. Pauli, etc.’ (Venice 1893); ‘Fragments of the Commentary of Ephrem Syrus Upon the Diatessaron’ (J. R. Harris, ed., London 1895); ‘Selections Translated into English from the Hymns and Homilies of Ephraim the Syrian’ (J. Gwynn, ed. and transl., in ‘A Select Library of Nicene and Post-Nicene Fathers,’ 2d ser., Vol. XIII, pt. 2, p. 112, New York 1898). Consult Alsleben, ‘Das Leben des H. Ephrem’ (Berlin 1853); Ferry, S., ‘Saint Ephrem, Poète’ (Paris 1877); Lamy, T. J., ‘Saint Ephrem Syrus’ (in *Dublin Review,* 3d ser., Vol. XIV, p. 20, London 1885).

EPHRAIM, ē'frā-ĭm, according to Gen. xli, 50–52, the younger son of Joseph and of Asenath and the founder of one of the 12 tribes of Israel. The tribe occupied one of the finest and most fruitful territories of Palestine; in the very centre of the land, and included the most of what was afterward called Samaria. Its approximate boundaries were: on the east the river Jordan, on the west the Mediterranean Sea and the tribe of Dan, on the south the tribe of Benjamin, and on the north that of Manasseh. The Ephraimites, when they left Egypt, are said to have numbered 40,500, and, being numerous and influential, often appear as the representatives of the 10 tribes, both in historical and prophetical passages of the scriptures. For a long time the ark and the tabernacle were situated at Shiloh in the heart of Ephraim. The tribe was the most warlike of all the Israelites as attested by their protests against Gideon (Judges viii, 1) and against Jephthah (Judges xii, 1–7) because they did not ask their aid in war. Joshua, who conquered the Holy Land, and Samuel, the prophet, were members of the tribe. Upon the death of Saul, the Ephraimites, in conjunction with all the other tribes except Judah, took part in the revolt of Saul's son Eshbaal (Ishbosheth), and recognized him as legitimate king in opposition to David (2 Sam. ii, 8–9), but upon his murder, submitted to the hegemony of Judah under David. Later, about 975 B.C., after the death of Solomon, the tribe revolted under Jeroboam against Rehoboam, the son of Solomon (1 Kings xii, 1–20), and with all the tribes except Judah, Simeon, part of Benjamin, and the Levites, merged into the northern kingdom of which they constituted the most important part. There are, of course, numerous references to Ephraim in many parts of the Old Testament. A list of these may be found in the article by H. W. Hogg in Vol. II of *Encyclopædia Biblica* (London 1901). Consult also English Commentaries on Bible, Old Testament, Exodus.

EPHRAIM, town of Palestine, mentioned in John xi, 54, as a place where Jesus took temporary refuge. A town of this name is mentioned twice in the Old Testament and by Josephus, and is probably the same place. Nothing is known of its history. Modern attempts to identify it with Et-Taiyibeh, four miles northeast of Beitin, the ancient Bethel, do not rest on any secure foundation beyond the fact that it best corresponds to the New Testament description as “near the wilderness.”

EPHRAIM CODEX. See BIBLE.

EPHRATA, Pa., township and borough in Lancaster County; on the Philadelphia and Reading Railroad, about 50 miles northwest of Philadelphia. It is an agricultural and mining region with forests nearby. It is a health resort and has manufactories of cigars, silk, underwear and hosiery. The borough owns its waterworks and electric-light plant. Ephrata was founded by Johann Conrad Beissel (q.v.) and his followers in 1735. The community established by Beissel was called “Order of the Solitary,” and it resembled somewhat the Seventh-Day Adventists. Ephrata contains several very ancient and singular buildings, particularly the brother and sister house. These houses are large four-story structures, each contains a chapel, and is divided into small apartments, so that six dormitories, barely large enough to contain a cot, a closet, and hour glass, surround a common room, in which each mess have their meals. The dress of the brethren and sisters was that of the Franciscans or White Friars. They were remarkable for their rigid adherence to the precepts and ordinances of the New Testament; they insisted upon the washing of the feet before administering the sacrament; and were very observant of the Sabbath. They were peaceful and temperate and distinguished for their music, which was composed and arranged by themselves. Prior to the Revolution they seemed to flourish, but now only a few of the order remain. Many of the members were well educated; Peter Miller, second prior of the monastery, translated the Declaration of Independence into seven languages, at the request of Congress. A printing press was set up, and a number of works, in both English and German, some of them very beautifully made and now highly prized, were published. Pop. of townships, 2,565; borough, 3,735. Consult Gibbons, ‘Pennsylvania Dutch and Other Essays’ (1872); Kuhns, ‘German and Swiss Settlements of Colonial Pennsylvania’; Sachse, ‘The German Sectarians of Pennsylvania’ (2 vols., 1900).

EPHYDRA, a genus of flies, of the Ephydridæ, the eggs and larvæ of which were considered a dainty by the aborigines of America. See FLY.

EPIBLAST, one of the layers in the developing embryo from which the structures making up the skin and its appendages are developed; also called ectoderm. See EMBRYOLOGY.

EPIC. See NARRATIVE POETRY.

EPICARDIUM. See HEART.

EPICHARMUS, Greek philosopher and comic poet: b. Cos, about 540 B.C.; d. 450 B.C. He lived at Syracuse, and there wrote his celebrated comedies, now lost. Their number is reckoned at 52, and the titles of 35 of them have been preserved. Very little is known definitely about his life. But it is said that, before commencing his career as a comic poet, which apparently he did somewhat late in life, he lived at Megara, engaged in the study of philosophy, both physical and metaphysical. The

fragments of his writings which are preserved abound with philosophical maxims, and with speculative discourses. His genius was highly esteemed among the ancients by such judges as Plato and Cicero. The Sicilian comedy of Epicharmus, prior to the Attic, grew out of the mimes, which were peculiar to this island, making a sort of popular poetry. He arranged the separate unconnected scenes, exhibited in the mimes, into continued plots, as in tragedy. His comedies were long regarded as models in this species of composition, and were as much distinguished by their knowledge of human nature as by their wit and lively dialogue. The Sicilian comedy, in opposition to the Attic-Ionic, is also designated as the Doric comedy and is written without chorus. As their subject matter Epicharmus chose mythological incidents which he travestied or characters from everyday life. He wrote in trochaic and anapaestic tetrameter. The best and most recent collection of his fragments is contained in ‘Poetarum Græcorum Fragmenta’ (G. Kaibel, ed., Vol. VI, Berlin 1899). Consult Koerte, A., ‘Die Griechische Komödie’ (Leipzig 1914).

EPICŒNE, or THE SILENT WOMAN, a comedy by Ben Jonson, produced in 1609. An old man, named Morose, disliking noise marries Epicœne because of her good reputation as a good listener and also with the aim of disinheriting a nephew. Immediately after marriage Epicœne displays an exceedingly shrewish disposition. Morose, in order to be rid of her, secures the services of his nephew by gifts and promises of reward. The nephew then discloses Epicœne as a boy in disguise, who had been induced to play this trick upon Morose.

EPICONTINENTAL SEAS, those shallow seas which cover the continental shelf (q.v.) and which from time to time have covered most parts of this and other continents in the geologic past. The term is in contrast to the deep seas which have been more persistent in their history.

EPICTETUS, Stoic philosopher: b. Hierapolis, Phrygia, about 60 A.D. He lived at Rome, where he was the slave of Epaphroditus, a brutal freedman of Nero, whose abuse and maltreatment he bore with fortitude. He was later manumitted. Epictetus himself did not leave any written account of his doctrines, which appear to have been of the most elevated kind. In his discourses he aimed to impress his hearers with the love of practical goodness. The foundation of philosophy he held to be the perception of one's own weakness and inability to do what is needful. His doctrines approach more nearly to Christianity than those of any of the earlier Stoics, and although there is no trace in what is recorded of them of his having been directly acquainted with Christianity, it is at least probable that the ideas diffused by Christian teachers may have indirectly influenced them. The excellence of his system was universally acknowledged. Banished from Rome by Domitian who hated him on account of his principles, Epictetus settled in Epirus, and although he possessed the favor of Hadrian, there is no evidence that he returned to Rome. His pupil Arrian, the historian of Alexander the Great, collected his maxims with affectionate care, in the work entitled ‘Enchiridion’ (‘Handbook’) and in eight books of ‘Commentaries,’ four of which are lost. These reveal the simple and noble earnestness of the philosopher's character, as well as that real heartfelt love of good and hatred of evil which is often assumed to be an exclusively Christian feeling. (See DISCOURSES). Consult the complete edition of his works by Schenkl (Leipzig 1898), and the translation by Carter (London 1758), Higginson (2 vols., Boston 1890) and Long (London 1897). Consult also Arnold, ‘Roman Stoicism’ (Cambridge 1911); Melcher, ‘De Sermone Epictetes’ (Halle 1906); Ritter and Preller, ‘Historia Philosophiæ Graecæ’ (9th ed., Gotha 1913).

EPICUREANISM. Epicureanism as a philosophical doctrine has its rise in the teachings of its founder Epicurus, who was borne in Samos in the year 342 or 341 B.C. He was the son of Neocles and Chærestrata. His father's name being the same as that of the great statesman Themistocles, suggested to the poet Menander a verse in which he contrasts the son of Neocles, who freed his country from slavery, with him who freed it from foolishness. In his early life, Epicurus taught in several schools in Asia Minor and in the year 306 came to Athens, where he founded a school of his own. By the subtle charm of his personality he attracted to himself a group of admiring friends and followers who were not only devoted to the teacher but were also fired with enthusiastic zeal for his teaching. They were his companions and friends rather than his pupils. Their meeting place was the famous garden of the master which has become so closely associated with the very name of the school. After the death of Epicurus in 270 his followers carried on his work and maintained the teachings and traditions of their leader with unabated earnestness and loyalty. Among the successors of Epicurus, the most conspicuous perhaps are Hermarchus, Dionysius, Apollodorus, Zeno and Phædrus. But no one of his followers achieved marked distinction until we come to the time of T. Lucretius Carus, the interpreter and chief apostle of Epicureanism. Though a Roman, he had caught that Greek spirit which had been so brilliantly illustrated in the garden of Athens.

Epicureanism as a distinct school flourished with varying fortunes until a period as late as the 4th century A.D. With the decay and disappearance of the school, its influences however did not cease, but lived on, and will live; for Epicureanism represents an attitude of mind which will ever appeal most strongly to certain natures, and in a way to all natures. It is not in a strict sense of the phrase, a system of philosophy. It is rather a theory of life. It is essentially practical in its purposes, methods and results. So far, however, as Epicureanism may be called a system of philosophy, it falls into three parts — a system of canonics, of nature and of morality. By canonics is meant a system which exhibits certain canons or tests of truth. With Epicurus the supreme test of truth was to be found in the sensations. It is the same thought as that which is contained in the old adage — seeing is believing. He held that only the actual facts of a sensory experience can furnish a scientific basis upon which to construct a body of knowledge. The notions are to be regarded merely as generalized sensations, and all opinions are inferences which at the last analysis must rest upon simple sensations. The sensation as such, therefore, is the court of last appeal. Concerning his philosophy of nature, Epicurus taught that there were only natural causes. Any belief in supernaturalism he regarded as a superstition which only a weak intellect could possibly entertain. As regards the constitution of matter, he followed Democritus in the essential features of his atomic theory of the universe. He did not follow, however, with complete rigor the logic of his materialistic conceptions, for he allowed that there must be a distinction between the irrational, or more sensory part of the soul on the one hand, and on the other, the rational part which he regarded as the superior and controlling power of man's nature. Moreover, while denying the existence of the gods, as gods of providence sustaining the forces of nature, and ruling the destinies of man, he nevertheless believed in their existence as beings apart and wholly separate from mundane affairs. From the standpoint of his ethical system, the gods were of very necessity beings supremely happy, and such they could not be, were they supposed to be in any way cognizant of the darker side of nature and the manifold ills of human life. According to Epicurus the great end to be attained through the study of nature was to disabuse the mind of any lurking superstition concerning the possibility of the supernatural.

It is, however, the ethical system of Epicurus which is the heart of his teaching, and it is this system that the term Epicureanism usually suggests to one's mind. With Epicurus man's chief end is the attainment of pleasure,— not in the sense, however, that life is a heedless pursuit of pleasure here, there and everywhere. The end is pleasure, not pleasures. The supreme pleasure, the constant source of all other pleasures, is the tranquil and happy mind. In placing the true source of pleasure within, Epicurus here differs from the earlier Cyrenaic who regarded man's happiness as consisting in the full round of delights, the sum total of all his actual enjoyments. Epicurus taught that mere bodily pleasures were not an end in themselves, but only as they minister to peace of mind. Violent excesses disturb, extreme asceticism torments the inner spirit of man. Therefore be not too indulgent, nor too rigorous with self. Study to attain the maximum of enjoyment with the minimum of distress. Let a wise prudence transmute both the good and the evil of life into a tranquillity of soul. In this conception of conduct, virtue is never an end in itself. It is always a means to an end. The end is happiness and so far as a life of virtue contributes to well-being, so far only is it to be commended.

We find in Epicureanism and in Stoicism alike, the common endeavor to free man from the dominion of circumstance, and to establish an inner world of mind wholly independent of the outer world of chance events, of untoward influences, of hostile forces and fleeting delights. The Stoic, however, urged the repression of all desire; the Epicurean, on the other hand, urged its wise regulation. As Epicurus himself puts it, "It is not an unbroken succession of drinking feasts and of revelry, not the pleasures of sexual love, nor the enjoyment of the fish and other delicacies of a splendid table, which produce a pleasant life, it is sober reasoning, searching out the reasons for every choice and avoidance, and banishing those beliefs through which greatest tumults take possession of the soul. Of all this, the beginning and the greatest good is prudence. Wherefore prudence is a more precious thing even than philosophy: from it grow all the other virtues,— for, it teaches that we cannot lead a life of pleasure which is not also a life of prudence, honor and justice, nor lead a life of prudence, honor and justice which is not also a life of pleasure. For the virtues have grown into one with a pleasant life, and a pleasant life is inseparable from them." In dealing with the fear of death Epicurus proved that the dissolution of the body involves that of the soul, and therefore death is nothing to us, because when we are, death is not; and when death is, we are not.

President of Princeton University.

EPICURUS, ĕp-ĭ-kū'rus, Greek philosopher: b. Samos 341 B.C.; d. Athens 270 B.C. He went to Athens 323 B.C., where he is said to have enjoyed the instructions of Xenocrates, then at the head of the Academy, but this he himself does not admit. Epicurus generally denied his obligations to other philosophers. Although some parts of his system are evidently borrowed from his predecessors, he claimed to be self-instructed, and treated his teachers with hostility and contempt. His stay at Athens, however, was brief; and on leaving it he went to Colophon, where his father was engaged in teaching, and began himself to give lessons in grammar. It was here, according to some accounts, that his attention was first turned to philosophy. He himself says he began his philosophical studies at the age of 14, but they may have subsequently taken a more distinct development. The inability of the grammarians to explain a passage about Chaos and the accidental possession of a copy of the works of Democritus are variously assigned as the cause of this new or more decided direction of his mind. From Colophon he went to Mytilene and Lampsacus, where he engaged in teaching philosophy. He returned to Athens in 306 and purchased a garden in a favorable situation, where he established a philosophical school. Here he spent the remainder of his life except for short visits to Asia Minor. His mode of life appears to have been simple and temperate. He abstained, as a principle, from politics, and took no part in public affairs. During the latter part of his life he was afflicted with severe physical suffering which was borne with heroic courage.

Epicurus was a very voluminous writer. He wrote some 300 separate treatises. His works, however, are represented as full of repetitions and quotations. In ancient times his philosophy appears to have been more popular in Greece than in Rome, although his disciples were numerous in both. This is easily comprehended, as it was in fact a system engendered by the decline of public virtue in Greece, while the severest stoical philosophy was better adapted to the still active public spirit of Rome. Little is left of his numerous writings. Some fragments of a 'Treatise on Nature,' which is known to have consisted of 37 parts, were found at Herculaneum and published by J. C. Orellius (Leipzig 1818). All other fragments have been published by H. Usener in his 'Epicurea' (Leipzig 1887). The chief account of his philosophy is contained in the great poem of Lucretius, 'De Rerum Natura,' one of the masterpieces of Roman literature. A good edition of the latter is that by W. A. Merrill (New York 1907). There is also a translation by H. A. J. Munro (London 1908). Consult 'Epicurus and His Sayings' (in *Quarterly Review*, Vol. CLXXXV, p. 68, London 1897); 'Epicurus and Lucretius' (in *Westminster Review*, n. s. Vol. LXI, p. 299, London 1882); Du Rondel, J., 'La Vie d'Epicure' (La Haye 1686); Gassend, P., 'De Vita et Moribus Epicuri' (1647); Girard, J., 'Etudes sur la Poésie Grecque,' etc. (Paris 1884); Gomperz, T., 'Greek Thinkers' (4 vols, London 1901–12); Guyau, M., 'La Morale d'Epicure' (Paris 1881); Hicks, R. EPICYCLE, in ancient astronomy, a small circle supposed to move round the circumference of a larger, a hypothetical mode of representing the apparent motion of the planets, which were supposed to have such a motion round the circumference of a large circle, called the deferent, having the earth in its centre. See Astronomy.

EPICYCLOID, in geometry, is a curve generated by a point in one circle, which rolls on the convexity of the circumference of another circle. If the rolling circle is inside the fixed circle the curve generated is a hypocycloid. The common cycloid is generated by a point in a circle that rolls along a right line. The latter has sometimes been assimilated with the former by considering the right line as the circumference of a circle whose diameter is infinite. The invention of epicycloids is ascribed to Roemer, the Danish astronomer. See Geometry.

EPICYCLOIDAL WHEEL, a wheel or ring fixed to a framework, toothed on its inner side and having in gear with it another toothed wheel of half the diameter of the first, fitted so as to revolve about the centre of the latter. As the inner wheel revolves a point on its periphery will oscillate in a straight line. It is used for converting circular into alternate motion, or alternate into circular.

EPIDAMNUS. See Durazzo.

EPIDAURUS, ĕp ĭ dâ'rŭs, one of the most important towns and commercial seaports of ancient Greece, situated in Argolis, on the east coast of the Peloponnesus, particularly celebrated for its magnificent temple of Æsculapius, which stood on an eminence eight miles west of the town. An inscription over the entrance declared it to be open only to pure souls. Crowds of invalids resorted to the place in hopes of obtaining a cure from the beneficent divinity, in whose honor festivals were celebrated yearly. It received its name from Epidaurus, a son of Argus and Evadne. Excavations made by the Greek Archæological Society have brought to light parts of Tholos; a temple, probably that of Æsculapius, 81 feet long by 43 feet wide; the theatre, which is the most perfect example of Greek theatre in existence; stadia, baths, gymnasia and hospital. Epidaurus is now called Pidavro, or Edidairo, and is the place where in 1821 the first Greek Congress assembled. The modern town contains about 100 inhabitants. Consult Caton, 'Epidaurus' (1900); Diehl, 'Excursions in Greece' (1893); Delfrasse and Lichat, 'Epidaure' (1895); Gardner, 'New Chapter in Greek History' (1892).

EPIDEMIC. See Epidemiology.

EPIDEMIC CEREBROSPINAL MENINGITIS. See Meningitis.

EPIDEMIOLOGY, the study of epidemics or the science that treats of those diseases that are known to attack a number of persons at the same time or in close succession. The essential feature is that epidemic diseases belong to a group of infective or microparasitic maladies which have the common property of spreading from time to time in a community. It is well known that many diseases of an epidemic character have their favorite haunts. In such places they are always present and there they are said to be endemic. It is only when they appear in large numbers of people in their favorite habitats that they assume epidemic proportions. Thus there is little distinction between the two classes of disease, since the same disease may be at one time both endemic and epidemic. When an epidemic disease, for instance, influenza, spreads the entire world over, the word pandemic is applied. The essential feature in an epidemic disease is that it must have a definite contagium. The contagia may be either of bacterial or protozoan character. Thus cholera, dysentery, the plague are caused, as is known, by bacteria which, being carried in the ordinary paths of commerce, or by bodies of a moving population, are spread about the world. Occasionally epidemic disease is due to an animal parasite. This is presumed to be the case in yellow fever, and is known to be true of malaria. In malaria, as is now positively demonstrated, the agent that is all-important in the spreading of the disease is one genus of mosquito, *Anopheles*. The parasite lives normally in the human body and is conveyed by means of the blood into the mosquito, where it undergoes a special cycle of development, until it is inoculated into another human being, who develops the disease.

The importation of epidemic and parasitic disease from Africa and Asia is now urged as a reason for extreme precaution in the contact of whites with alien races. The importation of such diseases from Africa is now considered to have contributed materially to the downfall of the Roman Empire. The negroes, according to recent investigation, are responsible for the introduction into the Southern States of malarial fever, which they brought in their blood from Africa, and to which, themselves immune, the whites fell victims. Similarly the American negroes, according to a discovery made by Dr. Stiles in 1902, carry in their intestines the virus of hookworm with relatively slight discomfort; but not so the white population; and to this cause is set down the physical inefficiency and mental inertia which afflict so many of the Southern whites. Cholera, bubonic plague, typhus and smallpox have all had their origin in Asia.

Further, it may be said that the essential features for the development of epidemic conditions are (1) A virus; (2) a susceptible population; (3) free intercommunication between the sick and the susceptible. In the group in which the animal parasites belong there must be (1) A virus; (2) a breeding-place outside of man; (3) a means of transport from place to place, either naturally or artificially; (4) a vehicle for the diffusion of the disease, such as the mosquito, for instance, or a contaminated water-supply, or a person suffering from the disease who travels from place to place and (5) a susceptible population. It is well known that variation in the susceptibility of populations is a very important element in the consideration of epidemics. Thus measles, whooping-cough, diphtheria and similar affections ravaged Hawaiian (formerly Sandwich) Islands with a fierceness and mortality unknown to modern times. Seasonal movements, sectional fluctuations, time fluctuations and oscillations are interesting features in the study of epidemics. By some writers the word epidemic is very loosely used to indicate certain waves of mental excitation which have caused and still cause mental storms throughout the community, as the dancing mania and similar occurrences. These cannot be spoken of as epidemics in the true sense unless one wishes to use the broad term of «emotional contagion.» Some of the most interesting epidemics of modern years have been the influenza epidemic of 1890, which traveled round the world in from three to four years, and the plague epidemic that was raging from 1895 to 1902, slowly traveling over the habitable globe. There have been no severe extensive epidemics in the United States, save the epidemic of influenza, for a great many years, and in civilized countries at the present time the chances for the spreading of more severe epidemics are greatly lessened by the application of the laws of modern hygiene as well as by procedures arising from the newly acquired knowledge concerning immunity. The time does not seem far distant when immunity from many forms of infectious disease may be conferred by proper serum therapy. Consult Creighton, 'The History of Epidemics in Great Britain from 664 A.D. to the Extinction of the Plague' (2 vols., Cambridge 1891–94); Hecker, 'Epidemics of the Middle Ages' (trans. by Babington, 2 vols., London 1835); Hirsch, 'The Geographical Distribution of Disease' (1893); Weichselbaum, 'Epidemiologie' (1900); and 'Epidemiology' (in 'Encyclopædia Medica,' 1900).

EPIDENDRUM, a large genus of tropical American orchids, most of the species of which are epiphytic, growing on trees. There are upward of 500 species in South America alone. The stems develop pseudo-bulbs, the leaves are strap-shaped and leathery and the flowers are single or in spikes, panicles or racemes. The flowers of some species are very handsome and a large number of the species are in cultivation. Two of the finest cultivated species are the Mexican plants *E. nemorale* and *E. vitellinum,* the former with rose-colored and the latter with orange-colored flowers. The plants are much used in hybridization, as they are hardy and rigorous, and are valuable for crossing with the less hardy species of other genera, the result being in many cases long-stemmed flowers of fine appearance.

EPIDERMIS, the outer layer of the skin. See SKIN.

EPIDIDYMIS, an organ lying beside the testicle and transmitting the semen to the vas deferens. See TESTICLE.

EPIDIDYMITIS, inflammation of the epididymis, resulting in pain, redness, heat and swelling of the testicle, with general constitutional malaise. Treatment consists in rest in bed and soothing applications.

EPIDOTE, a common mineral, usually yellowish-green in color, and crystallizing in prismatic forms belonging to the monoclinic system. It is a silicate of calcium, iron and aluminum, with the general formula $HCa_2(Al, Fe)_3Si_3O_{13}$, the ratio of the aluminum to the iron varying, in different specimens, from 6:1 to 3:2. Its hardness is from 6 to 7 and its specific gravity is about 3.4. Epidote occurs throughout the world. Fine crystals are found in France, the Tyrol, Haddam, Conn., Calumet, Colo., and Alaska. The epidote group contains, in addition to epidote proper, the minerals piedmontite and allanite, which resemble it in general nature but contain manganese and cerium respectively; and also the calcium epidote, zoisite, which crystallizes in the orthorhombic system.

EPIGÆA, ĕp-ĭ-jē'a. See ARBUTUS, TRAILING.

EPIGASTRIUM, the upper fore part of the abdomen, reaching from the pit of the stomach to an imaginary line above the umbilicus (navel) supposed to be drawn from the one extremity of the last false rib, on one side, to the corresponding point on the other.

EPIGENE, a term applied to those geological agents of change which affect chiefly the superficial portions of the earth's crust, as the atmosphere, water, plants and animals.

EPIGENESIS, ĕp-ĭ-jĕn'ĕ-sĭs, in biology, the development of the animal from the simple protoplasm of the egg. This term therefore expresses the theory and process of embryology as now understood, and is opposed to the prevailing theory, previous to the researches of Harvey, and especially of Wolff and Von Baer, which was then known as the *emboitment* theory, an account of which is given under PREFORMATION. See also EMBRYOLOGY.

In physiology the supposed production in organized beings of or additional formations by means of new vital influences, as opposed to the idea that new parts are simply the result of developments or changes in pre-existing structures.

EPIGENETIC. See SYNGENETIC.

EPIGLOTTIS, the cartilage at the root of the tongue forming a valve which partly closes the aperture of the larynx (q.v.) during the process of swallowing. When respiration takes place the epiglottis is vertical but falls back and covers the larynx on the approach of food. Any portion of food, however minute, entering the sensitive larynx, causes distress and is automatically ejected by a spasm of coughing.

EPIGONI, a name given in Greek legend to the sons of the seven Greek chiefs who conducted the expedition against Thebes in the war between Eteocles and Polynices. The name literally means descendants, successors or heirs, and the second expedition in command of the sons to avenge the first disastrous defeat was thus called the «war of the epigoni.» The name is also applied to students who attempt to develop the ideas of the great masters of a previous period.

EPIGRAM. The Greek noun from which the word epigram comes was originally used to denote a prose inscription on a temple, tomb, statue, votive-offering to a god or the like. Conciseness and brevity were, therefore, essential qualities. To give pleasure to the ear and help the memory, the Greeks next chose some poetic form for them, preferably the elegiac distich. Their use for practical purposes eventually suggested their composition as a form of literature, with subject matter sometimes wholly imaginary. These poems now often embraced several distichs, and appeared in other metres, but continued to be ordinarily of a simple, expository or descriptive nature. In the Alexandrine period, however, when poets affected almost exclusively short but highly elaborate poems, epigram lost much in simplicity while attaining its highest popularity among the Greeks. Its composition had become the pastime, and even the serious ambition, of authors of first rank, and its recitation and improvisation one of the favorite entertainments at symposia and other social gatherings. Collections of epigraphical epigrams were made. Meleager of Gadara followed these early in the 1st century B.C. with his «Garland» of literary epigrams, the prototype of our Greek Anthology or «Bouquet of Flowers.» This numbers about 4,500 poems by over 300 writers in two collections, the Palatine Anthrology of Constantinus Cephalas (early 10th A.D.), and that which Planudes made four centuries later, supplying important additions. These collections with countless poetical inscriptions found in modern times constitute for us Greek epigrammatic literature. The Greek Anthology not only throws valuable light on human life from the time of the Persian wars to the age of the Byzantine collectors, but through widespread translation and imitation has deeply affected modern languages and thought. For the names of the prominent writers and a characterization of their work see the special article «Anthology.» As a literary genre imported from the Greeks, epigram enters Latin literature with Ennius, but as an inscriptional poem much earlier. Latin is peculiarly adapted to a lapidary, epigrammatic style, and certain racial characteristics, in particular their devotion to the practical, made the Romans naturalize this species of poetry at once. At first they modeled after the Greeks, and we have a few specimens of the erotic epigram as the Alexandrines wrote it. By Cicero's time most of the literary men of importance were writing epigram, and its value as a political weapon was fully appreciated. Catullus is, however, the only writer from whom we have any considerable collection. Although we find in him lyric qualities as fine as in the poems of the Anthology, it is still clear that the national aptitude for satire has already turned epigram strongly in that direction. It is the Latin satiric epigram and not the more lyrical Greek that becomes the model for modern writers. In the Augustan Age, Domitius Marsus and Pedo Albinovanus were, according to Martial, the greatest epigrammatists, but we have not enough of their work to judge it. Martial himself brought this branch of poetry to its acme. None of the eminent poets who followed in his steps, Petronius, Apuleius, Ausonius and Claudian, have equalled him in epigram. In the 6th century Luxorius maintains the tradition, but at a low level. About this time the Salmasian collection was made which forms the nucleus of the modern compilations which we call the Latin Anthology. In the time of Charlemagne epigram enjoyed a veritable renaissance, taking the inscriptional form to describe the material glories of Christianity as well as to sing the praises of the dignitaries of the Church. Then the humanists, to whom Latin was almost a second mother tongue, revived this form once more. But the Latin scholars who have written epigrams are too numerous to name here. One, John Owen of Oxford, should not perhaps be passed by, since he devoted himself wholly to this field and with marked success. In English literature the composition of epigram has long been out of fashion, but for centuries it was popular with literary men. Notable achievements in this line are to be found in the works of Herrick, Johnson, Dryden, Swift, Prior, Addison, Jonson, Goldsmith, Congreve, Hood, Hook, Byron and Burns. Pope's poems might be reckoned a conglomeration of epigrams. Some of the best in our language are by Landor, who cutting loose from the Latin type, at times becomes a Greek in spirit. Epigram has enjoyed wide favor in other modern tongues. In Italy, it long played an important part in politics, as both the Pasquino and Marforio in Rome would testify, could they speak, but it has gradually given way to the madrigal and sonnet. In France from the time of Clément Marot, who introduced it from the Latin, the satiric sort has enjoyed a wonderful popularity. Boileau, J. B. Rousseau, Piron, Lebrun and Chénier have shown its possibilities in many lines. The poetic Priamel of the 14th century may be said to begin epigrammatic literature in Germany, where indeed it has always inclined more to the moral and didactic than in the Latin countries. Among her more eminent epigrammatists are Opitz, Friedrich von Logau who is the best of all, Wernicke Kästner, Klopstock, Lessing, Herder, Schiller and Goethe, who brought out their 'Xenien' together in 1797, Haug, and in more recent times Bodenstedt, Vischer and Fulda. We pass from the history to the theory of epigram. Since it is unlimited in its choice of subject, the form and not the contents must determine whether a poem is an epigram or not. Lessing has shown much acumen in tracing the essential elements of the epigram in its modern conception to the primitive type, the inscription. Just as a monument arouses in a spectator a curiosity about the author and purpose of its construction, which the inscription then satisfies, so the first part of a literary epigram, whether dealing with some material object, or not, is intended to excite an interest which the close of the poem must duly satisfy. The suspense may be increased by making the prefatory portion of some length. The more remotely separated and apparently contradictory the ideas that are brought together, and the briefer and more unexpected the commentary or explanation at the end, the more successful we deem the poem. This point or conclusion becomes in the satiric epigram a sting. Hence the frequent comparison of an epigram to a bee or wasp. While the above applies to most epigrams as written to-day, no definition is quite satisfactory with reference to much that the ancients included under the term. Consult Adam, 'Book of Epigrams' (London 1890); Booth, 'Epigrams Ancient and Modern' (2d ed., ib. 1865); Dodd, 'Epigrammatists of Mediæval and Modern Times' (2d ed., ib. 1875); Watson, 'Epigrams of Art, Life, and Nature' (Liverpool 1884).

WALTON BROOKS MCDANIEL,
Assistant Professor of Classical Philology, University of Pennsylvania.

EPIGYNY, ep-ij'ĭ-ni, in flowers, the condition arising when the petals, stamens and sepals appear as coming from the top of the ovary, the latter showing just below the flower. See FLOWER.

EPIHIPPUS, a diminutive horse of the Upper Eocene of Wyoming, in which only the last two premolars had taken on the molar pattern. See HORSE.

EPILEPSY. Epilepsy is no longer used as a definite disease name but rather as a symbolic term under which are grouped a great variety of conditions presenting a general resemblance. These are sudden and relatively transient attacks accompanied usually by disturbances of consciousness called variously "faints," "absences," "blanks" and amnesias and convulsive seizures which involve the voluntary and involuntary muscular apparatus.

The historic name epilepsy, the "falling sickness," points to the most evident symptom, the falling due to this loss of muscular control. The strictly etymological origin of the word, literally from the Greek word "to seize upon," also denotes the antiquity of the recognition of this form of disturbance and the ancient animistic character of the hypotheses which sought to explain it, and which has long clung about its mysterious and often violent manifestations. It was recognized in its pure type by the most ancient observers. Hippocrates described it, and evidences are found in the earliest Indian writings of Charaka that the disease was then known.

The most modern belief concerning it is undergoing a process of modification. There is a tendency to speak of "the epilepsies" rather than to consider a disease entity, which fails to cover the wide range of conditions of which the attacks are but the outward manifestation. The dynamic concept which is making its way into medicine draws attention to the attack as the result of a faulty distribution of energy which may be brought about in various ways and from a variety of far-reaching causes in the constitution and experience of the individual.

The dynamic, energetic concept of the nervous and psychic functioning establishes a working basis by dividing nervous activity into three levels of operation which have been progressively developed according to functional biological needs. Thus the nervous apparatus of man presents the capability of reaction to environment on the physicochemical or purely vegetative level, the sensori-motor and the level which must express itself symbolically as in all the higher psychic forms of reaction. Any one of these levels offers itself as an outlet for the epileptic discharge. The unity of the nervous organism permits the view of it as a mass of interrelated reflexes redistributing the energy bound up with the individual in order to effect his adaptations and his reactions toward his environment, which may thus take place at any one of the three levels. The epileptic inefficiency to so distribute the energy as to bring about a series of harmoniously adjusted activities may in turn emphasize itself in any one of these spheres of discharge.

This accounts for the wide range of manifestations in attacks of the equally extensive underlying conditions. The attacks comprise psychic forms, the so-called functional neuroses and psychoneuroses, the more pronounced psychoses, also toxemic states, many organic brain diseases and the grosser defects of development, even idiocy. The toxic states may be transitory with removable cause or may be due to defective metabolic functioning which cannot be remedied or to other obscure factors working at the physicochemical level. None of these causes in themselves can any longer be regarded as sufficient explanation of the epileptic form of reaction. The more fundamental conception of a faulty energy distribution indicates a blocking or closing of many paths of outlet either structurally or by psychic inhibition and so accumulation of the discharge within relatively narrow confines. This viewpoint applies thus equally well to the psychic manifestations, the physiological and localized attacks (Jacksonian types) of the physicochemical (tetany).

More accurate and pathological and clinical knowledge tends to separate off from the great epileptic group certain varieties of conditions which can be more definitely identified with other disease groups. There remains, however, for general consideration the still broad and ill-defined "genuine or classical epilepsy" in which the typical reactions are evident for description. The classical major epileptic attack (grand mal) is sudden in onset though preceded often by a warning aura. This may be sensory, motor or purely psychic. At the sudden onset of the attack the patient falls and immediately develops a tonic spasm with unconsciousness. The direction of the patient's fall depends upon the muscles first involved, but in a few moments all the voluntary muscles are affected. Cyanosis results from convulsion of

the respiratory muscles and biting of the tongue from that of the jaw muscles. As the tonic convulsion is succeeded in a few moments by clonic spasms frothy, bloody saliva issues from the mouth and the cyanosis gradually disappears through the return of respiration. Urine is often passed during the attack and less frequently feces. The gradual subsidence of the clonic spasms is followed by a short period of automatic activity after which the patient returns gradually to full consciousness or sinks at once into a deep sleep from which he awakens with lameness and weakness in the muscles which are affected, and perhaps with headache.

The minor attacks (petit mal) exhibit an endless procession of variations. The disturbance of consciousness is shorter in duration and less profound and the convulsive phenomena are so mild that they may even escape observation. Occasionally there is a slight convulsion, an involuntary contraction and extension of some of the muscles without loss of consciousness, and the patient resumes his regular course of work or play. In cases of a slight loss of consciousness the patient may suddenly stop in the midst of play or work or conversation, a shade passes over his face and in a moment he is himself again. Sometimes there is a momentary confusion, faltering or fumbling about the clothing in a dazed fashion, which quickly passes over and leaves the patient occupied as if nothing had happened. Occasionally he feels sleepy, lies down for a second and then gets up perfectly well. These attacks may also be preceded by an aura.

Psychic disturbances many and varied may precede or follow the attack or may even replace it. In many subjects there is a marked disturbance sometimes for several days preceding the convulsion, which serves as a warning to those associated with the patient. The manifestations may be increased irritability, complaining, depression or dullness and perhaps also disturbances of the sensory functions, hypochondriacal complaints and hallucinations, all of which conditions are significantly relieved by the convulsion. A condition of active excitement may, however, occur just after the attack, sometimes before, which may reach an actual frenzy, *epileptic furor.* In this state the patient is liable to any act of violence but fortunately the attack is usually brief and moreover the patient's efforts are diffuse and lack coherence.

The so-called *epileptic equivalent* is an attack in which the convulsion is replaced by a purely mental disturbance. The form of attack is frequently that of the *epileptic automatism* or *epileptic dream state.* Almost any act may be committed in these conditions with absolutely no recollection on the part of the patient when he comes to himself. The recognition of this condition is of great importance from a medicolegal standpoint for crimes are sometimes committed and these, if crimes of violence, are often marked by their ferocity and fury. Moreover, the seizure associated with these acts may have been so slight as not to have been noticed. Usually, however, the acts are rather simple and the attacks of short duration. There are also transitory conditions of depression, excitement, confusion, delirium and stupor and peculiarly characteristic one of ecstasy with hallucinations, particularly of a religious character. There are also transitory states of ill-humor which may be psychical equivalents. These are frequently associated with drinking.

The etiology as well as the prognosis of epilepsy are so involved in the broader concept which avoids the limitation of definitions and unsubstantial formulations that these are best considered also from the energic standpoint. The genuine epileptic usually comes from a badly tainted ancestral stock, manifesting perhaps not epilepsy in the ancestors or collaterals but evidences of ill-defined nervous disorders. There is evidently a defect of the germ plasm and hence epilepsy and feeble-mindedness are often found associated. This accords with what has been said about the inadequate distribution of energy discharge. There is actual developmental failure to lay down paths for the higher avenues of discharge and constitutional inadequacy to adapt to the demands of environment. The epileptic type of character is apt to be morose, irritable, suspicious and hypochondrical with resultant unreliability and shallow aggressive religiosity. He is marked by an extreme egocentricity and hypersensitiveness. This, it has been well said, "is not to be taken in any narrow or moralistic sense, but is to be considered . . . in a broad biologic view, a personality-defect which makes its possessor incapable of social adaptation in its best setting and which, if it remain uncorrected, renders the individual entirely inadequate to make a normal adult life. The seizure phenomenon is essential epilepsy . . . constitutes a reaction away from the difficulties in a loss of consciousness."

All the patient's interests centre about the ego. His interests are variable but shallow and easily fall away as they fail to contribute to his egotism or as they present some difficulty which calls for a greater effort without a sufficient egotistic premium. There is always a tendency to turn conversation or any external stimulus to the ego centre. In this as in all his reactions the epileptic manifests the infantile character to a marked degree. His sexuality like his religiosity is of a superficial, infantile, expansive type. The impulses are prominent and easily roused but undeveloped and tending to seek outlet in a number of ways which belong to the infantile polymorphus components of sexuality not yet converged into the adult sexual aim (Freud).

The epileptic state leads in a certain proportion of cases, if it has begun in early life, to conditions of feeble-mindedness, imbecility and idiocy or it has originally been associated with these conditions. It produces in many cases a very profound general mental deterioration. The progress toward this condition as well as the ultimate clinical picture present an accentuated manifestation of the heightened infantile and egocentric character of the epileptic character and reaction. It is associated in a close inter-relation with the superficiality and ready loss of interest. As has been said: "This process . . . consists of a progressive loss of interest associated with a failure of mentation in respect to normal stimuli in which interest is lost. Both loss of interest and intellectual decay proceed from the barely perceptible early stages to total loss of speech and other acquired functions, when a condition is reached equivalent to the lowest grade of idiocy or the helplessness of a suckling infant.” The dementia does not manifest itself in a withdrawal into an hallucinatory world or in the further symbolic activities of other types of dementia. It consists rather in this gradual withdrawal from all contact with environment until a stage of complete infantilism is reached when the individual is merely a biological egocentric entity in the state of supreme infantile dependence and security which characterize the earliest post-embryonic, almost the fetal period. This is also the psychic goal attained temporarily by the attacks which produce profound unconsciousness. Such a conception of the meaning of the tendency and ultimate end of the psychic reaction has been made possible through the psychoanalytic understanding of controlling impulses belonging to the unconscious and determining such reactions. The application of psychoanalytic knowledge and methods to individual cases has led to and confirmed these conclusions and throws a light upon the obscure problems of epilepsy which have so far baffled the neuropathologist and the psychiatrist of older schools. This psychological approach to the problem does not exclude further research along anatomical and pathological lines. On the contrary it awaits accurate and conclusive knowledge which can only come through such exact research and which must form the physiological basis for complete psychological understanding and enlarge the possibility of prophylactic and therapeutic control.

Meanwhile a psychic therapy is proving its efficacy in a more rational understanding of the epileptic constitution and its inadequacy before the demands of life. This brings an explanation of its yielding at points of particular difficulty and utilizing the characteristic modes of energy discharge. It thus affords a prophylactic basis for education and early training to counteract the essential egocentricity and superficiality of interest and in further treatment, whether able to effect a cure or merely to alleviate existing conditions and retard or prevent the ultimate dementia, it stimulates to a sympathetic and watchful interest in the patient in order to meet him at the points of least resistance and rearouse a flagging interest and utilize his very tendencies for counteracting his self-centring. The epileptic colony provides the ideal environment for this course of treatment. The patients are there under the constant supervision of the trained psychotherapist who has this necessary understanding. The variety of occupations provided furnish means for the essential change of interest and the patients are not subjected to a competition which they are constitutionally unable to withstand.

The question of the use of drugs is an important one because of a widespread belief in their efficacy. Bromide is the only one, however, which deserves consideration, being in fact the basis of most of the other remedies offered for this condition. The larger conception of the clinical picture which recognizes the convulsion as not the disease, nor even the cause nor the first expression of it, but only one form of its outward manifestation, an outlet for the accumulated and unutilizable energy, seriously questions the rationality of bromide medication. Experience seems to show that the convulsion is only postponed, that sooner or later the energy discharge will take place and the drug may indeed in the end produce a summation of attacks which will lead up to that final stage of which the epileptic stands in danger, the condition known as status epilepticus, a terminal stage which consists of repeated and continued convulsive attacks associated with high fever and usually ending in death. It cannot be denied that the bromides have a function in regulating the convulsions when such a danger is imminent but they must be employed with the utmost caution and consideration on the part of the physician. The general observance of hygienic measures is of course of great importance. An outdoor life with a mild, healthful occupation, plain, digestible food, the absence of tobacco, alcohol and other stimulants, a free intestinal canal and surroundings in consonance with the mental capacity of the patient are very desirable features. Treatment during a convulsion is merely protection to prevent injury to the patient. Beyond these measures, however, lies the more comprehensive understanding of the constitutional burden of the epileptic and the very practical aid which this must bring to him in directing and adapting his capacity to the demands of his environment. Consult Jelliffe and White, ‘Diseases of the Nervous System’ (2d ed., 1917).

Smith Ely Jelliffe.

EPILEPTIC CHILDREN. See Children, Defective.

EPILEPTIC COLONIES. The treatment and care of epileptics in special institutions may be said to be one of the developments of applied philanthropy of distinctly recent origin. By the founding of epileptic colonies is meant the setting apart of distinct tracts of ground for buildings and for the exclusive care and training of epileptics. The position of the epileptic in society is altogether anomalous. As Letchworth well says: “As a child he is an object of solicitude to his parents and guardians. The streets to him are full of dangers, and if sent to school he is apt to have seizures on the way or in the class-room. His attacks shock his classmates and create confusion. He cannot attend church or public entertainments, nor participate in social gatherings with those of his own age and station. In consequence of his infirmity the epileptic grows up in idleness and ignorance, bereft of companionship outside of the family, and friendless. He silently broods over his isolated and helpless condition.” The recognition of these truths has caused philanthropists to found such colonies. In continental countries more has been done for epileptics than elsewhere, but in the last 20 years the movement for taking care of this unfortunate class of society has grown to large proportions and, as expressed by Peterson in his presidential address to the National Association for the Treatment and Care of Epileptics 1902, “there is hardly a community in the civilized world that is not now thoroughly aroused to the necessity for the treatment of this class of defectives.”

This awakening took place about 1887, and has continued to the present time. The first distinct attempt to provide for epileptics was inaugurated by a Lutheran pastor, Friedrich von Bodelschwingh, who founded at Bielefeld, in Westphalia, Germany, the Bethel Colony, which, from small beginnings, has grown up to a village inhabited solely by epileptics. Here everything has been provided to meet their special needs, to make up for their deprivations in the outside world. They are supplied with schools to improve their minds, industrial teachers to make them more or less self-supporting, and physicians to study and treat their cases. Outdoor occupations are provided, special diet is arranged for, recreations, amusements, religious instruction, in fact all of the devices that go to make up a home, have been provided under this man’s guidance, so that at least nearly 4,000 people, not less than half of whom are epileptics, are being taken care of in Bethel.

The success of the Bielefeld Colony prompted movements elsewhere. Other colonies were founded in Germany and other European countries. Ohio established the first institution for epileptics in the United States, although this was built on the hospital rather than the colony plan. New York has Craig Colony at Sonyea, one of the most elaborate and beautiful institutions of this class, closely modeled on the Bielefeld plan, and accommodating a population of nearly 2,000. Massachusetts has a colony at Palmer; Pennsylvania a colony farm at Oakburn; and there is a New Jersey State village for epileptics at Skillman. A colony for epileptics was established in 1902 at Abilene, Tex., and there are similar establishments in Connecticut, Indiana, Illinois, Kansas, North Carolina, Missouri, Minnesota and California. In England the first colony founded was at Chalfont in 1893 and another at Warford in 1900. There is also a colony, the Waghull Home, near Liverpool; another at Godalming; a large colony at Chelford, and finally a fifth institution was completed 1903–04 for the city of London, not far from Croydon. Other colonies have been founded in Brazil, Belgium, Switzerland, Sweden, Russia, Italy, Turkey, India, Japan and Australia.

The Craig Colony, of Sonyea, N. Y., being one of the most modern and ideal, is selected as a type of this institution. Consult Letchworth, ‘Care and Treatment of Epileptics’ (1900).

EPILEPTIC CONSTITUTION. The epileptic constitution, or makeup, has long been recognized as the mental stigma of essential epilepsy itself. Only recently have studies disclosed that the main tenets of such a character are present years before the nervous disorder of epilepsy, as such, is shown in fits. Indeed, most frequently defects of personality may be detected in earliest childhood. The chief instinctive defects are egocentricity, supersensitiveness and emotional poverty. The potential epileptic is intensively self-centred and fails to project his life interests into his environment in a normal and healthful manner. Partly because of this character-fault, and still more because of his innate inheritance, he is or soon becomes unduly sensitized to all forms of stress and annoying demands. He either extraverts his supersensitiveness by exhibitions of rage and tantrums of a type more severe than those occasionally seen in passionate children, or he introverts this feeling and represses his environmental conflicts, causing him to develop a very unstable, irritable and sullen emotional life, which paves the way for larger and more difficult adaptations which he cannot meet; outspoken fits may then occur. By possessing an egocentric and supersensitive makeup, the potential epileptic fails to make the degree of environmental contact which would lead him into a broad and rich experience with life, hence sooner or later he fails to acquire a well-rounded emotional development. This deficit may or may not limit the individual’s purely intellectual equipment in later life. Previously endowed with the instinctive defects noted, the demands of adolescence and adult life increase the difficulties of such individuals until they reach the breaking point in a fit or seizure. Hand in hand with the handicap of defective endowment occurs a disintegration of habits and character, known as deterioration, which often precedes actual epileptic seizures for a considerable time. This accounts for the fact that an essential epileptic from the very nature of his makeup is usually doomed to mental failure in its broadest sense if proper measures to check or controvert his innate faults are not taken at the earliest possible moment. Any effective plan of treatment must essentially take strict and early account of the makeup of epileptics before all else.

L. Pierce Clark, M.D.

EPILEPTIC PSYCHOSIS. In the older descriptive neurological concepts, this indicated a mental complex accompanying epilepsy. It was characterized by a certain degree of mental deterioration, as shown in the impairment of intellect and memory, by impulsiveness, mental irritability, loss of moral sense and partial or complete loss of productiveness. It is also accompanied by periodic disturbances, transitory attacks of anger, dream-states or automatic phenomena. Many patents with epileptic attacks do not develop such severe psychoses as to require certification and sequestration, but the mental deterioration may appear at almost any period following the onset of the epilepsy. In many chronic epileptic states there is pronounced weakness, mentally, morally and emotionally. One’s sense of one’s surroundings is usually preserved, and consciousness may be clear save during the dream-states or automatic periods. Comprehension is usually not markedly impaired, but the field of attention is diminished and easily diverted. Hallucinations are infrequent, illusions are common during an attack or following a grand mal seizure, and delusions are transitory, being found usually only in the dream-states. Morbid and sudden impulses are quite frequent, sometimes approaching distinct nerve-storms, during which suicidal and homicidal attacks may occur. The conduct otherwise is usually orderly, and the ordinary rules of propriety are observed. There is greatly diminished capacity for work in practically all epileptics. The subject of a severe epileptic psychosis is one deserving wide recognition as there are unquestionably a number of phenomena termed “psychical” epilepsy that need recognition by specialists. In some of these attacks the patients are confused. They move in a mechanical or automatic manner. They wander aimlessly about, recognizing no one, although sometimes answering incoherently when addressed. Occasionally they exhibit symptoms of excitement, at other times depression, and not infrequently they may set fire to their beds or furniture, commit theft, assaults, homicides, expose their persons and otherwise conduct themselves in an irrelevant and insane manner. Treatment is extremely difficult in advanced stages. While younger psychoanalysis and careful endocrinopathic study offer the best chances for modifying the conditions which tend to bring about the epileptic deterioration. The patient should be kept in a sanatorium or asylum. See EPILEPSY.

EPILOBIUM, ep-ĭ-lō'bē-ŭm, the willow-herbs, a genus of herbaceous plants belonging to the evening primrose family (*Onagraceæ*). The species are herbs or under-shrubs with pink or purple, rarely yellow, flowers, single in the axils of the leaves, or having terminal leafy spikes. The seeds are tipped with a pencil of silky hairs, and are contained in a long four-celled capsule. There are about 65 species scattered over the Arctic and temperate regions of the world, 40 of them being found in the western and northwestern portions of North America. *E. hirsutum*, or codlins-and-creams, a great hairy willow-herb, is a common and conspicuous plant of waste places in New England and northern New York. Its flowers are pink and rather large, and the whole plant is very downy. Some species are cultivated in America, but these plants are more common in English cottage gardens than in America.

EPILOGUE (from the Greek *epi*, upon, and *logos*, word, speech), the closing address to the audience at the end of a play. The epilogue is the opposite of the prologue, or opening address. Many of Shakespeare's plays have an epilogue as well as prologue, in which the poet sometimes craves the indulgence of the spectators for the faults of his piece and the performance, and sometimes intimates in what light his work is to be considered. The epilogue is sometimes a necessary appendage, to tell us something of a composition, which cannot be gathered from the composition itself. In rhetoric an epilogue, when fully developed, repeats the principal points already presented in the composition, and offers an appeal to the feelings of the reader or the audience.

EPIMENIDES, ĕp-ĭ-mĕn'ĭdēz, Cretan philosopher and poet: b. Crete, in the 7th century B.C. By some he is reckoned among the seven wise men, instead of Periander. When the Athenians were visited with war and pestilence, and the oracle declared that they had drawn on themselves the divine anger by the profanation of the temple, in which the followers of Cylon had been put to death, and must expiate their offense, they sent for Epimenides, who was renowned for his wisdom and piety, from Crete, to purify the temple. On his departure he refused to accept any presents, and only asked the friendship of the Athenians on behalf of Cnossus, his home. There is a legend of his having, when a boy, slept in a cavern for 57 years. On awakening, he found, to his astonishment, everything changed in his native town. This story is the ground-work of Goethe's poem, the 'Waking of Epimenides,' for the anniversary of the battle of Leipzig. According to some accounts he is said to have lived for upward of 150, according to others for nearly 300, years. He is supposed to be the prophet quoted by Saint Paul in Titus i, 12 as saying "The Cretans are always liars, evil beasts, slow bellies."

EPIMETHEUS, ĕp-ĭ-mē'thūs, in Greek mythology, a son of Iapetus and Clymene and the brother of Prometheus. Against the latter's advice he married Pandora, who opened the box in which the foresight of Prometheus had hid all the ills by which mortals were liable to be afflicted. All kinds of diseases and torments issued out of the box and hope alone remained behind. According to other accounts it was Epimetheus himself who opened the box. (See PANDORA). It is to be remarked that, in the Greek tradition, curiosity and disobedience are made the origin of evil, as in the Mosaic account of the fall.

EPINAL, ā-pē-nāl', France, town, capital of the department of the Vosges, in a narrow valley on the Moselle 1,070 feet above sea-level, 190 miles (264 by rail) east-southeast of Paris. It has a communal college, a public library of 30,000 volumes, a museum of antiquities and hospital and is surmounted by the ruins of an old castle. The manufactures consist of articles in iron and brass, leather, embroidery print and cotton goods, hats, paper and pottery; freestone and marble are quarried in the vicinity. The town was founded in the 10th century. With Belfort, Dijon and Bescançon it forms one of the line of forts along the Moselle. Pop. of commune, 30,042.

EPINAL GLOSSARY, a glossary of Old Saxon and Anglo-Saxon, said to date from the 7th century and preserved at Epinal, France. Consult the facsimile published by Sweet (London 1883).

EPINASTY, in botany, the rapid growth of a dorsiventral organ on its upper side, which causes it to bend downward to the earth. See GROWTH.

EPINAY, ā-pē-nā', **Madame de la Live d'** (LOUISE FLORENCE PÉTRONILLE TARDIEU D'ESCLAVELLES), French writer: b. Valenciennes 11 March 1726: d. Paris, 17 April 1783. She was the daughter of M. Tardieu Desclavelles, an officer of high rank, governor of Valenciennes and married her cousin d'Epinay. But his extravagance soon compelled her to separate from him. During the earlier part of her life she formed an acquaintance with Rousseau, who, quick and susceptible in all his feelings, devoted himself to the fascinating and accomplished woman with an ardor, the depth and strength of which he describes himself in his 'Confessions.' She was not insensible to the homage of her "bear," as she used to call him, on account of his eccentricities, and did all that was in her power to place him in a situation corresponding to his wishes. She gave him a cottage (the Hermitage, since so famous) in her park of Chevrette, in the vale of Montmorency. Here the author of the 'Nouvelle Héloïse' passed many days, rendered happy by his romantic attachment to Madame d'Epinay; until he became jealous of Baron Grimm, whom he had himself introduced to her; and in consequence of this feeling, which he took no pains to conceal, a coolness and finally an aversion took place between him and the lady, which is but too plainly expressed in his 'Confessions.' A defense of the later conduct of Madame d'Epinay toward Rousseau may be found in Grimm's 'Correspondence,' where an account is also given of some works written by her, of which the most celebrated is 'Les Conversations d'Emilie.' In this the authoress, in a rather cold but neat style, sets forth the principles of moral instruction for children, with equal elegance and depth of thought. It obtained, in 1783, the prize offered by Monthion (the chancellor to the Count d'Artois) for useful works of this kind, in preference to the 'Adèle et Théodore' of Madame de Genlis. She also wrote 'Lettres à mon fils,' and 'Mes moments heureux.' An abridgment of her memoirs and correspondence, showing her relations with Duclos, Rousseau, Grimm, Holbach, Lambert, etc., appeared in 1818. They give a true picture of the refined but corrupt manners which prevailed among the higher classes in France during the government of Louis XV.

EPIORNIS, or **AIPYORNIS**, an extinct ratite bird of Madagascar (*Æpyornis maximus*), interesting not only for iself, but because its remains appear to have formed the basis for the Arabic tale of the gigantic roc. It was much like an ostrich in size and structure, except for the massiveness of its limbs and the extraordinary size of its eggs. These have been found in considerable numbers in muck-swamps, or sometimes floating in the river-mouths, often in perfect condition, and are the largest and strongest eggs known, measuring about 13 inches by 9½. These dimensions are twice those of an ostrich's egg, and an egg of the epiornis would hold the contents of six ostrich eggs, yet the epiornis was little if any larger. First made known to science about 1850, so many remains have since been found that about 12 species have been indicated, and a second genus (*Mullerornis*), which has been joined with *Æpyornis* into the family *Æpyornithidæ*. Tradition and the evidences of some bones indicate that these birds were exterminated since human occupation of Madagascar began. See MOA.

EPIPHANIUS, ĕp-ĭ-fā'nĭ-ŭs, **Saint**, Greek father of the Church: b. of Jewish parents near Eleutheropolis, Palestine, about 315; d. at sea near Cyprus 403. In his youth he went to Egypt where at first he came under the influence of teachers of Gnosticism; but afterward he embraced monasticism, and returning to his own country there became head of a community of monks. In Palestine he made the acquaintance of the two western churchmen, Jerome and his associate, Rufinus; the friendship of the three men was cordial and intimate till Rufinus' defense of the teachings of Origen angered Epiphanius, whose special mission seemed to be to obliterate every line written by Origen. He was made bishop of Constantia (the older name Salamis), in Cyprus 367, and held that see till his death. On one occasion, 394, he visited Jerusalem to denounce Origenism. He must have been more than 80 years old, perhaps near 90, when he went to Constantinople to charge the patriarch of that see, Saint John Chrysostom, with the sin of favoring the Origenists, but a few words from Chrysostom opened his eyes. His numerous writings are now of little account, his theological polemics being distinguished by fervor rather than by penetration.

EPIPHANY, ĕ-pĭf'-ā nĭ, (Latin *epiphania*, appearance or evidence), festival of the Catholic, Anglican and Eastern churches held on 6 January to commemorate the manifestations of Jesus Christ as son of God; (1) to the Wise men of the East (Magi) at Bethlehem; (2) at his baptism by John in the Jordan, when the voice from heaven proclaimed, "Thou art my beloved son in whom I am well pleased"; (3) at the marriage feast at Cana in Galilee, where Jesus wrought his first miracle. The observance of this festival can be traced to an earlier period in the Eastern Church than in the Western. In the Greek Church it was observed as early as the 2d century, but the event commemorated by the Greeks was not the visit of the Magi to Nazareth but the manifestation of Jesus at the Jordan as the Messiah. Not till the 4th century does the Epiphany appear to have been observed in the Latin Church. In the Greek and Oriental churches it is customary to administer baptism on the eve of this festival, with unwonted solemnity. This is said to be because of the relation of the festival to the baptism of Jesus by Saint John. In those churches, too, the Epiphany (Epiphaneia, Theophaneia) was the festival commemorative of the birth of Jesus; for it was believed that the baptism in the Jordan took place precisely on the 30th anniversary of the birth. A popular name for this festival in English is "Twelfth Day," that is, twelfth day from Christmas. It is also called "Little Christmas." In various other languages it is known as "Three Kings' Day," or "Day of the Kings." In the Western Church special attention was paid to the celebration of the adoration of the Magi. This was followed by the celebration of baptism and the miracle of Cana, the latter being held on the succeeding Sunday. In England special holiday celebrations were held on the 12th day and the 12th night when the Christmas festivities closed. Following the provisions of the Council of Nicæa, the date of Easter has long been announced with great solemnity on the 12th night. Connected with the celebration of Epiphany, it was the custom in the Middle Ages and even later, to have sorts of miracle plays in the churches in order thus to visualize to the people the events commemorated on the occasion. These were frequently given during the mass. Similar dramatic representations of a still more popular character were given by the people themselves in their own homes. Performances of this nature, though now generated into popular entertainment, are still to be met with in parts of Germany, Tirol, the mountain districts of Austria and occasionally among the

Christianized Indians and mestizos of Latin America. This dramatic representation generally presented the oblation of the wise men, and fitted it in so that it appeared to form a natural part of the mass. In the traditions of the church the wise men were venerated as the «Three Holy Kings» after which the festival was itself frequently called, being variously designated as *festum trium regum, festum magorum, festum stellae.* It has long been the custom in the College of the Propaganda at Rome for young men belonging to various foreign nations to represent, by speeches in their native languages, the appearance of Jesus the Christ unto all nations.

There was a tendency in the early days of the Epiphany to connect it with the heathen spring festival, and more especially with the sacrifices and offerings made to the gods of the running waters, in the rivers, the streams and the clouds. Some Christian communities even followed this old pagan custom and blessed the water, the rivers and lakes. This same pagan custom is noticeable in the attempts of certain sections of the Christian Church to make of the Epiphany a special day of baptism, or as it was called *dies luminum.* The Franks, who before their conversion to Christianity, had held special spring ceremonies in honor of the gods of growth and fertility, seem to have been strong supporters of the custom of Epiphany Baptisms. This custom probably corresponded to a spring purification ceremony (by water) common among the Franks and Germanic races in general. The custom of making Epiphany a day of baptism was also strongly clung to in the African Christian Church. The consecrating of the water survived the baptismal and other semi-papan rites in the Greek Church and is still observed in Russia. The Church connected this baptismal custom with that of the baptism of Christ by John; but it seems not to have become customary until the spread of Christianity into the Frankish and Sclave countries where the sacrifices and other ceremonies connected with the deities of growth and fertility were also offered to the gods of water. In explaining this cusious blending of pagan religious ceremonies and celebrations with Christian traditionary history, Christian writers have asserted that the first baptism of Christ was, in a sense, his real birth, since it was his first manifestation to man. So it was common, in early Christian centuries, to include the ceremony of the commemoration of the birth of Christ in that of Epiphany; and it was only considerably later that the Christian celebration came into vogue. Thus the ancient pagan celebration of the «appearance of the new birth of spring,» the purification by water and the celebrations in honor of the occasion, split into separate parts, became two of the greatest festivals in the Christian Church, and have continued to maintain their position as such to the present day.

It is probable that the custom of presents from the wise men to the infant Jesus arose out of the practice of presenting offerings to the gods of nature and growth at the spring festival, and also of a similar custom in vogue among the Roman people who made presents to one another on this occasion. The fact that Epiphany is one of the oldest ceremonies in the Christian Church, having already been established by the time of Clement of Alexandria, who lived in the latter half of the 2d and the early part of the 3d centuries, would seem to indicate that it was the survival of earlier customs and ceremonies; since, even at this early date, there was some considerable speculation as to its origin. See MAGI.

Editorial Staff of The Americana.

EPIPHYLLUM, ĕp-ĭ-fĭl'ŭm, a genus of plants of the natural order *Cactaceæ*. The few species seem to be confined to Brazil, where they are epiphytic upon trees. They have flat-jointed stems with blunt ends, from which the new branches and flowers are produced. These are borne in great abundance, on which account, and because of their brilliant red tints, this group of cacti is exceptionally popular in greenhouses, being probably the most useful of all cacti. They are easily propagated by means of cuttings or by grafting, particularly upon erect-growing species of other genera, and are generally used as hanging-basket plants, for which purpose their drooping habit specially recommends them. They need a porous, poor, fibrous soil and little water. The species most widely grown are *E. truncatum*, the crab or Christmas cactus, with numerous horticultural hybrids between it and related species, and *C. Gærtneri*, the Easter cactus.

EPIPHYSIS. See BONE.

EPIPHYTE, ĕp'ĭ-fīt, or **AIR-PLANT**, a plant attached to a tree or other support, organic or inorganic, living or dead, but from which it obtains no nutriment. The term air-plant has been popularly applied because these plants are typically neither parasitic, saprophytic nor terrestrial, but depend upon the dust which lodges around them and upon the water of dew and rain. Strictly speaking, they are not air-plants, because this term implies no other source of life than air. Besides the typical epiphytes, which have representatives in many plant families, particularly the tropical orchids, bromelias and ferns, there are many forms which are only partially epiphytic. In structure many of them exhibit adaptations for checking transpiration and for securing even minute quantities of water from the air or from objects to which they are attached. (See PITCHER-PLANTS). Others (certain orchids) have storage organs which are usually specialized stems. Some have roots which serve only to anchor the plants to their support. In these, which are the most typical, the absorption of food takes place in the leaves and other green parts. Others are only epiphytic at first, since they later develop true roots which obtain food from the soil. The home of the largest number of epiphytes is in the moist region covered by tropical forests, the trees of which are often so covered with these plants that their branches are wholly concealed by a very miscellaneous growth. In the temperate and colder climates the epiphytal forms are confined almost wholly to lower orders of plant life such as liverworts, mosses, algæ and lichens. These are also represented in the tropics, some of them even becoming attached to leaves of higher plants. Many of the flowering epiphytes are cultivated in greenhouses for ornament. Among the favorites are various species of *Nepenthes* (q.v.), orchids and bromelias. One of the best-known American species, common in the southern United States, is the so-called Florida or Spanish moss (*Tillandsia usneoides*) of the natural order *Bromeliaceæ*.

EPIRUS, ē-pī'rŭs (meaning the mainland in Greek), an ancient part of northern Greece which stretched from the Ionian Sea to the Ambracian Gulf and was bounded by Illyria, Macedonia and Thessaly. Epirus is very mountainous, especially so in the east, and this fact undoubtedly helped to shape the character of the inhabitants, who were of a bold and hardy nature and great lovers of their country, which was divided into numerous independent tribes, the principal of which were the Chaones, Molossi and Thesproti. The Greeks began early to settle along the coast of Epirus, and later, at some interior points. This led the way to Greek domination of the country at a later date. The chiefs of the Molossians, the most powerful of the tribes of Epirus, who claimed to be the direct descendants of Pyrrhus, the son of Achilles, whom legend credited with settling the country after the fall of Troy, and who consequently prided themselves on a long line of princely ancestors, jealously maintained their ascendency and gradually increased their power over the whole country. Arymbas I of this line, who was educated in Athens, introduced Greek culture among his people during the second quarter of the 5th century B.C.; Arymbas, a century and a half later, followed in the footsteps of his famous ancestor and namesake, and sedulously encouraged art and literature. One of his nieces, educated carefully by him and married to Philip II of Macedonia, was the mother of Alexander the Great. A period of wars followed the death of Arymbas II, interrupted from time to time. Pyrrhus, who succeeded to the throne in 295 B.C., carried the war to the Romans in Sicily and Italy for six years, and brought the name of Epirus prominently to the attention of the Greek and Roman world. Finally Epirus became a sort of republic governed by a magistrate elected annually by the vote of the assembled people. The country unwisely sided with Perseus in his war against the Romans (168 B.C.). The latter exacted a terrible retribution, making slaves of 150,000 inhabitants of Epirus after having destroyed 70 towns and villages; and 22 years later the whole country became a political part of Macedonia under the title of Epirus Vetus. On the fall of Constantinople (1204) it was seized by Michel Angelus Comnenus. Later, after passing through several hands, it became the property of the Turks (1430); and it later formed part of the Turkish Vilayet of Janina. Greece obtained the part east of the river Arta in 1881.

At the close of the Balkan War (1912–13) Greece added a new province to her territory on her northwest, and to this she gave the name of Epirus. This province is bordered on the north by Albania, on the east by the provinces of Macedonia and Thessaly, and on the south and west by the Gulf of Arta and the Ionian Sea. The population of this newly-acquired territory is between 600,000 and 700,000 and its capital is Janina, a city of 25,000. It is largely an agricultural country and among its chief products are wheat and other grains, olives, fruits, vegetables and tobacco.

EPISCOPACY, that form of Church government in which one order of the clergy is superior to another; as bishops to priests and deacons. Much discussion has taken place on the subject of episcopacy. Nothing conclusive can be gathered concerning it in the New Testament; but there can be no doubt that it existed universally in the Church from the earliest historic ages down to the time of the Reformation, and it is inferred, as no change can be shown to have taken place, that the same constitution existed from the time of the apostles. Presbyterians and others argue, on the other hand, that, as there is nothing definite concerning it in Scripture, Christians are left a discretionary power of modeling the government of their Church in such a manner as may seem to them most meet; and that every Christian society has a right to make laws for itself, provided these laws are consistent with charity and peace and with the fundamental doctrines and principles of Christianity. The power vested in the bishops or higher clergy differs very much among the different episcopal bodies. The Roman Catholic and the Greek Churches, as also the Church of England and sections of the Methodist Church, are episcopalian. See BISHOP; GREAT BRITAIN — THE CHURCH OF ENGLAND; GREEK CHURCH; METHODIST EPISCOPAL CHURCH; CATHOLIC CHURCH, ROMAN.

EPISCOPAL THEOLOGICAL SCHOOL, an institution situated at Cambridge, Mass. It was established in 1867 by Benjamin Tyler Reed, as a college for candidates studying for the ministry for the Episcopal Church. Students holding bachelors' degrees may obtain the degree of B.D., but those not holding such a degree receive only certificates. The principal buildings include the chapel, the deanery, the library and Reed, Burnham, Lawrence and Winthrop halls. The students number about 60. The school is affiliated with Harvard University.

EPISCOPIUS (a translation of Bisschop, his Dutch name), **Simon**, Dutch theologian: b. Amsterdam, 1 Jan. 1583; d. there, 4 April 1643. The religious movement known as Arminianism was fostered by him, and he was its leader after the death of Arminius (q.v.). He was educated at Leyden, where in 1606 he received his degree of M.A. In 1610 he was ordained pastor at the village of Bleyswyck near Rotterdam. In 1611 the States-General, with the intention of putting an end to the agitations created by the controversies between the Gomarists or Calvinistic party and the Arminians or Remonstrants, ordered a conference to be held in their presence at The Hague between six ministers of each party. Episcopius was one of the six charged with the advocacy of Arminianism, and highly distinguished himself by good temper, ability and learning. In 1612 the curators of the University of Leyden appointed him professor of theology in place of Gomar, who had gone to Seeland. This enraged the leaders of the orthodox party, who accused Episcopius of Socinianism and of having entered into an alliance with the Roman Catholics for the destruction of Protestantism. By this the fanaticism of the populace was roused; he was insulted and abused in the street, and on one occasion narrowly escaped being stoned to death. The house of his brother in Amsterdam was sacked, under the pretext that it was a rendezvous of the Remonstrants. In 1618 occurred the famous Synod of Dort. Episcopius was present, with several other Arminians. The Calvinists, who were in an overwhelming majority, would not allow him to speak; they told him that the synod was met not to discuss, but to judge; and all the proceedings exhibited much bigotry and tyranny. Expelled from the Church and banished from the country, Episcopius betook himself first to Antwerp, afterward to Rouen and Paris, but 1626 returned to Rotterdam, where the *odium theologicum* against his party had become less virulent. Here he married in 1630, and four years later was made primarius professor of divinity in the newly established college of the Remonstrants. Episcopius held enlightened principles in regard to religious toleration. Not placing a high value on merely doctrinal views, but trusting rather to the efficacy of the Christian spirit to elevate and purify the character, and seeing, moreover, the presence of this spirit in men holding the most conflicting opinions (when not inflamed with controversial hates), he was desirous of a broader and more catholic bond of unity among Christians than the opinionative creeds of his day permitted. He wrote 'Institutes of Theology'; 'Apology'; 'Confession.' (See GOMARUS; ARMINIUS). Consult Calder, 'Memoirs of Simon Episcopius' (London 1838).

EPISODE (Lat. *episodium*, from the Gr. *ἐπεισόδιον*, *epeisodion*, something adventitious), a separate incident, story or action introduced into the general narrative, to give variety or digression, but so arranged as to appear a part of the whole. This term is employed by Aristotle in two significations. Sometimes it denotes those parts of a play which are between the choruses, and sometimes an incidental narrative, or digression in a poem, which the poet has connected with the main plot, but which is not essential to it. In modern times it has been used in the latter sense only. With the best poets the episode is not an unnecessary appendage, serving merely to swell the size of the work, but is closely connected with the subject, points out important consequences or develops hidden causes. Of this kind is the narrative of the destruction of Troy, in Virgil's Æneid. This was the cause of the hero's leaving his country; but the poet does not commence with it because he wishes to bring the plot into a narrower space. He therefore inserts it in the course of the story, but so skilfully that we expect it in this very place; and it not only serves as a key to what has gone before, but prepares us for what is to come, namely, the passion of Dido. In this way the episode becomes an essential part of the whole, as it must necessarily be, if it is of any importance to preserve the unity of the poem. So with the tale in Wieland's 'Oberon'; it appears incidental, but explains to us the reason of Oberon's singular interest in the fate of Huon. In epic poetry there is much more room for the episode than in dramatic, where the poem is confined to a present action. An excellent instance of the skilful use of the episode in the modern novel is given in Manzoni's 'I promessi sposi,' in the tale of the 'Nun of Monza.' The term episode has also been transferred to painting, especially historic painting, in a sense analogous to that which it has in poetry. The term episode is also employed in music to designate an intermediate section of a composition. The term is also applied to a digressive section, especially in contrapuntal work, like a fugue.

EPISTATES, in ancient Greece, the name generally applied to an officer in charge of certain functions and specifically to the presiding officers of the Ekklesia and the Boule or Senate.

EPISTAXIS. See NOSEBLEED.

EPISTEMOLOGY (*ἐπιστήμη*, knowledge or science, and *λόγος* theory or discourse), or theory of knowledge, is an account of the nature of knowledge, treating of its origin and laws of development, its validity and relation to human experience as a whole. Investigations of this character fall within the field of general philosophy and have usually been included under the heading of metaphysics. The word «Epistemology» is said to have been first used by J. F. Ferrier in his 'Institutes of Metaphysics' (1854). Since its general adoption it has sometimes been taken to denote a field of inquiry co-ordinate with, and largely independent of, Metaphysics. It has been proposed to keep the investigation of the nature of knowledge distinct from the problems regarding the nature of being, and to call the former epistemology, and the latter metaphysics. The best usage of the present time, however, seems to retain the historical sense of the term metaphysics as the name for the more general field of philosophical inquiry which embraces both epistemology and ontology. (See also articles on PHILOSOPHY and METAPHYSICS). Moreover, a logical justification for this usage is furnished by the fact that it is impossible to carry on the two branches of inquiry in isolation. It must undoubtedly be granted that for an ultimate ontology, or final view of the world, it is necessary to go beyond the merely cognitional aspect of experience and include in our synthesis judgments based on other orders of value than the merely logical. But it is at once obvious that we cannot take one significant step in investigating the nature of reality without some criterion of knowledge, i.e., some theory of the conditions under which reality is known, and of what constitutes truth. It is perhaps not so evident that the nature of knowledge cannot be made the subject of inquiry without any reference to metaphysical theory. Indeed, it is not uncommon to speak of epistemology, as Locke does, as «a preliminary clearing of the ground» which is to be completed before any more ultimate metaphysical inquiries are to be undertaken,— if, indeed, these are to be undertaken at all. But this way of conceiving the matter is quite misleading. The figures which compare the knowing faculty to an instrument whose nature must first be understood, are here quite inapplicable. For knowledge has no existence by itself, or apart from and external to its objects. What we want, as Hegel has observed, «is to combine in our process of inquiry the action of the forms of thought with a criticism of them. The forms of thought must be studied in their essential nature and complete development; they are at once the object of research and the action of that object. Hence they examine themselves; in their own action they must determine their limits and point out their defects.» In other words, knowledge is never a mere series of ideas or mental representations that can be investigated apart from its relation to objects. In so far as it is knowledge it refers to and implies reality. To investigate its nature, then, is at the same time to test its conclusions regarding the nature of the objects with which it deals. But even if one refuses to take this standpoint, one must still admit the close connection of epistemology and metaphysics. For all theories of the nature of knowledge are based implicitly or explicitly on certain metaphysical assumptions regarding both the mind which knows and its relation to the objects known. Epistemology, then, cannot take one step without involving the ontological problems which some of its representatives seek to avoid.

It is likewise impossible to distinguish sharply the discussion of epistemological problems from logic. If a division can be made at the present time it is only in degree of ultimateness. It is possible, though perhaps not advisable, to limit the term «logic» to the somewhat narrow and abstract treatment which takes as its object the discovery of certain correct forms of thinking, or certain rules which are of practical value in testing arguments. When, however, logic breaks away from this narrow program, as has been done by the more important recent writers, and carries on its inquiries in a philosophical spirit, it becomes identical with epistemology. Epistemology, logic, and metaphysics may thus be said to denote certain main points of view, differing somewhat in the treatment of various writers in emphasis and inclusiveness, rather than three independent and isolated sciences.

Psychology, as a natural science, however, occupies a different field, and has quite a different problem from epistemology. It is true that attempts have frequently been made to explain knowledge by beginning with cognitive mental states viewed as psychological processes. But the characteristics of the mental states and functions with which psychology deals have no immediate bearing on the problem of knowledge. For psychology is concerned only with the mode in which ideas exist; it investigates their quality, duration, intensity, etc., as well as their various modes of combination, viewing them as particular forms of psychical reality. Epistemology, on the other hand, is interested not in the existential aspect of ideas, but in their significance, in the universal and objective validity of experience as a body of truth. It thus seeks to bring to light the forms and functions of intelligence, noting the conditions and presuppositions under which it works, and the laws by which knowledge develops from its simpler and more fragmentary stages to the more complicate and coherent structure of science. It is a philosophy of experience rather than a description of individual states of consciousness.

Reflection on the nature of knowledge does not arise until a somewhat late stage in the development of the thought of the individual and the race. Thought first announces its conclusions confidently and fearlessly. It is not until this naive confidence fails and scepticism arises that it is forced to reflect upon the nature of knowledge and its grounds of certainty. This is illustrated in the history both of ancient and of modern philosophy. The early Greek philosophers, as Hegel remarked, thought away fearlessly regarding the nature of reality. It was the collapse of those early systems and the scepticism of the Sophists (q.v.) which forced Socrates to take up the epistemological problem. In the same way the Stoic and Epicurean discussions regarding the canon of truth arose in response to the more outspoken and thorough-going scepticism of later times. In modern times the epistemological interest did not come into the foreground until Locke's 'Essay.' Locke's account of the origin of this work brings out very clearly the way in which problems of this character naturally arise: «Five or six friends meeting at my chamber, and discoursing on a subject very remote from this, found themselves quickly at a stand by the difficulties that rose on every side. After we had awhile puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts that we took a wrong course, and that before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities and see what objects our understandings were, or were not fitted to deal with . . . . Some hasty and undigested thoughts on a subject I had never before considered, which I set down against our next meeting, gave the first entrance into this discourse; . . . . and at last it was brought into that order thou now seest it.»

Kant's 'Kritik of Pure Reason' was the work which placed epistemology in the foreground of continental philosophy. In the Preface to that work, he showed that the motives that led to his undertaking were very similar to those which influenced Locke. The scepticism of his time, he says, "is clearly the result, not of the carelessness, but of the matured judgment of an age, which will no longer rest satisfied with the mere appearance of knowledge. It is, at the same time, a powerful appeal to reason to undertake anew the most difficult of its duties, namely, self-knowledge, and to institute a court of appeal which should protect the just rights of reason, but dismiss all groundless claims, and should do this not by means of irresponsible decrees, but according to the eternal and unalterable laws of reason." Kant has a poor opinion of Locke's account of knowledge, and characterizes it as "a certain physiology of the human understanding." He himself proposed to inaugurate a method of Criticism which should give a new direction to philosophical inquiry, and at the same time furnish to it a sure foundation for further advance. Since Kant's time epistemological problems have largely dominated modern philosophy; and indeed, it has been maintained by many thinkers that the criticism of knowledge is the sole function which philosophy is able to perform, and that ontological speculation is vain and fruitless.

In the Pre-Kantian philosophy Rationalism (q.v.) and Empiricism (q.v.) were the main types of epistemological theory. The basis of the former was laid by Descartes (q.v.), who sought to universalize the method of mathematics, and by this means to secure the certainty of absolute demonstration in all fields. As mathematics start from axioms and principles which are intuitively certain, and proceeds by means of reasoning to deduce all its other propositions from these as necessary consequences, so all science must derive its conclusions from fundamental and indemonstrable principles. These principles exist in the mind as *a priori* truths, and are universal and necessary in character. All science is thus built up by reasoning from general principles. Sense-perception and observation of particular facts were neglected, since it was held to be impossible to arrive in this way at the universal and necessary form of truth which science demands. It is evident that this theory of knowledge could more readily be applied to the general features of reality than to a determination of its particular details. As in the hands of Wolff (q.v.) and other continental rationalists it was occupied mainly in furnishing formal proofs of the existence of God, the nature of the soul, and the external features of the physical universe. Empiricism (q.v.), on the other hand, emphasizes sense-perception as the basis of all knowledge. Experience is described as a series of particular sensations and ideas in consciousness which are given to the mind from some external source. The mind itself is regarded as merely receptive, without any store of innate ideas, or of organizing principles. It was not strange, then, that in the hands of a genius like David Hume (q.v.), who carried this point of view to its logical outcome, empiricism should issue in scepticism. For if experience is nothing but a series of conscious states, each of which is "loose and separate" from all the others, it is impossible to know anything except these particular states in their isolation; impossible, therefore, to reach any universal propositions such as science demands. Again, if knowledge is limited to states of consciousness, it follows at once that there can be nothing known either of the nature of objects or of the subject or soul.

Kant (q.v.) did much to overcome the one-sidedness of these theories, and to give a more adequate account of the nature of knowledge. For, while he insists that knowledge must begin with experience, he points out that experience itself is a compound, implying both a given sense material and forms and principles of organization on the part of the mind. By his doctrine that "thoughts without perceptions are empty, while perceptions without thoughts are blind," he passed beyond the one-sided views of both Rationalism and Empiricism. By his transcendental method of inquiry he seeks to show what are the fundamental forms and categories which the mind employs in building up a coherent and universally valid system of experience. But, in spite of the great reform which he effected, he did not wholly succeed in reaching an organic view of experience. This was partly the result of presupposition which he inherited from the past, and partly due to his own tendency to make hard and fast divisions and distinctions. There always remained for him an unresolved dualism within experience between the datum of sense and the forms of thought. Again, thought, as he conceives it, does not pass beyond subjectivity and include in itself the nature of its object, but is occupied with bringing order and unity into sensations and mental representations. Although these states of consciousness, when thus acted upon by thought become objective in the sense that they are parts of a universal and necessary system, nevertheless they are still only "phenomena," objects in the mind, while the world of real being (the things in themselves) remain inaccessible to knowledge. The spirit of Kant's philosophy undoubtedly leads beyond any such absolute dualism. But from Kant's day to the present time this distinction has appeared the final word of philosophy to many thinkers who continue to accept the presuppositions and categories of the past century, and who fail to apply to this problem the organic and evolutionary conceptions which are now within their reach.

Modern epistemological investigation may be described as seeking to exhibit the organic unity of experience. To reach this result, new theories regarding the nature of the mind and its relation to objects are necessary. In the first place, the conception of the mind as made up of a number of distinct faculties must give place to the idea of the mind as a unitary system of functions which mutually co-operate and determine each other in the progressive development of experience. Secondly, the mind can no longer be regarded as a system of merely subjective functions related only in an external and accidental way to the real world of objects. The course of philosophical discussion has rendered it evident that if we begin by defining experience in terms of mental processes there is no way of deriving from these the world of objects. If our epistemological theory is to be adequate to experience as we know it, objectivity must be included within it. Thought, that is, is real only as a relation to objects; by itself, and apart from the world of real objects, it has no reality. It is only by thus recognizing from the beginning the essential relation of subject and object that it is possible to exhibit the real organic unity of experience as a system of knowledge. It was Kant's successors in Germany, and preeminently Hegel (q.v.), who first developed this organic view of experience. But partly on account of the form in which these systems were expressed, and partly as a result of the decline of philosophical interest, their most valuable and characteristic ideas failed for a long time to be appreciated. The credit of freeing these fruitful ideas from the somewhat obscure and uninviting form in which they were presented in the German systems of a century ago, belongs in the main to the English neo-Hegelians and their co-laborers in America, among the latter of whom a place of honor must be given to Dr. William T. Harris, the late United States Commissioner of Education. The fundamental doctrine of these writers is that what is real is rational, i.e., knowable in terms of reason, and therefore that all forms of cognitive experience can be exhibited as organically interconnected as a system of rational ideas or meanings. Conscious experience is from the first regarded, not as a series of psychological states, but as taking the form of a judging activity whose function is to interpret and reveal the nature of the objective world. Moreover, knowledge proceeds in its development through differentiation and integration in accordance with the fundamental laws of logical evolution. Its later and more highly developed forms are then to be understood as the differentiation and systematization of its more elementary forms and functions. The final truth regarding the nature of the real world must accordingly correspond with the ideal of completely developed and perfectly rationalized experience. As representatives of this general type of objective Idealism we may mention the late T. H. Green, Edward Caird, the late D. G. Ritchie, A. S. Pringle-Pattison, B. Bosanquet, W. T. Harris, John Watson and Josiah Royce.

There are, however, prominent philosophical writers of the present day who employ to some extent Hegelian methods and principles in dealing with experience, but who yet maintain that the account of knowledge in terms of reason requires to be modified and supplemented in various ways. Two main points of view may be here mentioned, which have much in common, and which are both often emphasized by the same writers. On the one hand, it is claimed that logical thinking operates with universal concepts, and can therefore never do justice to the individual aspects of real objects. Thought, in other words, is concerned only with universal relations, and is unable to apprehend the uniqueness and particularity of real existence; it gives us only descriptions of things in general terms, and has to receive as a datum from another form of knowing the particular facts which form its subject-matter. This latter aspect of reality, it is maintained, can be apprehended only in some form of immediate experience. In fact, it is often maintained that logical experience must both start from and pass into direct intuition or feeling. In its beginning, logical thinking presupposes the awareness of objects in sense-perception; for it is claimed it is only in this way that thought comes into contact with individual things and gets a foothold in reality. Again, since the total system of things must exist in individual form, the final synthesis of knowledge must transcend logical relations and be realized, if it can be attained at all, in immediate intuition — a mode of cognition that may perhaps be described as analogous to æsthetic contemplation. Although the neo-Hegelian writers have not been backward in meeting these arguments, and have successfully shown the difficulties involved in their opponents' antithesis of universal and individual, of thought and immediate knowing, yet the discussion cannot be regarded as closed at the present time.

In a similar spirit the function of will and purpose as a fundamental element in experience is at present emphasized in many quarters. The intellectual or rationalistic account of cognitive experience is maintained to be inadequate, since it abstracts from the volitional element which alone gives to knowledge its function and significance. Concrete experience is the process of living, and living consists in the realization of purposes. So much may, I think, be granted: experience is essentially a teleological process and must be interpreted in terms of purpose. But purposes are only defined and realized through thought. Pragmatism (q.v.) (as the popular theory of the present day is called) goes further, and interprets knowledge solely in its relation to action. Knowledge is the instrument which the will employs to discover the means whereby practical purposes may be realized. It is thus never an end in itself, nor does its function consist in revealing the nature of a reality beyond experience. The function of thought is to effect the practical control of experience, and the only realities which it can define are terms within experience itself. Its problems are set by the particular situations and concrete demands which the developing process of experience presents. There is no intelligible problem regarding the nature of reality in general, or reality that does not exist as a particular functional element in concrete experience. Against this position various objections have been urged by many writers; the chief of which are (1) that it does not reach a real organic unity of experience; (2) that it overlooks the fact that knowledge is an end in itself; (3) that it is subjective, and fails to recognize the objective and rational ends without which no real experience can exist.

At the present time perhaps the most important function of Epistemology consists in a criticism and evaluation of the fundamental conceptions and principles which underlie the procedure of the special sciences. These sciences set out from certain definite assumptions regarding the nature of the phenomena which they investigate, and with certain demands which their method of investigation has to fulfill. It is the function of Epistemology to make explicit the nature of these initial assumptions, and to show that the accounts given by these sciences are essentially determined by the character of these assumptions. Instead of assuming that the results of the special sciences are to be accepted at their face value as direct statements about the nature of reality, both philosophical epistemologists and workers in these sciences who have reflected on the problems of method (as e.g., E. Mach and Karl Pearson) now agree that the view of the world given by natural science — and especially the mechanical theory — is itself a logical construction, based on certain assumptions which are necessary to carry out the purpose of the scientific co-ordination and explanation of facts. This construction must not be read apart from the purpose for which it was designed. Indeed, the prevailing tendency is to emphasize the merely methodological character of scientific results to such an extent as to make them appear almost arbitrary and devoid of any ontological significance. This is undoubtedly an extreme position. It must, of course, be admitted that the results of the special sciences are largely hypothetical and possess only relative truth. But they are never mere logical constructions in the sense that they are entirely divorced from reality. The ultimate purpose of science, as of all thinking, is to exhibit the structure of the real world, and the assumptions and hypotheses of the special sciences derive their significance and justification solely from their employment as means for the accomplishment of that end. In its task of criticizing the assumptions of the special sciences, then Epistemology cannot escape the consideration of metaphysical problems regarding the nature of the external world and its relation to the human mind.

Bibliography.— The bibliography of this subject is coextensive with that of general philosophy. A few works may be mentioned which deal with the more recent development of the subject: Albee, ‘The Significance of Methodological Principles’ (in *Philosophical Review,* Vol. XV, 1906); Bergson, Henri, ‘Creative Evolution’ (Eng. trans., New York 1911); Creighton, James E., ‘Methodology and Truth’ (in *Philosophical Review,* Vol. X, 1901); Dewey, ‘Studies in Logical Theory’ (Chicago 1902); id., ‘The Influence of Darwin on Philosophy’ (New York 1910); James, ‘Pragmatism’ (ib. 1907); id., ‘The Meaning of Truth’ (ib. 1909); id., ‘Essays in Radical Empiricism’ (ib. 1912); ‘The Will to Believe’ (ib. 1909); Ladd, ‘Philosophy of Knowledge’; Marvin, ‘The New Realism’ (New York 1912); Münsterberg, ‘Psychology and Life’; id., ‘Grundzüge der Psychologie’; Ormond, ‘Foundations of Knowledge’ (1894); Rickert, ‘Die Grenzen der Naturwissenschaftlichen Begriffsbildung’ (1902); Seth, ‘Epistemology and Metaphysics’; id., ‘Problem of Epistemology’ (in *Philosophical Review,* Vol. I, 1892); Ward, ‘Naturalism and Agnosticism.’

JAMES E. CREIGHTON,
Professor of Logic and Metaphysics, Cornell University.

EPISTLE TO ARBUTHNOT. Pope's ‘Epistle to Arbuthnot’ (1734–35), known also as ‘The Prologue to the Satires,’ is quite the best thing of its kind in English. Characteristic of the writer in its invective, its brilliant wit, its epigrams and apothegms, and its incisive and compressed style, it is far more than any other of his satires a key to the character of the man himself. Indeed, it presents an entire autobiography in little more than 400 lines. It is Pope's *apologia,* in which he disproves the statement that he was of lowly birth, tells how and when he entered upon his profession as poet, relates his persecution by literary pretenders and bores; dwells especially upon the slanderous attacks by his enemies; and draws portraits of his enemies and his friends. The whole is a mélange of personal confession and of satire to which unity is given only by the personality of the poet and by his interest in himself. So highly autobiographical and allusive is the ‘Epistle’ that a commentator is needed to point out its full significance. Quite apart from any autobiographic element, however, it is intrinsically great among its kind, and even to the reader who knows little of Pope's character and disregards the contemporary allusions, is still immensely entertaining. As Sir Leslie Stephen has remarked, Pope is at his best when he expresses personal antipathies and attachments, when he is autobiographic, and when he points his morality by personal and concrete instances. He was a curious mixture of honesty and hypocrisy, though often honestly self-deceived, and certain passages of the ‘Epistle’ must «be read by the rule of contraries.» Yet there is no more reason to doubt the sincerity of his tender tributes to his mother and to his friend Arbuthnot than his vitriolic lines on Lord Hervey (Sporus). Though of various tones, the ‘Epistle’ is in the main bitterly satirical. The original cause of the entire series of Pope's apologetic satires was his ‘Dunciad,’ which provoked violent counter attacks. The immediate cause for the composition of the ‘Epistle,’ however, was the publication in 1733 of ‘Verses to the Imitator of Horace,’ which attacked the family, the person, the manners and the morals of the poet, and in which Lady Mary Wortley Montague and Lord Hervey were implicated. Characteristically, Pope pretended to be indifferent to the attack, and in his «advertisement» asserts that the ‘Epistle’ was composed long before the appearance of the Montague-Hervey volume. The statement is disingenuous, since only 96 lines (151–214, on Addison; 238–241, on Bufo; 406–419, on Arbuthnot) were old matter. These disconnected passages were pieced together and over 300 lines added to form the brilliant and scathing rejoinder to ‘Verses to the Imitator of Horace.’

Dr. Johnson traces the idea of the ‘Epistle’ to Boileau's address ‘A son esprit,’ but, though Boileau's poem is admirable, Pope far excels it. «The sustained dramatic power, the variety of the detail, the richness of the imagery, the elevation of the sentiment, the force of the invective, contrasting so exquisitely with the pathetic repose of the conclusion, combine to place the ‘Epistle’ beyond reach of rivalry in this kind of writing» (Elwin and Courthope). For a full discussion of the date of composition, consult Pope's ‘Works,’ (Vol. III (Poetry), ed. Elwin and Courthope, 1881). Sir Leslie Stephen in his life of Pope in the ‘English Men of Letters’ series makes interesting comments on the satires.

MARION TUCKER.

EPISTLE TO AUGUSTUS. Pope's ‘Epistle to Augustus’ (1737) is a literary satire in imitation of the epistle which Horace addressed to the Emperor Augustus (Book II, Ep. I). In his choice of topics and their order Pope follows his original rather closely, except of course that he substitutes English literature for Latin, London for Rome, and George II for Augustus. There is also a change of tone, in that Horace's eulogy of Augustus becomes bitterly ironical when applied to George II. Pope discusses the relative merits of ancient and modern English writers, the theatre, the London judgment of poets and poetry, the progress of poetic art and the poet's power to confer distinction upon his patrons. In effect, the whole is a satire upon George II, upon unworthy writers, and upon poor literary taste. Here and there occur passages full of sound sense and excellent literary criticism, expressed with Pope's characteristic terseness and point (for example, lines 213-20, on Dryden and Addison). The most celebrated passage in the ‘Epistle’ is perhaps the one on the progress of English poetic art (ll. 267–81), which states that

> " Dryden taught to join
> The varying verse, the full-resounding line,
> The long, majestic march, and energy divine."

Though less frequently quoted than some others of Pope's poems, the ‘Epistle’ contains lines which have passed into the common use, such as «The last and greatest art — the art to blot.»

MARION TUCKER.

EPISTLE SIDE OF THE ALTAR, the right side of the altar, looking toward it, so named because the epistle of the day is read at that side. It is secondary to the gospel or left side, and on fête days is occupied by the lesser ecclesiastical dignitaries.

EPISTLES, Spurious. See APOCRYPHA.

EPISTLES OF HORACE. See HORACE.

EPISTOLÆ OBSCURORUM VIRORUM, ē-pĭs'tō-lē ŏb-skŭ-rō'rŭm vĭ-rō'rŭm (Lat. «Letters of obscure men»), a collection of satirical letters which appeared in Hagenau, Germany, in 1515–19, and professed to be the composition of certain ecclesiastics and professors in Cologne and other German towns. They were addressed to Ortunius Gatius at Deventer, who had gained the ill will of the liberals on account of his open hostility to them. They are considered one of the most masterly sarcasms in the history of literature, and their importance is enhanced by the effect they had in promoting the cause of the Reformation through their attacks upon scholastics and monks. The first issue consisted of 41 letters; but others were subsequently added. The authorship of this satire has been a fertile subject of controversy, but the major portion has been attributed to Reuchlin, Ulrich von Hutten and Erasmus, and also to Crotius Rubianus, the great humanist, who is said to have originated the idea of the letters and the title. The best edition is that of Böcking, supplementing his edition of the works of von Hutten (Leipzig 1864–70).

EPISTOLER, or **EPISTLER,** the clergyman in the English Church who assists the celebrant in administering Holy Communion, and who reads the epistle. The office corresponds to that of subdeacon in the Catholic Church.

EPISTULÆ EX PONTO, four books of letters, written by Ovid during his exile. They are made up for the most part of appeals to his friends at Rome for intercession with the emperor. They are in elegiac metre.

EPISTYLIUM, or **EPISTYLE,** a beam of stone or wood, used to span the space between columns or pillars. It is synonymous with the term *architrave.*

EPITAPH (Gr. ἐπιτάφιος, *epitaphios,* funeral, from ἐπὶ, *epi,* upon, and ταφος, *taphos,* tomb), an inscription upon a tomb. The earliest known are those upon Egyptian sarcophagi. Epitaphs are common among many people, and arose, in all probability, out of the desire to commemorate the dead. They were in use among both the Greeks and Romans. Many of the later Greek epitaphs were of considerable length, while those of the Romans commonly recorded only brief particulars regarding the deceased. The tombs of the Romans were placed near the highways, and their epitaphs generally commenced with *Sta viator!* (Stop, traveler!). On Christian tombstones epitaphs frequently express the pious hopes of survivors in reference to the doctrines of the Christian faith. In the catacombs of Rome, which were made a place of refuge by the persecuted Christians under the pagan emperors, are many remarkable epitaphs of this description. Among memorable epitaphs, one of the happiest, is that of Sir Christopher Wren, in Saint Pauls, London, of which he was the architect:

> *Si monumentum quæris circumspice*
> "If you seek for his monument, look about you."

The following is the epitaph of a Roman matron:

> *Domum servavit,*
> *Lanam fecit.*
> " She kept the house and span the wool."
> *Sta, viator: heroem calcas,*—
> " Traveler, pause: thou treadest upon a hero,"

has been ascribed both to Montecuculi and to Gen. Merci.

> *Sufficit huic tumulus, cui non suffecerat orbis,*—
> " This tomb suffices for him for whom the world did not suffice,"

was the epitaph of Alexander the Great.

Count Tessin, a governor under Gustavus III of Sweden, ordered the words

> *Tandem felix,*
> " Happy at last "

to be inscribed on his tomb. The following is Sir Isaac Newton's epitaph:

> *Isaacum Newton,*
> *Quem immortalem*
> *Testantur Tempus, Natura, Cælum,*
> *Mortalem hoc Marmor,*
> *Fatetur.*
> " This marble acknowledges Isaac Newton mortal, to whose immortality time, nature, and heaven bear witness."

Saint Anne's Church, at Cracow, has the following suggestive epitaph, dedicated by Count Sierakowski to Copernicus:

> *Sta, sol, ne moveare.*
> " Stand, O sun! move not."

Many so-called epitaphs are merely epigrams, never intended for serious use as monumental inscriptions. Among such may be cited that of Piron, on Marshal de Belle-Isle, who was buried next to Turenne:

> *Ci-gît le glorieux a côté de la gloire,*
> " Here beside glory lies the vainglorious."

ographic Elements in Latin Inscriptions' (New York 1910); Blommaert, etc., 'Inscriptions funéraires et monumentales de la prov. de Flandre Orient' (Ghent 1857–60); Brown, J., 'Epitaphs' (Edinburgh 1867); Bücheler and Riese, 'Antologia Latina' (Vol. II, Leipzig 1869); Chwolson, 'Achtzehn hebräische Grabschriften aus der Krim' (1850); Hacket, 'Select and Remarkable Epitaphs' (1757); Kaibel, 'Epigrammata Græca ex Lapidibus Collecta' (Berlin 1878); Kippax, 'Churchyard Literature' (Chicago 1876); Labbe, 'Tesaurus Epitaphiorum' (Paris 1666); Le Blant, 'Inscriptions chretiènnes, etc.' (1856–65); Lewysohn, 'Sechzig Epitaphien von Grabsteinen' (1855); Loaring, 'Quaint, Elegant and Curious Epitaphs' (1872); Pettigrew, 'Chronicles of the Tombs' (1857); Preger, 'Inscriptiones Græcæ Metricæ ex Scriptoribus præter Antologiam Collectæ' (Leipzig 1891); Pulleyn, 'Churchyard Gleanings' (1830); Reinach, 'Traité d'épigraphie grecque' (Paris 1885); Robinson, 'Epitaphs from Cemeteries' (1859); Thompson, 'Tædium vitæ in Roman Sepulchral Inscriptions' (Saint Louis 1911); Tolman, 'A Study of the Sepulchral Inscriptions in Bücheler's Carmina Epigraphica Latina' (Chicago 1910); Weever, 'Ancient Funeral Monuments' (1631); Wordsworth, 'Essay on Epitaphs.'

EPITHALAMIUM, ĕp"ĭ-thȧ-lā'mĭ-ŭm (Lat. *epithalamion*, from the Gr. ἐπιθαλάμιος, *epithalamios*, nuptial, from ἐπί, *epi*, upon, and θάλαμος, *thalamos*, a chamber), a nuptial song, a poem in honor of a newly married couple or one of the pair. Among the Greeks and Romans it was sung by young men and maids at the door of the bridal chamber of a newly-married couple. It consisted of praises of the bridegroom and bride, with wishes for their happiness. Examples may be seen in Theocritus' epithalamium of Helen, and the three epithalamia of Catullus, in which the Greek form is much modified. Some Roman epithalamia were collected by Wernsdorf in Vol. IV of his 'Poetæ Latinæ Minores' (Helmstedt 1789).

EPITHELIOMA, a species of cancer in which the disease attacks the surfaces covered with epithelium or epidermis. See CANCER.

EPITHELIUM, ĕp-ĭ-thē'lĭ-ŭm, one of the simplest forms of tissue derived chiefly but not alone from the outer embryonic layers and characterized by its non-vascularity. It consists of flattened or columnar cells united into continuous membranes by an intercellular cement substance. Epithelium serves for the most part to protect exposed surfaces of the body, and performs the functions of absorption, secretion and excretion. The epithelial tissues are developed from all three layers of the developing embryo. They themselves secrete their own cement substance. This takes on the form of thin plates between the cells, gluing them together. Occasionally the epithelial cells develop short lateral projections (prickles), forming with similar structures of neighboring cells intercellular bridges, between which are intercellular spaces filled with lymph for the nourishment of the cells. Inasmuch as practically all epithelial cells have one exposed surface and one surface lying in contact with tissues underneath, the upper and lower surfaces show certain variations of structure. Occasionally the free surface develops fine hairs or cilia. These are found in various localities. The outer surface of the cell, being exposed, develops more truly animal functions, the inner more vegetative. Blood vessels and lymph vessels do not penetrate, as a rule, into epithelial tissues, but they are richly supplied with nerve-end organs.

According to their shape and relation, the epithelial cells are divided into these varieties: (1) Simple epithelial cells, with or without cilia, comprising (a) squamous epithelium; (b) cubical epithelium; (c) columnar epithelium; (d) pseudostratified columnar epithelium. (2) Stratified epithelium, comprising (a) stratified columnar epithelium, with superficial flattened cells without cilia; (b) transitional epithelium; (c) stratified columnar epithelium. (3) Glandular epithelium. (4) Neuro-epithelium.

1. **Simple Epithelium.**— This is that type in which the cells lie in a single continuous layer. This form is found lining almost the entire alimentary tract, the smaller air-passages, the majority of the gland-ducts, the ovarian ducts, the uterus, the central canal, the spinal cord and the ventricles of the brain. In (a) simple squamous epithelium the cells are flattened, forming a mosaic with the nuclei lying in the middle of the cell. It is found in the alveoli of the lungs. In (b) simple cubical epithelium the appearance is that of short polygonal prisms. It occurs in the smaller bronchioles of the lung, in certain portions of the uriniferous tubules, the liver, pancreas, salivary and mucous glands. In (c) simple columnar epithelium the cells are pyramidal or prismatic. This type is found in the intestinal tract from the cardiac end of the stomach to the anus, and in certain portions of the kidney. Ciliated columnar is found in the ovarian duct and uterus, in the central canal of the spinal cord and in some of the smaller bronchi. (d).

2. **Stratified Epithelium.**—When the cells of simple epithelium increase to such an extent that layer upon layer is developed, the epithelium no longer remains simple, but becomes stratified. The lower layers are richly supplied with blood vessels, and multiply very rapidly, pushing out the upper layers that are constantly dying and being cast off. The various forms are: (a) Stratified columnar epithelium, with superficial flattened cells, forming the outer covering of the body, the epidermis and its continuations inside of the body, as, for instance, the walls of the œsophagus, the epithelium of the conjunctiva, the external auditory canal, the sheath of the hair-follicles, the walls of the rectum, the anus and the vagina. The deeper cells are usually cubic-cylindrical, and are followed, as a rule, by one or more layers of slightly flattened cells, until finally the outmost layers become very much flattened and horny, or they may be developed into distinct horn-like substances such as that found in the nails. (b) Transitional epithelium, a type of stratified epithelium found in the kidney, uterus, urethra and bladder. It is somewhat similar to the stratified columnar epithelium, but does not show the characteristic deep papillæ in the basal membrane, so characteristic of the former. (c) Stratified columnar epithelium, consisting of a superficial layer of columnar cells and deeper layers of irregular, triangular, cubical or spindle-shaped cells. This type is found in the larger duct-glands, in the mucous membrane of the nose, portions of the male urethra and in parts of the larynx. Many of this type of cells have cilia, particularly those found in the back of the nose, larynx, respiratory tract, larger bronchi, Eustachian tube, epididymis and portions of the vas deferens.

3. **Glandular Epithelium.**—This is a type of epithelium occasionally found scattered among other epithelial cells, and which shows the characteristic of gland-structures. See GLANDS.

4. **Neuro-epithelium.**— Neuro-epithelial cells are highly specialized cells in which special nerve-end organs are to be found. In one sense nearly all epithelium is neuro-epithelium since many nervous receptors are located in flat, stratified epithelium and also both receptors and effectors are found in the epithelium of mucous membranes. Consult Bailey, 'Histology.'

EPITHEM, in botany, a gland which excretes water, or, the internal tissue of a hydathode (q.v.).

EPITOME, ē-pĭt'ō-mē, a summary or abstract of any book or writing; a compendium containing the substance or principal matters of a book. Such digests or abstracts were common in the Middle Ages and have not been uncommon even in modern times, for instance, the abridgment of the French encyclopædia Larousse.

EPIZOA, in a general sense, external parasites, as contrasted with Entozoa, or internal parasites. These are not exact terms in scientific classification. Among them are the fleas, lice, ticks, itch-mites and similar minute "vermin" infesting man or beast.

In a more restricted sense the term is applied to the degraded, distorted copepod crustaceans parasitic upon the skin, gills and other parts of marine animals, especially fishes. See FISH-LICE.

EPOCH, or ERA (Gr. ἐποχή, *epoche*, epoch, pause). In history, a fixed point of time, commonly selected on account of some remarkable event by which it has been distinguished, and which is made the beginning or determining point of a particular year from which all other years, whether preceding or ensuing, are computed. Some writers distinguish between the terms epoch and era. According to them, both mark important events, but an era is an epoch which is chronologically dated from; an epoch is not marked in this way. The birth of Christ was thus both an epoch and an era from this point of view.

The more important historical epochs are here enumerated. For further details on the mode of reckoning see CALENDAR.

The Creation.— The biblical record of the creation has formed the foundation of numerous chronologies. Of course the authorities (Jewish and Christian) on these various modes of reckoning do not agree as to the time signified by the common authority for the event dated from. The more important of these epochs, of which there are about 140 different varieties, are (1) The epoch adopted by Bossuet, Ussher and other Catholic and Protestant divines, which places the creation in 4004 B.C. (2) The Era of Constantinople (adopted by Russia), 5508 B.C. The civil year begins 1 September, the ecclesiastical year about the end of March. (3) The Era of Antioch, used till 284 A.D., placed the creation 5502 B.C. It was merged in the following year in (4) The Era of Alexandria, which made the creation 5492 B.C. This is also the Abyssinian Era. (5) Jewish Era. The common era of the Jews places the creation in 3760 B.C. Their year is lunar-solar, that is, lunar with intercalary months, forming a cycle of 19 years, of which 12 have 12 months and seven 13 months. The year thus varies from 353 to 385 days. The civil year begins with the new moon following the autumn equinox. The eras dating from the creation are distinguished by the initials A. M. Const., Abyss., etc., are sometimes added to distinguish the particular epochs.

Julian Period.— This begins 4713 B.C. It is an arbitrary epoch, fixed for the purpose of computing all dates forward, as in the case of the creation epochs.

The Olympiads.— The Greeks computed their time by periods of four years, called Olympiads. Their year was lunar, with intercalary months. The first Olympiad, being the year in which Corœbus was victor in the Olympic games, was in the year 776 B.C. The period of the commencement of the year, which was variable, was about July. The contraction used for the Olympic epoch is Olymph.

The Roman Era (Ab Urbe Condita).— The Romans dated from the supposed era of the foundation of their city, 21 April, in the third year of the sixth Olympiad, or 753 B.C. (according to some authorities 752 B.C.). This epoch is designated by the initials A. U. C. The Roman mode of computation was the foundation of our modern chronology.

Era of the Seleucides.— Begins 1 Oct. 312 B.C., the epoch when Seleucus I (Nicator) took possession of Babylon. The year consisted of 365 days, with a leap year every fourth year. This era is used in the book of Maccabees.

Spanish Era.— This dates from 1 Jan. 38 B.C. The months and days were the same as those of the Julian calendar. It was disused in Aragon in 1350; in Valencia, 1358; in Castile, 1383; in Portugal, about 1415.

Christian Era.— Our mode of computing from supposed data of the birth of Christ was first introduced in the 6th century, and had not been generally adopted until the year 1000. Since the first year of the 1st century was 1 A.D., the last year of the same century was 100 A.D. Similarly the year 1900 A.D. was the last year of the 19th century. The same holds good in reckoning backward. For particulars of the mode of reckoning the years of the Christian era and the changes which it has undergone, see CALENDAR.

Armenian Era.— This began 7 July 552, and was superseded by the Julian era about 1330. The year consisted of only 365 days.

Mohammedan Era, or Hegira.— This begins on 16 July 622. The conversion of the Mohammedan into Christian chronology causes more difficulty and confusion than arises with any of the other modes of reckoning. The Mohammedan year is purely lunar. It consists of 12 months, and each month commences with the appearance of the new moon. Hence their years have no correspondence with the recurrence of the seasons, and to know the period when a Mohammedan year begins it must be reckoned from the beginning of the era. In chronology, history, etc., they use months of 29 and 30 days alternately, making the year consist of 354 days. Eleven times in 30 years one day is added to the last month, making 355 days in the year. The mean length of the year is thus 354 11/30 days, of the month 29 191/360, differing from the true lunation by little more than three seconds, or less than a day in 2,260 years. As 33 Mohammedan years amount to only six days (including intercalary days and leap years) more than 32 of our years, by deducting one year from each 33 Mohammedan years, and adding 621½ years, the year of the Christian era will approximately be found. The Hegira is distinguished by the initials A. H.

Persian Era.— The era of Yezdegird III began 16 July 632. The year consisted of 365 days. It was reformed in 1075 by the addition of a day whenever it was necessary to make the commencement of the year occur on the day of the sun's passing the same degree of the ecliptic. The months have each 30 days, with five or six days intercalated. This era is still used by the Parsees in India.

Indian Chronology.— The best-known eras computed by solar time are the Kaliyuga, which dates from 3,101 years before Christ and the Salivahana from 77 A.D. Both are computed astronomically, losing one day in 60 years by our computation. The era of Vikramaditya, beginning 57 years B.C., is computed by lunar months, with intercalations made according to astronomical observation, and bringing the year up to 365 or 366 days. The Bengali year was formerly identified with the Hegira, but is now reckoned by solar computation.

Chinese Chronology.— The Chinese, like all the nations of northeast Asia, reckon their time by cycles of 60 years. Instead of numbering them as we do, they give a different name to every year in the cycle. The Chinese months are lunar, of 29 and 30 days each. Their years have ordinarily 12 months, but a 13th is added whenever there are two new moons while the sun is in one of the zodiac. This will occur seven times in 19 years. The boasted knowledge of the Chinese in astronomy has not been sufficient to enable them to compute their time correctly. The first cycle, according to Roman Catholic missionaries, began February 2397 B.C. To find out the Chinese time multiply the elapsed cycle by 60 and add the odd years; then if the time be before Christ subtract the sum from 2,398; but if after Christ, subtract 2,397 from it; the remainder will be the year required.

Primitive American Chronology.— The natives of America, previous to its discovery by Europeans, particularly the Peruvians and Mexicans, appear to have had a considerable acquaintance with astronomy and to have reckoned their time with great care. The Mexican year consisted of 365 days, composed of 18 months of 20 days and five added days. At the end of a cycle of 52 years 12 and 13 days were added alternately, making the mean year very near the truth.

In geology, according to United States Geological Survey usage, a subdivision of a period of geologic time, the period in turn being a subdivision of an era, the largest time unit in use. The rocks laid down during an epoch are usually known as a series, this term being used as a subdivision of a system, the latter being the rocks laid down during a period. The Cambrian (q.v.) period is usually divided into three epochs, Georgian, Acadian and Saratogan, and the Cambrian system into three corresponding series of rocks known by the same names. Other periods are also divided into epochs. The Eocene, Oligocene, Miocene and Pliocene are sometimes given the rank of periods, but are now generally considered to be epochs of the Tertiary period. While periods are divisions the nomenclature of which is fairly well standardized the world over, epochs are not so constant, and go by various names in various lands. See CAMBRIAN; ORDOVICIAN; EOCENE, etc.

In astronomy, epoch is the longitude which a planet has at any given moment of time. To predict this for any future period the longitude at a certain instant in the past must be known; that instant is termed the epoch of the planet.

EPODE (Lat. *epodus*, Gr. *epōdus*, an after song or epode). In Greek choral poetry the term is used of an ode succeeding a strophe and antistrophe, or a series of strophes and antistrophes. The name was also given by grammarians to any poem the material unit of which is a distich consisting of a long, followed by a short verse. In this sense it was especially used by the iambic trimeter followed by the iambic dimeter, as in Epodes 1–10 of Horace. In music the term epode is used to signify a burden or refrain.

EPOMEO, ā-pō'mā-ō, a volcano, on the island of Ischia, Italy, 15 miles south by west of Naples. It has an elevation of 2,588 feet and commands a fine panoramic view of the coast with the famous bay of Naples. Terrific eruptions have marked its history; one in 474 B.C. caused most of the inhabitants to flee from the island. In 1302 occurred the last great upheaval. The mountain is sometimes known as Mount San Nicola, from the San Nicola Hermitage near the summit. The mount is mentioned in Virgil's 'Æneid,' IX, 716.

EPONA, the goddess of stables, asses, mules and horses. She was at first exclusively worshipped in Gaul but the cult spread to Rome in the 1st century of our era. Inscriptions to her have been uncovered in France, Germany, the Dobrudja and Italy. Consult Wissowa, 'Religion und Kultus der Römer' (2d ed., Munich 1912).

EPONYM, ĕp'ō-nĭm, a mythical personage created to account for the name of a tribe or people; thus Tros is the eponymous hero of Troy; Italus was assumed as ancestor of the Italians; Romulus of the Romans. It is also more generally used in the sense of names of people, places and periods derived from those of persons. Thus Bolivia is derived from Bolivar. Hearn, in his 'Aryan Household,' declares that "wherever there was a clan there was an eponym or founder, whether real or legendary, of that clan." By extension the term is also applied to the name of something, as a part or organ of the body derived from a person, as the fissure of Sylvius.

EPONYMOUS, an adjective of Greek origin and meaning usually the giving of a name to some person or thing. In ancient Greece it was especially applied to the ephor, from whom the year was named. Tribes and cities usually traced their origin to some eponymous ancestor, generally a national hero. Thus Tros is the eponymous hero of Troy, Italus of the Italians, etc.

EPOREDIA. See IVREA.

EPOS. See NARRATIVE POETRY.

EPPES, John Wayles, American statesman: b. Virginia 1773; d. near Richmond, Va., 20 Sept. 1823. He received an academic education, and after studying law was admitted to the bar and began practice in Richmond. In 1803 he was elected as a Democrat to the House of Representatives at Washington, and with successive re-elections served continuously from 17 Oct. 1803 to 3 March 1811. Later he was elected to the 13th Congress and served from 24 May 1813 to 3 March 1815. He was chosen United States Senator in 1817, but resigned the office two years afterward on account of failing health and retired to his estates in Chesterfield County. He married Maria, the daughter of Thomas Jefferson, who died at Monticello in April 1804.

EPPING, England, market town, in Essex, 17 miles from London and in the midst of the forest to which it gives name. This ancient royal forest, once a part of Waltham forest, and all much larger than at present, has an area of 6,000 acres and presents some fine woodland scenery. It was secured to the nation by legislative enactment and was opened by Queen Victoria in 1882 as a public recreation ground. The town consists of a single broad street on a ridge of hills. Pop. 4,253.

EPPING FOREST. See EPPING.

EPSOM, England, market town in the county of Surrey, 14 miles southwest of the heart of London. Epsom was formerly celebrated for a mineral spring, from the water of which the well-known Epsom salts were manufactured. A number of the sons of medical men are educated at the Royal Medical College, and adjoining the school is a home for aged physicians or their widows. The principal attraction Epsom can now boast of is the grand race-meeting held on the Downs, which is attended by hundreds of thousands of persons. The races begin on Tuesday and continue to the end of the week preceding Whitsuntide; the Derby stakes are run for on Wednesday, which is the principal day, and the Oaks on Friday. There is also racing on two days earlier in the season; the town being otherwise characterized as "a dull little place for 50 weeks in the year." Epsom gives name to one of the parliamentary divisions of the county. Pop. 19,156.

EPSOM SALT, a hydrous sulphate of magnesium, having the formula $MgSO_4 + 7H_2O$. It occurs abundantly in nature and takes its name from its occurrence, in dissolved form, in a mineral spring at Epsom, England. It may be prepared also from dolomite, by decomposing the mineral by the addition of sulphuric acid. Epsom salt, proper, is known to the mineralogist as epsomite, and more popularly as hair-salt, from the delicate fibrous efflorescent deposits in which it often occurs on the walls of mines, quarries and caves. Epsomite crystallizes in the orthorhombic system, and large quantities of it are found in the limestone caves of Kentucky, Tennessee and Indiana, mingled with earthy matter. In the Mammoth Cave it occurs in loose masses suggestive of snowballs, adhering to the roof and walls. An allied mineral known as kieserite, which has the composition $MgSO_4+H_2O$, and occurs abundantly at Stassfurt, is largely used as a source of epsom salt. Magnesium sulphate is used as a fertilizer, as a raw material for the manufacture of the sulphates of sodium and potassium and in sizing and dyeing cotton goods. The epsom salt is also extensively used as a purgative, in medicine.

EPSOMITE, natural magnesium sulphate of the same composition as Epsom salt ($MgSO_4+7H_2O$). It has a bitter saline taste and is found in fibrous crusts in white botryoidal lumps.

EPSTEIN, Jacob, English sculptor: b. New York, 1880. He is of Polish-Prussian descent, made his studies under Rodin at Paris and settled in London. He was commissioned to execute 18 figures to decorate the new building of the British Medical Association in 1907–08. The work when finished was attacked by newspapers and various religious bodies, but was defended by the *Times*, Herbert Gladstone, Sir Martin Conway and others. Epstein was also commissioned to execute the tomb of Oscar Wilde in Père Lachaise Cemetery, Paris, which he completed in 1909. He also decorated Church Square, facing the government buildings, Pretoria, Transvaal. His art is intensely realistic and is a protest against the conventional imitation of the Greek.

EPULIS. See MOUTH.

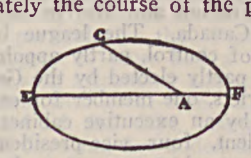
EPWORTH LEAGUE, a society of young people of the Methodist Episcopal Church; formed 15 May 1889 in Cleveland, Ohio, by the union of five societies affiliated with the Methodist Church. It adopted as its motto: "Look up, Lift up," and its declared object is to "promote intelligent and loyal piety in the young members and friends of the Church; to aid them in the attainment of purity of heart and constant growth in grace, and to train them in works of mercy and help." The following pledge is required of its members: "I will earnestly seek for myself, and do what I can to help others to attain, the highest New Testament standard of experience and life. I will abstain from all forms of worldly amusement forbidden by the discipline of the Methodist Episcopal Church, and I will attend, as far as possible, the religious meetings of the chapter and the Church, and take some active part in them." The league exists in both the Northern and Southern branches of the Methodist Episcopal denomination and also in the Methodist Church of Canada. The league is governed by a board of control, partly appointed by the bishops and partly elected by the General Conference districts, one member for each district; represented by an executive cabinet, consisting of a president, four vice-presidents, general secretary, general treasurer and an assistant treasurer. The league has grown rapidly, extending to foreign lands, and there are chapters in India, Mexico, South America, Italy, Norway, Sweden, Denmark, Finland, China, Japan and Hawaii. There are in the league about 30,000 chapters and over 2,000,000 members. Its official organ is the *Epworth Herald*, published in Chicago, which has a circulation of over 100,000. Consult Bacon and Northrop, 'Young People's Societies' (New York 1900); 'The Methodist Year Book'; Brummett, 'Epworth League Methods' (New York 1906).

EQUAL RIGHTS PARTY, in 1835. See Locofocos.

EQUAL RIGHTS PARTY, in 1884. Belva Lockwood nominated herself for the presidency, on a platform of Woman Suffrage; and gave her voters this title.

EQUALITY BEFORE THE LAW, a fundamental of civil liberty, in which the equality of all men to receive the protection afforded by law is assumed. The guaranty of liberty and equal privilege to all freemen was embodied in Magna Charta (q.v.) in 1215, and in the Declaration of Independence the equality of all men with unalienable rights was emphasized. The equal protection of the laws excludes any distinction between individuals, invidious discrimination, and class legislation not founded on legal or reasonable distinctive grounds. See Due Process of Law; Common Law.

EQUATION, a term based on the idea of equality, in general use throughout the various branches of calculus. (1) *In mathematics* it is the statement in algebraic expressions of the identity of two or other mathematical expressions. The assertion of equality is made by writing the sign = (read "is equal to" or "equals") between the expressions. Thus: $5x+7=32$, and $ax^2+bx+c=0$, are equations, each of which indicates the equality of the quantity written on the left of the sign (=) to that written on the right of the sign. Usually the object of writing down an algebraic equation is to express in symbols known relations between given and unknown quantities, so that by algebraic processes the latter may be determined in terms of the former. Such equations are designated *conditional,* while equations which are true for all values of the variables they involve or which involve no variables, are called *identities.* (See Algebra, Definitions and Fundamental Concepts). (2) *In astronomy,* is the correction by addition to or subtraction from the mean motion of any heavenly body, in order to determine its true place at any given time. The angular motion of a planet around the sun will not be uniform if its orbit is not circular, regardless of any perturbations. Furthermore, the mutual attraction among the planets renders each one capable of producing a perturbation in the orbits of all the others. An equation is required for every such perturbation before it is possible to calculate accurately the course of the planet. Thus



we have the equation of the centre, a quantity to be added to or subtracted from the anomaly, in order to determine the true position of a heavenly body. For instance, let the curve E C F represent the earth's orbit (which is an ellipse), E F the line of the aspides, and A the position of the sun. When the earth is in any position as C, the line A C drawn from the sun to the planet is the radius vector, then will the angle C A F be the anomaly, or the angular distance from the perihelion. Were the earth's angular motion uniform the increase or decrease of this angle would be equal in equal times, and the mean anomaly would be the true anomaly; but the earth's motion is retarded as it advances from F to C, is slowest at E, and is accelerated from that point, the aphelion, through the other half of its orbit till it arrives at F, the perihelion. The quantity to be added to the mean angular motion, during one portion of the orbit, or subtracted from it in the other, in order to find that true anomaly, is called the equation of the centre. (3) *In chemistry,* is a collection of symbols to denote that two or more definite bodies — simple or compound — have been brought within the sphere of chemical action, that a reaction has taken place, and that new bodies are produced. It is called an equation because the total weight of the substances concerned remains the same. Equations may also involve the energy consumed or given off in a reaction. See Chemistry.

EQUATION, Personal, an important correction that must be considered in connection with refined measurements in astronomy and physics, and which originates in the fact that no two observers agree precisely as to the instant at which a phenomenon occurs, nor as to the setting of a micrometer-wire so as to bisect a division mark on a scale. Differences of this sort are exceedingly irregular among inexperienced observers, but among the more experienced ones the regularity, while not absolute, is strongly marked. In some kinds of work the personal equation of the observer can be eliminated by the method in which the observations are made. Thus in the determination of differences of longitude by telegraphic methods, it is usual to eliminate the effect of personal error from the final result by having the observers change places when the work is half done; so that if the difference of longitude as determined by the first half of the work was too large, that determined during the second half will be too small by an equal amount, and the effect of personal equation will disappear from the final mean. In other cases it is impossible to eliminate the effects of personal error in any such way, and in these cases the attempt is often made to determine the magnitude of the personal equation, and apply the proper correction to the results as directly observed. Thus Otto Struve, in connection with his measurements on double stars, had artificial double stars constructed, upon which he made regular observations for the purpose of studying his personal equation in such work, and he applied to his results for the genuine stars, a series of corrections deduced in this way. When the thing to be measured is an interval of some kind, the personal equation can usually be neglected, provided the same observer makes all the measures. For example, in determining the length of a bar, the reading of the micrometers will be in error (so far as the personal equation is concerned) by the same amount at both ends of the bar, and hence the difference of these readings; or, in other words, the observed length of the bar will be independent of the observer's personal equation.

EQUATIONS, Differential. 1. Introduction.— The invention of the calculus, made necessary by the demands of natural science, was followed immediately by the most brilliant applications. The names of Newton, Leibnitz, Euler, Lagrange and Laplace are attached to the principal discoveries of this period, whose importance from a scientific and philosophical point of view can hardly be overestimated. A simple example will suffice to explain the ruling idea of this epoch. From the observations of Tycho Brahe, Kepler had obtained the laws of planetary motion still known by his name. Newton had shown that Kepler's laws were but a consequence of the laws of universal gravitation, which assumes that every particle in the universe acts upon every other according to a definite law. The effect of Newton's law upon a system of moving bodies can be formulated in mathematical symbols without any difficulty. This formulation gives rise to a system of equations involving the co-ordinates of the moving bodies and their accelerations, i.e., the second derivatives of these co-ordinates with respect to the time. The problem of expressing the co-ordinates as functions of the time, i.e., the problem of integrating this system of differential equations, was solved by Newton for the case of two mutually attracting bodies, and its solution is given precisely by Kepler's laws. Newton himself and his successors, especially Laplace and Lagrange, studied the further consequences of the law of gravitation as applied to the solar system. The accord between the theory and observation became closer and closer, so that it was reasonable to suppose that the true law of nature had been found. Gradually other branches of physical science were treated in a similar way. In all cases, the fundamental laws being assumed, the mathematical formulation of the problems led to the question of integrating differential equations. It should be noted that, although in some cases this method of arriving at the formulation of the physical problems has now been abandoned, differential equations are now, more than ever, used as the expressions for the fundamental phenomena in physical science. For the applications of mathematics there is no field so important as the theory of differential equations. That the whole world is a mathematical problem was the point of view gained by Laplace, an insight gained in a different way also by Leibnitz and Spinoza. But the mathematician is more specific; we learn from him that this world-problem belongs to the domain of the theory of differential equations. Even if the details of the picture have changed, the formulation of this general idea is one of the positive achievements of the philosophical thought of the 18th century.

Ordinary Differential Equations; Elementary Theory.— Let y be determined as a function of x by means of an equation,

$$\phi(x,\ y,\ a)=0, \tag{1}$$

which involves an arbitrary constant a. If x and y be interpreted as the co-ordinates of a point in the plane, equation (1) represents a family of curves, one curve for each value of a. By differentiation we find, from (1),

$$\frac{\partial\phi}{\partial x}+\frac{\partial\phi}{\partial y}\frac{dy}{dx}=0. \tag{2}$$

Between these two equations a may be eliminated; the result will be an equation of the form

$$f\left(x,\ y,\ \frac{dy}{dx}\right)=0, \tag{3}$$

free from a. Equation (3) is a *differential equation.* Since it does not contain the constant a it gives the expression of a property which is common to all of the curves of the family (1). The main object of the theory of differential equations is to invert the process which we have just carried out, i.e., the equation (3) being given, the equation (1) involving an arbitrary constant, from which (3) may be derived by differentiation, is to be found. This process is known as the *integration of the differential equation.*

In general let there be given an equation of the form

$$f\left(x,\ y,\ \frac{dy}{dx},\ \frac{d^2y}{dx^2},\ \cdots\ \frac{d^ny}{dx^n}\right)=0,$$

between x, the function y of x and its derivatives up to the nth order; it is called an *ordinary differential equation of the nth order.* The adjective *ordinary* implies that y is considered as a function of only *one* independent variable x. Under certain restrictions as to the continuity of the function f (a question to which we shall recur later), it may be shown that there exists a function y of x and of n arbitrary constants which satisfies the differential equation; it is known as the *general integral of the differential equation;* the determination of this function is the object of the theory of differential equations. The equation is then said to have been integrated.

The simplest case of such a differential equation presented itself in the problem of finding the area included between a curve $y=f(x)$, the x-axis, and two ordinates erected for $x=a$ and $x=x$. The differential equation satisfied by the area z considered as function of x is

$$\frac{dz}{dx}=f(x),$$

and the area itself becomes

$$z=\int_a^x f(x)dx.$$

This simple case served as a model for the earlier investigators in this field. Confining ourselves for the moment to equations of the first order, it may be possible to reduce such an equation to the form

$$\frac{dx}{R(x)}+\frac{dy}{S(y)}=0,$$

where $R(x)$ is a function of x, and $S(y)$ a function of y alone. The variables are then said to be *separated,* and we may write

$$\int\frac{dx}{R(x)}+\int\frac{dy}{R(y)}=c,$$

where c is an arbitrary constant. Owing to the fact, which has just been mentioned, that the problem of areas is solved by the computation of an integral of the form $\int_a^x f(x)dx,$

such an integration is known as a *quadrature.* If the variables can be separated, the differential equation may, therefore, be integrated by quadratures.

The earlier analysts believed that any differential equation could be integrated by the elementary functions then in use, and by quadratures. This we now know not to be the case, just as we know, since the days of Abel, that all algebraic equations cannot be solved by the mere extraction of roots. (See ALGEBRA; THEORY OF EQUATIONS; GALOIS' THEORY). Moreover, even if the reduction to quadratures can be effected, such a reduction is, properly speaking, the beginning and not the end of the investigation. For it does not suffice to give a formal indication of the relation between x and y; this relation must be thoroughly understood in its essential properties before the integration can be said to have been accomplished. Nevertheless the consideration of the simpler cases, in which integration by means of elementary functions or by quadratures is possible, constitutes a first important chapter of the theory of differential equations. We may characterize this chapter as the *elementary* theory of differential equations.

Elementary Theory of Differential Equations.—We have already referred to the case in which the variables are separated. In many cases a simple transformation will accomplish the separation. Consider, for example, the equation

$$(4)\qquad \frac{dy}{dx}+Py=0,$$

where P is a function of x only. We may write

$$\frac{dy}{y}+Pdx=0,$$

whence

$$\log y+\int Pdx=\log c,$$

or

$$(5)\qquad y=ce^{-\int Pdx},$$

This example will be useful in enabling us to treat, at once, a more general equation; we shall do so, moreover, by making use of a method frequently employed, and especially important in the applications to theoretical astronomy, the method of *variation of constants.* We consider the equation

$$(6)\qquad \frac{dy}{dx}+Py=Q,$$

where P and Q are functions of x only. This equation is the most general linear differential equation of the first order, a linear equation being one which contains y and its derivatives in no higher than the first power. Equation (6) differs from (4) only in having Q in the right member in place of zero. The expression (5) will certainly not satisfy (6) since it satisfies (4). Clearly, however, it must be possible to satisfy (6) by an expression of the form analogous to (5), viz.,

$$(7)\qquad y=ue^{-\int Pdx},$$

where u is a properly chosen function of x instead of being a constant. Moreover, as we shall see, we can actually determine the function u by quadratures. In fact, we find from (7)

$$\frac{dy}{dx}=\left(\frac{du}{dx}-Pu\right)e^{-\int Pdx},$$

which gives, on substitution into (6)

$$\frac{du}{dx}=Qe^{\int Pdx}$$

so that we shall have

$$(8)\qquad y=e^{-\int Pdx}\left[C+\int Qe^{\int Pdx}dx\right],$$

as the general integral of (6). This formula was found by Jacob Bernoulli, who also showed that the equation

$$(9)\qquad \frac{dy}{dx}+Py=Qy^{-m+1}$$

could be reduced to (6) by putting $u=y^m$.

The *homogeneous* equations of the form

$$(10)\qquad \frac{dy}{dx}=\phi\left(\frac{y}{x}\right),$$

where $\phi\left(\frac{y}{x}\right)$ depends only upon the ratio of y to x, may be solved by quadratures. In fact, if we put $y=vx$, the equation becomes

$$\frac{dx}{x}+\frac{dv}{v-\phi(v)}=0,$$

whence

$$(11)\qquad \log x+\int\frac{dv}{v-\phi(v)}=c.$$

Euler's method of the *integrating factor* is sometimes useful. It rests upon the following considerations. Let $\phi\ (x,\ y)$=const. be the equation of any integral curve of the equation

$$(12)\qquad P(x,y)dx+Q(x,y)dy=0.$$

We shall have, by differentiation from $\phi(x,y)$=const.,

$$\frac{\partial\phi}{\partial x}dx+\frac{\partial\phi}{\partial y}dy=0,$$

an equation which must have the same significance as (12). We must, therefore, have

$$(13)\qquad \mu P(x,y)=\frac{\partial\phi}{\partial x},\quad \mu Q(x,y)=\frac{\partial\phi}{\partial y},$$

if μ is a properly chosen function of x and y. If μ is known, the determination of ϕ by quadratures can be immediately accomplished on account of the two equations (13). For this reason μ is called an integrating factor. Equations (13) show that μ must satisfy the partial differential equation

$$(14)\qquad \frac{\partial(\mu P)}{\partial y}-\frac{\partial(\mu Q)}{\partial x}=0.$$

In general, the determination of an integrating factor is just as difficult as the integration of the equation. But Euler succeeded in finding a number of equations with known integrating factors. Herein lies the value of the method.

By means of these various methods there was obtained in the course of time a considerable number of equations which could be integrated by quadratures. Lie showed that this rather scrappy theory could be understood as the consequence of a single principle. This we shall now proceed to explain, making use of geometric images for the sake of clearness as well as brevity.

The equations

$$x_1=\phi(x,y),\ y_1=\psi(x,y),$$

are said to constitute a *transformation* of the point (x, y) into the point (x_1, y_1) if they can be solved for x_1 and y_1.

These equations may contain a certain number of arbitrary constants $a_1, \dots a_r$; they are then said to constitute an r-parameter family of transformations. Let us consider the simplest case of a one-parameter family which we may write

$$(15)\qquad x_1=\phi(x,y;a),\quad y_1=\psi(x,y;a).$$

If the parameter a has a definite value, this transformation converts every point (x, y) into a definite other point (x_1, y_1). Let us transform this new point (x_1, y_1) by equations of the *same* form, but with a different parameter b, into a third point (x_2, y_2), so that we shall have

$$(16)\qquad x_2=\phi(x_1,y_1;b),\quad y_2=\psi(x_1,y_1;b).$$

In general, if we eliminate x_1, y_1 between (15) and (16) we shall find x_2 and y_2 as functions of x, y, a and b. It *may* happen that these functions assume the form

$$(17)\qquad x_2=\phi(x,y;c),\quad y_2=\psi(x,y;c)$$

where c is a function of a and b, and where the functions ϕ and ψ are the *same* as in (15) and (16). If this is the case, the transformations (15) are said to form a one-parameter *group.* The one-parameter family of transformations (15) then has the property that the transformation, obtained by combining any two of its transformations, is itself a member of the family. It is for this reason that the family is then called a *group.* (See GROUPS, THEORY OF). It is obvious how this definition may be extended to cover r-parameter groups.

The one-parameter group (15) will contain, in general, the identical transformation; i.e., for a certain value a_0 of a (15) will reduce to $x_1=x$, $y_1=y$. If now we denote by δt an infinitesimal, and put in (15) $a=a_0+c\delta t$, we shall find a transformation which transforms (x, y) into a point (x_1, y_1) such that the differences $x_1-x=\delta x$ and $y_1-y=\delta y$ will be infinitesimals of the order of δt. This will be true unless certain exceptional cases arise which we need not, at present, discuss. From every one-parameter group we may deduce in this way an *infinitesimal transformation,* and Lie has shown that conversely every infinitesimal transformation determines a one-parameter group. There is a similar connection between an r-parameter group and a corresponding set of r infinitesimal transformations, between which certain relations must then be satisfied.

A one-parameter group always has an *invariant:* i.e., there exists a function $\Omega(x, y)$ such that, for all transformations (15) of the group. $\Omega\ (x_1, y_1)=\Omega(x,\ y)$. Such a function is said to *admit* the one-parameter group of transformations. It admits, in particular, the infinitesimal transformation of the group. Similarly, a differential equation may admit one or more infinitesimal transformations. Lie has shown that in the cases in which the variables may be separated, i.e., in which integration by quadratures is possible, it is possible to write down infinitesimal transformations which leave the equations invariant. He has developed a general theory showing what advantage is gained for the integration of a differential equation by the knowledge that it admits one or more infinitesimal transformations. Let us remark, explicitly, that this theory is not confined to equations of the first order nor even to ordinary differential equations.

Before passing to the consideration of the elementary theory of equations of higher order, we proceed to explain the important notion of *singular solution.* Geometrically, an equation of the first order $\frac{dy}{dx}=\phi(x,y)$ determines the tangent of an integral curve at every point of the plane. If we start from any point P, the tangent of the integral curve passing through that point is completely determined. We follow the direction thus indicated for an infinitesimal distance to the point $(x+\delta x,\ y+\delta y)$. At this point the tangent is again given by the differential equation, etc. We obtain in this way, synthetically, the family of integral curves, say $F(x,\ y,\ c)=0$. Any one of these curves is obtained by giving a definite value to the constant of integration c. The envelope of this system of curves, however, will also be a solution of the differential equation. For it will also be a curve whose tangent satisfies the requirements of the equation. But, in general, the envelope will not be itself a member of the family of curves, i.e., it will not be possible to find its equation by giving a special value to c. The envelope is then said to give a singular solution of the equation. If it exists, it may be found without any integration, that is to say, without a knowledge of the general integral of the differential equation.

The most important case of a differential equation of a higher order, which may be treated by elementary methods, is that of the linear homogeneous differential equation of the nth order with constant coefficients. A linear homogeneous differential equation of the nth order has the form

$$(18)\qquad \frac{d^ny}{dx^n}+p_1\frac{d^{n-1}y}{dx^{n-1}}+\dots+p_ny=0.$$

If $y_1, y_2, \dots, y_n$ are particular solutions of the equation, $y=c_1y_1+c_2y_2+\dots+c_ny_n$, where $c_1, \dots c_n$ are constants, is also a solution. Moreover, if $y_1, \dots y_n$ are linearly independent, i.e., if they satisfy no relation of the form $\gamma_1y_1+\gamma_2y_2+\dots+\gamma_ny_n=0$, where $\gamma_1, \dots \gamma_n$ are constants, the above expression for y is the general solution. $y_1, \dots y_n$ are then said to constitute a *fundamental system* of solutions. In the case that $p_1, \dots p_n$ are constants a fundamental system may be easily obtained. In fact we find that $y=e^{\rho x}$ is a solution of (18) if ρ is a root of the equation

$$\rho^n+p_1\rho^{n-1}\dots+p_{n-1}\rho+p_n=0.$$

Moreover, if $\rho_1, \dots \rho_n$ are the roots, supposed distinct, of this equation, $e^{\rho_1x}, e^{\rho_2x}, \dots e^{\rho_nx}$ actually form a fundamental system. If λ roots, say $\rho_1, \rho_2, \dots \rho_\lambda$, coincide, the λ identical functions $e^{\rho_1x}, \dots e^{\rho_\lambda x}$ are replaced by e^{ρ_1x}, xe^{ρ_1x}, $x^2e^{\rho_1x}, \dots x^{\lambda-1}e^{\rho_1x}$.

Total Differential Equations.—In the case of an equation between two variables which we have considered so far, one important distinction, which we shall now have to make, has not been necessary. If $P(x,y)dx+Q(x,y)dy=0$ is such an equation, it is always possible to find a single function $\phi(x,\ y)$ such that $\phi(x,\ y)=$ const. shall represent the general integral. Either the expression $Pdx+Qdy$ is the complete differential of $\phi(x,y)$ so that $P=\frac{\partial\phi}{\partial x}$ and $Q=\frac{\partial\phi}{\partial y}$, or else upon multiplication with Euler's integrating factor $\mu(Pdx+Qdy)$ becomes such a complete differential. This is not the case when there are more than two variables. Consider such an equation in three variables,

$$(19)\qquad Pdx+Qdy+Rdz=0,$$

where P, Q, R are functions of x, y, and z. For the sake of symmetry assume that x, y, z are regarded as functions of a fourth variable t. The problem before us is to find all sets of functions x, y, z of t which will satisfy (19). It *may* happen that the left member of (19) becomes a complete differential upon multiplication with a function μ of x, y, z, so that

$$\mu P=\frac{\partial\phi}{\partial x},\ \mu Q=\frac{\partial\phi}{\partial y},\ \mu R=\frac{\partial\phi}{\partial z}.$$

The elimination of μ from these three equations shows that this can be the case only if P, Q, R satisfy the so-called integrability condition:

$$(20)\ P\left(\frac{\partial Q}{\partial z}-\frac{\partial R}{\partial y}\right)+Q\left(\frac{\partial R}{\partial x}-\frac{\partial P}{\partial z}\right)+R\left(\frac{\partial P}{\partial y}-\frac{\partial Q}{\partial x}\right)=0.$$

Moreover it may be shown that if P, Q, R satisfy this condition, there exists a function $\phi(x,y,z)$ and an integrating factor $\mu(x,y,z)$ such that

$$\mu(Pdx+Qdy+Rdz)=d\phi,$$

so that integration of (19) will give the result $\phi(x,y,z)=\text{const.}$ But if (20) is not satisfied, no integration of (19) in this sense is possible. The reason for this distinction as well as the discussion of the non-integrable case will be clearly understood if we make use of a geometric interpretation. Let x, y, z be Cartesian co-ordinates of a point in space. If x, y, z are known as functions of t, there will be determined a certain space-curve. It is our problem to determine such space-curves

$$x=f(t),\quad y=g(t),\quad z=h(t)$$

as satisfy (19). Through every point (x_0, y_0, z_0) of space there may be drawn an infinity of such curves. The tangents of all of these curves which pass through the point (x_0, y_0, z_0) form a plane pencil with (x_0, y_0, z_0) as vertex and the plane

$$P(x_0,y_0,z_0)(x-x_0)+Q(x_0,y_0,z_0)(y-y_0)+R(x_0,y_0,z_0)(z-z_0)=0$$

as plane. Thus there is for every point P a plane p containing P, to which all of the integral curves of (19) which pass through P must be tangent. We may now imagine an integral curve of (19) constructed as follows: Start from a given point P and construct the corresponding plane p. We go from P to a point Q infinitesimally close to P but otherwise arbitrarily situated in the plane p. At Q we construct the plane q corresponding to it, and in this plane we pick out a point R infinitesimally close to Q. Proceeding in this way we gradually build up an integral curve. It *may* happen that *all* of the integral curves of (19) which pass through the point P are situated upon a certain surface S. If this is the case for all points P, the integrability condition is satisfied; there exists a single infinity of surfaces $\phi(x,y,z)=c$, such that an arbitrary curve upon each of these surfaces satisfies the differential equation. In general, however, such a family of surfaces does not exist. We may then integrate (19) as follows: Take an *arbitrary* surface $\phi(x,y,z)=0$. Let P be any point upon it. Let p be the plane of the pencil of directions which the differential equation assigns to P, and let p' be the plane tangent to the surface $\phi(x,y,z)=0$ at P. The intersection t of p and p' will be at the same time tangent to an integral curve of (19) and tangent to the surface $\psi=0$. From P we go along t to a point Q infinitesimally close to P and there repeat this process. We may build up in this way all of the integral curves of (19) which are situated upon an arbitrary surface. Upon every arbitrary surface there will be a single infinity of such curves. Analytically this process may be carried out as follows: From $\psi=0$ we find

$$\frac{\partial\psi}{\partial x}dx+\frac{\partial\psi}{\partial y}dy+\frac{\partial\psi}{\partial z}dz=0.$$

From this equation and $\psi=0$, dz and z may be expressed in terms of x, y, dx and y. Substitution of these values into (19) gives rise to an equation of the form

$$M(x,y)dx+N(x,y)dy=0,$$

which may be integrated, in the form $\phi(x,y)=c$. This latter equation together with $\psi(x,y,z)=0$ gives the required solution. By giving all possible forms to the functions ψ all possible solutions will be obtained.

Similar considerations are necessary in the general case of n variables. The first considerable contribution to this theory is due to Pfaff. For this reason such an equation is known as a *Pfaffian equation*, and the problem of its integration as *Pfaff's problem*. The problem leads to a system of no more than n integral equations when the number of variables is $2n$ or $2n-1$. If the equations are of higher than the first degree in the differentials, Lie speaks of them as *Monge equations*. Many problems of differential geometry, especially in relation to the theory of complexes, are connected with Pfaffian and Monge equations.

Partial Differential Equations.— Frequently functions of several variables are defined by relations between those functions and their partial derivatives. Such equations are called partial differential equations. For the sake of simplicity we will confine ourselves to the case of a single unknown function, and for the most part to the case of two independent variables. As in the case of ordinary differential equations, it will be instructive to see first how such equations may arise as the result of elimination of arbitrary elements from equations which do not involve the derivatives. Let z be given as a function of x, y and of the two arbitrary constants a, b by the equation

$$(21)\qquad f(x,y,z;a,b)=0.$$

Let p, q represent $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ respectively. Then differentiation will give

$$(22)\qquad \frac{\partial f}{\partial z}p+\frac{\partial f}{\partial x}=0,\ \frac{\partial f}{\partial z}q+\frac{\partial f}{\partial y}=0.$$

Between the three equations (21) and (22) a and b may be eliminated. Let

$$(23)\qquad F(p,q;x,y,z)=0.$$

be the result of this elimination. It is the partial differential equation which corresponds to (21); (21) is called the *complete* integral of (23).

But a and b in (21) may be functions of x, y and still the result of the elimination may

be the same equation (23). In fact we find from (21), assuming that a and b are functions of x and y.

$$\frac{\partial f}{\partial z}p+\frac{\partial f}{\partial x}+\frac{\partial f}{\partial a}\frac{\partial a}{\partial x}+\frac{\partial f}{\partial b}\frac{\partial b}{\partial x}=0,$$

$$\frac{\partial f}{\partial z}q+\frac{\partial f}{\partial y}+\frac{\partial f}{\partial a}\frac{\partial a}{\partial y}+\frac{\partial f}{\partial b}\frac{\partial b}{\partial y}=0,$$

which equations will reduce to (22), and therefore give rise to the same equation (23), if

$$(24)\quad \frac{\partial f}{\partial a}\frac{\partial a}{\partial x}+\frac{\partial f}{\partial b}\frac{\partial b}{\partial x}=0,\ \frac{\partial f}{\partial a}\frac{\partial a}{\partial y}+\frac{\partial f}{\partial b}\frac{\partial b}{\partial y}=0.$$

Let the determinant of these equations be denoted by Δ, so that

$$\frac{\partial a}{\partial x}\frac{\partial b}{\partial y}-\frac{\partial a}{\partial y}\frac{\partial b}{\partial x}=\Delta;$$

then we may write, in place of (24), the equivalent equations

$$(24a)\qquad \Delta\frac{\partial f}{\partial a}=0,\quad \Delta\frac{\partial f}{\partial b}=0.$$

If $\Delta\neq 0$, we must therefore have

$$\frac{\partial f}{\partial a}=0,\ \frac{\partial f}{\partial b}=0.$$

From these equations a and b may be obtained as functions of x and y; if these values are substituted in (21), a function z of x and y is obtained, independent of any arbitrary constants, but still a solution of the partial differential equation (23). This solution is called a *singular* integral of (23). It may or may not be a special case of the complete integral.

Equations (24a) are also satisfied if $\sqrt{\Delta}=0$, i.e., if

$$(25)\qquad b=\phi(a),$$

where $\phi(a)$ denotes an arbitrary function of a. If we multiply the left members of (24) by dx and dy respectively, and add, we find

$$\frac{\partial f}{\partial a}da+\frac{\partial f}{\partial b}db=0,$$

whence, since $db=\phi'(a)da$,

$$(26)\qquad \frac{\partial f}{\partial a}+\frac{\partial f}{\partial b}\phi'(a)=0.$$

If we eliminate a and b from the equations (21), (25) and (26), we find z as a function of x and y, the expression of which depends upon the arbitrary function ϕ. Moreover this function z will again be a solution of (23). It is known as the *general integral* and involves an arbitrary function. It may be shown that every integral of such a partial differential equation belongs to one of these three classes.

Geometrical interpretation will again render the matter perfectly clear. Let x, y, z be coordinates of a point in space; (21) will represent a two-parameter family of surfaces, or, as we may say, a family of ∞^2 surfaces. The equation of the plane tangent to one of these surfaces at a point (x,y,z) will be

$$\zeta-z=p(\xi-x)+q(\eta-y).$$

For a fixed value of x, y, z, (23) gives therefore an infinity of planes through that point (enveloping a cone); any integral surface of (21), which passes through that point must have one of these planes as its tangent plane. In other words, the differential equation determines a certain cone corresponding to every point of space, and with this point as vertex; an integral surface must be tangent at each of its points to the corresponding cone. Now let a complete solution of the equation be given, so that we know a family of ∞^2 surfaces each of which fulfils the requirements of the problem. If we put $b=\phi(a)$, where $\phi(a)$ is any function of a, we obtain a one-parameter family of surfaces included among the ∞^2 surfaces just mentioned. The envelope of this one-parameter family is given by the general integral. The singular integral is the envelope of all of the ∞^2 surfaces of the complete integrals, provided that such an envelope exists.

Since the surface represented by the general integral is the envelope of a single infinity of surfaces represented by the complete integral, each of these latter surfaces will touch the former along a certain curve; such a curve is known as a *characteristic*. If the partial differential equation is not linear in $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$, there are ∞^3 characteristics. A linear equation has only ∞^2 characteristics. The integral surfaces may be looked upon as generated by characteristics, and the usual method of integrating the partial differential equation consists in setting up a system of ordinary differential equations which determines the characteristics.

The points of view in the higher theory.— In speaking of ordinary differential equations, we have already mentioned the fact that the point of view of the elementary theory is inadequate even in those cases in which the reduction to quadratures is possible. Given for example, the equation

$$\left(\frac{dy}{dx}\right)^2=(1-y^2)(1-k^2y^2),$$

which may be reduced to a quadrature,

$$x=\int\frac{dy}{\sqrt{(1-y^2)(1-k^2y^2)}}.$$

The reduction of the equation to this form is a mere formal process which, in itself, teaches us nothing. We shall have to ask ourselves the following questions: to what extent does a given differential equation define a function y of x? what are the characteristic properties of this function? what analytical processes involving known functions, infinite series, products, etc., will serve for the computation of the values of the function for all of the values of its argument? In the case of the above differential equations these questions have been completely answered by the creation of the theory of elliptic functions by Abel and Jacobi. In general it is to be expected that every differential equation defines a transcendental function; it is the theory of these transcendentals which constitutes properly the most important portion of the theory of differential equations.

In order fully to understand the properties of functions it has been found necessary to look upon the variable as being capable of assuming not only all real but also all complex values. In the hands of Cauchy, Riemann, Weierstrass there has grown up in this way the *theory of functions of a complex variable* (q.v.). This theory serves as a base for our further discussions. We shall, however, confine ourselves to a few of the simplest cases, merely indicating the general point of view.

Let

$$\frac{dy}{dx}=f(x, y)$$

be the given differential equation: Let $f(x, y)$ be analytic in the vicinity of (x_0, y_0) i.e., let it be possible to develop $f(x, y)$ into a series proceeding according to positive integral powers of $x-x_0$ and $y-y_0$. Then, as was first proved by Cauchy, there exists a function y of x which may be developed according to positive integral powers of $x-x_0$, which reduces to $y=y_0$ for $x=x_0$, and which satisfies the differential equation. This theorem, which may be easily generalized to apply to equations of higher order, or to systems of equations of the first order, is generally known as the fundamental theorem of the theory of differential equations. It proves the existence of analytic functions which are uniquely defined as solutions of analytic differential equations and which satisfy the subsidiary condition of reducing to given values for a given value of the argument. The theorem may be proved by the method of dominating functions. This consists in finding a series which formally satisfies the differential equation and reduces to y_0 for $x=x_0$; its convergence is then demonstrated by comparing it term for term with a corresponding series, which is formed in the same way from another differential equation, and which is known to be convergent. The exact circle of convergence cannot, however, be generally stated. A great many papers have been written on questions which easily suggest themselves in connection with this theorem. If the function $f(x,y)$ is not developable in the given form; if, for example, its development contains negative or fractional exponents, how far are its solutions determined and what is the form of their developments? Besides the analytic solutions whose existence Cauchy has demonstrated, are there other non-analytic solutions? The first investigations of these questions are due to Briot and Boquet. They have since been completed by a great many authors.

Cauchy's existence theorem can be made more precise in the case of *linear* differential equations. Let

$$(27)\qquad \frac{d^ny}{dx^n}+p_1\frac{d^{n-1}y}{dx^{n-1}}+\ldots+p_ny=0$$

be a homogeneous, linear differential equation of the nth order. In the vicinity of $x=x_0$ let the coefficients p_k be expressible as power-series, proceeding according to positive integral powers of $x-x_0$, and convergent for all values of x for which $|x-x_0|<r$, where r is a real positive quantity, i.e., for all points of the plane of the complex variable which are within a circle of radius r and of center x_0. Then there exists a function y of x, expressible as a power series convergent in the *same* domain, which satisfies the differential equation, and which, together with its first $n-1$ derivatives, assumes arbitrarily prescribed values for $x=x_0$.

The proof of this theorem, due to Fuchs, is also based on the method of dominating functions. The important point is the fact that the true radius of convergence of the series is determined by inspection from the differential equation itself. The existence of a fundamental system of solutions expressible by power-series follows at once.

Let $y_1, \ldots y_n$ be the members of such a fundamental system. Let $a_1, \ldots a_m$ be the singular points (poles) of the coefficients $p_1, \ldots p_n$ which we shall assume to be rational functions of x. Let $y_1, \ldots y_n$ be continued analytically along a path passing, in the positive direction, around one of these singular points a, and let $\bar{y}_1, \ldots \bar{y}_n$ be the new branches of the functions $y_1, \ldots y_n$ which are thus defined by power-series in the vicinity of $x=x_0$ after this process. We must have

$$(28)\qquad \bar{y}_k=a_{k1}y_1+a_{k2}y_2+\ldots+a_{kn}y_n,\ (\kappa=1, 2, \ldots n),$$

where a_{ki} are constants, since $\bar{y}_1 \ldots \bar{y}_n$ must constitute again a system of solutions (moreover a fundamental system). A new fundamental system may be chosen in the following manner. Put

$$z=c_1y_1+c_2y_2+\ldots+c_ny_n,$$

where $c_1, \ldots c_n$ are constant coefficients. After the continuation around a, z will be changed into

$$\bar{z}=c_1(a_{11}y_1+\ldots+a_{1n}y_n)+\ldots + c_n(a_{n1}y_1+\ldots+a_{nn}y_n).$$

This will be equal to ωz, where ω is a constant, if

$$(29)\qquad \begin{aligned} &c_1(a_{11}-\omega)+c_2a_{21}+\ldots+c_na_{n1}=0,\\ &c_1a_{12}+c_2(a_{22}-\omega)+\ldots+c_na_{n2}=0,\\ &\cdot\quad\cdot\quad\cdot\quad\cdot\quad\cdot\\ &c_1a_{1n}+c_2a_{2n}+\ldots+c_n(a_{nn}-\omega)=0, \end{aligned}$$

whence

$$(30)\qquad F(\omega)=\begin{vmatrix} a_{11}-\omega, & a_{21}, & \ldots & a_{n1}\\ a_{12}, & a_{22}-\omega, & \ldots & a_{n2}\\ \cdot & \cdot & \cdot & \cdot\\ a_{1n}, & a_{2n}, & \ldots & a_{nn}-\omega \end{vmatrix}=0.$$

If ω_1 is a root of (30) and the ratios of $c_1, \ldots c_n$ are determined from (29) after ω has been put equal to ω_1, we shall therefore find a solution z_1 of (27) which changes into ω_1z_1 when the variable x describes a closed path around the singular point considered. If the equation $F(\omega)=0$ has n distinct roots, we shall find n such solutions, and we may write

$$(31)\qquad \bar{z}_i=\omega_iz_i,\qquad (i=1, 2, \ldots n)$$

in place of (28). Moreover, these n solutions $z_1, \ldots z_n$ will constitute a fundamental system. We shall not attempt to discuss the case of coincident roots of the equation (30), which is known as the *fundamental* or *characteristic* equation.

Now the function

$$(x-a)^{r_i}=e^{r_i \log (x-a)},\ r_i=\frac{1}{2\pi i}\log \omega_i$$

has precisely the same property. Therefore the quotient $\frac{z_i}{(x-a)^{r_i}}$ is a function uniform in the vicinity of $x=a$, and therefore expressible by a so-called Laurent series proceeding according to positive and negative but integral powers of $x-a$. Let $\phi_1(x)$ be such series; then we have

$$(32)\qquad z_i=(x-a)^{r_i}\phi_i(x),\ (i=1, 2, \ldots n).$$

The Laurent series will be convergent for all points, excepting a itself, of the circle which has a as center and which reaches up to the nearest singular point of the differential equation. The main questions to solve are: 1st. Determine the exponents r_i; 2d. Find the coefficients of the Laurent series ϕ_i. These questions are capable of a direct and general solution in the special case in which the Laurent series contains only a finite number of terms involving negative

powers of $x-a$. In that case the differential equation (27) may be written in the form.

$$(33)\qquad \frac{d^ny}{dx^n}+\frac{P_1(x)}{x-a}\frac{d^{n-1}y}{dx^{n-1}}+\frac{P_2(x)}{(x-a)^2}\frac{d_{n-1}}{dx_{n-2}}+\ldots + \frac{P_n(x)}{(x-a)^n}y=0,$$

where $P_1, P_2, \ldots P_n$ are expressible as power-series proceeding according to *positive*, integral powers of $x-a$. The exponents r_i are then the roots of the *determinating fundamental equation* of the nth degree

$$(34)\qquad r(r-1)\ldots(r-n+1)+P_1(a)r(r-1)\ldots (r-n+2)+\ldots+P_n(a)=0.$$

After r_i has been obtained from this equation, the method of indeterminate coefficients enables one to find the coefficients of the power-series. In the case of equal roots some of the solutions may contain such terms as $\log (x-a)$, $\{\log (x-a)\}^2$, etc.; the general discussion of the various cases which may arise is rather complicated.

The case in which the equation may be written in the form (33) is usually described as that in which the solutions are *regular* about $x=a$. If they are regular in the vicinity of each singular point, including $x=\infty$, the equation is said to be of the *Fuchsian type*, and may be written as follows:

$$(35)\qquad y^{(n)}+\frac{G_{\rho-1}}{\psi}y^{(n-1)}+\frac{G_{2(\rho-1)}}{\psi^2}y^{(n-2)}+\ldots + \frac{G_{n(\rho-1)}}{\psi^m}y=0,$$

where y', y'', etc., denote the derivatives of y of the first, second order, etc., where

$$(35a)\qquad \psi=(x-a_1)(x-a_2)\ldots(x-a_m),$$

$a_1, \ldots a_m$ and ∞ being the singular points, and where G_λ denotes a polynominal in x of degree no higher than λ. The most important special case of such an equation is that of the hypergeometric series, the so-called Gauss equation, which is of the second order and has three singular points, 0, 1 and ∞. Historically, the theory of the Gauss equation, as treated by Riemann, was the origin of the general theory of linear differential equations. A large number of the most important conceptions of the theory of functions are closely connected with this equation. The question of finding the cases in which the general solution is algebraic led Schwarz, Fuchs and Klein to the remarkable algebraic functions which are connected with the five regular solids. This equation also leads to the general theory of automorphic functions, of which the elliptic functions are a special case.

If, in the vicinity of a singular point, the solutions are regular, they may be developed in the manner indicated. The problem of finding the developments of the solution in the vicinity of a point where they are not regular is far more difficult and still awaits a satisfactory general solution. A solution, not regular at $x=a$, may have the special form.

$$e^{\Omega}(x-a)^{\rho}\psi(x),$$

where ρ is a constant, where $\psi(x)$ is an ordinary power-series in $x-a$, and where

$$\Omega=\frac{a_1}{(x-a)^s}+\frac{a_2}{(x-a)^{s-1}}+\ldots+\frac{a^s}{x-a},$$

so that it differs from a regular integral only by the presence of the factor e^{Ω}. Such an integral, if it exists, is called a *normal integral.* There may also be integrals of a similar form in which, however, $(x-a)^{1/k}$ appears in place of $x-a$, where k is a positive integer. They are called *subnormal.* The conditions for the existence of normal and subnormal integrals have been investigated, but none of these investigations is as yet in a final form. Considerable progress in the theory of non-regular integrals has been made in recent years by Birkhoff.

It is possible however to change the method of attack. The general theory shows that, in the vicinity of the singular point $x=a$, a solution exists of the form $(x-a)^{\rho}\phi(x)$, where $\phi(x)$ is, in general, a Laurent series. The question is this: how to determine the exponent ρ and the coefficients of $\phi(x)$. In the regular case, when $\phi(x)$ is an ordinary power-series, substitution of this expression into the differential equation, and comparison of powers of $x-a$, solves the problem. One may do the same thing in general. But then one finds it necessary to solve a system of linear equations infinite in number and with an infinity of unknown quantities. This leads to the notion of *infinite determinants,* due primarily to G. W. Hill. Hill applied infinite determinants just as though they were finite, paying no attention to convergence or rigorous definitions. This deficiency was made up and the whole theory placed upon a solid basis by Poincaré and Koch.

The theory of linear differential equations has served as a basis for practically all that is known about non-linear equations. There are two fundamental properties of the linear equations which render them peculiarly accessible. In the first place it is known, *a priori,* how the arbitrary constants enter into the expression of its general integral; in the second place the singular points of its solutions are *fixed,* i.e. independent of the constants of integration. Other classes of differential equations may be defined which have one or both of these properties. The first-mentioned point of view leads to the differential equations with fundamental solutions. These may be defined in various ways and have been investigated by Guldberg, Vessiot, Lie and Wilczynski. The idea of investigating the differential equations with fixed branch-points is due to Fuchs. For equations of the first order he succeeded in formulating the conditions in a very simple theorem. Poincaré then showed that all such equations can be transformed into a Ricati equation, i.e., an equation of the form

$$(36)\qquad \frac{dy}{dx}=a_0+a_1y+a_2y^2,$$

where a_0, a_1, a_2 are functions of x, or else are integrable by quadratures or algebraic functions. Differential equations of the first order with fixed branch-points do not, therefore, as was at first expected, lead to new transcendental functions. For, the Riccati equation may, by the transformation $y=-\frac{1}{a_2z}\frac{dz}{dx}$, be converted into a linear differential equation of the second order. It may be noted, incidentally, that this remark enables us to prove, in a simple manner, the theorem that the anharmonic ratio of any four solutions of a Riccati equation is constant. This is important in geometric applications.

The most important recent investigations in the theory of differential equations, from the standpoint of the theory of functions of a complex variable, are due to Painlevé. A brief account of some of them will indicate their fundamental nature. Let

$$\frac{dy}{dx}=f(x,\,y) \tag{37}$$

be an algebraic differential equation of the first order. The general integral will be a function of x and u, u being the constant of integration. We may, instead, consider u as a function of x and y defined by the partial differential equation

$$\frac{\partial u}{\partial x}+\frac{\partial u}{\partial y}f(x,\,y)=0. \tag{38}$$

The general integral of (37) is said to be *reducible* if other equations, algebraic in x, y, u, $\frac{\partial u}{\partial x}$, $\frac{\partial u}{\partial y}$, $\frac{\partial^2 u}{\partial x^2}$, etc., may be adjoined to (38) compatible with it without being deducible therefrom. All of the equations of the first order which have been studied are reducible in this sense; for instance, the Riccati equation, the linear equation, etc. In the case of a linear equation the condition $\frac{\partial^2 u}{\partial y^2}=0$ may be thus adjoined; if the equation admits an algebraic integrating factor λ, we may adjoin the condition $\frac{\partial u}{\partial y}=\lambda$; etc. This definition of reducibility may be extended to equations, or systems of equations, of any order.

Applied to equations of the first order, the following theorem results. If an equation of the first order is reducible, only four cases are possible: 1st, the equation is algebraically integrable; 2d, it has an algebraic integrating factor; 3d, the logarithm of the integrating factor has algebraic first derivatives; 4th, a first integral is given by a system of differential equations whose general solution is of the form $u=\frac{au_1+b}{cu_1+d}$, (a, b, c, d being arbitrary constants,) and which may be reduced to a Riccati equation.

Irreducible equations of the first order lead to known results, if we confine ourselves to the case that y shall be a uniform function of x. This is not the case, however, for equations of higher order. Among the equations of the second order, the simplest case is that of the equation

$$y''=6y^2+x. \tag{39}$$

Its general integral is a uniform function of x, which may be represented as a quotient of two integral transcendental functions in the form $y=\frac{d^2\log u}{dx^2}$, where u is an integral transcendental function which satisfies the equation

$$\tfrac{1}{2}(z'')^2+2(z')^3+xz'-z=0, \tag{40}$$

where $z=\frac{u'}{u}$, and which may, therefore, be represented by an ordinary power-series convergent for all values of x.

Although great progress has been made in this direction and although greater progress is to be expected as the efforts of mathematicians are being gradually rewarded, the results are meager from the point of view of the mathematical physicist, who would like to refer to the mathematician the questions connected with the integration of a differential equation which may have appeared in some of his investigations. For very rarely will it happen that such an equation belongs to one of the classes with which the mathematician is prepared to deal. It remains necessary to study such equations directly by methods of successive approximation especially adapted to them, usually upon the assumption that all of the variables that enter be confined to real values. The restriction to real variables in such cases, the systematic and rigorous application of the method of successive approximations, has been productive of many valuable results in recent years, especially in the hands of Picard and Hilbert. The theory of partial differential equations, primarily, has made rapid progress through their efforts and many mathematicians are following their example. It may, however, be predicted that, even in the theory of partial differential equations, the restriction to real variables will gradually pass away. For in the case of analytic functions, and these after all are the most important, the characteristic properties are veiled by such a restriction. But a necessary prerequisite for a theory of partial differential equations with complex variables is the theory of functions of several complex arguments; this theory, however, is still in its infancy.

Painlevé, 'Leçons sur la théorie analytique des équations différentielles, professées à Stockholm,' Sept., Oct., Nov., 1895. Lithographed at Paris, 1897, an account of the most advanced points of view. L. Schlesinger, 'Handbuch der Theorie der linearen Differentialgleichungen' (Leipzig 1895–98). For further bibliographical indications and for a brief account of the whole subject from the point of view of the expert mathematician, see the various articles on differential equations in 'Encyclopädie der mathematischen Wissenschaften mit Einschluss ihrer Anwendungen,' which is now being published in Leipzig. A French edition, much more extensive than the German edition, of this monumental work is also being published.

ERNEST J. WILCZYNSKI,
Professor of Mathematics, University of Chicago.

EQUATIONS, Galois' Theory of.— In the 16th century the Italian mathematicians succeeded in solving the cubic and biquadratic equations. Their brilliant achievements must have made it seem probable that the solution

of the equations of fifth and higher degrees would soon be found. Such, however, was not to be the case. For two centuries the first mathematicians of the day essayed in vain to solve the quintic. Tschirnhausen, Euler, Vandermonde, Malfatti and Lagrange embodied their researches in valuable memoirs, but at the close of the 18th century the solution of the equation of the fifth degree seems farther away than ever.

In their apparent defeat, however, lay the germs of ultimate victory. As a result of all these investigations it became manifest that the solution of algebraic equations and certain groups of substitutions of their roots were intimately related. In the case of the general equations of degrees three and four this relation was very clear indeed; it was less clear in regard to the general equation of degree n, and still more hazy in regard to the special equations which had been considered up to that time. It was reserved to Evareste Galois to put these loose ends together and to develop a theory of the solution of algebraic equations at once simple and far-reaching. Indeed, the ideas of Galois are not only fundamental in most algebraic investigations, but they have also been extended by Lie and others with great effect to the theory of differential equations. But even here they do not stop. It is in Galois' theory that the notion of a group first came prominently before the mathematical public; a notion which to-day pervades a good part of the whole domain of mathematics.

Galois died at the age of 22 (1832). Twice he presented memoirs to the Paris Academy, containing an account of his theory. The first was lost, the second was returned to its youthful author by Poisson as unintelligible. Galois' theory was first made public to the mathematical world in 1846 when Liouville published this latter memoir without comments. In 1858 Betti published an exposition of Galois' theory with complete proofs and some valuable extensions.

Lagrange in his great memoir of 1770–71 developed what he styled a *calcul des combinaisons* and which is in fact the origin of Galois' Theory of Equations. This new *calcul* was further developed in a number of papers by Ruffini, beginning 1799, who tried to demonstrate the impossibility of the algebraic solution of the general equation of degrees greater than four by this means; by Gauss (1801) and Lagrange (1808) in the solution of the equations on which the roots of unity depend; and finally by Abel, who, besides being the first to rigorously demonstrate the insolvability of the quintic by radicals (1826), discovered a new class of algebraic solvable equations which occur in the division of the elliptic functions (1829).

BASAL NOTIONS.

Domain of Rationality.— One of the most fundamental notions in Galois' theory is that of a domain of rationality which was first clearly formulated by Abel. When an equation

$$f(x)=a_0x^n+a_1x^{n-1}+\dots+a_{n-1}x+a_n=0 \tag{1}$$

offers itself for solution, its coefficients are supposed known. It often happens that other quantities are known, or are assumed as known. Suppose λ, μ, ... ω are such quantics, finite in number. The totality of rational functions of these letters with rational numbers as coefficients constitutes a domain of rationality which we denote by,

$$R(\lambda,\,\mu,\,\dots\,\omega).$$

Thus any element of this domain may be obtained by a finite number of additions, subtractions, multiplications and divisions performed on the letters λ, μ, ... ω. The domain of rationality which we lay at the base of a given algebraic investigation is to some degree a matter of choice. In any case, however, the coefficients of the equations we start with should lie in it.

Every domain must contain the domain $R(1)$, called the absolute domain, and which is simply the totality of rational numbers. For the domain $R(\lambda, \dots \omega)$ must contain the element $\lambda/\lambda=1$. It is often desirable to add certain elements η, ζ, ... to a domain $R(\lambda, \mu, \dots)$ forming the new domain $R'(\lambda, \mu, \dots \eta, \zeta, \dots)$ The elements η, ζ, ... are said to be *adjoined* to R.

Rational Functions in R.— In elementary algebra and in the function theory a rational function of x, y, z, ... is an expression of the form

$$\frac{Ax^{m_1}y^{m_2}z^{m_3}\dots+\dots}{Bx^{n_1}y^{n_2}z^{n_3}\dots+\dots}, \tag{2}$$

where the exponents m, n are non-negative integers and the coefficients are merely independent of the variables x, y, z, ... In Galois' theory the term rational function is a much narrower one. In fact the term rational has no meaning unless in connection with a specific domain of rationality. Thus the expression (2) is a rational function of x, y, ... in Galois' theory with respect to the domain R, when and only when the coefficients A, B, ... lie in R. Thus such a function as (2) may be rational with respect to one domain and not with respect to another. For example

$$x+\sqrt{-3}\,y.$$

is a rational function of x, y with respect to the domain $R(\rho)$, $\rho=e^{\frac{2\pi i}{3}}$; but it is not rational with respect to $R(1)$ or $R(\sqrt{-5})$. When the denominator in (2) reduces to a constant, it becomes a rational *integral* function.

An equation as (1) is *rational* with respect to R when its coefficients a_0, a_1, ... a_n lie in R.

Reducibility and Irreducibility is another basal notion of Galois' theory. The rational integral function of x, y, z ...,

$$F(x,\,y,\,z,\,\dots)=Ax^{m_1}y^{m_2}z^{m_3}\dots+\dots+Lx^{r_1}y^{r_2}z^{r_3}\dots, \tag{3}$$

with respect to the domain R is *reducible* in R when it is the product of two or more rational integral functions of x, y ... with coefficients in R, viz., $F=G\cdot H\cdot I\dots$ In this case we say F is divisible by G, H, ..., which are factors or divisors of F in the domain R. If the expression (3) cannot be split up into two such factors, it is *irreducible* with respect to R. An equation as (1) is reducible or irreducible in R according as its left side is reducible or irreducible in R.

An equation as (1) may be irreducible in one domain and reducible in another. Thus

$$x^2+x+1=0$$

is irreducible in $R(1)$, but is reducible in $R(\sqrt{-3})$. In fact,

$$x^2+x+1=(x-\rho)\,(x-\rho^2),\quad \rho=e^{\frac{2\pi i}{3}}$$

If $\xi_1, \ldots \xi_n$ are the roots of (1), it is obviously reducible in $R(\xi_1, \ldots \xi_n)$. In fact its left side splits up into rational lineal factors,

$$f(x) = a_0(x-\xi_1)\ldots(x-\xi_n).$$

A theorem of utmost importance in Galois' theory is the following:

Let $f(x)=0$, $g(x)=0$ be rational equations for the domain R, and let $f(x)=0$ be irreducible in R. If $g(x)=0$ admits a root of $f(x)=0$, it admits all the roots of $f(x)=0$, and $g(x)$ is divisible by $f(x)$.

Equality.—As a third pillar on which Galois' theory rests is the distinction between *formal* and *numerical* equality, as we may designate it for lack of better terms. It is only by such a distinction that Galois was able to extend Lagrange's methods so as to apply to any type of algebraic equation. As long as we are dealing with constants, equality and inequality are of course the same as in arithmetic — they are numerical. What do we mean, however, by the equation

$$\phi(p, q, \ldots) = \psi(p, q, \ldots),$$

ϕ, ψ being rational functions of the variables p, q, ... for a domain R? In general R will contain variable elements which then may enter the coefficients of ϕ, ψ. Let us write the above equation

$$\phi(v_1, v_2, \ldots c_1, c_2, \ldots) = \psi(v_1, v_2, \ldots c_1, c_2, \ldots),$$

where v_1, v_2 represent now all the variable elements in ϕ, ψ, among which will be p, q, ..., while c_1, c_2, ... represent constants. By an equation of the above type we mean: *that for each and every set of numerical values v_1, v_2, ... can take on consistent with their definition, the resulting numerical value of ϕ is identical with that of ψ.*

When no two of the quantities ϕ, ψ, χ, ... are equal we shall call them *distinct* or *unequal.*

THE GALOISIAN RESOLVENT AND GROUP.

Construction of n!-valued Functions; Indeterminants.— Let

$$f(x) = a_0x^n + a_1x^{n-1} + \ldots + a_n = 0 \quad (1)$$

be an equation whose solution is to be effected. The first thing to do is to choose a domain of rationality R. As already remarked, the nature of R depends partly upon (1) and partly upon our own pleasure. In any case it must contain the coefficients.

Without loss of generality we may suppose its roots unequal. For by means of the greatest common divisor of $f(x)$ and $f'(x)$ we may obtain by rational operations an equation whose roots are the distinct roots of (1).

Let us now adjoin n new variables $u_1, \ldots u_n$ to R, forming a domain R', and introduce the rational function

$$V_1 = u_1x_1 + u_2x_2 + \ldots + u_nx_n. \quad (4)$$

If we permute the $x_1, x_2, \ldots x_n$ in all possible ways, or, as we say, apply the $n!$ substitution

$$\begin{pmatrix} x_1 & x_2 & \ldots & x_n \\ x_{i_1} & x_{i_2} & \ldots & x_{i_n} \end{pmatrix}$$

of the symmetric group, we get the $n!$ functions

$$V_1, V_2, \ldots V_{n!}. \quad (5)$$

With these we form the equation

$$F(t; u_1, \ldots u_n) = (t-V_1)(t-V_2)\ldots(t-V_{n!}) = 0, \quad (6)$$

whose coefficients lie in R'. In the discriminant of (6), $D(u_1, \ldots u_n)$, we may give to $u_1, \ldots u_n$ values, $a_1, \ldots a_n$, in R, integral values, even, if we choose, in an infinity of ways so that $D \neq 0$. In that case the quantics (5) are distinct and the roots of (6) thus unequal. The function (4) has thus $n!$ values under the symmetric group. A special case of this function (4) was used by Lagrange; in its general form it was first employed by Abel. Its fundamental importance in the solution of algebraic equations was first brought out by Galois. For this reason the function V in (4) is called the *Galoisian resolvent function.* Besides the function (4) there are obviously an infinity of other $n!$-valued functions. The function (4) is employed on account of its simplicity.

On replacing the u's by the a's these variables disappear. Their introduction was to show the existence of $n!$-valued rational functions of the roots $x_1, \ldots x_n$. Such auxiliary variables which we introduce into our reasoning, and which at any moment can be made to disappear by giving them appropriate special values, are called *indeterminates.* In a primitive way they are used by all mathematicians. Kronecker has shown that they are an implement of immense power in algebraic investigations. Since in the end we can always replace the indeterminates by values lying in our domain, we shall suppose that our domain contains in advance as many of these auxiliary variables as we care to use.

Galoisian Resolvent and Group.— In general the equation (6) is reducible in R, so that

$$F(t) = G_0(t, u_1, \ldots u_n)\, G_1(t, u_1, \ldots u_n) \ldots$$

Let us take now any one of these irreducible factors, say that one which admits V_1 as root, to form the equation

$$G_0(t, u_1, \ldots u_n) = 0. \quad (7)$$

This is called the *Galoisian Resolvent of (1) for the domain R.* Let its degree in t be m.

Galois showed now that the solutions of (1) and (7) are equivalent problems. In fact every rational function of the roots of (1), and in particular the roots themselves and hence also the roots $V_2, V_3, \ldots V_m$ of (7), are rational functions of V_1. We have therefore for any rational function of the x's

$$\phi(x_1, \ldots x_n) = r_0 + r_1V_1 + r_2V_1^2 + \ldots + r_{m-1}V_1^{m-1}.$$

The advance that is made by considering the equation (7) instead of the original equation (1) lies in the fact that the roots of (7) are rational in any one of them. Let the roots of (7) be

$$V_1, V_2, \ldots V_m.$$

These are obtained from the expression (4) by effecting certain substitutions,

$$s_1 = 1, s_2, \ldots s_m, \quad (G)$$

on the roots $x_1, \ldots x_n$. These m substitutions G enjoy now three remarkable properties:

1° *Every rational function $\phi(x_1, \ldots x_n)$ of the roots of (1) which remains unaltered by G lies in R, or, as we say, is rationally known.*

2° *If the rational function of the roots $\phi(x_1, \ldots x_n)$ is rationally known, it remains unaltered for the substitutions G.*

3° *The substitutions G form a group, and there is no other group of substitutions having the properties 1°, 2°.*

This group is called *the Galoisian group of the equation (1) for the domain R.* For the definition of the various terms concerning groups see GROUPS, THEORY OF. The *index* of a sub-group H of a group G with respect to G is the ratio between the number of terms in H

and the number of terms in G. We say for the domain R, because by changing R the irreducible factors of (6) will in general change, and therefore the substitutions G will in general change. The importance of the Galoisian group, or, as we shall say more shortly, *the Group,* of an equation $f(x)=0$ lies in the fact that an investigation of its structure reveals many of the most important properties of the algebraic irrationalities defined by this equation. In particular it affords a rational and uniform scheme for effecting the solution of any algebraic equation. Before entering on this topic let us consider

SOME PROPERTIES OF THE GALOISIAN GROUP G.

Since the group G of an equation

$$a_0x^n + a_1x^{n-1} + \ldots + a_n = 0 \quad (1)$$

is unique for a given domain of rationality R, it follows: 1° that the group is independent of the particular $n!$-valued function we take; 2° that we get the same group whichever of the irreducible factors $G_0(t), G_1(t), \ldots$ of (6) we may choose; and 3° that these functions G_0, G_1, ... are all of the same degree.

4°. *In any rational equation*

$$\phi(x_1, \ldots x_n) = \psi(x_1, \ldots x_n)$$

between the roots of (1) the substitutions of G may be applied, and the result is a true equation.

This is not true for all substitutions. For example, let

$$f(x) = x^3 - 1 = 0,$$

whose roots are

$$x_m = e^{\frac{2\pi i m}{3}}, \quad m = 0, 1, 2.$$

Take as domain $R(1)$, and as rational relation

$$x_1x_2 = 1.$$

On applying the substitution

$$\begin{pmatrix} x_0x_1x_2 \\ x_1x_2x_0 \end{pmatrix} = (0, 1, 2)$$

this relation becomes,

$$x_0x_2 = 1,$$

which is false.

Group Belonging to a Rational Function of the Roots and Rational Functions Belonging to a Group.—Let

$$\phi(x_1, \ldots x_n)$$

be a rational function of the roots of (1). Since the group G of (1) contains the identical substitution, ϕ remains unaltered by at least one substitution of G and may remain unaltered by others. *These substitutions form a subgroup of G called the group belonging to ϕ.* On the other hand, let H be a subgroup of G. Any rational function $\phi(x_1, \ldots x_n)$ which remains unaltered by the substitutions of H but is changed by all other substitutions of G is said to belong to H. It is important to note that while the substitutions of the Galoisian group which leave a rational function $\phi(x_1, \ldots x_n)$ unaltered form a group, this property does not hold for substitutions which lie outside G. For example, the substitutions of the symmetric group S_6 which leave

$$\phi = x_1x_5, \quad x_m = e^{\frac{2\pi i m}{6}}, \quad m = 0, 1, 2, 3, 4, 5,$$

do not form a group. This is due to the fact that the group of the equation $x^6 - 1 = 0$, the domain being $R(1)$, is not S_6 but a smaller group.

If $\phi(x_1, \ldots x_n)$, $\psi(x_1, \ldots x_n)$ belong to the same subgroup H of the Galoisian group, each can be expressed rationally in terms of the other.

RATIONAL RESOLVENTS.

Let $\phi(x_1, \ldots x_n)$ be a rational function of the roots of

$$a_0x^n + a_1x^{n-1} + \ldots + a_n = 0, \quad (1)$$

whose group for the domain R is G. Let ϕ belong to a subgroup H of G of index r. Then on applying the substitutions of G to ϕ it will take on r distinct values,

$$\phi, \phi_1, \ldots \phi_{r-1}, \quad (8)$$

which are called *conjugate functions.* They are in fact roots of an irreducible equation

$$\Phi(y) = (y-\phi)(y-\phi_1)\ldots(y-\phi_{r-1}), \quad (9)$$

whose coefficients lie in R. It is thus a rational equation. Suppose one of its roots, say ϕ, can be found. If we adjoin it to R, forming a domain R', the group of (1) is no longer G, but H.

Suppose not only ϕ but all the roots of (9) can be found. Their adjunction to R forms a domain R'' for which the group of (1) is the greatest invariant subgroup of G contained in H. In any case the adjunction of one or more roots of (9) produces a reduction of the group of the given equation (1). But in reducing the group of this equation we have made a step in its solution. For when the domain of rationality has been enlarged to such an extent that the group of the equation (1) embraces only the identical substitution, the roots of (1) are rationally known, that is, can be expressed rationally in terms of quantities lying in that domain of rationality. The equation (9) is called a resolvent equation, or more specifically a *rational resolvent,* since its roots ϕ, ϕ_1, ... are rational functions of the roots of a given equation (1).

The group of the resolvent equation (9) is of importance sometimes. In the functions (8) considered as functions of the x's, let us effect the substitutions of the group G. This gives rise to a substitution group Γ in the ϕ's, and this group is the group of the resolvent equation (9), the domain of rationality being that of G, viz., R. The groups G and Γ are what is called meroedrically isomorphic. To the identical substitution of Γ corresponds the group I above mentioned, viz., the subgroup of G, which leaves all the roots (8) unaltered. To any subgroup Γ_1 of Γ will correspond a subgroup G_1 of G, and conversely. In particular if Γ_1 is an invariant subgroup, G_1 is also invariant.

GALOIS' SOLUTION OF AN EQUATION.

Let G be the group of the equation

$$a_0x^n + a_1x^{n-1} + \ldots + a_n = 0 \quad (1)$$

for the domain R. Let H_1 be a subgroup of G of index r_1. Let $\phi_1(x_1, \ldots x_n)$ be any one of the infinity of rational functions belonging to H_1. Then ϕ_1 is root of a rational resolvent $\Phi_1(y) = 0$ of degree r_1. On solving $\Phi_1 = 0$ and adjoining one or more of its roots to form a new domain R_1, the group of (1) is now a subgroup of G_1 of G. Let H_2 be a subgroup of G_1 of index r_2, to which belongs the rational function $\phi_2(x_1, \ldots x_n)$. This is the root of a resolvent $\Phi_2(y)=0$ of degree r_2. On solving $\Phi_2=0$ and adjoining one or more of its roots to form a new domain R_2, the group of (1) is now a subgroup G_2 of G_1. As the order of the groups G, G_1, G_2, decreases, we must eventually arrive at the identical group when the roots of (1) are rationally known. Since the group G usually admits quite a variety of subgroups, and since the functions ϕ belonging to a given subgroup are infinite in number, Galois' theory shows that the number of ways for solving a given equation is endless. At the same time it clearly shows that the number of distinct ways is usually quite limited, depending on the subgroups of G.

Among the solutions of the equation (1) which Galois' theory offers, one class is particularly interesting, depending on a

Series of Composition.— This is defined as follows: Let G_1 be an invariant subgroup of G, such that G contains no invariant subgroup containing G_1. It is then a *maximum invariant* subgroup of G. If G has no maximum invariant subgroup besides the identical group, it is *simple*. The series of groups

$$G, G_1\, G_2, \ldots G_\lambda=1, \qquad (10)$$

such that each is a maximum invariant subgroup of the preceding group, is called a *series of composition of* G. If the index of G_m under G_{m-1} is r_m, the numbers $r_1, r_2, \ldots r_\lambda$ are called *the factors of composition.* It may be possible to decompose a group G into a series of composition in more than one way. Thus the cyclic group C_6,

$$1,\ s,\ s^2,\ s^3,\ s^4,\ s^5,$$

where $s=\begin{pmatrix}x_1x_2x_3x_4x_5x_6\\ x_2x_3x_4x_5x_6x_1\end{pmatrix}=(1,\ 2,\ 3,\ 4,\ 5,\ 6)$ admits the series

$$C_6, A, 1$$

and

$$C_6, B, 1,$$

where

$$A=\{1, s^2, s^4\},\quad B=\{1, s^3\}.$$

The factors of composition of the first series are 2, 3, while those of the second series are 3, 2. They are thus the same aside from their order. A theorem of Jordan states that *however a group be decomposed in a series of composition, the factors of composition are the same aside from their order.*

What makes the solution of an equation by means of a series of composition so remarkable is the fact that the resolvents $\Phi_1=0, \Phi_2=0, \ldots, \Phi_\lambda=0$ corresponding to the subgroups G_1, $G_2 \ldots G_{\lambda-1}$ of (10) have groups $\Gamma_1, \Gamma_2, \ldots \Gamma_\lambda$ for their respective domains which are simple. Their orders are the factors of composition. Moreover, any root of one of these equations is a rational function of any root of that equation. Thus on adjoining one of its roots the same effect is produced as adjoining all. Finally, the resolvent equations $\Phi=0$ are the simplest possible.

Cyclic Equation of Prime Degree.— When the group G of an equation $F(x)=0$ is a cyclic group of prime order p its solution is readily effected, as Abel showed. Let the roots of $F=0$ be $x_0, x_1, \ldots x_{p-1}$, and let $\gamma=(0, 1, \ldots p-1)$. Then

$$G=\{1, \gamma, \gamma^2, \ldots \gamma^{p-1}\}.$$

For the case in hand we may suppose the pth roots of unity $\rho, \rho^2, \ldots$ lie in the original domain of rationality. Consider the rational functions

$$\theta_h=x_0+\rho^h x_1+\ldots+\rho^{h(p-1)}x_{p-1};\ h=1, 2, \ldots p-1.$$

On applying γ they go over into $\rho^{-h}\theta$. Hence $\theta^p_h=\Theta_h$ are unaltered by γ and hence by G. They are therefore rationally known. On extracting a pth root we get

$$x_0+\rho^h x_1+\ldots+\rho^{h(p-1)}x_{p-1}=\sqrt[p]{\Theta_h}.$$

This system of $p-1$ equations together with

$$x_0+x_1+\ldots+x_{p-1}=\sqrt{\Theta_0}$$

gives

$$x_s=\frac{1}{p}\sum_{h=0}^{p-1}\rho^{-hs}\sqrt[p]{\Theta_h}, \quad s=0, 1, \ldots p-1.$$

The pth roots which enter here must be determined uniquely in terms of one of them, say $\sqrt[p]{\Theta_1}$. The others are rational in this one, for

$$(x_0+\rho^h x_1+\ldots+\rho^{(p-1)h}x_{p-1})$$
$$(x_0+\rho x_1+\ldots+\rho^{p-1}x_{p-1})^{p-h}=A_h$$

remains unchanged for γ and hence for G. Hence these A_h are rationally known. We have now

$$x_s=\frac{1}{p\Theta_1}\sum_h \rho^{-hs}\left(\sqrt[p]{\Theta_1}\right)^h A_h.$$

This result gives the theorem: *Cyclic equations of prime degrees can be solved algebraically*, i.e., *by the extraction of roots from known quantities.*

Algebraic Solution of an Equation.— Let the equation

$$a_0x^n+a_1x^{n-1}+\ldots+a_n=0 \qquad (1)$$

have a group G for a certain domain R, whose factors of composition

$$r_1, r_2, \ldots$$

are all primes. Then (1) can be solved algebraically. For the corresponding chain of resolvents

$$\Phi_1=0, \Phi_2=0, \ldots$$

have groups of prime orders $r_1, r_2, \ldots$; they are therefore cyclic equations, whose solution has just been effected. Since, as will be set forth later at more length, it is never necessary to employ other than rational resolvents, the above results leads to Galois' Criterion for the Solution of an Equation by Radicals. *In order that (1) admit an algebraic solution it is necessary and sufficient that the factors of composition of its Galoisian group consist of primes only.*

Application to the Solution of the Biquadratic

$$x^4+a_1x^3+a_2x^2+a_3x+a_4=0. \qquad (11)$$

For simplicity let us suppose its coefficients are independent variables. Let the original domain of rationality R embrace besides the coefficients a cube root of unity ρ. Then the group of (11) is the symmetric group S_4. As subgroups of S_4 we note the alternate group A_4, which consists of all the substitutions of S_4 which can be obtained by an even number of exchanges of the roots of our equation, the axial group $G_4=\{1, (12)(34), (13)(24), (14)(23)\}$, and the semi-axial group $G_2=\{1, (12)(34)\}$. The groups S_4, A_4, G_4, G_2, 1 form a series of composition whose factors are obviously

$$2, 3, 2, 2.$$

As they are primes, the equation (11) admits an algebraic solution. To solve (11) let us proceed with Starkweather as follows: To form our first resolvent, let us use the subgroup A_4, and take as function belonging to this group

$$\phi=(x_1-x_2)(x_1-x_3)(x_1-x_4)$$
$$(x_2-x_3)(x_2-x_4)(x_3-x_4) \qquad (12)$$

The corresponding resolvent is

$$\Phi=\phi^2-\Delta=0, \qquad (13)$$

where Δ is the discriminant of (11).

On adjoining $\phi=\sqrt{\Delta}$ our domain is $R_1(R,\sqrt{\Delta})$, for which the group of (11) is A_4.

A subgroup of A_4 is G_4. A rational function belonging to this is

$$\psi=x_1x_2+x_3x_4.$$

This gives the resolvent

$$\Psi=\psi^3-a_2\psi^2+(a_1a_3-4a_4)\psi$$
$$-\{a_4(a_1^2-4a_2)+a_3^2\}=0. \qquad (14)$$

The solution of this cubic, which is a cyclic equation, gives ψ as a known explicit function of quantities in R_1. On adjoining ψ we get the domain $R_2(R,\sqrt{\Delta},\psi)$, for which the group of (11) is G_4. The next subgroup we take is G_2 to which belongs

$$\chi=x_1+x_2-(x_3+x_4).$$

This gives the resolvent

$$X=\chi^2-(4\psi+a_1^2-4a_2)=0.$$

The extraction of a square root gives χ, whose adjunction produces the domain $R_3(R,\sqrt{\Delta},\psi,\chi)$, for which the corresponding group of (11) is G_2. The last group we take is the identical group, to which belongs x_1. The corresponding resolvent is

$$x^2+\tfrac{1}{2}(a_1-\chi)x+\left(\psi+\frac{2a_3-a_1\psi}{\chi}\right)=0.$$

The solution of this quadratic gives x_1. Its adjunction gives the domain $R_4(R,\sqrt{\Delta}, \psi, \chi, x_1)$ for which the group consists only of the identical substitution. Hence all the other roots of (11), viz., x_2, x_3, x_4, must lie in R_4. This is indeed so, for

$$x_2=x_1-\tfrac{1}{2}a_1+\tfrac{1}{2}\chi.$$

To get x_3, x_4, we note that if ψ', ψ'' denote the two other roots of (14),

$$a=\psi'-\psi''=\frac{(\psi-\psi')(\psi-\psi'')(\psi'-\psi'')}{(\psi-\psi')(\psi-\psi'')}.$$

Here the numerator is the square root of the discriminant of (14), which, as is well known, is the same as the discriminant Δ of (11). The denominator is obviously $\frac{d\Psi}{d\psi}$. Thus

$$a=\frac{\sqrt{\Delta}}{\Psi'}=(x_1-x_2)(x_3-x_4),$$

a quantity lying in R_4.

Moreover, x_1, x_2 being already found, $x_1-x_2=\beta$ and $x_1+x_2=\gamma$ are known; also $x_1+x_2+x_3+x_4=\gamma+x_3+x_4=-a_1$ is known. This last with $\beta(x_3-x_4)=a$ gives x_3 and x_4.

Lagrange's Solution instead of employing a series of composition uses the following subgroups, A_4, O, G_2, 1, where

$$O=\{1, (1324), (13)(24), (1423), (12), (34), (12)(34), (14)(23)\}.$$

As rational function belonging to A_4 Lagrange uses the function (12), which gives rise to the resolvent (13). As rational function belonging to O, Lagrange takes

$$\theta=\{x_1+x_2-(x_3+x_4)\}^2,$$

whose conjugate values are

$$\theta_1=\{x_1+x_3-(x_2+x_4)\}^2,\ \theta_2=\{x_1+x_4-(x_3+x_2)\}^2.$$

The corresponding resolvent is

$$\Theta=\theta^3-(3a_1^2-8a_2)\theta^2+(3a_1^4-16a_1^2a_2+16_2a^2$$
$$+16a_1a_3-64a_4)\theta-(a_1^3-4a_1a_2+8a_3)^2=0.$$

For the subgroup G_2 he takes

$$\eta=x_1+x_3-(x_2+x_4),$$

which gives the resolvent

$$H=\eta^2-\theta_1=0.$$

For the identical group 1, Lagrange uses

$$\omega=x_1+x_2-(x_3+x_4),$$

which gives the resolvent

$$\Omega=\omega^2-\Theta=0.$$

For the domain $R'(R, \sqrt{\Delta}, \theta, \theta_1, \theta_2, \eta, \omega)$, the group of the biquadratic is (1), and its roots therefore lie in R'. In fact we have

$$x_1+x_2-x_3-x_4=\sqrt{\theta},$$
$$x_1+x_3-x_2-x_4=\sqrt{\theta_1},$$
$$x_1+x_4-x_3-x_2=\sqrt{\theta_2},$$
$$x_1+x_2+x_3+x_4=-a_1.$$

From which we get

$$x_s=\tfrac{1}{4}(-a_1+\sqrt{\theta}+\sqrt{\theta_1}+\sqrt{\theta_2}),\ s=1, 2, 3, 4.$$

Here we choose at will the signs of $\sqrt{\theta}$, $\sqrt{\theta_1}$. The sign of $\sqrt{\theta_2}$ is then determined, for

$$\sqrt{\theta}\sqrt{\theta_1}\sqrt{\theta_2}=4a_1a_2-a_1^3-8a_3.$$

Abelian Equations.— Let G be the group of an equation $f(x)=0$ for a certain domain. If the substitutions of G are commutative, that is, f $s_\iota s_\kappa=s_\kappa s_\iota$ for any two substitutions s_ι, s_κ of G, the equation $f=0$ is called Abelian in honor of Abel, who first studied them. We may show at once that every subgroup of G is invariant and that its factors of composition are all primes. Hence *all Abelian equations can be solved algebraically.* The most important equations of this type are the equations of degree $\phi(n)$ on which the nth roots of unity depend. Here $\phi(n)$, called the *totient of* n, is

$$n\left(1-\frac{1}{p}\right)\left(1-\frac{1}{q}\right)\ldots,$$

where $p, q, \ldots$ are the different prime factors of n. The domain of rationality is $R(1)$.

Equation of Degree >4.— The group of the equation (1) when no restrictions are placed on the coefficients, i.e., when they are independent variables, and when the domain of rationality contains not only the coefficients but any constants, is the symmetric group. When $n=2, 3, 4$, its factors of composition are primes. Not so when $n>4$. In this case its only invariant subgroup besides the identical group is the alternate group whose order is $\frac{1}{2}n!$. Thus the factors of composition are 2, $\frac{1}{2}n!$. The latter is not a prime. We have thus *Abel's Theorem: Equations of degree >4, whose group is the symmetric group, cannot be solved* *algebraically;* i.e., their roots cannot be found by extracting roots from known quantities.

We have just observed that when the coefficients of an equation of degree > 4 are independent variables, it cannot be solved algebraically. From that we cannot, however, deny that *every* equation of degree > 4 with constant coefficients *may* admit an algebraic solution. This important question was finally settled by Hilbert, who showed that there are an infinity of equations of any degree with rational integral coefficients whose group in $R(1)$ is the symmetric group.

IRRATIONAL RESOLVENTS.

Up to the present we have considered the effect on the Galoisian Group of an equation, of adjoining roots of rational resolvents to the current domain of rationality. In many investigations it is important to consider the adjunction of roots of equations which may not be rational functions of the roots of the given equation. Equations whose roots are not rational functions of the roots of the given equation are called *irrational resolvents* when used in the solution of the given equation. A theorem which lies at the foundation of this subject is due to Kronecker. *Let $f(x)=0$, $g(y)=0$ be two rational irreducible equations for the domain R of degrees m, n respectively. If on adjoining a root x_1, of $f=0$, $g(y)$ becomes reducible, the adjunction of a root y_1 of $g=0$, will make $f(x)$ reducible. If $\phi(x)$, $\psi(x)$ of degrees a, β, respectively, be the irreducible factors for the new domains that x_1 y_1 satisfy, then*

$$\frac{m}{a}=\frac{n}{\beta}.$$

As an important corollary of Kronecker's theorem we have: Let the adjunction of y_1 reduce the group G of $f(x)=0$ to an invariant subgroup of index i. Then n is a multiple of i and hence never less than i. When $n=i$ (and this is always the case if n is a prime) $g(y)=0$ is a rational resolvent.

Another theorem of great importance in this connection is due to Jordan. *If the adjunction of all the roots of $g(y)=0$ reduces G to a subgroup G_1 of index i, the adjunction of all the roots of $f(x)$ reduces the group H of $g(y)$ to a subgroup H_1 of index k. The two groups G_1, H_1 are invariant and $i=k$. Finally, when H is simple $g(y)=0$ is a rational resolvent.*

Application to Some Celebrated Problems. — The Delian Problem or duplication of the cube requires the solution of

$$x^3-2=0$$

by rule and compass. The construction of the regular polygons by rule and compass is another famous problem of antiquity. Its solution depends upon the irreducible equation of degree $\phi(n)$ already referred to. That the Delian Problem is impossible follows at once from the theorem: *In order that a root, real or imaginary, of an irreducible equation $f(x)=0$ can be constructed geometrically it is necessary that the degree of f be a power of two.* From this theorem we also conclude: *The necessary and sufficient condition that a regular polygon of n sides can be constructed by rule and compass is that the totient of n is a power of two.*

Another famous question is the *Casus Irreducibilis* of cubic equations. The theory of irrational resolvents enables us to prove readily the following general theorem: *An irreducible equation of degree n whose roots are all real can never be solved by real radicals alone if n contains other factors than two.*

That the casus irreducibilis is indeed such follows as corollary of this theorem.

Hölder's Theorem. — One of the most important and fundamental contributions to Galois' theory in recent years is a theorem of Hölder. Speaking roughly, it asserts that however the solution of a given equation $f(x)=0$ be conducted, sometime in the course of the solution certain simple equations whose groups are uniquely determined and known in advance must be employed. When the group of $f(x)=0$ is simple (in which case we say $f(x)$ is simple) it can be solved by no other simple equation $g(y)=0$ essentially different from $f=0$. The solution of any given equation therefore depends upon a chain of simple equations. But of all simple equations belonging to a given group certain ones will enjoy peculiar properties which will recommend their selection as *normal* equations. The reduction of the given equation to these normal equations is a problem by itself.

THE SOLUTION OF THE QUINTIC.

We have seen that the equation of fifth degree $Q=0$ whose group is the symmetric group cannot be solved by means of radicals, i.e., by resolvents of the type $x^m-a=0$. On adjoining $(x_1-x_2)(x_1-x_3)(x_1-x_4)(x_1-x_5)(x_2-x_3)(x_2-x_4)(x_2-x_5)(x_3-x_4)(x_3-x_5)(x_4-x_5)$ the square root of its discriminant Δ, the group of $Q=0$ reduces to the alternate group A_5 of 60 substitutions. But A_5 is simple. Thus $Q=0$ is a simple equation for the domain $R(\sqrt{\Delta})$. Other algebraic equations having this group arise in the theory of linear differential equations, and also in the theory of elliptic functions. In fact the hypergeometric function

$$F(a,\beta,\gamma,x)=1+\frac{a\cdot\beta}{1\cdot\gamma}x+\frac{a\cdot a+1\cdot\beta\cdot\beta+1}{1\cdot2\cdot\gamma\cdot\gamma+1}x_2+\cdots$$

is a solution of a very simple differential equation of the second order $G=0$. For variable a, β, γ, it represents a new transcendent; but for certain values of these parameters it reduces to the elementary functions; e.g., it may become algebraic. In seeking for these latter cases Schwarz was led to introduce a new variable s, the quotient of two fundamental integrals of $G=0$. This variable for certain values of a, β, γ satisfies the equation

$$J(s)=1728xf^5(s)+H^3(s)=0,$$

where

$$f(s)=s(s^{10}+11s^5-1),$$
$$H(s)=s^{20}-288s^{15}+494s^{10}+288s^5+1.$$

The equation $J=0$ stands in so intimate relation with the icosahedron that it is called the icosahedral equation. Indeed if we project stereographically the icosahedron, on the s-plane, the centre being at the origin, the 12 vertices and the middle points of the 20 faces will be precisely the roots of f and H respectively.

From this it is easy to conclude that the group of $J=0$ is formed of the 60 rotations which leave the icosahedron unchanged. Klein has shown that the icosahedral equation whose roots are very simple known functions of $F(a,\beta,\gamma,x$ can be put in connection with $Q=0$. The equation $J=0$ may thus be considered as a normal resolvent of the quintic.

A normal resolvent which springs from the elliptic functions is the following: In trigonometry one of the problems is to express $\sin\frac{x}{n}$ in terms of $\sin x$, n a prime number. This may be done algebraically, as is readily shown. In the elliptic functions the same problem arises. Here the algebraic relation between $p\left(\frac{u}{n},\omega_1,\omega_2\right)$ and $p(u,\omega_1,\omega_2)$ is of degree n^2-1. The solution of this equation depends upon an equation of degree $n+1$ called an equation of transformation. For $n=5$ such an equation is

$$\Delta^2y^6+10\Delta y^3-12g_2y+5=0, \tag{15}$$

whose group is the above A_5 and whose roots are

$$\left(p\frac{2\omega_1}{5}-p\frac{4\omega_1}{5}\right)^{-1}$$

and

$$\left(p\frac{2\omega_2+48r\omega_1}{5}-p\frac{4\omega_2+96r\omega_1}{5}\right)^{-1},$$
$$r=0,1,2,3,4.$$

Here Δ is the discriminant $g_2^3-27g_3^2$. How equations of this type could be set in relation with the quintic was first shown by Hermite in 1858. The equation (15) was used by Kiepert. It forms a very convenient normal resolvent of the quintic.

Having found in the elliptic functions convenient normal resolvents for this quintic, we might hope to employ the equations of transformation of higher orders to solve the general equations of higher degrees. The consideration of their groups, however, shows very easily that this is not possible. To find suitable equations we must pass from the elliptic to the hyperelliptic functions. By their aid the general equation of every degree can be solved.

EQUATIONS, General Theory of. The theory of equations finds its origin in efforts to solve the equations which arise in the applications of algebra to problems in pure geometry or in applied mathematics. In the exposition of this theory a rational integral algebraic function of x arises which may be defined as follows:

$$f(x)=a_0x^n+a_1x^{n-1}+a_2x^{n-2}+\ldots+a_{n-1}x+a_n.$$

It is assumed here that the exponent n is a positive integer and that the coefficients a_0, a_1, a_2, ..., a_n are algebraic numbers independent of x. If this polynomial, is put equal to zero, we have an equation of the nth degree. Any value of the variable x which makes the value of the polynomial zero is said to «satisfy the equation» $f(x)=0$ and is called a «root» of the equation. Thus, -1 is a root of the equation $x^3+x+2=0$, because $(-1)^3+(-1)+2=0$.

Fundamental Theorems about Roots. — That at least one root of the equation $f(x)=0$ always exists is a fundamental theorem which it is somewhat difficult to establish rigorously. The proofs usually given in elementary texts lack rigor. Among the most satisfactory demonstrations are the four given by C. F. Gauss and the one based on the theory of functions, given by A. L. Cauchy. Granted that every equation of the nth degree has at least one root, it is easy to show that it has n roots and no more. An equation of the second degree (a «quadratic equation») has two roots, one of the third degree (a «cubic equation») has three roots, one of the fourth degree (a «quartic» or «biquadratic equation») has four roots, and so on. The proof of this theorem may be outlined as follows: If r_1 is a root of $f(x)=0$, then $f(x)$ is divisible by $x-r_1$ without a remainder, so that $f(x)=(x-r_1)f_1(x)$, where $f_1(x)$, the quotient, is of the $(n-1)$th degree. If r_2 is a root of $f_1(x)=0$, then in the same way $f_1(x)=(x-r_2)f_{11}(x)$, and $f(x)=(x-r_1)(x-r_2)f_{11}(x)$. Proceeding in this manner, the degrees of the successive quotients diminish by unity at every step, until finally a binomial quotient of the first degree of the form $a_0(x-r_n)$ is obtained. We then have $f(x)=a_0(x-r_1)(x-r_2)\ldots(x-r_n)=0$. There are here n binomial factors and no more, each of which, when equated to zero, yields a root. In special cases some of these roots may be equal to each other. Such roots are called «equal» or «multiple» roots.

There are important relations existing between the roots and the coefficients of an equation. From the equalities

$$(x-r_1)(x-r_2)=x^2-(r_1+r_2)x+r_1r_2=0;$$
$$(x-r_1)(x-r_2)(x-r_3)=x^3)-(r_1+r_2+r_3)x^2+(r_1r_2+r_1r_3+r_2r_3)x-r_1r_2r_3=0;$$
$$\cdots\cdots\cdots$$
$$(x-r_1)(x-r_2)\ldots(x-r_n)=x^n-(r_1+r_2+\ldots+r_n)x^{n-1}+(r_1r_2+r_1r_3+\ldots+r_{n-1}r_n)x^{n-2}-\ldots+(-1)^nr_1r_2\ldots r_n=0.$$

we see that in the equation $f(x)=0$, when $a_0=1$, the coefficient a_1 of the second term is equal to minus the sum of the roots; the coefficient a_2 of the third term is equal to the sum of the products of the roots, taken two by two; the coefficient a_3 of the fourth term is equal to minus the sum of the products of the roots, taken three by three; and so on, until finally we arrive at the last coefficient, a_n, which is equal to $(-1)^n$ times the product of all the roots. The coefficients of the equation are said to be *symmetric functions* of the roots, that is, functions in which any two roots may be interchanged without altering the value of the function. As an illustration take $2x^3+4x^2+6x-5=0$. To make $a_0=1$, divide through by 2. Then the sum of the three roots is -2, the sum of their products, taken two by two, is 3, the product of all three roots is $\frac{5}{2}$.

The roots of an equation may be complex

(i.e., imaginary) quantities. (See ALGEBRA). Thus the equation $x^2+x+1=0$ has the two complex roots $\frac{1}{2}(-1+i\sqrt{3})$ and $\frac{1}{2}(-1-i\sqrt{3})$, where $i\equiv\sqrt{-1}$. If the coefficients of the equation $f(x)=0$ are all real, then it can be shown that, if complex roots occur at all, they occur in conjugate pairs; that is, if $a+ib$ is a root, then $a-ib$ is likewise a root. From this it follows at once that no cubic or other equation of odd degree and with real coefficients can have all its roots complex. Considerable information on the character of the roots can usually be secured from «Descartes' Rule of Signs,» which may be stated as follows: *An equation with real coefficients has as many positive roots as it has variations in sign, or fewer by an even number.* A variation is said to exist whenever two successive terms have opposite signs. Thus there are two variations in $+--+$. The theorem may be proved from the consideration that every time that a new positive root is introduced into an equation, by multiplying $f(x)$ by $(x-r)$, the number of variations is increased by an odd number. Applying Descartes' Theorem to the equation $x^6-x^5+x^4+2x^2-5=0$, observe that the sequence of signs is $+-++-$. There are three variations; hence, the equation has either three positive roots or one. To apply the theorem to negative roots, we first transform the given equation into a new one whose roots are the same as those of the given equation, excepting in sign. This can be done by writing $-x$ in place of x. The above sextic then becomes $x^6+x^5+x^4+2x^2-5=0$. This transformed equation has one variation; hence, by Descartes' Rule (q.v.), it has one positive root, and the given equation has one negative root. As the total number of roots is six and the number of real roots is four or two, it follows that either two or four of the roots are complex. By the same reasoning we can show that $x^5-1=0$ has one positive and four complex roots and that $x^4+x^2+1=0$ has all its roots complex. In some cases, as in $x^4+x^3-x^2+5=0$, Descartes' Rule gives but little information.

Strenuous efforts have been put forth by mathematicians to discover theorems by which the exact number of real and of complex roots of equations with real coefficients can always be determined. The most noted result of these efforts is the theorem of J. C. F. Sturm, discovered in 1829. Sturm's theorem tells the number of complex roots, and the number of real roots within a given interval, with unfailing certainty; but it labors under the disadvantage of being laborious in its application. Hence it is commonly used only when the simpler methods fail to give the wanted information. We state the theorem for the special case when $f(x)=0$ has no equal roots. Let $f'(x)$ be the first derived function of $f(x)$. (See CALCULUS). Then proceed with the process of finding, by division, the highest common factor of $f(x)$ and $f'(x)$, with this modification, that the sign of each remainder be changed before it is used as a divisor. Continue the process until a remainder is reached which does not contain x, and change the sign of that also. The functions $f(x)$, $f'(x)$, together with the several remainders with their signs changed, viz., $f_2(x)$, $f_3(x)$, $\ldots$, $f(x)$, are called «Sturm's functions.» Sturm's theorem is as follows: *If $f(x)=0$ has no equal roots, let any two real quantities a and b be substituted for x in Sturm's functions, then the difference between the number of variations of sign in the series when a is substituted for x and the number when b is substituted for x expresses the number of real roots of $f(x)=0$ between a and b.* To make this clearer, take $f(x)=x^3-x^2-10x+1$, then $f'(x)=3x^2-2x-10$, $f_2(x)=62x+1$, $f_3(x)=38{,}313$. For the indicated values of x the signs of the Sturmian functions are as follows:

x	$f(x)$	$f'(x)$	$f_2(x)$	$f_3(x)$
∞	+	+	+	+
4	+	+	+	+
3	—	+	+	+
1	—	—	+	+
0	+	—	+	+
—2	+	+	—	+
—3	—	+	—	+
—∞	—	+	—	+

Since $x=\infty$ gives no variations and $x=-\infty$ gives three variations, there are three real roots between ∞ and $-\infty$. Hence there are no complex roots. The real roots lie between 3 and 4, 0 and 1, -2 and -3.

Transformations of Equations.— The study of the properties of an equation is frequently facilitated by the transformation of the given equation into a new one whose roots (coefficients) bear a given relation to the roots (coefficients) of the original equation. Thus, in applying Descartes' Rule to negative roots we transformed the equation into another whose roots were numerically the same, but differed in sign. If the roots of the new equation are to be m times those of the one given, we place $y=mx$ and substitute y/m for x. For instance, if the roots of the transformed equation are to be 10 times those in

$x^3-x^2-2x+5=0$, we get $\frac{y^3}{1000}-\frac{y^2}{100}-\frac{2y}{10}+5=0$,

or $y^3-10y^2-200y+5000=0$. The result is obtained more easily by the rule: *Multiply the second term by m, the third by m^2, and so on.* If the roots of the new equation are to be the reciprocals of the roots of the old we write $x=\frac{1}{y}$. A more important transformation is the one of diminishing the roots by a given number h. We have here $y=x-h$. Substituting $y+h$ for x in $a_0x^n+a_1x^{n-2}+a_2x^{n-2}+\ldots+a_n=0$, we obtain

$$a_0(y+h)^n+a_1(y+h)^{n-1}$$
$$+a_2(y+h)^{n-2}+\ldots+a_n=0.$$

Expanding the binomials and collecting like terms, we obtain, let us suppose,

$$A_0y^n+A_1y^{n-1}+A_2y^{n-2}+\ldots+A_n=0.$$

Writing $x-h$ for y we get

$$A_0(x-h)^n+A_1(x-h)^{n-1}$$
$$+\ldots+A_{n-1}(x-h)+A_n=0,$$

which differs from the original equation merely in form. This new form suggests an easy way for carrying out the actual computation. Dividing the left member by $x-h$, the remainder obtained is seen to be A_n, the absolute term. Dividing the quotient thus obtained

by $x-h$, the remainder is A_{n-1}. By repeating this process the remaining coefficients of the required equation are secured. The process, called «synthetic division,» is very convenient in this transformation. Suppose we desire to transform $x_4+8x_3-x+6=0$ into another in which the second term is wanting. The sum of the roots is -8 hence, to cause x^3 to disappear, we must increase each root by 2 (i.e., diminish by -2). Dividing successively by $x+2$ we obtain the coefficients -40, 63, -24, 0, 1, and the required equation is $x^4-24x^2+63x-40=0$.

The transformations thus far considered are all special cases of the so-called *homographic* or *projective* transformation in which $y=\frac{ax+b}{cx+d}$, a, b, c, d being constants. Thus, if $a=d=1$ and $c=0$, we have the preceding transformation. The homographic transformation is of interest in geometry, in the study of homographic ranges of points. The most general rational algebraic transformation of the roots of an equation $f(x)=0$ of the nth degree can always be reduced to an integral transformation of a degree not higher than the $(n-1)$th, and can, therefore, be represented by the relation

$$y=d_1+d_2x+d_3x^2+\ldots+d_nx^{n-1}.$$

This last is known as the «Tschirnhausen transformation,» by which Tschirnhausen in 1683 hoped to be able to reduce the general equation of the nth degree to the binomial form $x^n-a=0$, which is always solvable. But this transformation to the binomial form can be effected only for general equations that are lower than the fifth degree.

Solution of Equations.— This subject resolves itself into two quite distinct parts: (1) The solution of numerical equations (i.e., equations whose coefficients are given numbers) by some method of approximation to the exact value of the roots; (2) the solution of equations, whose coefficients are either given numbers or letters, by operations which will give the accurate values of the roots, expressed in terms of the coefficients,— such expressions to involve no other processes than addition, subtraction, multiplication, division and the extraction of roots. The former is called a solution *by approximation*, the second is called the *algebraic* solution of equations. In the former each root may be found separately, in the latter a general expression is obtained which represents all of the roots indifferently. The former is of importance to the practical computor, the latter is of special interest to the pure mathematician. The solution by approximation can be effected for equations of any degree; the algebraic solution is impossible for general equations of the fifth or of higher degrees. See EQUATIONS, GALOIS' THEORY OF.

Algebraic Solution of Equations.— The algebraic solution of the quadratic equation $ax^2+bx+c=0$ is well known. (See ALGEBRA). The algebraic solution of the cubic, due to Scipio Ferro and Tartaglia, and first published by H. Cardan in 1545, is known as «Cardan's solution.» To effect it, first transform the general cubic equation so that the second term shall be wanting. This done, we have $x^3+ax+b=0$. Putting $x=y+z$ we obtain

$$y^3+3yz(y+z)+z^3+a(y+z)+b=0,$$

or $$y^3+z^3+(3yz+a)(y+z)+b=0.$$

We may subject y and z to any second condition which is not inconsistent with $x=y+z$. It will be convenient to assume $3yz+a=0$. Then $y^3+z^3+b=0$, or, substituting for z its value $-a/3y$, we obtain $y^6+by^3=\frac{a^3}{27}$ and

$$y^3=-\frac{b}{2}\pm\sqrt{\frac{b^2}{4}+\frac{a^3}{27}},$$

$$z^3=-y^3-b=-\frac{b}{2}\mp\sqrt{\frac{b^2}{4}+\frac{a^3}{27}}.$$

Since $x=y+z$, we have

$$x=\sqrt[3]{-\frac{b_1}{2}+\sqrt{\frac{b^2}{4}+\frac{a^3}{27}}}+\sqrt[3]{-\frac{b}{2}-\sqrt{\frac{b^2}{4}+\frac{a^3}{27}}}.$$

Since y^3 and z^3 have each three cube roots, it might seem as if $y+z$ or x had altogether nine values. As the cubic has only three roots, this cannot be. Of the nine values, six are excluded by the relation $3yz+a=0$, which y and z must satisfy. Eliminating z between $x=y+z$ and $3yz+a=0$, we get $x=y-\frac{a}{3y}$ where y has the three values obtained from the expression for y^3 given above. This last expression for x does not involve the difficulties of the first expression. If the numerical values of the coefficients a and b are given, the numerical values of the roots may be obtained by substituting the values of a and b in the above expression for x. In any case, this mode of computing x is more laborious than Horner's method of approximation (explained below), but when all three roots of the cubic are real and distinct, an unexpected difficulty is encountered. In this case $\frac{b^2}{4}+\frac{a^3}{27}$ represents a negative number. As the square root of a negative number is a complex (imaginary) number, we are required to find the cube root of a complex number. But there exists no convenient arithmetical process for doing this. Nor is there any way of avoiding the complex radicals and of expressing the values of the real roots by real radicals. This is the famous «irreducible case» in the solution of the cubic. Its interest is purely theoretical. The practical computor experiences no difficulty, for he can always find the values of x by the methods of approximation.

Since Cardan's time a great many different algebraic solutions of the cubic and also of the quartic have been given. They are brought together for convenient reference in L. Matthiessen's 'Grundzüge der Antiken und Modernen Algebra,' Leipzig 1878. We proceed to give Euler's algebraic solution of the general quartic. By transforming it, bring it to the form $x^4+ax^2+bx+c=0$. Assume the general expression for a root to be $x=\sqrt{u}+\sqrt{v}+\sqrt{w}$. Squaring,

$$x^2-u-v-w=2\sqrt{u}\sqrt{v}+2\sqrt{u}\sqrt{w}+2\sqrt{v}\sqrt{w}.$$

Squaring again and simplifying,

$$x^4-2x^2(u+v+w)-8x\sqrt{u}\sqrt{v}\sqrt{w}$$
$$+(u+v+w)^2-4(uv+uw+vw)=0.$$

Equating coefficients of this and the given quartic we have

$$a=-2(u+v+w),\quad b=-8\sqrt{u}\sqrt{v}\sqrt{w}.$$
$$c=(u+v+w)^2-4(uv+uw+vw).$$

But $-(u+v+w)$, $(uv+uw+vw)$, $-uvw$ are the coefficients of a cubic whose roots are u, v, w. This cubic, called «Euler's cubic,» is

$$y^3+\frac{a}{2}y^2+\frac{a^2-4c}{16}y-\frac{b^2}{64}=0.$$

Solving it, we have the values of u, v and w, and, therefore, the values of x. Of the eight apparent values of x, four are excluded by the relation $b=-8\sqrt{u}\sqrt{v}\sqrt{w}$. To solve the quartic by the present method we must, therefore, first solve «Euler's cubic,» called the *resolvent*. When this resolvent has a rational root, then its other two roots can be expressed in terms of square roots and the quartic can be solved algebraically without the extraction of cube roots. All methods of solving algebraically the general quartic depend upon the solution of some resolvent cubic.

Binomial equations of the form $x^n-1=0$, or more generally, of the form $x^n-a=0$, are known as cyclotomic equations, and can always be solved algebraically. They possess also many interesting properties. We shall give a *trigonometric* solution and mention a few of these properties. Let $x^n=a=r[\cos(2k\pi+\theta)+i\sin(2k\pi+\theta)]$, where a may be a complex quantity, where k may be any integer, and where r and θ are known from the value of a. (See TRIGONOMETRY). By De Moivre's heorem we obtain

$$x=\sqrt[n]{r}\left\{\cos\frac{2k\pi+\theta}{n}+i\sin\frac{2k\pi+\theta}{n}\right\}.$$

By assigning to k any n consecutive integral values we obtain n distinct values for x and no more than n, since the n values recur in periods. These values are the roots required.

Among the properties of $x^n-1=0$ are the following: It has no multiple roots; if r is a root, then any positive integral power of r is a root; if m and n are relatively prime, then $x^m-1=0$ and $x^n-1=0$ have no roots in common, except 1; if h is the highest common factor of m and n, then the roots of $x^h-1=0$ are common to $x^m-1=0$ and $x^n-1=0$; if r is a complex root of $x-1=0$, n being a prime number, then $1, r, r^2, \ldots, r^{n-1}$ are the roots; the roots of $x^m-1=0$ and $x^n-1=0$ satisfy the equation $x^{mn}-1=0$; $x^n-1=0$ has always *primitive* roots, i.e., roots which are not also roots of unity of a lower degree than n. For the proofs consult Burnside and Panton, 'Theory of Equations,' Vol. I. The theory of roots of unity is closely allied with the problem of inscribing regular polygons in a circle, or the theory of the «division of the circle.» Consult P. Bachmann, 'Kreistheilung,' Leipzig 1872.

Solution by Approximation.— Of the various methods which have been given for the solution of numerical equations, the most satisfactory, all things considered, is the one known as «Horner's method.» It is commonly used for finding *incommensurable* roots (i.e., such as involve an interminable decimal which is not a repeating decimal), but it may be used also for finding *commensurable* roots (i.e., such as are integers or rational fractions). It is desirable here to begin with the theorem that *a rational fraction cannot be a root of an equation of the nth degree with integral coefficients, the coefficient of x^n being unity.* To prove this, let, if possible, $\frac{h}{k}$ be a root of $f(x)=0$, where h and k are integers and $\frac{h}{k}$ a fraction reduced to its lowest terms, and where $a_0=1$. Substitute $\frac{h}{k}$ for x, then multiply both members of the equation by k^{n-1}, and we obtain, after transposing, $\frac{h^n}{k}=-a_1h^{n-1}-a_2h^{n-2}k-\ldots-a_nk^{n-1}$. This equation is impossible, since a fraction in its lowest terms cannot equal an integer. Hence $\frac{h}{k}$ cannot be a root. This being the case, it follows that all commensurable roots are exact divisors of a_n, for a_n is numerically the product of all the roots. We know that if (fx) is divisible by $x-r$, without a remainder, r is a root. Hence we are enabled to find all commensurable roots of numerical equations of the type now under consideration by testing in succession each factor of a_n. For instance, in the equation $x^3+8x^2+13x+2=0$ the factors of a_n are ± 1 and ± 2. Taking the factor -2, we find that $f(x)$ is exactly divisible by $x+2$. The test for each of the three other factors yields a remainder. Hence -2 is the only commensurable root.

Before we can apply Horner's method we must know the first significant figure of the root to be found. In other words, we must «locate» the root. This can always be done by Sturm's theorem, but usually the following theorem is more convenient. *If two real numbers a and b, when substituted for x in $f(x)$, give to $f(x)$ contrary signs, an odd number of roots of the equation $f(x)=0$ lies between a and b.* Thus, to locate the roots of $x^3-3x^2-46x-71=0$, substitute for x, in succession, the values $-6, -5, -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10$. It is found that $f(-5)$ and $f(-4)$, $f(-2)$ and $f(-1)$, $f(8)$ and $f(9)$ are pairs of values of $f(x)$ having opposite signs. As there are three roots in all, we conclude that there is just one root between each of the pairs of values -5 and -4, -2 and -1, 8 and 9. To reduce the number of trials in more difficult examples, there are theorems on the upper and lower limits of roots which may be applied.

Horner's method consists of successive transformations of an equation. Each transformation diminishes the root by a certain amount. If the required root is 1.955, then the root is diminished successively by 1, .9, .05, .005. Synthetic division is employed. Suppose we desire to find, to three decimals, the root between -1 and -2 in the above example. It is convenient first to transform the equation so that the root becomes positive. We get $x^3+3x^2-46x+71=0$. The first significant figure in the root is 1. To diminish the roots by 1 we perform by synthetic division the following operation:

1	+ 3	− 46	+ 71	1
	1	+ 4	− 42	
	4	− 42	+ 29	
	1	+ 5		
	5	− 37		
	1			
	6			

The transformed equation, whose root under consideration now lies between 0 and 1, is $x^3+6x^2-37x+29=0$. This root being less than unity, x^2 and x^3 are less than x. Neglecting x^3 and $6x^2$, we obtain an approximate value for x from $-37x+29=0$, viz., $x=.7$. As in the process of ordinary long division or in the extraction of roots, so here the digit obtained by the first approximate division may be too large or too small and may need correction. An error of this sort will reveal itself later in the attempt to find the third digit of the root. Such correction is needed here. Actually $x=.9$. Diminish the roots of the last transformed cubic by .9, then find the third digit by the process just indicated for finding the second digit, then diminish the roots again, and so on. The entire operation is as follows:

1 + 3	− 46	+ 71	1.955
1	4	− 42	
4	− 42	+ 29	
1	5	− 27.711	
5	− 37	+ 1.289	
1	0.21	− 1.166625	
6	− 30.79	+ .122375	
.9	7.02		
6.9	− 23.77		
.9	.4375		
7.8	− 23.3325		
.9	.4433		
8.7	− 22.8925		
.05			
8.75			
.05			
8.80			
8.05			
8.85			

The broken lines indicate the conclusion of the successive transformations. For advanced reading on the solution of numerical equations consult McClintock, E., in Am. Jour. of Maths.,' Vol. XVII, pp. 89-110; Carvallo, M. E., 'Résolution numérique complete d. Equations algébriques ou transcendantes' (Paris 1896); A. Xavier, 'Approximations numériques' (Paris 1909).

Multiple Roots.—Suppose that in $f(x)=0$ there are m multiple roots; that is, m roots are equal to each other. Then $f(x)=(x-r)^m\phi(x)$, and the first derivative is $f'(x)=(x-r)^m\phi'(x)+m(x-r)^{m-1}\varphi(x)$. The *fact that* $f(x)$ and $f'(x)$ *have the factor* $(x-r)^{m-1}$ in common suggests the following rule for the discovery of multiple roots: Find the highest common factor of $f(x)$ and $f'(x)$. If that factor is $(x-r)^s$, then r occurs as a root $s+1$ times. If the highest common factor is $(x-r)^s(x-r_1)^t$, then r occurs as a root $s+1$ times and r_1 occurs $t+1$ times. If $f(x)\equiv 8x^3-20x^2+6x+9$, then $f'(x)\equiv 24x^2-40x+6$, and the H.C.F. is $2x-3$. Hence $\frac{3}{2}$ is a double root.

Elimination.— Take the equations,

$$f(x)\equiv x^2+b_1x+b_2=0,$$
$$F(x)\equiv x^2+a_1x+a_2=0,$$

and let r_1 and r_2 be the roots of the second equation. The necessary and sufficient conditions that the two equations shall have a root in common is that $f(r_1)$ or $f(r_2)$ shall vanish; that is, that the product $f(r_1)\cdot f(r_2)$ shall be zero. Multiply together

$$f(r_1)\equiv r_1^2+a_1r_1+a_2,$$
$$f(r_2)\equiv r_2^2+a_1r_2+a_2,$$

we get

$$r_1^2r_2^2+a_1(r_1r_2^2+r_1^2r_2)+a_2(r_1^2+r_2^2)$$
$$+a_1^2r_1r_2+a_1a_2(r_1+r_2)+a_2^2.$$

Expressing the symmetric functions of r_1 and r_2 in terms of the coefficients of the second of the given equations, we get $r_1^2r_2^2=b_2^2$, $r_1r_2^2+r_1^2r_2=-b_1b_2$, $r_1^2+r_2^2=b_1^2-2b_2$, $r_1r_2=b^2$, $r_1+r_2=-b_1$. Substituting these values, we have $b_2^2-a_1b_1b_2+a_2b_1^2-2a_2b_2+a_1^2b_2-a_1a_2b_1+a_2^2$.

This expression, involving the coefficients of the two given equations, is called the *eliminant* or *resultant*. Its vanishing is the condition that these equations have a root in common. More generally, if from n equations with $n-1$ variables we eliminate the variables and obtain an equation $R=0$, involving only the coefficients, the expression R is called the *eliminant* or *resultant* of the given equations.

In the above example the elimination was performed with the aid of symmetric functions. Of other methods of elimination the best known are those of Euler, Bezout and Sylvester. We outline the last, known as Sylvester's Dialytic Method. To eliminate x between

$$f(x)\equiv a_0x^n+a_1x^{n-1}+\ldots+a_n=0,$$
$$F(x)\equiv b_0x^m+b_1x^{m-1}+\ldots+b_n-0,$$

multiply the first successively by $x^0, x^1, x^2, \ldots, x^{m-1}$, and the second successively by $x^0, x^1, x^2, \ldots, x^{n-1}$, and we obtain $m+n$ equations. The highest power of x is $m+n-1$. If $f(x)=0$ and $F(x)=0$ have a common root, it will satisfy all the $m+n$ equations. If the different powers of x, viz., $x, x^2, \ldots, x^{m+n-1}$, be taken as $m+n-1$ unknown quantities, satisfying $m+n$ linear equations, a relation will exist between the coefficients. This condition of consistency is the vanishing of the resultant. This resultant Sylvester expressed neatly in the form of a determinant. See DETERMINANTS.

Discriminants.— It has been shown that a multiple root of $f(x)=0$ is also a root of $f'(x)=0$. But the condition that these two equations have a common root is expressed by the vanishing of the resultant.

The resultant of $f(x)=0$ and $f'(x)=0$ is called the *discriminant* of $f(x)=0$. It may be otherwise defined as the simplest function of the coefficients, or of the roots, whose vanishing signifies that the equation has equal roots.

EQUATIONS, Integral. See INTEGRAL EQUATIONS.

EQUATOR, an imaginary great circle of the celestial vault or on the surface of the earth. As used in astronomy the term signifies a great circle of the celestial vault at right angles to its axis, and dividing it into a northern and a southern hemisphere. It is constituted by the plane of the earth's equator, produced in every direction till it reaches the imaginary celestial sphere. The sun is twice a year in the celestial equator — namely, at the equinoxes, whence the equator is also known as the equinoctial line, or simply the equinoctial (see EQUINOX). The point in the equator which touches the meridian is raised above the true horizon by an arc which is the complement of the latitude. The sun and planets all have equators. They rotate around their several axes and the plane at right angles in each case is the equator of the heavenly body. In geography, the equator is a great circle on the surface of the earth equidistant from its poles, and dividing it into two hemispheres. Its latitude is zero; it is therefore marked on maps as 0. Other parallels of latitude are counted from it, augmenting in their numerical designation as their distance from it north or south increases, the poles being 90 degrees. The plane of the terrestrial equator is a plane perpendicular to the earth's axis and passing through its centre. The magnetic equator is a somewhat irregular line, nearly but not quite a great circle of the earth, in which there is no dip of the magnetic needle. It is hence called also the aclinic line. It is not far from the geographical equator, but its situation slowly alters year by year, there being a slow oscillation of the magnetic poles, while the geographical equator and poles are almost fixed.

EQUATORIAL («of the equator»), a geographical and astronomical term. In astronomy it is usually applied to a telescope so mounted that the right ascension and declination of the point in the heavens at which it is directed can be read off from two scales. Clockwork is sometimes attached to the instrument to give the motion in right ascension, and thereby keep the object constantly in the field of the instrument. See ASTRONOMY; TELESCOPE.

EQUATORIAL COUDÉ («Elbow Equatorial»), a form of equatorial telescope invented by Loewy, of the Paris Observatory. The observer can remain stationary in a comfortable position, with a desk table built around the eyepiece end, and can have all this part enclosed from the cold, and warmed if desired, at the same time commanding the whole heavens without rising from his chair. See ASTRONOMY; TELESCOPE.

EQUATORIAL CURRENT. See OCEAN CURRENTS.

EQUERRY, ĕk'wĕ rĭ, an official of the royal household of Great Britain in the department of the master of the horse. There are the crown equerry, equerries in ordinary and extra equerries, 7 of the former and 15 of the latter, all army or navy officers, one or more of whom is attached to the suite of each member of the royal family.

EQUESTRIAN ORDER, or **EQUITES**, the order of knights in ancient Rome (Latin *ordo equester*). The equites or knights originally formed the cavalry of the army. They are said by Livy to have been instituted by Romulus, who selected 300 of them from the three principal tribes, naming them «celeres.» Servius Tullius increased the number to 18 centuries, and later there were 1,800 equites. Soon after the first Punic War the equites became a distinct order in the state and the juries and the farmers of the revenue were selected from their ranks. They held their position in virtue of a certain property qualification, 400,000 sestertii, about $17,000, and toward the end of the republic they possessed much influence in the state. The body of equites was of mixed patrician and plebeian rank, a fact that helped to increase their political power. They had particular seats assigned to them in the circus and theatre, and the insignia of their rank, in addition to a horse, were a gold ring and a tunic with two narrow purple stripes. At first the equites received two horses from the state, one for the knight and the other for his servant, and the wherewithal to maintain them. But, at a later date when the order had become a desirable one to belong to (shortly after 400 B.C.) wealthy citizens began to enter it; and these furnished their own horses and maintained them at their own expense. This was because from the equites the higher officers of the army were selected, only after the candidate for office had passed successively through the equestris cursus honorum, a definite series of offices, supposed to fit him for the performance of the duties of the higher post in the army or of that of certain magistrate offices to which the equites might be appointed. Their privileges were curtailed by Sulla and under the later emperors the order disappeared from the stage of political life.

EQUIDÆ, ĕk'wĭ-dē, the horse family, the most highly specialized of the perissodactyl ungulates, characterized by the fact that only one toe (the third) in each foot is now functional, traces («the splint bones») remaining of the two other toes (the second and fourth) in the «splint bones» hidden beneath the flesh on each side of the shank of the foot. (For the relationships of this family to the titanotheres, tapirs and rhinoceroses, see UNGULATA; and for the evolution of the characteristic foot-structure see HORSE, EVOLUTION OF). The family contains but a single extant genus (*Equus*), structural distinctions not being of sufficient importance to separate generically the modern horses from several extinct species, or from the asses or zebras, or these from each other. Apart from the dependence upon a single toe, the family is characterized by the facts that the orbit is completely surrounded by bone; the incisor teeth are chisel-shaped; the canines or «tushes» are rudimentary (when present), and the premolars (except the first or «wolf tooth») resemble the hypselodont molars. Externally the members of this family are robust, with comparatively slender limbs, the feet «booted» in a single horny hoof, encasing the terminal phalanx; the body thickly clothed with short close hair, which, however, becomes longer, and in some species profuse, forming a mane, on the nape and tail. The colors are apt to be disposed in dark stripes on a yellow or brownish ground, most strikingly in the zebras, but traceable in most others. There are never any horns, and speed is depended on to escape from enemies which cannot be beaten off by kicking with the hind feet, while struggles between rival males for the leadership of the bands of mares are carried on mainly by biting and striking with the fore feet. The fore-limbs, or both pairs, have a callous pad upon the inside, «which,» says Beddard, «is possibly to be looked upon as an aborted gland, probably originally of use as secreting some odorous substance calculated to enable strayed members of the herd to regain their companions.» The whole structure of the *equidæ* has been developed in adaptation to a life upon open dry plains, where ability to travel with rapidity and to live upon grass and herbage has been perfected to a high degree. The stomach has no such complicated arrangement for the assimilation of this comparatively innutritious diet as has been acquired by the ruminants (q.v.). The alimentary canal is of great length (about eight times the length of the body); and the stomach, simple in form, is divided into a cardiac and a pyloric part, sharply distinguished by the dense epithelial lining of the former. The cæcum is twice as large as the stomach and there is no gall-bladder. The teats are two in number and situated in the groin. One or two foals are produced at a birth after a gestation of about 11 months. All the species are gregarious and polygamous and like most such animals are readily tamable, though the zebra has proved somewhat intractable and useless to mankind.

The family in the course of its history has occupied all the larger land-areas of the globe except Australia; but although its ancestors abounded in both Americas in the past, and modern horses run wild have multiplied and flourished exceedingly upon their grassy plains, no living species is native to the New World. In the Old World the horse or horses and several of the asses were Asiatic and European; a second species of ass and the various zebras were wholly African. See ASS; HORSE; QUAGGA; ZEBRA.

EQUILIBRIUM, a state of balance as to the forces acting upon any body. The condition is generally considered in respect to the action of gravity, and especially as to the centre of gravity of the body under observation. In accordance with that law of physics that the centre of gravity tends always to occupy the lowest possible position — that is, the position in which it is nearest to the centre of the earth — equilibrium appears in three forms: (1) stable equilibrium, when the centre of gravity is below the point of support; (2) unstable equilibrium, when the centre of gravity is above the point of support; (3) neutral equilibrium, when the centre of gravity and the point of support coincide. An illustration may be found in a wheel supported free of the ground on its axle. If the wheel is of uniform build in all of its parts it will be in neutral equilibrium, remaining at rest in any position to which it may be revolved on the axle. If, however, a weight be attached to the rim of the wheel at its lowest point, when the wheel is moved so as to raise the weight ever so little the wheel will swing back until the weight is again at the lowest point, in which position it is in stable equilibrium. If the wheel is then revolved so that the weight is directly above the axle, and carefully balanced in that position, the wheel will be in unstable equilibrium, for when disturbed it will immediately revolve so as to bring the weight to the lowest point again, and come to rest in stable equilibrium. See APPLIED MECHANICS; MECHANICS.

In physiology, the ability to maintain the body by proper muscular force under nervous control, so that it can perform co-ordinated movements or resist the force of gravity. By equilibrium is here meant the control of the body in the upright position, apart from the localized processes of co-ordination. Loss of equilibrium shows itself particularly in walking and running. Here the centre of gravity of the body is constantly changing and the ability of the individual to hold himself erect depends upon a number of features. The eye, the tactile sense of the feet, the joint-senses, the muscular sense that weighs the various muscular movements and the higher cerebral centres are all involved, and loss of equilibrium or inco-ordination may result from disease or injury to any of these functions. Loss of eyesight does not necessarily involve any loss of equilibrium, but loss of tactile sense of the feet, such as is seen in locomotor ataxia or in people who have had their feet frozen, almost invariably produces a loss of equilibrium. In the same disease (locomotor ataxia) and in forms of neuritis the loss of muscular sense and joint-sense produces similar phenomena. For the higher cerebral centres of control there is good reason to believe that the semi-circular canals in the internal ear constitute a special sense-organ for the determination of the direction of the movements of the head which are so essential in the preservation of general equilibrium. Diseases of the semi-circular canals are frequently accompanied with dizziness and vertigo. It has been suggested that the sacculus and utriculus of the internal ear act to maintain equilibrium while at rest. It also seems probable that certain areas in the cerebellum are closely associated with the equilibrium. See CEREBELLUM; INCO-ORDINATION; LOCOMOTOR ATAXIA.

EQUILIBRIUM, Chemical. In mechanics a system is said to be in equilibrium when the forces that act upon it are precisely balanced, so that their resultant is everywhere zero. A system or mass is similarly said to be in chemical equilibrium when its state is such that there is no tendency toward a sensible chemical change in any of its parts. As set forth by Berthollet, chemical equilibrium is not a condition of rest, but one in which the velocity of reaction in one direction is equal to the velocity in the opposite direction. The absence of chemical action may be absolute, or merely apparent.

In other words, there may be no chemical changes going on at all, or there may be opposite changes going on simultaneously in such a way that no resultant modification can be observed in any part of the system, however small the part selected for observation may be. In the latter case the existence of the simultaneous and opposite reactions can only be indirectly inferred from a study of the system when it is not in equilibrium.

According to the theory of chemical affinity that was held before the importance of mass-action was understood, two substances either would combine or would not, according as their «affinities» were more or less completely satisfied in the combined state, or in the uncombined state. That this view is entirely inadequate to explain the facts of chemistry is made evident by the following simple example: When steam is passed over red-hot iron filings it is decomposed into oxygen and hydrogen, the iron absorbing the oxygen with the formation of oxide of iron, while the hydrogen escapes in the free state; but if hydrogen is passed over red-hot oxide of iron the oxide is reduced to the metallic state, its oxygen combining with the hydrogen to produce steam, which passes on in the hydrogen current. This apparent contradiction may be best explained by assuming that when a mixture of steam and hydrogen is in contact with a red-hot mixture of iron oxide and metallic iron, both of the foregoing reactions take place simultaneously. If the metallic iron and the steam are present in excessive amounts, the resultant action will be, on the whole, the oxidation of the iron and the decomposition of the steam; while if the iron oxide and the hydrogen are present in excess, the resultant action will be the reduction of the oxide to the metallic state and the simultaneous formation of steam. It is therefore apparent that in some reactions, at any rate, the relative masses in which the various constituents are present must be considered with much care before any prediction of the chemical deportment of the mixture can be made. Attention was first directed to this fact by Claude Louis Berthollet (‘Essai de statique chimique’ 1803). In the example cited above, if the iron, iron oxide, hydrogen and steam were left in contact in a closed vessel, a state of apparent equilibrium would be finally attained in which the formation and decomposition of the steam would occur with equal rapidity, so that no visible change would take place thereafter. When this state of «chemical equilibrium» is attained the abstraction of hydrogen or of iron oxide, or the addition of steam or of metallic iron, will destroy the equilibrium, and more iron will be oxidized, until a new state of equilibrium is established. Similarly, the abstraction of steam or of metallic iron or the addition of hydrogen or of iron oxide when the system is in equilibrium will be followed by the reduction of a portion of the iron oxide and the establishment of a new state of equilibrium. According to Berthollet, all reactions are fundamentally of this kind. When sodium chloride is added to a solution of silver nitrate we know that the silver is all thrown down in the form of an insoluble chloride. In this case, Berthollet would consider that the sodium chloride, sodium nitrate, silver chloride and silver nitrate tend toward a state of chemical equilibrium; but that since the silver chloride is continually removed from the solution by reason of its insolubility, it is impossible for the state of equilibrium ever to be attained, just as it would be impossible for such a state to be attained in our previous illustration, if one of the constituents (say the iron oxide) were removed, or rendered inactive in any way, as fast as it were formed.

The ideas of Berthollet have been found to be sound in their essentials, and they have served as the foundation for the modern theory of chemical action, though their full development cannot be explained without the use of the differential calculus. The basis of the theory of mass-action, so far as solutions are concerned at all events, appears to be substantially as follows: Two substances in solution cannot combine with each other, except when a molecule, or ion (see SOLUTIONS) of the one, in its wandering through the solution, chances to encounter a molecule or ion of the other. Now while we do not know the actual number of encounters that take place in a given time between molecules of different kinds, we do know that in a homogeneous solution the chance that any one given molecule of the first kind will encounter some molecule of the second kind within (say) the next second, is strictly proportional to the number of molecules of the second kind that are present in the solution; and conversely, the chance that any given molecule of the second kind will encounter some molecule of the first kind within the next second is strictly proportional to the number of molecules of the first kind that are present. Since the number of molecules of each kind that are present in an actual solution is practically infinite, this amounts to saying that the actual number of encounters between molecules of different kinds, in one second, is proportional to the product of the number of molecules of the first and second kinds that are present. As an illustration of the usefulness of this principle, we may consider the equilibrium of a mixture of acetic acid and ethyl alcohol. Some of the acid combines with some of the alcohol to form water and ethyl-acetic ester (see ESTERS), but the reaction is never complete, since a state of equilibrium is attained after a time, in which the inverse combination takes place just as fast as the direct one. The molecular weight of acetic acid ($CH_3COO.H$) is 60, that of ethyl alcohol (C_2H_5OH) is 46, that of ethyl-acetic ester or ethyl acetate ($CH_3COO.C_2H_5$) is 88, and that of water (H_2O) is 18. A mass of any substance which contains as many grams as there are units in the molecular weight of the substance is known as a «gram-molecule» of the substance. This name is rather unhappily chosen, but the idea itself is a useful one, and is commonly employed in modern writings upon theoretical chemistry. Let us suppose that one gram-molecule of acetic acid (60 grams) is originally mixed with M gram-molecules of ethyl alcohol (46M grams), and with N gram-molecules (18M grams) of water, and let us inquire what the composition of the mixture will be when the state of final chemical equilibrium has been attained. The advantage of taking the gram-molecule as a unit of mass is, that when this unit is used the number of grams of acetic acid, alcohol and water that are originally present will be proportional to 1, M and N, and we may speak of M and N and

write them in our equations precisely as though they were really the number of actual molecules present. The acetic acid and alcohol act upon each other as indicated by the equation $CH_3COO.H + C_2H_5OH = CH_3COO.C_2H_5 + H_2O$. Now let us assume that when the state of equilibrium has been attained, X gram-molecules of the alcohol have been decomposed. This implies that X gram-molecules of the acetic acid have also been decomposed, and that X gram-molecules, each of water and of ethyl acetate have been formed. The total numbers of gram-molecules of the various substances that are present when the final state of equilibrium is attained are therefore as follows: Acetic acid, $1-X$; alcohol, $M-X$; water, X; ethyl acetate, $N+X$. The number of molecular collisions per second, in which a molecule of acetic acid encounters a molecule of alcohol, is therefore (in the final state) proportional to $(1-X)(M-X)$; and since the chemical action is itself proportional to the number of such collisions, we may assume that the number of gram-molecules of ethyl acetate formed per second, in the state of equilibrium, is $A(1-X)(M-X)$, where A is a constant whose value we do not know. The same line of reasoning shows that the number of gram-molecules of ethyl acetate that are lost from the solution in the same time, through combining with water to reproduce acetic acid and alcohol, is $B(N+X)X$, where B is another constant, whose value is also unknown. Since the existence of equilibrium requires that the quantity of ethyl acetate present shall be constant, we have $A(1-X)(M-X)=B(N+X)X$. Now it is known by experiment that when the original mixture is free from water, and contains chemically equivalent amounts of acetic acid and alcohol, so that $M=1$ and $N=0$, the state of final equilibrium is attained when $X=\frac{1}{3}$. If these values of M and X are substituted in the foregoing equation, we find that A and B are connected by the necessary relation $A=4B$. If we replace A by 4B and then divide through by B, the foregoing equation reduces to $4(1-X)(M-X)=(N+X)X$, or $3X^2-(4+4M+N)X+4M=0$, a quadratic equation from which the value of X (that is, the number of gram-molecules of acetic acid decomposed) may be inferred, in the final state of equilibrium, for any desired initial mixture of acetic acid, alcohol and water. This example has been given at some length, both because it illustrates clearly the principles of chemical equilibrium and the law of mass-action, and because reactions of this very kind, in which esters are formed by the direct action of an acid upon an alcohol, have a special historic interest, since their study has contributed in no small measure toward placing the modern theory of chemical equilibrium upon a firm foundation.

When it is desired to determine the state of a chemical system after the lapse of a definite interval from an initial instant for which its state is given, we must form a differential equation in which the condition is expressed that the chemical change, per unit of time, is proportional (as above) to the product of the number of gram-molecules of the reacting substances that are present at the instant considered; and having formed this equation and integrated it, we obtain an expression in which the composition of the system is expressed as a function of the time. When several substances that may react upon one another are present, the differential equation is more complicated in form, as might be expected; but for details of this sort reference must be made to works on theoretical chemistry. When the system contains several acids and one or more bases, the distribution of the bases among the various acids may be investigated in accordance with similar principles, and by comparing the numerical results that are thus obtained with the facts of observation, estimates of the true relative «affinities» of the acids may be had.

When, as is often the case, the course of a reaction depends upon the temperature, the principles of mass-action apply as before, but regard must also be had for the laws of thermodynamics (q.v.), which usually impose certain limitations upon the equations. The full theory of chemical changes in which thermodynamical considerations play an important part was given by J. Willard Gibbs, in a paper of great power and originality, entitled ‘On the Equilibrium of Heterogeneous Substances,’ published in the ‘Transactions of the Connecticut Academy of Arts and Sciences’ for 1875. Gibbs' basic phase law, or «phase rule» as it is commonly called, is as follows:

n different bodies (chemical substances, either simple or compound) can form $n+2$ phases, and these can co-exist at one single point only; that is, at a definite temperature and pressure.

The great importance of a full understanding of the laws of chemical equilibrium rests in the fact that by far the larger part of all chemical processes, both in nature and in the industrial arts, result not in complete reactions, but in a condition of chemical equilibrium, with measurable quantities present of every possible compound.

EQUIMULTIPLE. See MULTIPLE SERIES.

EQUINE ANTELOPE. See BLAUBOK.

EQUINOCTIAL, in astronomy, synonymous with equator. When the sun is on the equator there is equal length of day and night over all the earth: hence the name equinoctial. See EQUATOR; EQUINOX.

EQUINOCTIAL GALE, a gale popularly supposed to occur at the time of the spring or autumn equinox. See EQUINOX.

EQUINOCTIAL POINTS are the two points wherein the equator and ecliptic intersect each other; the one, being the first point of Aries, is called the vernal point; and the other, in the first point of Libra, the autumnal point. See ECLIPTIC; EQUINOX; EQUINOXES, PRECESSION OF THE.

EQUINOX, in astronomy, is that time of the year when the day and night are equal: the length of the day is then 12 hours; the sun is ascending six hours, and descending the same time. This is the case twice a year, in spring and in autumn, when the sun is on the equator. When the sun is in this situation the horizon of every place is divided into two equal parts by the circle bounding light and darkness, generally. The vernal equinox is on 21 March, and marks the beginning of spring; the autumnal is generally on 23 September, which is considered the commencement of autumn; at all other times the length of the day and of the night are unequal, and their difference is the greater the more we approach either pole, and in the same latitude it is everywhere the same. On the equator this inequality entirely vanishes; there, during the day, which is equal to the night, the sun always ascends six hours and descends six hours. In the opposite hemisphere of our earth the inequality of the days increases in proportion to the latitude: the days increase there while they diminish with us, and vice versa. The points where the ecliptic intersects the equator are called equinoctial points. The vernal equinoctial point was formerly at the entrance of the constellation of Aries; hence the next 30 degrees of the ecliptic, reckoned eastward, have been called Aries; but this point long ago deserted the constellation of Aries, and now stands in Pisces; for it is found by observation that the equinoctial points, and all the other points of the ecliptic, are continually moving backward or westward; which retrograde motion of the equinoctial points is what is called the precession of the equinoxes. This retrograde motion is quite analogous to the revolution of a gyroscope weighted at one end and balanced in the middle. It is due to the gravitational pull exerted by the sun and moon on the equatorial protuberances of the earth, which is a spheroid, not a sphere. It appears from the result of calculations that the path of the poles of the equator is nearly a circle, the poles of which coincide with those of the ecliptic, and that the pole will move along that circle so slowly as to accomplish the whole revolution in about 25,800 years. The diameter of this circle is equal to twice the inclination of the ecliptic to the equator, or about 47°. Now, as the ecliptic is a fixed circle in the heavens, but the equator, which must be equidistant from the poles, moves with the poles, therefore the equator must be constantly changing its intersection with the ecliptic. And from the best observations it appears that the equator cuts the ecliptic every year 50.25″ more to the westward than it did the year before; hence the sun's arrival at the equinoctial point precedes its arrival at the same fixed point of the heavens every year by 20 minutes 23 seconds of time, or by an arc of 50.25″. Thus, by little and little, these equinoctial points will cut the ecliptic more and more to the westward, till, after 25,800 years, they return to the same point. The precession of the equinoxes is not absolutely uniform, for the forces inducing the precession depend on the position of the sun and moon with reference to the earth. Thus at the vernal and autumnal equinoxes the sun is in the plane of the equator, and can cause no precession. Another important factor in causing the precession to vary is the fact that the plane of the moon's orbit is somewhat inclined to the ecliptic. Besides causing the component of the moon's attraction in the plane of the ecliptic to vary, this inclination introduces a component perpendicular thereto. This is an important factor in causing the path of the pole of the equator to be a wavy curve rather than a precise circle. This wavy motion is known as nutation. See DAY; ECLIPTIC; EQUATOR; GYROSCOPE.

EQUINOXES, Precession of the, the motion of the equinoxes along the ecliptic due to the change in the direction of the earth's axis of rotation, caused by the attraction of the moon and sun on the protuberant equatorial ring of the earth. See EQUINOX.

EQUISETUM. See *Equisetales* under FERNS AND FERN ALLIES.

EQUITES, ĕk'wĭ-tēz. See EQUESTRIAN ORDER.

EQUITY. The name equity was given to that supplemental law which was formerly administered exclusively in the Chancery Courts of England, and which was designed to work out substantial justice in cases where that could not be obtained normally in the common law courts. The common law became very strict and narrow at a very early period, and if a suitor could not bring his case in such a form as to fall within one of the recognized writs, he was without a remedy. For example, the common law courts had no provision for the preventing of wrongs, however imminent they might be. Here the Chancery Court could step in, and by injunction against the person threatening a wrong, cover this contingency. A body of law subsidiary to the common law therefore arose, whose administration was in the hands of the Chancellor (q.v.). Hence arose the curiosity presented for an extended period in English legal history, in which a suitor's chances of success depended largely upon the particular court in which he brought his action. The existence of this body of law led ultimately to scandals and vexatious delays; the rules of equity varied at different periods, depending a good deal upon the personal idiosyncrasies of the Lord Chancellor for the time being, and justifying Selden's sneer, that «they should make the standard for equity the Chancellor's foot.» Between the 17th century and the beginning of the 19th century, however, equity became almost as fixed as the common law, but the systems were always kept distinct until the passing of the Judicature Acts of 1873 and 1875, under which they were consolidated. Since 1875 law and equity have been administered equally to all the divisions of the High Court of Justice, and if there is any conflict between the rules of law and equity, those of equity are to prevail.

After the Revolution, the States of the American Union continued the English system; but while some of them have kept strictly to that system and have distinct courts of law and of equity, other States have law and equity administered by the same judges and courts, at one time sitting as courts of law and at another time as courts of equity.

Some of the rules and maxims of equity are: «Equity considers that as done which ought to be done.» «Equity acts *in personam*.» «He who comes into equity must do so with clean hands.» «Between equal equities priority of time will prevail.» «Between equal equities the law will prevail.» «No right without a remedy.» «When a court of equity has once acquired jurisdiction of a cause it will continue to act until the matter is finally disposed of.»

Equity is divided into three great classes or divisions: Equitable titles, equitable rights and equitable remedies. Equitable titles are those which are recognized only by a court of equity, as where, when a person gave a value for a *chose in action* which was assigned to him, the assignment was not recognized at law, as it would violate the rules against champerty and maintenance, but equity allows the assignee to bring suit in the name of the assignor. Equitable rights arise where a guardian enters into a transaction with his former ward a very short time after the ward has obtained his majority. If within a reasonable time the ward returns what he received from the guardian the guardian will, in equity, be compelled to return the property to the ward. Equitable remedies arise in those cases in which the law recognizes a right but cannot enforce it, as where a contract is made for the sale of a piece of property, if the seller refuses to convey, the purchaser's remedy at law is for damages for breach of the contract; but in equity the court will decree specific performance. Generally this applies only to real estate, because if it is personal property, after the damages are recovered other personal property of the same kind can be purchased; but if the personal property is of such nature that it cannot be duplicated, such as a painting by a particular artist, equity will affirm relief in the way of specific performance.

Suits in equity are commenced by a bill or petition. The bill may be amended, or, if the proceeding have gone too far for that, a supplemental bill may be filed. The defense is by demurrer, plea or answer. The judgment of the court is called a decree, and the relief granted is such as to affect all the parties, and is adapted to the facts and circumstances of that particular case. The general rules of evidence are the same as in a proceeding at law, but the answer to the bill, if made under oath, is evidence for the defendant in so far as it is responsive to the bill.

Consult Kerly, D. M., 'Historical Sketch of the Equity Jurisdiction of the Court of Chancery' (London 1890); Pomeroy, J. N., 'Equity Jurisprudence as Administered in the United States' (3d ed. San Francisco 1905); Spence, G., 'Equity Jurisdiction of the Courts of Chancery' (2 vols. London 1846–49).

EQUITY, Courts of. See COURT.

EQUITY OF REDEMPTION. The right, enforceable in equity, of a mortgagor to redeem the mortgaged property, even after forfeiture, by paying the debt with interest and costs. This right is barred only by strict foreclosure proceedings or by one of the various statutory procedures provided for the purpose, or by the mortgagee taking possession of the property after forfeiture and holding it for the period required by the statute of limitations. The term is also applied to the interest or estate remaining in the mortgagor in property he has mortgaged. See CHANCERY; EQUITY; FORFEITURE; MORTGAGE; REDEMPTION.

EQUIVALENT, having equal value, power, area or volume. In chemistry, (1) atomic weight. (2) The equivalent of a base is the number of grams of it which will neutralize one gram-molecule of a monobasic acid. The equivalent of an acid is the number of grams of it which will neutralize one gram-molecule of caustic potash or soda. See CHEMISTRY.

EQUULEUS, ĕ-kwoo'lē-ŭs, in astronomy («the Colt» or «Little Horse»), one of the 48 original constellations of the Almagest, situated just between the head of Pegasus and Delphinus. It has Aquarius on its south side. It is a very inconspicuous constellation, its brightest star being of the fourth magnitude. Also a name given to the rack, or instrument of torture.

ERA, the largest unit of geologic time. According to United States Geological Survey usage, all geologic time is divided into the following eras, beginning with the oldest: Proterozoic, Palæozoic, Mesozoic, and Cenozoic. By some authorities one and sometimes two other eras are recognized. The earlier part of the Proterozoic is split off under the name Archeozoic or Azoic, and to its latter divisions is given the name Proterozoic or Eozoic. The latter part of the Cenozoic is also sometimes split off to form the Psychozoic. But these names are not generally recognized, and the official classification is into the four eras first given. These divisions are in part based on palæontologic evidence, that is on changes in fossil form, and in part on structural considerations. With few exceptions there is unconformity (q.v.) between the Proterozoic and the Palæozoic. The close of the Palæozoic is marked by the folding of the Appalachian Mountains and the close of the Mesozoic by the Rocky Mountain uplift. See CHRONOLOGY; EPOCH; PROTEROZOIC; PALÆOZOIC, etc.

ERA OF GOOD FEELING, 1817–24. In American political history, Monroe's two administrations, up to the canvass for his successor. There were practically no issues, and but one party. The issue on which the Federalist party was founded had long since been appropriated by the Democrats, and it had foolishly taken theirs in exchange. The embargo and the war had created a sectional issue; but peace ended that and left no pretext for division. The Hartford Convention (q.v.) had killed the old leaders politically; the new ones had joined the Democrats, because the embargo and the war had driven New England capital from commerce into manufactures, and it wished to demand tariff favors from the administration. But it was a decade before the tariff and internal improvements, the next division lines, assumed theoretic consistency. Monroe issued an inaugural in 1817 especially to placate the Federalist; and followed it by a tour through New England where he was received with immense ovations from both parties. He was unanimously re-elected in 1820, save for the whim of one elector. The personal factions which contested the field in 1824, the coalition (q.v.) which decided the result, and the Jacksonians' fury over it, effectually ended the good feeling.

ERAGROSTIS, a large genus of the grasses, belonging to the *festuceæ*. There are over 100 species of the Eragrostis, of which there are in America about 30, either native or naturalized. The species are from a few inches to several feet in height, and are found in nearly all parts of the United States. None are of commercial importance, and such as are used for hay are accidental growths among cultivated grasses. The strong scented Eragrostis (*E. major*), is an ill-smelling grass, but tall, erect and rather handsome, owing to the shape and size of its leaves. It is found in almost every part of the United States and Ontario, naturalized from Europe.

ERAN, Eranian. See Iran, Iranian.

ERARD, â-rär, Sébastien, French musical instrument maker: b. Strassburg 5 April 1752; d. Passy, near Paris, 5 Aug. 1831. He went to Paris at 18, and with his brother, Jean Baptiste, produced pianofortes so superior to any previously made in France that his fame quickly spread, and orders flowed in upon him from all quarters. During the Revolution he went to England and established a manufactory in London, and when peace was restored his life was passed between that city and Paris. His improvements upon the harp, more especially that of the double movement, the principle of which he afterwards communicated to the piano, entitled him to high merit as an inventor.

ERAS, â'räs, Wolfgang, German economist: b. Schönfeld, 1843; d. 1892. He received his education at the universities of Leipzig, Jena and Berlin. In 1866–70 he served as secretary to the Rhenish-Westphalian Industrial Association and from 1871 to 1886 was recorder of the Chamber of Commerce at Breslau. After 1886 he was secretary of records of the Silesian Textile Manufacturers' Association. He published 'Der Währungsstreit' (1883); 'Einrichtungen für die Binnenschiffahrt an deutschen und holländischen Handelsplätzen' (1885); 'Unser Handel mit den Balkanländern' (1891). He edited the *Jahrbuch für Volkswirtschaft* in 1868–69.

ERASISTRATUS, ĕr-a-sĭs'tra-tŭs, Greek physician. He lived in the 3d century before the Christian era, was the court physician to Seleucus Nicator, king of Syria, and rendered himself famous by the sagacity with which he discovered the malady of Antiochus, the king's son. He subsequently went to Alexandria, where he devoted himself to the study of anatomy. He was the first who systematically dissected the human body, and his description of the brain and nerves is much more exact than any given by his predecessors. He classified the nerves into nerves of sensation and of locomotion, and it is said had almost stumbled upon the discovery of the circulation of the blood, for he explained that the veins and the arteries had their origin in the motion of the heart. He was remarkably adverse to blood-letting and the giving of purgatives, relying chiefly upon diet and regimen, bathing, exercise, friction and the most simple articles of the vegetable kingdom, for the restoration and preservation of health. His professional followers, a body of physicians of note, were known as Erasistrateans. He wrote several works on anatomy, practical medicine and pharmacy, of which only the titles remain, together with a great number of short fragments preserved by Galen and other ancient medical writers. Consult Fuchs, 'De Erasistrato Capila Selecta' (in 'Hermes,' Vol. XXIX, Berlin 1894); Hieronymus, 'Erasistrati et Erastitratcorum Historia' (Jena 1790); Susemihl, 'Geschichte der griechischen Litteratur' (Vol. 1, Leipzig 1892).

ERASMUS, ĕ-răz'mŭs, Saint, Syrian bishop and martyr. He is said to have been put to death under Diocletian by disemboweling, and his martyrdom is frequently represented in art. As he was counted as one of the 14 Succorers of the Distressed, so was his aid especially invoked in affections of the stomach. The remaining 13 Succorers are Saints Acasius, Blasius, Christopher, Cyriacus, Dionysius the Areopagite, Egidius, Eustathius, George the Martyr, Pantaleon, Vitus, Barbara, Catharine and Margaret. June 2 is the saint's day of Erasmus. On the capture of Formiæ (the reputed scene of the martyrdom of Erasmus in the 3d century), by the Saracens in 842, the body of the saint, or what was popularly believed to be his, was removed to Cajeta.

ERASMUS, Desiderius, Dutch scholar: b. Rotterdam, probably 28 Oct. 1467; d. Basel, Switzerland, 12 July 1536. He was the illegitimate son of one Gerhard of Gouda. The name by which he is known is merely the Latin and Greek rendering of Gerhard, Desiderius, the Latin, and Erasmus, or, more correctly, Erasmius, the Greek equivalent. He was a singing-boy in the cathedral of Utrecht till his ninth year, then entered the school at Deventer, where he displayed such brilliant powers that it was predicted that he would be the most learned man of his time. At the age of 17 he assumed the monastic habit near Gouda, but the bishop of Cambrai delivered him from this constraint by taking him as a Latin secretary. In 1492 he was ordained, and went to Paris to perfect himself in theology and polite literature, and there became the instructor of several rich Englishmen, from one of whom — Lord Montjoy — he received a pension for life. He accompanied them to England in 1497, where he was graciously received by the king. He returned soon after to Paris, and then traveled into Italy to increase his stock of knowledge. He now asked a dispensation from the vows of his order, which the Pope granted him. He visited Venice, Padua and Rome; taught at Louvain 1502–04; but brilliant as were the offers here made him, he preferred the invitation of his friends in England. When he visited the lord-chancellor, Sir Thomas More (1506), without making himself known to him, the chancellor was so delighted with his conversation that he exclaimed, «You are either Erasmus or the devil.» He made his third visit to England in 1509. He was offered a benefice, but was unwilling to fetter himself by an office of this kind. He was for a short time professor of divinity and Greek at Oxford. He afterward traveled through Germany and the Netherlands, and went to Basel, where he had his works printed by Froben and acted as general adviser of Froben's presses, which he raised to be the most important in Europe.

To profound and extensive learning Erasmus joined a refined taste and a delicate wit. Naturally fond of tranquillity and independence, he preferred the pleasure of literary ease and retirement to the pomp of high life. All through life he suffered from a bad stomach; he could not eat nor bear the smell of fish; as he humorously put it, «his heart was Catholic, but his stomach was Lutheran.» For a man of a detached and inquiring mind like his, partisanship was impossible; but he wished to see the power of the clergy broken as the main obstacle to the spread of liberal ideas. But he recoiled from the fanaticism which accompanied the Reformation, and had no sympathy with the evangelicism to which it gave birth. Indeed theological disputation had no attractions for him, although it has been said of him that he laid the egg which Luther hatched. Luther spoke for the low-born; Erasmus for the more cultured class. He implies that the revelation of religion has added nothing to life that makes it worth living. The incisive way in which he handled the religious abuses of his time prepared men's minds for Luther's work, and he was also free and outspoken in his criticism of the treatment meted out by kings to their subjects. The great service he rendered was in fighting the battle of sound learning and plain common sense against obscurantism, and in emphasizing the sovereign place of reason as the ultimate guide in all questions, religious and political not excepted. Besides his editions of various classics, the first edition of the Greek Testament from MSS. (with Latin translation), and his other philological and theological writings, may be only mentioned his well-known book in praise of folly, 'Encomium Moriæ,' and his 'Colloquies' (1519). His letters are very valuable in reference to the history of that period. (See Colloquies of Erasmus; Praise of Folly, The). Consult 'Lives' by Knight (1726); Jortin (1748); Burigny (1752); Durand de Laur (1874); Feugère (1874); Drummond (1873); Froude (1894).

ERASMUS MONTANUS, comedy in five acts by Holberg; translated by O. J. Campbell and F. Schenck. It was written before 1723 but not produced till 1747. It did not at once score such a success as many of his other comedies. Now, however, it is considered not only to be an excellent picture of the times, but it has its value for all times as showing the contrast in life between appearance and reality and also the demand, strong then as now, that the individual seek the truth for its own sake.

Erasmus, the son of a well-to-do peasant, has studied at the university and now is on a visit to his parents in the village, called 'The Hill.' As he has tasted of the tree of knowledge, he wants to show off his great learning, claiming to be able to «prove» in a logical way any assertion, however foolish, he makes. His arrogant ways and hair-splitting methods arouse the antagonism of all. Through the «Lieutenant,» who is Holberg's mouthpiece in the comedy, Erasmus is properly punished, and he is finally compelled to renounce the only true assertion he has made, viz., that the earth is round.

In the leading character, Erasmus Montanus, with his insufferable intellectual conceit, acquired at the university, Holberg attacks the methods and aims of this seat of learning, ridicules the academic pedantry, the formalism of logic and the Latin disputations as practised at the time. Holberg knew that among the peasants, ignorant though they were and often so sadly neglected, there was a good deal of common sense. In Jacob, Erasmus' brother, Holberg has presented, in a most humorous manner, the contrast to the vain and empty «learning» of the hero. In Peter the deacon, Jesper the bailiff, Jeronimus whose conservatism shrinks in terror from anything that is new, Holberg shows his mastery in drawing character, and in the scenes in which they figure, the author's humor is at its best. Many sayings in this comedy are common property in the current speech of the Scandinavian countries even to-day. Consult Campbell, 'The Comedies of Holberg.'

Gisle Bothne.

ERASTIANS, in England, a name applied to a party that arose in the 17th century, denying the right of autonomy to the church — a right neither maintained nor denied by Erastus (q.v.). The Erastian controversy broke out at the time of the Westminster Assembly. The leading Erastians in that assembly were Lightfoot and Coleman, who were supported by Selden, Saint John and Whitelocke, three noted lawyers, in the House of Commons. The Erastians in England would subordinate the government of the Church to the authority of the State, both as regards doctrine and discipline. Since the time of the Reformation the controversy has been confined chiefly to the Church in Scotland where the term Erastinian has been applied to those denying the power of the Church to nullify the operation of lay patronage. Consult Cunningham, 'Historical Theology' (Vol. II, Edinburgh 1862); Henson, 'English Religion in the Seventeenth Century' (London 1903).

ERASTUS, Thomas (a Latin translation of his name Liebler or Lieber), German theologian and physician: b. Auggen, near Mühlheim, 1524; d. Basel, Switzerland, 1583. He studied theology at Basel (where he Grecized his name), and philosophy and medicine at Bologna and Padua. After nine years in Italy, he was appointed physician to the counts of Henneberg. In 1558 he received an invitation to go to the court of the Elector Palatine, and accepted it. There he became first physician and Privy Councilor and professor of medicine at Heidelberg. He removed from Heidelberg to fill the chair of medicine at Basel in 1580. Shortly before his death he had been appointed professor of ethics. Erastus was a skilful physician and a man of upright character, an equally vigorous writer against «the new medicine of Philip Paracelsus» (1572) holding that the only true road to knowledge is to be found in experimental investigation, and not in astrology, magic and other obsolete practices. In theology he was a follower of Zwingli, and his fame now rests on his strenuous opposition to Calvinist discipline and Presbyterian order. In 1564 he maintained the Zwinglian doctrine of the Lord's Supper at the conference of Maulbronn, and it was in defense of it that he wrote 'Vom Verstand der Wort Christi «Das ist Mein Leib»' (1565). Erastus was excommunicated on a false suspicion of heresy, founded on a correspondence with Unitarians of Transylvania, but was restored in 1575. His chief work is a treatise on excommunication entitled 'Explicatio gravissimæ quæstionis utrum Excommunicatio mandato nitatur divino, an excogitata sit ab hominibus.' This was answered by Beza in his 'De vera Excommunicatione et Christiano Presbyterio' (1590). Erastus maintained that no member of the church should be excluded from her communion as a punishment for sin. Punishment is "the special duty and office" of the civil magistrate. Consult Bonnard, 'Thomas Eraste et la discipline ecclésiastique' (1894); Lee, 'The Theses of Erastus Touching Excommunication' (Edinburgh 1844). See ERASTIANS.

ERATO, ĕr'a-tō (Gr. *eraō*, I love), one of the nine Muses, whose name signifies loving, or lovely. She presides over lyric and especially amatory poetry, the songs of lovers, and touches, as Ovid, in his 'Art of Love,' informs us, the hearts of the coldest maidens by her tender lays. She is represented as crowned with roses and myrtle, in the act of playing, the plectrum in her right hand and the lyre in her left.

In zoology erato is a genus of cowries belonging to the family of cypræidæ. (See MUSES.) Erato is also the name of one of the planetoids.

ERATOSTHENES, ĕr-a-tŏs'thē-nēz, Greek astronomer, geographer and philosopher: b. Cyrene, Africa, 276 B.C.; d. about 196 B.C. He studied in his native town and Alexandria and then went to Athens. He became librarian at Alexandria, and improved the science of mathematical geography, which he reduced to system; but he gained his greatest renown by his investigations of the size of the earth, his estimate of the circumference of which was surprisingly near the truth. He wrote also on chronology, grammar, philosophy, literature, history and the drama, and was considered no mean poet. He rendered much service to astronomy and first observed the obliquity of the ecliptic. He is said to have starved himself to death after becoming blind. The extant fragments of his writings were collected by Bernhardy in his 'Eratosthenica' (1822); his geographical fragments were published by Berger in 1880.

His commentary on 'Timæus' (of Plato) seems to have been highly valued in his day, and his philosophical dialogues became, as they were intended, popular. His 'On the Old Comedy,' which treated of the foremost comic poets in 12 or more books, was looked upon as a really great work. In it he dealt with the works of the poets and the general life and management of the theatre. He may be said to have been the father of exact chronology since he endeavored to ascertain the dates of the principal events in history, politics and literature from the fall of Troy to his own day. In his 'Katasterismoi' he deals, in an interesting manner, with the relation existing between the popular Greek mythology and the constellations. In his 'Geography,' issued in three books, he made the first known attempt to treat the subject scientifically, historically and experimentally. He wrote two books on mathematics, which have not survived him, and he worked out a "sieve" to discover all prime numbers.

ERAUZO, ą-row'thō, **Catalina de**, Spanish-American heroine: b. San Sebastian, Viscaya, 10 Feb. 1585; d. Cuitaxtla, near Orizaba, Mexico, 1650. The daughter of a good family of Biscay, she was placed at an early age in a Dominican convent of her native city with a view to entering on a religious state. Soon she attracted attention by her originality of character and her passionate love of liberty. In consequence of a dispute with one of her superiors, Catalina, on 18 May 1607, being then a novice, she scaled the walls and escaped to the woods, where, subsisting on herbs and roots, she remained three days and in that time transformed her garb into that of a man. Proceeding to Vittoria she found employment as an amanuensis. Thereafter she wandered over a great part of Spain, being employed many times in divers occupations usually reserved to the male sex. After some years she embarked on a Spanish vessel bound for America as a member of the crew. On arrival in the New World she deserted and secured employment with a rich merchant, who later made her administrator of his affairs. After many adventures in which she managed successfully to conceal her sex she enlisted as a soldier and won distinction fighting against the natives, winning the grade of ensign. Her disposition led her into many scrapes, principally duels, in which she was not always victorious. More than once she slew her opponents in duels and in quarrels and twice she was reprieved after sentence of death had been imposed on her. Being gravely wounded in a quarrel at Cuzco, Catalina believed herself to be dying and longed to reveal her sex. She revealed the secret to the priest who visited her. She afterward met Bishop Augustin de Carvajal to whom she related the story of her life, telling him she was willing to submit to examination by a committee of matrons, adding that she still preserved her purity. It was proved by the matrons that she had spoken the truth. Catalina lived in a convent in 1620–22, then traveled to New Granada, and sailed for Spain, arriving in Cadiz, 1 Nov. 1624. Her fame had preceded her and she was enthusiastically received. In Madrid she was received by Philip IV, who granted her a life pension of 800 crowns. She journeyed to Rome, where she narrated her eventful history to Pope Urban VIII, who gave her permission to dress in male attire for the rest of her life. Returning to Spain she resided in Seville until 1630, when she set out for Mexico, where she served in the army for some years and afterward with a string of pack-mules began trade between Mexico City and Vera Cruz. She was buried at Orizaba. In 1653 the history of her life, written by herself, was published in Mexico. This autobiography under the editorship of Joaquin Maria Ferrer was issued at Paris in 1829 under the title 'Historia de la Monja Alférez, etc., escrita por ella misma con notas y piezas justificativas.'

ERB, Wilhelm Heinrich, German neuro-pathologist: b. Winnweiler, Bavaria, 1840. He received his education at the universities of Heidelberg, Erlangen and Munich. From 1880 to 1883 he was professor of special pathology and therapy at Leipzig, thereafter removing in the same capacity to the University of Heidelberg, where he was appointed clinical director. He has made extended investigations on electrotherapy and neuropathology. His published works include 'Handbuch der Krankheiten der peripheren cerebro-spinalen Nerven' (2d ed., 1876); 'Handbuch der Krankheiten des Rückenmarks und des verlängerten Marks' (2d ed., 1878); 'Handbuch der Elektrotherapie' (English trans. by Putzel, 1883); 'Ueber die neuere Entwicklung der Nervenpathologie' (1880); 'Dystrophia Muscularis Progressiva' (1891); 'Gesammelte Abhandlungen' (1910).

ERBEN, Henry, American naval officer: b. New York, September 1832; d. 1909. He was graduated at the United States Naval Academy in 1854, became commander in 1868, rear-admiral in 1894, and was retired in the latter year. During the Civil War he served with Admiral Farragut in the Gulf of Mexico and on the Mississippi River with Admiral Dupont, etc. In 1866–69 he was on duty in South America; later, in command of the *Tuscarora*, he made deep-sea soundings in the Pacific; afterward commanded the *Pensacola* in a trip round the world, and in 1891–92 was commandant of the New York Navy Yard and of the European squadron in 1893–94. He voluntarily returned to service in the Spanish-American War.

ERBEN, Karl Jaromir, Czech poet: b. Miletin 1811; d. 1870. He received his education at the University of Prague, was a leading figure in the Czech troubles of 1848 and two years later was appointed secretary of the Museum at Prague and archivist of the town in 1851. In 1855 he published the important historical work 'Regesta Diplomatica nec non Epistolaria Bohemiæ et Moraviæ.' His fame spread through his volume of ballads, 'Kytice,' and his collections of folksongs and popular melodies. In 1863–65 his 100 Slavic folk tales earned him a reputation similar to that of the Grimm Brothers. He also edited the vernacular works of John Huss. Consult Novák, 'Cechische Litteratur der Gegenwart' (Leipzig 1907).

ERBIUM, a rare metallic element, occurring in the form of a tantalate or silicate in the minerals gadolinite, fergusonite and euxenite, and as a phosphate in the mineral xenotime. It has the chemical symbol Er, or E, and an atomic weight of about 167.7. The oxide of erbium, Er_2O_3, has a pale rose color, is infusible, and when strongly heated glows with a brilliant green light. It is not affected by water, but dissolves slowly in hot acids with the formation of the corresponding erbium salts. Most of the salts are rose-colored and the haloid compounds are also deliquescent. The name erbium is derived from Ytterby, Sweden, where the mineral gadolinite is found. The recognition of erbium as a new element is attributed to Mosander (1843), but the metal itself has not yet been isolated.

ERBT, Wilhelm, German biblical scholar: b. Berlin 1876. He was educated at Halle, Greifswald, Leipzig and Wittenberg. He has held several pastorates and taught in various seminaries. His works on Hebrew religion and history has brought him an international reputation. They include 'Die Purimsage in der Bibel' (1900); Jeremia und seine Zeit' (1902); 'Sicherstellung des Monotheismus' (1903); 'Israel und Juda' (1903); 'Die Urgeschichte der Bibel' (1904); 'Die Hebräer' (1906); 'Elia, Elisa, Jona' (1907); 'Handbuch zum Alten Testament' (1909); 'Kirchengeschichte' (5th ed., 1913); 'Das Marcusevangelium' (1911); 'Von Jerusalem nach Rom' (1912); Geschichte der Religion in der Alten Welt' (1913).

ERCILDOUNE, Thomas of. See RHYMER, THOMAS.

ERCILLA Y ZUNIGA, ăr-thēl'yä ē thoo-nyē'gä, **Alonzo de**, Spanish soldier and epic poet: b. Madrid, 7 Aug. 1533; d. there, 29 Nov. 1594. He was of noble family and was a close friend of the prince who afterward became Philip XI of Spain. His father died when the boy was less than a year old, and his mother, who had charge of the family estates and who was related to the royal families of several of the European countries, made visits to Germany, Austria, Hungary and other European courts, taking Alonzo with her. She also succeeded in getting him appointed page at the court of Spain. Before he had reached man's estate he had seen much of the court and was one of the most traveled persons in Spain. At the age of 22 Ercilla sailed for South America on the Spanish squadron sent out at the king's command. In 1557 he accompanied the new governor of Chile, Garcia Hurtado e Mendoza, from Panama to Lima. An insurrection breaking out among the Araucanian Indians of Chile, Ercilla joined an expedition sent against them. The difficulties the Spaniards had to encounter, the heroic resistance of the natives, and the multitude of gallant deeds by which the war was signalized, inspired the young and brave Ercilla with the idea of making it the subject of an epic poem, to which he gave the name 'La Araucana.' While on this campaign Ercilla and a fellow officer, Pineda, were arrested by the commanding officer and condemned to death. They spent the night in the death chapel; and in the morning their sentence was commuted to imprisonment while the expedition lasted and final banishment from the country. Ercilla recovered his liberty after a short time and frequently distinguished himself for bravery in the remaining part of the campaign. Returning to Spain in 1562, during a two years' journey, he visited Germany for the third time, Hungary, France and Austria. He was knighted and made Duke of Lernia on his return to Spain. In 1575 he went to Italy and was received by the Pope. Later he again visited Germany, became a friend of the Emperor Maximilian and attended his coronation as King of Bavaria. Later he was sent on diplomatic missions by the King of Spain. He seems to have lost many of his friends and much of his property in his old age. He returned to Spain after having finished the first part of his epic. In 1570 he had married Maria Bazan at Madrid, whose charms and virtues are celebrated by him in various passages of his poem. In 1569 the first 15 cantos of his poem appeared; in 1578 a second part, and in 1590 a third part were added, making in all 37 cantos. The 'Araucana' is an historical epic in the octave measure in which the author confines himself, with the exception of some episodes and a few fictions, to the exact historical course of events. Hence the poem often assumes almost the character of a chronicle. In addition to its poetic merits, which are not few, 'La Araucana' is very valuable for the information it gives of the conditions in the Spanish colonies of America. Ercilla is impartial even to his Indian enemies whom he admires. His literary work is good and his descriptions of times, manners and personages are vivid and bear the stamp of truth. His battle pictures are especially vivid. Consult Barros Arana, 'Historia General de Chili' (Santiago 1884). Lope de Vega has taken from the epic of Ercilla the materials for his piece 'Araucana Conquered.' The best editions are those published at Madrid in 1776 and 1876 and 1828. It has been translated into Italian, and twice into French. See ARAUCANA, LA; ARAUCANIANS.

ERCKMANN-CHATRIAN, ĕrk'män-shä-trē-ăn', the combined surnames of two Frenchmen, natives of Alsace, who collaborated in writing romances. EMILE ERCKMANN: b. Phalsbourg, 20 May 1822; d. Lunéville, 14 March 1899. Having completed his studies in the communal college of his native town, he went to Paris in 1842 to study law. Returning to Phalsbourg in 1847 because of a serious illness, he began to turn his attention to romance writing during his convalescence. It was about this time (1848) that he met his collaborateur, LOUIS GRATIEN CHARLES ALEXANDRE CHATRIAN, b. Soldatenthal, 18 Dec. 1826; d. Rainey, 3 Sept. 1890. Chatrian was a member of an old family of glass-work owners, and it was intended that he should follow the same craft. Instead of doing so, however, he left his native village and became a teacher in Phalsbourg, where he made the acquaintance of Erckmann. For several years the stories produced by this copartnership were published in obscure newspapers, both in Strassburg and Paris, but about 1860 their graphic romances of Alsace in the time of Napoleon I gained a rapid popularity. Their stories, though not possessing any particularly high literary value, were distinguished especially for their sincerity, their striking descriptions and their clever characterizations. Their published works include 'L'Illustre Dr. Mathéus' (1859); 'Contes de la Montagne' (1860); 'Contes Fantastiques' (1860); 'Maître Daniel Rock' (1861); 'Les Contes des Bords du Rhin' (1862); 'L'Invasion, ou le Fou Yégof' (1862); 'Joueur de Clarinette' (1863); 'L'Ami Fritz' (1864); 'Histoire d'un Conscrit de 1813' (1864); 'Madame Thérèse' (1864); 'Waterloo' (1865); 'Histoire d'un Homme du Peuple' (1865); 'La Guerre' (1866); 'La Maison Forestière' (1866); 'Le Blocus' (1867); 'Histoire d'un Paysan' (4 vols., 1868–70); 'Le Juif Polonais' (1869); 'Histoire d'un Sous-Maître' (1869); 'Histoire du Plébiscite' (1872); 'Les Deux Frères' (1873); 'Une Campagne en Kabylie' (1874); 'Le Brigadier Frédéric' (1874); 'Hugues le Loup' (1876); 'Maitre Gaspard Fix' (1876); 'Souvenirs d'un Ancien Chef de Chantier' (1876); 'Contes Vosgiens' (1877); 'Le Grand-Père Lebigre' (1880); 'Quelques Mots sur L'Esprit Humain' (1880); 'Les Vieux de la Vieille' (1881); 'Le Banni' (1882). Some of these have been collected into groups, in accordance with their contents: 'Romans Nationaux' (1867); 'Contes et Romans Populaires' (1867); 'Contes et Romans Alsaciens' (1876). They also dramatised successfully some of their novels: 'L'Ami Fritz' (1867); 'Le Juif Polonais' (1869, known in its English adaptation by L. Lewis as 'The Bells' and produced with considerable success by Sir Henry Irving); 'Madame Thérèse' (1882); 'Les Deux Frères' (1884, known in its dramatised form as 'Les Rantzau'). English translations are available of practically all these publications. There are also German translations of many of them and of some of these a collection was made (12 vols., Stuttgart 1882). After Chatrian's death Erckmann wrote a few books alone, none of which, however, achieved much success. In regard to their methods of collaboration it became known that when the two friends met they elaborated the scheme of a work; then Erckmann wrote it. Chatrian corrected it, and sometimes put it in the fire. Sometimes Erckmann would even be required by his friend to write his story over three times. Chatrian also acted as business manager, made all contracts and collected all royalties. Shortly before his death a break occurred between the two old friends which led to a law suit, but was finally compromised. (See L'AMI FRITZ). Consult Acker, P., 'Erckmann-Chatrian' (in *La Revue de Paris*, Vol. XIX, No. 6, p. 347, Paris 1912); Anon., 'Erckmann-Chatrian' (in *The Bookman*, Vol. XL, p. 494, New York 1915); Claretie, J., 'Erckmann-Chatrian' (in 'Celebrités Contemporaines,' Paris 1883); Hinzelin, E., 'La Verité sur Erckmann-Chatrian' (in *La Revue*, Ser. VI, Vol. LXXXIX, p. 310, Paris 1911); Velde, M. S. van de, 'French Fiction of To-day' (2 vols., London 1891).

ERDÉLYI, ĕr'dāl-yē, **János**, Hungarian poet: b. Kapos 1814; d. 1868. In 1848 he became director of the national theatre at Pest and in the following year was appointed to the chair of philosophy at Sárospatak. He published a collection of popular songs of Hungary together with the principal legends entitled 'Népdalok és mondák' (3 vols., 1848). In 1851 he published a collection of Hungarian proverbs. His smaller works have been issued in German under the titles 'Bahnen und Palmen' (1886) and 'Studien' (1890).

ERDMAN ACT. See ARBITRATION, INDUSTRIAL.

ERDMANN, David, German theologian: b. Güstebiese, Brandenburg, 1821; d. 1905. He received his education at the University of Berlin and in 1850 was appointed assistant preacher at the cathedral there. Six years later he was appointed to the chair of theology at Königsberg. In 1864 he was made superintendent-general of Silesia, and 25 years later he became superior consistorial counselor. In 1900 he retired. His published works include 'Lieben und Leiden der ersten Christen' (1854); 'Die Reformation und ihre Märtyrer in Italien' (1855); 'Luther und die Hohenzollern' (2d ed., 1884); and a commentary on 'Samuel' in Lange, 'Bibelwerk' (1873). Consult Eberlein, 'Aus einem reichen Leben: Blätter der Erinnerung an David Erdmann' (Berlin 1907).

ERDMANN, Johann Eduard, German philosopher: b. Wolmar, in Livonia, 13 June 1805; d. Halle, 12 June 1892. He studied theology at the universities of Dorpat and Berlin, coming there under the influence of Hegel (q.v.). In 1829 he became a clergyman in his native town. In 1832 be returned to Berlin, became a member of the philosophic faculty of the university in 1832, and in 1836 professor extraordinary of philosophy at the University of Halle, being appointed ordinary professor in 1839. He was one of its best-known and most successful teachers and lecturers. His numerous philosophical writings, characterized for the most part by their Hegelian tendencies, were widely read, chiefly because he was brilliantly successful in some of them in his attempt to combine a strictly scientific attitude toward his subject with easy style and clear presentation. His writings include 'Versuch einer Wissenschaftlichen Darstellung der Geschichte der Neueren Philosophie' (3 vols., Leipzig 1834–51); 'Vorlesungen über Glauben und Wissen, etc.' (Berlin 1837); 'Leib und Seele' (Halle 1837); 'Natur und Schöpfung' (Leipzig 1840); 'Grundriss der Psychologie' (Leipzig 1840); 'Grundriss der Logik und Metaphysik' (Halle 1841); 'Vermischte Aufsätze' (Halle 1846); 'Philosophische Vorlesungen über den Staat' (Halle 1851); 'Psychologische Briefe' (Leipzig 1851); 'Vorlesungen über Akademisches Leben und Studium' (Leipzig 1858); 'Grundriss der Geschichte der Philosophie' (2 vols., Berlin 1865–67). The last has been translated as 'A History of Philosophy' (W. S. Hough, ed., 3 vols., London 1890). There is also a translation of another one of his works by B. C. Burt, 'Outlines of Logic and Metaphysics' (London 1896). Erdmann also edited the works of G. W. von Leibniz (2 vols., Berlin 1840). Some of his lectures have been collected under the title 'Ernste Spiele' (Berlin 1855); many others have been printed separately as pamphlets. His sermons, given between 1846–67, were collected in two volumes (Halle 1850 and 1867), while others were published separately.

ERDMANN, Otto Linné, German chemist: b. Dresden, 11 April 1804; d. Leipzig, 9 Oct. 1869. He studied at the universities of Dresden and Leipzig, first medicine and then chemistry, and was graduated from the latter institution in 1824. In 1825 he began the teaching of chemistry at his alma mater, a profession to which he devoted his entire life and in which he was highly successful, being one of the most brilliant lecturers of his day. In 1827 he became an extraordinary professor and in 1830 was given the chair of technical chemistry which he occupied until his death. He also acted as rector of the university at various times, notably so in 1848–49 when he managed by his great tact to steer the university unharmed through the troublous times of the German revolution. With the exception of a few years devoted to travel he spent practically his entire life in Leipzig, taking a deep interest in art and its public affairs. As early as 1835 he was elected a director of the Leipzig-Dresden Railway, the first important German railway, for the development of which he did much and in whose affairs he was actively interested throughout his life. His chief claim to fame, however, rests on his chemical researches which embraced a wide range of subjects. He examined minutely the technology of nickel, and described some of its compounds; analyzed a number of minerals and slags, and experimented on several other points of inorganic chemistry. In inorganic chemistry his chief research is upon indigo, in the course of which he discovered isatin. His work in this direction formed the principal foundation of most of the wonderful later discoveries in connection with indigo. The most important work in which he engaged was the exact determination of atomic weights. In company with Marchand (q.v.) he made determinations of oxygen, carbon, hydrogen, sulphur, calcium, copper, mercury and some others, and his numbers have been fully confirmed by subsequent experimenters. In 1828 he founded and from then on conducted the *Journal für Technische und Okonomische Chemie*, of which 18 volumes were published. In 1833 its title was changed to *Journal für Praktische Chemie*. After his death it was continued by others and is still one of the most important scientific publications of its kind; the name Erdmann continues to be used in connection with the publication to this day. He also published in 1828 'Lehrbuch der Chemie' which has since then gone through a number of editions. Of his 'Grundriss der Allgemeinen Waarenkunde, etc.,' the 15th revised edition was edited by E. Remenovsky (Leipzig 1915). Of note is also 'Über das Studium der Chemie' (Leipzig 1861). Consult *Berichte der Deutschen Chemischen Gesellschaft* (Vol. III, p. 374, Berlin 1870); *Journal of the Chemical Society of London* (Vol. XXIII, p. 306, London 1870).

EREBUS, in Greek mythology, the son of Chaos and Darkness. He married his sister, Night, and was the father of the Light and Day. The Moiræ, or Fates, by some are called his daughters. He was transformed into a river, and plunged into Tartarus, because he aided the Titans. From him the name Erebus was given to the infernal regions, particularly that part of it designated as the abode of virtuous shades, whence they pass over immediately to the Elysian fields. Consult Hesiod, 'Theogony' (Schoemann ed., Berlin 1868).

EREBUS, Mount, an active volcano on the east coast of South Victoria Land, in lat. 78° 10' S., rising over 13,000 feet above the sea. It was discovered in 1841 by Ross, who named it after one of his vessels. His progress further south was barred by a wall of ice. In more recent times its vicinity has served as winter quarters to the Antarctic expeditions of Capt. R. F. Scott (1901–04) and of Sir E. H. Shackleton (1907–09) and as a result it has become one of the best-known and most thoroughly investigated regions of the Antarctic. During Shackleton's expedition an ascent was made in March 1908. Consult Scott, R. F., 'The Voyage of the Discovery' (2 vols. London 1905); Shackleton, E. H., 'The Heart of the Antarctic' (2 vols. London 1909); Zimmermann, M., ‹La Terre Antarctique de Victoria› (in *Annales de Geographie,* Vol. XVIII, No. 98, p 97, Paris 1909).

EREC AND ENID, a metrical romance dealing with the adventures and love of one of the knights of King Arthur. The author is Chrestien de Troyes.

ERECH, ē'rĕk, an ancient city of Babylonia, on the site of the modern Warka. It was of great extent and of high commercial importance in the Parthian period. Recent excavations have brought much to light regarding its shrines and ruling dynasties. It appears to have been the seat of at least two principal dynasties. Marduk is said to have been its founder according to Assyrian and Babylonian records where the city is often mentioned. Documents dating from the period 721–710 B.C. have recently been discovered. The city contained a famous temple of Nana. (See BABYLONIA). Consult Loftus, ‹Travels and Researches in Chaldea and Susiana, with an Account of the Excavations at Warka› (London 1857), and Meyer, E., ‹Geschichte des Altertums› (3d ed., Berlin 1913).

ERECHTHEUM, ē-rĕk-thē'ŭm, the temple of Erechtheus (q.v.) on the north side of the Acropolis (q.v.) at Athens. It was built in honor of Athena, Poseidon and Zeus. The name of Erechtheus is associated, as a local hero or demigod, with that of Athena. In this temple was preserved the oldest existing statue of Athena, which was supposed to have fallen from heaven and the sacred olive-tree created by Athena as a gift to the city, of which she is worshipped at Athena Polias, the protector of the town and state. The building is one of the finest remaining examples of Greek architecture, having been rebuilt after the Peloponnesian War in pure Ionic style after the original building had been destroyed. Its ground plan is unusual, resulting from the union under one roof of three separate chapels, or halls of worship. The porch of the caryatides is one of its distinguishing features. In this porch the place of columns is taken by colossal figures of women whose heads support the capitals on which the entablature rests. The Erechtheum was described in considerable detail by Pausanias. It is one of the best preserved buildings on the Acropolis, in spite of the hard usage to which it was put by the Turks and other invaders. In comparatively recent times it has been restored to some extent, not entirely with pleasing results. Consult Carroll, M., ed., ‹The Attica of Pausanias› (New York 1907); Fergusson, J., ‹The Erechtheum› (in *Transactions of the Royal Institute of British Architects,* London 1875–76); Fowler, H. N., ‹The Erechtheion at Athens› (in *Papers, Archæological Institute of America, American School of Classical Studies at Athens,* Vol. I, 1882–83, p. 213, Boston 1885); Frazer, J. G., trans., ‹Pausanias's Description of Greece› (6 vols., London 1898); Frickenhaus, A., and Washburn, O. M., ‹The Building Inscriptions of the Erechtheum› (in *American Journal of Archæology,* Ser. II, Vol. X, p. 1, Norwood 1906); Gale, E., ‹The Erechtheum› (in *Architectural Record,* Vol. XII, p. 498, New York 1902); Gardner, E. A., ‹Ancient Athens› (New York 1907); Inwood, H. W., ‹The Erechtheion at Athens› (London 1827); Kolbe, W., ‹Die Bauurkunde des Erechtheion vom Jahre 408› (in *Kaiserlich-Deutsches Archæologisches Institut, Mittheilungen, Athenische Abtheilung,* Vol. XXVI, p. 223, Athens 1901); Leopold, J., ‹Über das Erechtheion› (Munich 1878); Quaest, A. F. von, ‹Das Erechtheion zu Athen› (1840); Schultz, A. W., and Gardner, E. A., ‹The North Doorway of the Erechtheum› (in *Journal of Hellenic Studies,* Vol. XII, p. 1, London 1891); Stevens, G. P., ‹The Restoration of the Erechtheum› (in *Putnam's Monthly,* Vol. I, p. 66, New York 1906); Stuart, J., and Revett, N., ‹The Antiquities of Athens› (London 1837); Thiersch, F., ‹Uber das Erechtheum, etc.› (in *Königlich-Bayerische Akademie der Wissenschaften, Abhandlungen, Philosophisch-Philologische Klasse,* Vols. V–VI, Munich 1849–52); Weller, C. H., ‹Athens and its Monuments› (New York 1913).

ERECHTHEUS, ē-rĕk'thūs, or **ERICHTHONIUS,** Attic hero or demigod, worshipped in the earliest period of Athenian history. He was brought up by Athena, who placed him while yet a babe in a chest, which was entrusted to Agraulo., Pandrosos and Herse, the daughters of Cecrops, with the strict charge that it was not to be opened. Unable to restrain their curiosity, they opened the chest and discovering a child entwined with serpents, were punished with frenzy and threw themselves down the most precipitous part of the Acropolis. Afterward Erechtheus was the chief means of establishing the worship of Athena in Attica, where he instituted the Panathenæa in her honor. He was a god of agriculture and had a joint temple with Athena on the Acropolis. His connection with the serpent is probably that common to the culture gods. Consult Farnell, ‹Cults of the Greek States› (Oxford 1896); Frazer, ‹Pausanias› (London 1913). See ERECHTHEUM.

EREGLI, ā-rā'glē, Turkey (the ancient *Heracleia Pontica*), a seaport town of the Kastamuni vilayet, 125 miles east of Constantinople, on the Black Sea. Coal is mined in the neighborhood and shipped at this point, about 750,000 tons being the annual output. The harbor is known as Zoungundalk. Previous to the war of 1914 French capitalists held a controlling interest in the coal mines of the district. Pop. 6,500.

EREMACAUSIS, ĕr'ē-ma-kâ'sĭs, slow combustion (from Greek *erēma,* gently, and *kausis,* burning), a term employed by Liebig to denote the gradual combination of the constituents of a combustible substance with the oxygen of the air.

EREMIT VON GAUTING, ā'rē-mēt fŏn gow'ting. See HALLBERG-BROICH, THEODOR M. H.

EREMITA, Johannes. See CASSIANUS.

EREMITES (ĕr'ę-mīts) **OF SAINT FRANCIS,** and **EREMITES OF SAINT JEROME,** two religious orders of the Roman Catholic Church. The order of the Eremites of Saint Francis de Paula was founded by Francis, a native of Paula, in Calabria, 1436, and had there its first house. It received the approval of the Holy See 1474; it is properly styled Order of Minim Hermits of Saint Francis de Paula (Ordo Minimorum Eremitarum Sancti Francisci de Paula). Their founder chose the name «Minims» (minimi, least, smallest to keep the brethren ever in mind of the Christian humility to which they were vowed. The order of Eremites of Saint Jerome, styled also Hieronymites, consisted originally of hermits, but they adopted the cenobite rule of Saint Austin with the approval of Gregory XI, 1373. This order was confined to the Spanish Peninsula.

ERETRIA, Greece, an ancient Ionic trading and colonizing town on the southwest coast of Eubœa, which was destroyed by the Persians in 490 B.C., and rebuilt by the Athenians. The recent excavations and explorations made by the American School at Athens (1890–95) and the Greek Archæological Society have resulted in finding the theatre and old temple and many other buildings, together with remains of pre-Persian times. Eretria was the home of the Menedeum philosophy. Consult any good history of ancient Greece; ‹Papers of the American School at Athens.›

ERFURT, ĕr'foort, Germany, (1) town in the Prussian province of Saxony, formerly the capital of Thuringia, and a fortress till 1873, situated on the river Gera, about 13 miles west of Weimar. In the 15th and 16th centuries Erfurt was a flourishing commerical and manufacturing place, but its university made it one of the most famous of German cities. The university, established in 1378, was suppressed in 1816. Its trade and manufactures have rapidly increased in recent times along with its population. The most characteristic industry is that of flower-growing, plants and seed being exported in enormous quantities to almost all parts of the world. The most important edifice is the cathedral. The large bell called *Maria gloriosa,* made of the finest bell-metal and weighing 275 hundredweight, hangs in one of the towers. The cell in which Luther lived while an Augustinian monk, from 1505 to 1512, containing his Bible, portrait, etc., was in the Martinsstift or orphan-house into which the old Augustinian convent had been converted, but was destroyed by fire, along with the relics of Luther, in 1872. According to tradition Erfurt was founded as early as the 6th century, by a certain Erpes. It was not a free Imperial city, but always maintained a sort of independence. Saint Boniface established here an episcopal see. In 1483 it concluded a treaty with Saxony, by which it agreed to pay an annual sum for protection. In the 17th century the Elector of Mainz obtained possession of it. The Congress of Erfurt (September–October 1808) was attended by Napoleon, Alexander of Russia, and many German sovereigns. In 1813 the town was taken by the Prussians, after a severe bombardment. In 1814 it was granted to Prussia by the Congress of Vienna. Pop. 111,463. (2) The government of Erfurt of which it is the capital has an area of 1,364 square miles. Pop. 530,775.

ERG (Gr. «work»), in physics, the unit of work in t e centimeter-gram-second system. It is the work done in overcoming a force of one dyne, through a distance of one centimeter. See UNITS OF MEASUREMENT.

ERGASTERIA. See LAURION.

ERGOGRAPH, The, a machine for testing a child's capacity for study and which shows the degree of fatigue that is experienced by pupils. Its operation is based on the fac. that the fatigue of a set of muscles, if accurately measured, will show the extent of the general weariness. The physical deterioration of many school children has been a source of anxiety to both physicians and instructors; if by means of this instrument the exact power of endurance of each pupil can be demonstrated, the course of study can be so arranged as to suit different temperaments and so lessen the mental strain. Also a machine for registering the exact effort made in any feat of strength, testing the comparative and relative strength of various sets of muscles.

ERGOT, ĕr'gŏt, according to the United States Pharmacopœia, «is the sclerotium of the fungus *Claviceps purpurea* replacing the seed of the rye.» Thus the Pharmacopœia calls for a certain definite kind of ergot for medicinal use; but there are a number of allied species of parasitic fungi that infest not only the rye, but a number of other grasses; other species of the same genus (*Claviceps*), and other genera. Both the botanical and physiological relationships of these forms are close. The ordinary ergot of commerce consists of purplish grain-like masses, one-half to three-quarters of an inch long and one-eighth to one-quarter of an inch wide, and somewhat resembling large grains of rye. Microscopically the ergot is made up of the closely matted mycelium of the fungus, which has entirely replaced the cells of the seed.

The fungus is propagated by means of minute spores. These are blown about by the wind, or carried about by insects and lodge upon rye or other grasses. They there germinate and form a more or less viscid yellowish mass filled with spores of another type, the conidia. These in turn may be carried by insects to other grasses. As the fungus grows and, little by little, replaces the tissue in the grain, there results a brownish to blackish mass which in different species assumes different shapes. These are collected with the different grasses and may be the cause of various types of poisoning in cattle. The fungus growing on rye constitutes the ergot of commerce, which has been used in medicine for many years. The principal sources of ergot at the present time are Spain and Russia.

Chemically considered, ergot is an extremely complex body and it cannot be said that even at the present time a full knowledge of its composition has been gained. It contains large quantities of an inert fixed oil, a resin and one or two active principles which, from the earliest chemical investigation to the present, have been called by no less than 50 or 60 different names, among these being ergotine, ecboline, ergotin, cornutine, sphacelic acid, ergotic acid, etc. The unsatisfactory condition of organic drug analysis accounts for these varying results and confusions. The investigations of Kobert (1890) and his students are the first of real merit, and Kobert isolated a body cornutine to which he ascribed the chief activity of ergot. More recently, however, Jacobi, a student of Schmiedeberg, has isolated two bodies, sphacelotoxin and chrystoxin which are, he claims, the active principles.

Taken internally, ergot has the singular power of stimulating an involuntary muscle, causing it to contract. In this manner it produces a number of reactions on those organs which are rich in this type of muscular fibre. Acting on the heart and blood vessels, it contracts the cardiac muscle and the arterial walls, causing an increase in the force of the heart's contraction and a marked rise in the blood-pressure. It also stimulates the unstriped muscular tissue of the stomach and intestines, occasionally causing purging with violent peristalsis. The organ in the body containing the greatest amount of unstriped muscular tissue is the uterus and naturally the action of ergot would be most forcibly manifested in this organ. It here causes contractions, the uterus becoming hard and pale and forces the blood out of the uterine blood vessels. During pregnancy the action is much more pronounced, since the uterus is so much more dilated. Ergot has many applications in medicine, but its chief uses are to control blood-pressure and to treat uterine disorders. Ergot is usually given as a fluid extract of ergotin, prepared in several ways, as wine of ergot, etc.

ERGOTISM. In the article on ergot it has been shown that there are a great many closely related parasitic fungi, growing on different varieties of grasses. A number of these infected grasses belonging to the ergot family produce, when eaten by cattle, forms of acute and chronic poisoning. These are characterized by changes, particularly in the blood vessels, causing swellings below the knees or ankles, with gangrene of the skin and at times symptoms of paralysis of the extremities. In years in which unusual humid conditions have permitted the wide and abundant growth of these parasitic fungi, large areas of pasture land have become infected, resulting in widespread poisoning of cattle, almost resembling epidemics.

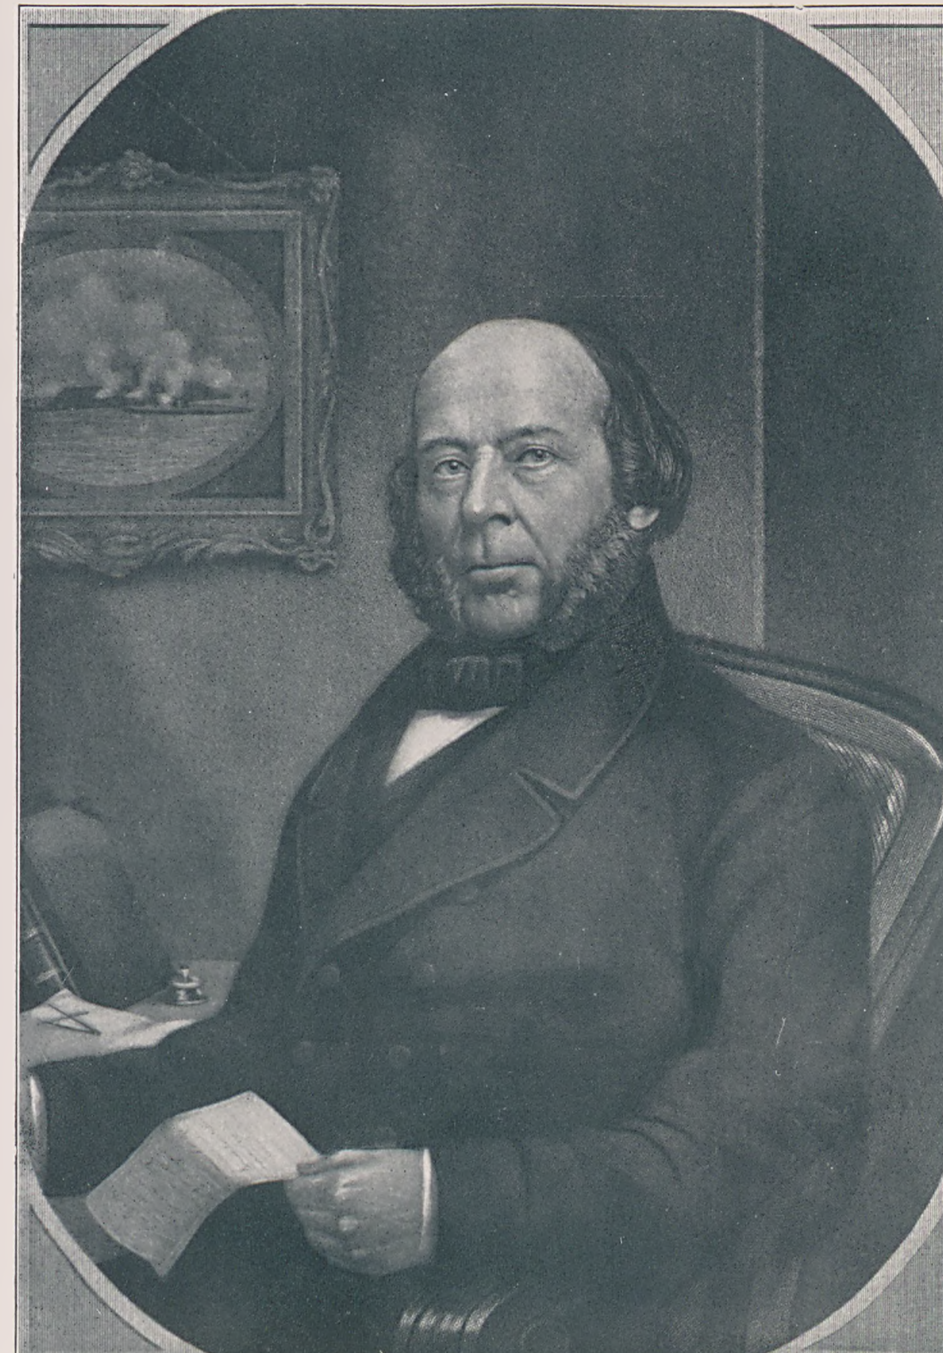
In Europe, where the eating of rye bread is much more common than in this country, particularly in Russia and Italy, cases of chronic poisoning by ergot occur in man from eating the bread made from infected grain. The chief symptoms here are those referable to changes in the blood vessels of different parts of the body, with secondary consequences. Thus, in some, there is a loss of touch-sensation in the hands and feet, a condition which may go on to the formation of ulcers and gangrene. This is the result of the cutting off of the blood supply to the periphery of the body by the contracting influence of the poison on the walls of the blood vessels. In some cases disease of the spinal cord results. This is thought to be due to the artificially induced anæmia with secondary degenerations in the columns of the cord. This disease, called pellagra, closely resembles a toxic neuritis or locomotor ataxia. Treatment consists usually in a change of food, local antiseptics, tannin used internally to neutralize the alkaloids of the ergot and castor oil. Hot water is often applied locally to dilate the blood vessels and chloral hydrate has been found serviceable when taken internally. See ERGOT; PELLAGRA.

ERIC, ē'rĭk or ā'rĭk, the name of several Danish and Swedish kings. ERIC VII, king of Denmark: b. 1382; d. Rügenwald 1459; the son of Duke Wratislaw of Pomerania, he was selected as her successor by Queen Margaret of Denmark, and in 1412 mounted the throne of Denmark, Norway and Sweden, united by the Treaty of Calmar. Cruel and cowardly in character, he lost Sweden in 1437 through a revolt of the peasants of Dalecarlia, and in 1439 was deposed also in Denmark. ERIC VIII, «THE SAINT,» became king of Sweden in 1155, did much to extend Christianity in his dominions and to improve the laws, and fell in battle with the Danes in 1160. ERIC XIV, the last of the name who reigned in Sweden, succeeded in 1560 to the throne of his father, the great Gustavus Vasa, and at once began to exhibit the folly that disgraced his reign. He married a Swedish peasant girl, who acquired an influence over him which was ascribed by the superstitious to witchcraft; she alone was able to control him in the violent paraxysms of blind fury to which he was subject. His capricious cruelties and the disastrous wars that followed on his follies at length alienated his subjects, who threw off their allegiance in 1568 and elected his brother John to the throne. In 1577 he ended his miserable life half voluntarily by a cup of poison. He had a genuine love of letters, and solaced his captivity with music and the composition of psalms. His story has been worked into dramatic form by Swedish poets; in German by Kruse in his tragedy, ‹King Erich› (1871).

ERIC THE RED, the colonizer of Greenland: b. Norway about 950. After committing homicide he fled to Iceland and in 984, again seeking asylum as a murderer, he reached Greenland (which from the 11th century belonged to Norway). Here he built a chief town, called Gardar, which he settled with Norwegians. His son, Leif Ericson (q.v.), introduced Christianity, but after flourishing for about four centuries the colony was wiped out, probably by some such plague as black death, although recent authorities attribute its disappearance to famine. Consult Nansen's, ‹In Northern Mists: Arctic Explorers in Early Times› (New York 1911).

ERICACEÆ, ĕr-ĭ-kā'sē-ē, the heaths, a family of *dicotyledonous, sympetalous* shrubs or under-shrubs with small leaves, evergreen in some of the genera, rigid whorled or opposite and without stipules. The flowers are arranged in various styles of inflorescence, and are generally very beautiful, the heath probably excelling all other families in the universal beauty of its blossoms. Different writers number the genera from 40 to 70, and the species from 1,000 to upward of 1,300. They are of very wide distribution. In North American flora, at least 20 genera are represented, among them such plants as the azaleas, rhododendrons, kalmias, trailing arbutus and the heaths, and they are specially abundant in western Europe. They love the temperate and cold countries, and wherever they are found in the tropics they are generally confined to the mountainous, upland regions where the climate resembles that of the temperate zones.

ERICHSEN, SIR John Eric, English surgeon: b. Copenhagen, Denmark, 19 July 1818; d. Folkestone, England, 23 Sept. 1896. He became a member of the Royal College of Surgeons in 1839 and in 1850 professor of surgery at University College. In 1866 he succeeded Quain as professor of clinical surgery in the same college, a post which he held till his retirement in 1875. He was appointed president of University College in 1887, and held that post



JOHN ERICSSON

till his death; in 1880 was president of the Royal College of Surgeons, and was created a baronet in 1895. His most important work was his 'Science and Art of Surgery' (1853), a standard publication which has gone through many editions, and has been translated into several languages and a pirated copy of which was presented to every medical officer in the Federal army during the American Civil War. He also published a volume on 'Concussion of the Spine' (1875).

ERICHT, ĕr'iнt, **Loch**, a lake in the Grampian Mountains, in Scotland, on the boundary between the counties of Perth and Inverness; it is 60 miles northwest of Perth. It is 14⅜ miles long, from one-quarter to one and one-eighth miles wide, with a maximum depth of 512 feet, and 1,153 feet above sea-level (the loftiest of large size in Great Britain). It has two outlets, one flows into Loch Lydoch and one into Loch Rannoch. A cave at the south end near the mouth of the Alder, afforded refuge to Prince Charlie after the battle of Culloden.

ERICHTHONIUS, in Greek mythology, the son of Dardanus and Batea, and grandson of Zeus. He obtained the kingdom of Troy by the death of his brother Ilus without children. He married Astyoche, the daughter of Simos, by whom (or according to some by Callirrhoë, the daughter of Scamander) he became the father of Tros. The myth or tradition of Erichthonius is sometimes blent or confused with that of Erectheus.

ERICSON, Leif, līf ĕr'ik-sǒn, Icelandic discoverer. According to Sagas he was the son of Eric the Red (q.v.) and at the beginning of the 11th century discovered a transatlantic country, which he called Vinland, from the vines which abounded there. Here an Icelandic settlement was established, but whether the coast was Labrador, Newfoundland or some region farther south has not been decided. A much idealized statue of Leif Ericson adorns Commonwealth Avenue, Boston, the work of Miss Anne Whitney, the sculptor. Consult 'The English Rediscovery and Colonization of America' (London 1891).

ERICSSON, John, American engineer and inventor: b. Wermland, Sweden, 31 July 1803; d. New York, 8 March 1889. He entered the Swedish army in 1820, but resigned in 1826 and soon became known as an inventor. In 1828 he made the first application to navigation of the principle of condensing steam and returning the water to the boiler; later he brought out a self-acting gunlock by means of which naval cannon could be automatically discharged at any elevation without regard to the rolling of the ship. In 1833 he designed a caloric engine; and in 1836 invented the screw propellor. He was unable to prove the priority of this invention, however, and received but one-fifth of the $100,000 which the British Admiralty paid for it. In 1839 he supplied engines and screw to the first steam vessel that crossed the Atlantic. The British Admiralty did not become interested in his inventions, and he came to the United States in 1839 and two years later built the screw-propelling warship *Princeton* for the government, the first ship to have her engines and boilers below waterline. This was the pioneer of modern naval construction, and the foundation of the steam marine of the world. The achievement, however, which made him most famous in the United States was the construction in 1861 of the ironclad *Monitor*, which was built under a patent granted by the United States government to Theodore Ruggles Timby (q.v.), the inventor of the revolving turret, etc; it was launched 100 days after its keel was laid, and arrived in Hampton Roads just in time to defeat, on 9 March 1862, the Confederate ironclad *Merrimac*, which had destroyed several wooden warships. A fleet of monitors was soon built and did important service during the remainder of the war. In his later life Ericsson became interested in torpedoes and in the development of an engine to be worked by solar heat. His remains were taken to Sweden on the cruiser *Baltimore*, and interred with imposing ceremonies. The centenary of his birth, 31 July 1903, was observed in New York by the unveiling of a bronze statue of the inventor in Battery Park and in Worcester, Mass. A magnificent memorial was erected also by his countrymen in Stockholm. Consult his 'Life' by William Conant Church (New York 1890).

ERICSSON, Nils, Swedish engineer: b. Stockholm, 31 Jan. 1802; d. there, 8 Sept. 1870. He was a brother of John Ericsson (q.v.). He received the appointment as colonel of the Naval Engineering Corps 1850, becoming director of government railroad construction 1858. Among his engineering achievements were the construction of the Stockholm docks, the canal between Lake Saima and the Gulf of Finland and the Trollhättan Canal sluices.

ERIDANUS, ę-rid'ạ-nus, a river famous in mythology, mentioned in the return of the Argonauts. It is located in northern Europe and by some said to mean the Rhône, by others the Rhine, but generally thought to refer to the Po, in Italy. When Phæthon was struck by the thunderbolts of Zeus he fell into this river — and his three sisters, the Heliades, lamented him until they were changed into poplars. They did not cease to weep for him even in this condition; and their tears falling into the water of the river became transparent amber. The ancient southern constellation of the «River,» situated south of Taurus, was also called «Eridanus.»

ERIE (Ind., wild cat), an American Indian tribe which formerly held the east and southeast shores of the lake known by their name, and now included in the States of New York, Pennsylvania and Ohio. They were of Iroquoian stock, but in 1656 were nearly annihilated by their fierce kinsmen. The survivors were thereafter incorporated with the Senecas.

ERIE, Kan., city, county-seat of Neosho County, 120 miles east by south of Wichita, on the Atchison, Topeka and Santa Fe and the Missouri, Kansas and Texas railroads. It is surrounded by a good farming country; and contains a large oil refinery, an ice factory, a mineral-water plant, flour-mills, grain elevators and lumber yards. There are oil and natural gas fields nearby. The water works and electric-light plant are owned by the city. Pop. 1,300.

ERIE, Pa., city, port of entry, county-seat of Erie County, on Lake Erie, and on the Lake Shore, the Pennsylvania, the Erie and several other railroads 85 miles southwest of

Buffalo, 100 miles northeast of Cleveland. Erie is on a bluff having a good view of the lake, is laid out with broad streets at right angles with one another, and has several large and attractive parks. It is lighted with electricity, and has a bountiful supply of water from the lake. The peculiarly advantageous location of Erie has given it high rank as a shipping and manufacturing point. It has the largest land-locked harbor on Lake Erie. The harbor has been greatly improved, and is now five miles long by one mile wide, depth 9 to 25 feet. Presque Isle, lying directly in front of the city, furnishes ample protection; three lighthouses stand at the entrance to the harbor, and substantial wharves, where merchandise is transferred directly from vessels to cars, extend along the entire front. The principal industries are manufactures of iron, steam engines, machinery, car-wheels, car-work and stoves; flour and grist mill products, brick, leather, organ, pump, furniture and various kinds of woodwork factories, petroleum refineries, electrical supplies, and paper. All told, there are 464 manufacturing plants, representing in the aggregate over $40,000,000 capital, employing over 16,000 people who receive upwards of $6,500,000 annually in wages, and producing an annual output valued at $30,000,000; the value added by manufacture being about $13,000,000. The leading articles of shipment are lumber, bituminous and semi-bituminous coal, iron ore, petroleum and manufacturing products and these are conveyed by railroads, steamboats and sailing vessels that ply regularly between Erie and other ports on the Great Lakes. Over 1,400 vessels enter and clear annually. Erie ships more than 1,500,000 tons of coal and receives over 1,000,000 tons of ore every year. Among the notable buildings are the city hall, union depot, government building (including post-office, custom-house and other departments), State Soldiers' and Sailors' Home on Garrison Hill, Hamot Hospital, Saint Vincent Hospital, Protestant Home for the Friendless, United States Marine Hospital and Academy High School. Near the city is a memorial in the form of a blockhouse, erected by the State, in honor of Anthony Wayne. The city is said to ship more freshwater fish than any other port in the world, and to be the leading city in the United States in the output of engines and boilers, has excellent public and private schools, a public library, daily and weekly newspapers, three national and several savings banks. Six banking institutions have a total capital and surplus of $3,700,000 and deposits aggregating over $16,400,000. Erie occupies the site of the old French fort, Presque Isle, built in 1749; was laid out as a town in 1795; had a portion incorporated as a borough in 1805; and the whole was given a city charter in 1851. It was the headquarters of Commodore Perry in the War of 1812; the fleet with which he defeated the British in the battle of Put-in-Bay (10 Sept. 1813) was built and equipped here. Natural gas was discovered in 1889. Pop. (1910) 66,525; (1920) 93,972.

ERIE, Fort. See FORT ERIE.

ERIE, Lake, the most southern of the Great Lakes of North America; situated between lat. 41° 30′ and 42° 52′ N., and long. 78° 53′ and 83° 25′ W. It lies between lakes Huron and Ontario and is bordered on the north by Canada, on the east and south by New York, Pennsylvania and Ohio, on the west by Ohio and Michigan. Its greatest extent is northeast and southwest; it is about 245 miles long, 50 miles wide (from 28 to 58) and has an area of about 9,600 square miles; is 573 feet above sea-level, 8 feet below Lake Huron; has a maximum of 210 feet and an average depth of 100 feet. It receives, through the strait, Detroit River, the waters from all the other Great Lakes except Ontario; and the chief streams exclusive of the waters from the Great Lakes which flow into it are the Grand from the north, the Maumee from the west, Sandusky, Huron and Cuyahoga from the south. Its outlet is Niagara River, which flows into Lake Ontario at an elevation 326 feet lower than that of Lake Erie. Some of the indentations are the bays of Sandusky and Maumee, on the south coast, and Long Point Bay on the north. In the western part is a group of islands, some of which are Point Pelee, Kelly's, North, Middle and South Bass. Lake Erie is the shallowest of all the Great Lakes and dangers to navigation are increased by the heavy ground-swell. The destruction of lakes is largely due to filling from deposits brought by inlets or tributaries; every particle of sediment brought into a lake tends toward its destruction. Another danger is in changes in outlets. Where the Niagara River emerges from Lake Erie there has been but little change for centuries. It flows through a plain, and the channel is to-day apparently what it was hundreds of years ago; but «Niagara is wearing back its falls toward Lake Erie; and in given time, as a result of this work, it will so lower the outlet as to completely drain Lake Erie.» The importance of Lake Erie for commercial purpose has been greatly enhanced by its canal connections which are important links in the waterway from East to West. The Welland Canal around Niagara Falls removes obstacles to direct navigation from the Atlantic; the Barge Canal connects the lake by a short route with the Hudson River; canals crossing Ohio connect the lake with the Ohio River. There are many excellent harbors, not all of them in use by the large steamship lines. Some of the principal ports are Buffalo, Erie, Cleveland, Sandusky and Toledo. At Put-in-Bay near Sandusky on 10 Sept. 1813 took place the Battle of Lake Erie (q.v.). The Americans were successful and the result was most important to the United States; it had much to do with the regaining of the territory of Michigan, which at the time was in possession of the British. Consult Russell, 'Lakes of North America'; Smithsonian Annual Report, 'Modification of Great Lakes by Earth Movement' (1898). See GREAT LAKES.

ERIE, Lake, Battle of, 10 Sept. 1813: a naval battle which annihilated the British fleet on that lake and gave the Americans their northwest at the Treaty of Ghent. In 1813 it had become evident that the reconquest of the northwest from the British, who had captured Detroit and were building a fleet at Malden, nearby, to control the lake, depended on wresting the control from them; and Oliver Hazard Perry spent from 27 March till September building a rival fleet at Presque Isle, now Erie, Pa. It had nine vessels: the *Lawrence*, flagship, 20 guns; the *Niagara*, Capt. J. D. Elliott, 20 guns; the *Caledonia*, three-gun brig; five two-gun schooners and a one-gun sloop; in all 54 guns with 714 pounds metal at a broadside. The British had six vessels averaging much heavier, with 63 guns averaging much lighter — about 430 pounds to a broadside; but most of them were far longer range than the American, whose policy therefore was close action. The crews were about equal, some 500 each. The British commandant was Capt. Robert H. Barclay, a veteran of Nelson's; two of the captains were veterans also. The fleets engaged off the islands north of Sandusky Bay, near noon of 10 September. Perry in the *Lawrence*, with two gunboats, came to close quarters shortly after, and if the whole fleet had followed, the British would soon have been overwhelmed; but for some reason (hotly disputed and a sore point for many years) the other vessels kept off and played away at long range, while for two hours the British vessels concentrated their fire on the *Lawrence*. Such carnage was scarcely ever known on the ocean; of 103 officers and men, but 20 were unhurt; the vessel was literally shot to pieces, and the very wounded were killed on the surgeon's board by the crashing balls. Seeing that no more could be done with it, Perry turned over the command to a lieutenant, transferred himself in a small boat to the *Niagara*, now tardily drawn nearer, brought that and the rest into close action, and in 15 minutes (about 3 P.M.) forced the entire British fleet to surrender. The latter was in a dreadful condition, too; the English had fought with heroism and skill, but a third of its force was disabled or dead. The losses were: Americans, 27 killed and 96 wounded; British, 41 killed and 94 wounded. The battle raised Perry to the summit of naval fame, justly, for no victory was ever more due to the genius and energy of one man, and few naval battles have had such momentous results. The remains of the slain officers were buried at Put-in-Bay Island in 1858. Maclay's 'History of the Navy' (Vol. II, 1894); Spears' 'History of Our Navy' (1899); Roosevelt's 'History of the Naval War of 1812' (1882); Adams, Henry, 'History of the United States' (Vol. VII, 1891).

ERIE CANAL. See CANALS.

ERIE RAILROAD. Chartered 24 April 1832, by the New York State legislature to construct a railroad from Lake Erie to the Hudson River, the New York and Lake Erie Railway Company was organized with a capital of $3,000,000, the credit of the State being extended to a like amount. The charter provided that the road should make no connection with any railroad in New Jersey or Pennsylvania without special legislative consent and also provided that it should run through the southern tier counties of New York. This plan was in accordance with the idea advanced by W. C. Redfield in 1830 when he proposed a railroad from the Atlantic to the Mississippi River. His plan was that it should be a great national road to follow the so-called «Appian Way» advocated by Generals Clinton and Sullivan in 1780 to further the development of what then constituted the United States.

In 1841, the railroad was opened from Piermont, at the extreme southern point of New York State on the Hudson River, inland to Goshen, Orange County, a distance of 46 miles. Opposed as it was by the canal counties and their representatives in both the State and national legislatures, the Erie had to fight for its existence from its birth through a series of legislative obstructions and financial manipulations that developed even in its early days. Before its completion to Dunkirk, which was the objective point on Lake Erie, and as a consequence of these obstacles to progress, the road had to be placed in the hands of a receiver. In 1845, the State released its claim for the money advanced for construction and through the energetic efforts of the Erie's friends, it was finally opened by President Fillmore, Daniel Webster, his Secretary of State, and other government and State officials, from Piermont to Dunkirk, on 22 April 1851, a distance of 463 miles. From Piermont, passengers were conveyed to New York by steamer. This operated so much to the disadvantage of the road that its charter was amended in 1852 permitting it to pass through New Jersey to its present terminal in Jersey City, and Piermont was abandoned as a terminal in May 1861. Previous to that abandonment, the road was again — in 1859 — in the hands of a receiver and was sold to the Erie Railway Company in 1861. This new company also bought the Buffalo and New York City Railroad and so secured independent entrance into Buffalo, which was made its principal lake terminal in place of Dunkirk. It has so remained up to this time.

In accordance with English ideas, the road was built with a six-foot gauge, a mistake in construction that for years acted as a deterrent to its successful operation, owing to the fact that contents of cars had to be transferred at connecting points. Another mistake of its early managers was a refusal of the Erie to accept entrance into New York city over the New York and Harlem lines, then being constructed and which later passed to the control of the New York Central. But this management did see the value of the coal traffic and in 1861 it entered the anthracite coal fields of Pennsylvania and later through its Bradford branch reached the bituminous fields. But in the meantime, it had become a financial foot-ball in Wall street, partly through a desire to combine with the Atlantic and Great Western, then building, through Ohio, for the purpose of making a route to Saint Louis on the Mississippi River. A connection to the Ohio River at Cincinnati was ultimately effected through a combination with the Atlantic and Great Western and an operating connection with the C., H. and D. completed 33 years after the first work on the Erie was begun.

In 1867, Jay Gould and Col. James Fisk came into possession of the Erie and from 1868 to 1872 a fight ensued between Gould, Vanderbilt, Fisk, James McHenry and Daniel Drew for the possession of the property, resulting in its spectacular wreckage after one of the bitterest and most vindictive railway wars in history. The contest for the possession of the property and the financial manipulations indulged in enriched all who were interested excepting the actual owners of the road and these it impoverished as it did the road itself. At the conclusion of this historic fight, Hugh J. Jewett came in as president in 1874 and a year later was made receiver, the property having been purchased by the security holders to prevent it complete wreckage. It was reorganized in 1878 as the New York, Lake Erie and Western. It then owned 525 miles of road and leased 400 more. The road was converted into a standard gauge road at a cost of $25,000,000 and was double tracked from Jersey City to Buffalo.

Attempts to enter Chicago, first over what is now known as the "Pandhandle Route," and later over the Pittsburgh, Fort Wayne and Chicago were successfully blocked by rivals and it was not until 1883 that it secured an entrance into the western metropolis over the Chicago and Atlantic Railway. Under succeeding managements, the road, in spite of the enormous financial obligations which hampered it, was operated as a paying and successful property until the panic of 1883–84. The obligations accruing because of its purchase of the Chicago and Atlantic and Pennsylvania coal properties led the road to still further embarrassment and finally to another receivership in 1893. Two years later, the company was reorganized as the Erie Railroad Company and assumed possession of the property on 1 Dec. 1895, which it has since operated.

The Erie Railroad is to-day a great modern highway, its main line extending from Jersey City, N. J., to Chicago, Ill., a distance of 999 miles. Within the last few years this main line has been double-tracked and it is now known as a "low-grade line," for example, between Jersey City and Salamanca, N. Y., a distance of 414 miles, the ruling grade has been brought down from 0.65 to 0.2 per cent. The present ruling grade is said to be lower than that of any other railroad running from Pittsburgh, Buffalo or the Ohio State line to New York city. Between Marion, Ohio, and Hammond, Ind., the ruling grade of the Chicago and Erie has been reduced from 0.55 per cent west bound and 0.5 east bound to 0.2 per cent in each direction.

The following is the official statement of gross operating revenues and operating expenses and taxes for five recent years — operating revenues 1911, $56,649,908; 1912, $56,492,369; 1913, $62,647,359; 1914, $60,983,574; 1915, $66,436,719; the operating expenses for the same period were 1911, $40,245,301; 1912, $42,508,253; 1913, $46,146,760; 1914, $48,224,007; 1915, $45,670,748.

A pioneer as a trunk line, it was also the first railroad to adopt what are now universal methods — among these the running of trains by telegraph, the use of a printed time table, the running of Sunday trains, emigrant trains, and special service for suburban passengers, the use of parlor cars, the establishment of dining rooms along the line, the establishment of special milk trains, the running of a newspaper special train (this being done in 1842). It was also the first road to run an excursion train of the modern type with a brass band and a reduced round trip fare, the first road to use a bell cord to signal from the conductor to the engineer, the first to build up local industries by furnishing to manufacturing companies the use of switching and terminal tracks, a custom now so universal, and in more modern days, the first road to adopt all-steel baggage, express and postal cars, and is the only railroad in the world operating a triplex or "centipede" locomotive.

ERIGENA, ē-rĭj'ē-na, **Johannes**. See Scotus, Johannes Erigena.

ERIGERON, a genus of plants of the family *Compositæ*, having a strong odor. Terpene is the name of the oil distilled from *E. canadensis*, a widely diffused species, and used as an irritant and stimulant in medicine.

ERIN, an old name for Ireland. It is now used only in poetry.

ERINITE, a basic copper arsenate having the formula $Cu_5(OH)_4As_2O_8$ occurring as a dark green crystalline coating of fibrous structure in Cornwall, England, and the Tintic district, Utah. The name is also applied to an aluminum silicate from the Giant's Causeway, Ireland.

ERINNA, Greek poetess: b. Rhodes or Teos; about 600 B.C.; d. at age of 19. According to some she was a Lesbian and the intimate friend of Sappho. Others aver that she was born at Teos, Rhodes or Telos, and that she lived in the age of Demosthenes; while others again assert that there were two poetesses of the same name. She left behind her a few poems which were thought equal to those of Homer in point of merit. The chief of them was a work of about 300 lines, called 'Elakatē' (The Distaff), of which nothing has come down to us.

ERINYES, ē-rĭn'i-ēz, The Furies (q.v.).

ERIOCAULON, ĕr-ĭ-ō-kâ'lŏn, the typical genus of the pipewort family (*Eriocaulonaceæ*). See Pipewort.

ERIODENDRON, a genus of tropical trees of the natural order *Malvaceæ*. There are about a dozen species, which are characterized by digitate leaves, medium to large, white or reddish, solitary or clustered flowers, and thick, woody seed-capsules containing a cotton-like fibre which suggested the name silk cotton-tree. Some of the species exceed 100 feet in height, and furnish wood used in making boats. The seeds of several species are used for food to some extent. But the principal economic value for which these trees are noted is in the fibre which surrounds the seeds. This is too short to be successfully woven like cotton, but is highly valued in upholstery for stuffing cushions, lounges, etc., for making floss and, it is said, as a substitute for animal hair in making felt for hats. The chief source of supply is Java. It is known in various countries as kapok, rimi, bentang, etc. Various South American species of *Bombax*, a related genus, also furnish a similar fibre. Like many other species of the natural order *Malvaceæ*, the species of these two genera also furnish a valuable bast fibre which is used for rope and cordage-making. One species, *E. occidentale*, is grown in California to a small extent as an ornamental tree under the name *Ceiba occidentalis*.

ERIOMETER, an optical instrument for measuring the diameters of minute particles and fibres from the size of the colored rings produced by the diffraction of the light in which the objects are viewed.

ERIOPHORUM. See Cotton Grass.

ERIPHYLE, in the Greek mythology, the daughter of Talaus, and wife of Amphiaraus, whom she betrayed for a necklace presented to her by Polynices. The necklace was made by Hephæstus (Vulcan), and had the power of rendering whoever wore it unlucky.

ERIS, ē'rĭs or ĕr'ĭs, in Greek mythology the goddess of discord, daughter of Night, and sister of Nemesis, and the Parcæ or Fates. Not being invited to the marriage of Peleus, she revenged herself by means of the apple of discord. See Paris.

ERITH, England, town in Kent, on the Thames, about 14 miles east of London, contains the Maxim-Nordenfeldt gun-factory, engineering works and other manufactories. Several yacht clubs have their headquarters here. Pop. 27,750.

ERITREA, ā-rē-trā'a, or **ERYTH'RÆA** (from Greek *erythros*, red, referring to the Red Sea), the official name of an Italian colonial possession stretching along the African shore of the Red Sea from Cape Kasar in lat. 18° 2' N. to the sultanate of Raheita on Bab-el-Mandeb in lat. 12° 30' N. The coast-line is between 500 and 600 miles in length, and the area of the colony is about 94,800 square miles. The chief town is Massowah. Population of the colony is about 400,000, the majority of whom are Arabs.

ERIVAN, ĕr-ĭ-vän', Armenia, (1) a fortified city, capital of the district of the same name in Transcaucasia, on the Sanga River at an elevation of 3,000 feet, 33 miles northeast from Mount Ararat. The manufactures consist of cottons, earthenware and leather; and the situation of the town, on the caravan route between Russia and Persia, gives it a considerable transit trade. Pop. 32,505. (2) The government of Erivan has an area of 10,745 square miles, and a diversified population totaling (1912) 971,290, of which Armenians and Tartars are the chief components, but including also Kurds, Greeks, Russians and Jews.

ERJISH DAGH, er'jish' däg (the ancient Argæus), an extinct volcano in the vilayet of Angora, Asia Minor. It has an elevation of 13,000 feet. The last eruption occurred in the 4th century of the Christian era.

ERK, Ludwig Christian, German musician: b. Wetzlar 1807 d. 1883. He studied at Offenbach under A. André, became conductor in the Domkirche at Berlin, founded the Erk Männergesangverein in 1843 and nine years later the Erk Gesangverein. He was eminently successful as a conductor and trained many fine singers. His library including many unpublished manuscripts after his death was acquired by the Königliche Hochschule für Musik, Berlin. His published songbooks include 'Singvögelein' (1896); 'Liederkranz' (1839 et seq.); 'Deutscher Liederschatz' (5th ed., 1893); 'Turnerliederbuch.'

ERLACH, an ancient family of Bern, Switzerland, several of whose members earned distinction in various fields. The first was Walter von Erlach, who lived in the 12th century and took his name from Erlach, a village near the lake of Brienz. Rudolf von Erlach (d. 1360) fought at Laupen. There is an equestrian statue to his memory in Bern. John Ludwig (b. 1595; d. 1650) commanded on the Reformers' side in the Thirty Years' War. Later he entered the French service and became a marshal of France.

12 **ERLANGEN**, Bavaria, town on the Regnitz, miles north of Nuremberg. As old as the 10th century, it owes its prosperity to the settlement here of French Huguenots after the revocation of the Edict of Nantes (1685) and to its university. The chief manufactures are articles made from wood, ivory and horn, electric instruments and some cotton goods. It has large breweries. Pop. 24,874.

ERLANGEN, University of, a Lutheran institution founded in 1742 in Baireuth, but the following year moved to Erlangen (q.v.). In 1769 Alexander, the then Margrave of Baireuth, gave valuable assistance to the university and the name was changed to its present legal title, "Friedrich-Alexander University." Owing to the changes of government of the country the growth of the institution was retarded until 1880. Since that time new buildings have been added, and the institution has increased in attendance and influence. In 1913 the number of students enrolled was about 1,350. Its library contains about 260,000 volumes, some 300,000 pamphlets and a considerable number of manuscripts.

ERLANGER, Camille, French composer: b. Paris 1863. At the age of 17 he entered the Paris Conservatoire and studied piano there under Mathias, and composition under Bazille and Delibes. His cantata 'Velléda' secured him the Roman prize in 1888. A dramatic legend, 'Saint Julien l'Hospitalier,' was very successful in 1894. Erlanger's first opera 'Kermavia' appeared in 1897 and scored a great success. It was surpassed three years later by 'Le juif polonais.' Others from his hand are 'Le fils de l'étoile' (1904); 'Aphrodite' (1906); 'Hannele' (1908); 'Noël' (1911; produced at Chicago in 1913); 'La Sorcière' (1912); 'Gioconda' (1914).

ERLANGER, Joseph, American physiologist: b. San Francisco, Cal., 5 Jan. 1874. He was graduated at the University of California in 1895 and from Johns Hopkins as M.D in 1899. Later he was house officer at the Johns Hopkins Hospital and from 1900 to 1906 was successively fellow in pathology, assistant, instructor, associate and associate professor of physiology at Johns Hopkins. In 1906–10 he held the chair of physiology at the University of Wisconsin and since the latter year has held a similar chair at Washington University.

ERLAU, ĕr'low, or **EGER**, ā'ger, Hungary, town, capital of the county Heves, on the Eger, 75 miles east-northeast of Budapest. The manufactures consist chiefly of woolen and linen cloth, hats, combs, leather, shoes and harness. The finest red wines of Hungary are made from grapes grown in the neighborhood. There are two thermal springs, one on each side of the river. Erlau was in possession of the Turks from 1596 to 1687. Pop. 28,052.

ERLKING (Ger. *Erlkönig*), a mythical personage first introduced into German poetry, through Herder's translation of a Danish ballad, 'The Erlking's Daughter,' and made familiar to all readers by Goethe's ballad, 'Der Erlkönig,' or translations of it. This goblin is represented as exercising a malignant and fatal influence upon men, and especially children, by alluring promises or visions which lead to their destruction. The word is of Danish origin (*Ellerkonge*, or *Elverkonge*, king of the elves).

ERLON, Jean Baptiste Drouet, Comte de. See DROUET.

ERMAN, (Johann Peter) Adolf, German Egyptologist: b. Berlin, 31 Oct. 1854. He received his education at the universities of Leipzig and Berlin. In 1883 he was made associate professor of Egyptology at the last named institution, where his father and grandfather had both held the chair of physics. Two years later he was appointed director of the Egyptian department of the Berlin Royal Museum. In 1892 he became full professor of Egyptology. His work on Egyptian grammar has been of inestimable value to students and he may be said to be the first to put this branch on a really scientific basis. His published works include 'Die Pluralbildung des Aegyptischen' (1878); 'Neuägyptische Grammatik' (1880); 'Die Sprache des Papyrus Westcar' (1889); 'Die Märchen des Papyrus Westcar' (1890); 'Altägyptische Grammatik' (1894; Eng. trans. by Breasted, London 1894); 'Gespräch eines Lebensmüden mit seiner Seele' (1896); 'Die Flexion des Ägyptischen Verbums' (1900); 'Zaubersprüche für Mutter und Kind' (1901); 'Aegyptische Religion' (1909); 'Aegyptische Grammatik' (1911); 'Aegypten und Aegyptisches Leben im Altertum' (1885; Eng. trans., 'Life in Ancient Egypt' 1896), the best work on the subject.

ERMINE, any weasel (q.v.) which turns white in winter, as is the habit of all those living in snowy regions; or has its pelt made up as a fur. The animal's coat becomes completely yellowish white, except the tip of the tail, which remains black. When this fur is made up into tippets, coat trimmings or garments, the black tails are attached as ornaments in rows, which gives the regularly spotted effect characteristic of ermine furs, and imitated in heraldry, under the terms «ermine» and «erminois,» expressive of furs as a bearing. In mediæval times the use of this kind of fur was restricted to royalty, and later it became a part of the insignia of judges in high courts, perhaps as a symbol of the majesty of the law; whence the expression «the ermine» as a metonym for the judiciary office. Ermine is mainly derived from northern Russia and Siberia, where it is the fur of the stoat (*Putorius erminea*); but a great amount is supplied by northern Canada, from two or three American species of weasels.

ERMINE MOTH, any of several white moths marked with black spots as in ermine furs. The name is given in America to various bombycids, but was originally applied to a European zygænid (*Ypomoneuta pellida*).

ERMINE, or ERMYNE, STREET, one of the four great roads constructed in England by the Romans. It led from Bishopsgate, London, by way of Durolipons (Godmanchester), Lindum (Lincoln), Danim (Doncaster) to Eboracum (York), whence it continued northward past Hadrian's wall into Scotland. At Lincoln it formed a junction with the Foss Way, leading to Bath and Exeter. The Vicinal Way, a branch from London, led through Essex, Suffolk and Norfolk to Venta Icenorum (Caistor near Norwich) and connected with the main road at Durolipons by a branch from Camulo-dunum (Colchester).

ERMINIE, a comic opera in two acts by Edward Jakobowski, first produced at the Comedy Theatre, London, 9 Nov. 1885, and in New York at the Casino 10 March 1886. Based upon the well-known melodrama 'Robert Macaire,' the plot is lightened by the substitution of the vagabonds Ravennes and Cadeaux for the two murderers of the original play. Erminie was one of the most conspicuous successes in the realm of light opera and to American audiences it is associated with the names of Francis Wilson and Pauline Hall, who took part in the first New York production. The music is light and graceful, if not strikingly original. The principal numbers are Erminie's song «Ah, when love is young,» «Dull is the life of the soldier in peace,» the fetching lullaby, «Dear mother in dreams I see her,» the whistling chorus, «What does the Dicky Bird say,» the gavotte, «Join in pleasure, dance a measure,» and the «Goodnight» chorus at the close.

LEWIS M. ISAACS.

ERMLAND, or ERMELAND, a diocese of East Prussia, situated in the District of Königsberg. It was erected as a see in 1230 under the Teutonic Knights and within 50 years became practically independent of the metropolitan of Riga. This independence was acknowledged when in 1742 the pallium was conferred on its prelate by Benedict XIV. Many of the earlier bishops were also temporal sovereigns of this district and as such after 1354 were acknowledged princes of the Empire. In 1466 they came under the king of Poland and with difficulty prevented the Polish sovereigns from invading their right of free election. Pope Pius II as Aeneas Sylvius Piccolomini was once bishop of Ermland. At the period of the Reformation the diocese was ruled by Stanislaus Hosias, who held his subjects in their allegiance to the older faith. In 1772, on the partition of Poland Ermland passed to Prussia. It is still a bishop's see, with the cathedral at Braunsberg. Consult Hipler, 'Analecta Warmiensia' (Braunsberg 1872) and Zeitschrift für Geschichte und Alterthumskunde Ermlands' (ib., 1858 et seq.).

ERN, or ERNE, earn, a name in poetic rather than common or scientific use for any of the sea-eagles; specifically the European white-tailed eagle of which the American bald-eagle (*Haliæetus leucocephalus*) is a near relative. It is the original English name for the eagle, the modern term coming from the French. See EAGLE.

ERNANI, an opera in four acts by Giuseppe Verdi (libretto by F. M. Piave, founded on Victor Hugo's drama), first produced at Venice, 9 March 1844. Its success was immediate and prolonged and was probably contributed to not a little by the interference of the police, who objected in particular to the conspiracy scene in the third act. The chorus «Si ridesti il Leon di Castiglia,» which ends this scene, aroused the Venetians to such a pitch of political enthusiasm that at one time the theatre was closed. The opera abounds in strenuous, hot-blooded music that found its way easily into the hearts of Verdi's countrymen. But its popularity was not confined to Italy. With 'Ernani' Verdi became an important European figure. When the opera reached Paris, Victor Hugo objected so strenuously to the utilization of his drama as an operatic libretto that the book was altered, the characters changed to Italians and the new title of 'Il Proscritto' given to it. Verdi traveled a long distance in his artistic growth and 'Ernani' now seems very old-fashioned. Nevertheless the dramatic power of some of the concerted numbers is undeniable and it contains melodies that still live, notably Elvira's aria in the first act «Ernani, involami.»

LEWIS M. ISAACS.

ERNE, the name of a lake and a river of Ireland. The river Erne takes its rise in Lough Gowna, flows north into Lough Oughter, thence through Upper Lough Erne to the Lower Lough Erne, from which it flows into Donegal Bay. The river has a total length of about 60 miles and is navigable for light-draught vessels for about two-thirds of that distance. Lough Erne, including Upper and Lower, has a length of about 40 miles and has a width varying from 4 to 12 miles. Many islets dot its surface which is 150 feet above sea-level. The lake is the paradise of the angler; salmon, trout, bream, perch, pike, abounding in its waters. The lake possesses remarkable scenic beauty and the archæological remains on some of the islets and on its shores form an added attraction to the tourist. Consult Devenish, 'Lough Erne: Its Histories, Antiquities and Traditions' (Dublin 1897).

ERNEST MALTRAVERS, a novel by Bulwer-Lytton, published 1837. Its sequel is entitled 'Alice, or The Mysteries' (1838). In the preface to the first-named novel, the author states that he is indebted for the leading idea of the work — that of a moral education or apprenticeship — to Goethe's 'Wilhelm Meister.' The apprenticeship of Ernest Maltravers is, however, less to art than to life. 'Ernest Maltravers' is written in the Byronic strain, and is a fair example of the English romantic and sentimental novel of the thirties.

ERNESTI, ĕr-nĕs'tē, **Johann August,** German scholar: b. Tennstädt, Thuringia, 4 Aug. 1707; d. Leipzig, 11 Sept. 1781. He studied at Wittenberg and Leipzig, and, devoting himself to classical studies, became rector of the Thomas School at Leipzig in 1734, a post which he held till 1759. He became professor of theology in the University in 1759. He prepared editions of Homer, Callimachus, Polybius, Suetonius and Tacitus, and of Xenophon's 'Memorabilia' and Aristophanes' 'Clouds,' and an excellent edition of Cicero (3d ed. 1776–77), to which he added a valuable 'Key to Cicero,' often re-edited. Regarded as the first Latinist of his age, he gave a great impetus to classical and biblical study and was the founder of a true exegesis of Scripture by the laws of grammar and history, independent of dogmatic prepossessions. His 'Latin Speeches' gained him the name of the «German Cicero.»

ERNST, ārnst, **I** (surnamed «THE PIOUS»), Duke of Saxe-Gotha and Altenburg, and founder of the house of Gotha: b. Castle of Altenburg, 24 Dec. 1601; d. 1675. He was the son of John, Duke of Weimar, and brother of the famous Bernard of Saxe-Weimar. He fought with distinction as colonel of horse under Gustavus Adolphus, at the battles of Nuremberg, Lützen and Nördlingen during the Thirty Years' War, and was one of the signatories to the Peace of Prague in 1635. He afterward became famous for the wisdom and frugality of his administration, for the reforms that he instituted and for the progress his principality made during his reign. He was the founder of the Gotha line which became extinct by the death of Frederick IV in 1825. His son Bernard founded the house of Meiningen; Ernst that of Hildburghausen, and Johan Ernst that of Saalfeld. Consult Beck's 'Ernst der Fromme' (1865).

ERNST II, Duke of Saxe-Gotha and Altenburg: b. 1745; d. 1804. On succeeding his father in the dukedom he set about to reform the government and ameliorate the condition of his people. He refused to allow his army to send levies to join the forces of his near relative George III in fighting against the American colonies, although large sums were offered as an inducement. He was a patron of science; instituted for the first time a measurement of an arc of the meridian in Germany and established an observatory near Gotha. He wrote on astronomy, and among his works are 'Astronomische Tafeln' (1799). A biography by Beck was published at Gotha in 1854.

ERNST II, Augustus Charles John Leopold Alexander Edward, Duke of Saxe-Coburg-Gotha: b. Coburg, 1818; d. 1893. He was brother of Prince Albert, consort of Queen Victoria of England, and seems to have resembled him in tastes and character. He was instrumental in winning the battle of Eckernförde in the war against Denmark in 1849, fought on the side of Prussia in the Austro-Prussian and Franco-Prussian wars. Alone among the German princes he was liberal and worked for the reform of the constitution as well as for the unification of Germany. His liberalism caused his little duchy to become an asylum for political refugees from the other states. He was succeeded by his nephew, Alfred, duke of Edinburgh. He wrote some successful operas.

ERNST, August, King of Hanover and Duke of Cumberland: b. Kew, 5 June 1771; d. 18 Nov. 1851. He was the fifth son of George III of England. He lost an eye at Tournai in 1794, held a command in the campaign in Hanover in 1813–14 and was present at the battle of Leipzig. He took up his abode at Berlin but returned to England while the discussions on Catholic emancipation were going on, and endeavored by every means in his power to prevent the passing of that measure. He as a reactionary also opposed the Reform Bill of 1832. On the accession of Queen Victoria in 1837 he ascended the throne of Hanover, in consequence of the succession to the sovereignty of that country being limited to male heirs. After 150 years of absentee rulers, Hanover again had a resident sovereign. His arbitrary and tyrannical disposition, which had hitherto shown itself in opposing every step in the way of political reform and progress, was now manifested by his abrogating the constitution which had been granted in 1833. In 1848, however, he was compelled to accede to popular demands and accord the nation a more liberal form of government. He was succeeded by his son, George V, the last of the Hanoverian kings. The unpopularity of the Duke of

Cumberland in Britain was extreme and the contingency of his succeeding to the throne, was regarded as one of the greatest misfortunes that could befall the nation. Thus was the Duke's ambition, balked by the marriage of Queen Victoria, against which he loudly protested, and refused to attend the ceremony. Consult Wilkinson, 'Reminiscences of King Ernst of Hanover' (1880).

ERNST, Harold Clarence, American bacteriologist: b. Cincinnati, Ohio, 31 July 1856. He was graduated at Harvard University in 1876 and at its medical school in 1880, and became professor of bacteriology there. From 1898 to 1908 he served as president of the Boston Society of Medical Sciences, and in 1909 was president of the American Bacteriologists' and Pathologists' Association. He was editor of the *Journal of Medical Research* after 1896, and contributes to scientific, medical and other periodicals. His published works include 'Infectiousness of Milk' (1896); 'Infection and Immunity' (1898); 'Prophylactic Hygiene'; 'Animal Experimentation' (1902); 'Modern Theories of Bacterial Immunity' (1902).

ERNST, Oswald Herbert, American military officer: b. near Cincinnati, Ohio, 27 June 1842. He was graduated at the United States Military Academy and was commissioned a brigadier-general of volunteers 1898. He was engineer in charge of western river improvements in 1878–86; had charge of harbor improvements in Texas in 1886–89; and while on the latter service began the great work which resulted in the deepening of the channel at the entrance of Galveston harbor from 12 to 35 feet. In 1893–98 he was superintendent of the United States Military Academy. In the war with Spain he went with General Miles to Porto Rico in July 1898, and on 9 August led the troops in the action at Coamo. He was a member of the Isthmian Canal Commission 1899–1901, which selected the Panama route, and of the Commission of 1905–06 which determined the type of canal should be with locks. He was president of the Mississippi River Commission 1903–06 and chairman of the American section of the International Waterways Commission 1905–15. He has been a director of the Panama Railroad since 1905. He retired from the army 27 June 1906. He has published 'Manual of Practical Military Engineering' (1873) and a 'Report' (1904) on the tunnels under the Chicago River.

ERNST LUDWIG, Grand Duke of Hesse: b. Darmstadt, 25 Nov. 1868. He succeeded to the throne in 1892. In 1896 he was made lieutenant-general. In 1894 he married Princess Victoria Melita of Saxe-Coburg-Gotha. He divorced her in 1901 and in 1905 he married Princess Eleonore of Solms-Hohensohms-Lich. In 1909 the Duke's play 'Bonifatius' was produced at Darmstadt in the Court Theatre.

ERNULF, ĕr'nŭlf, or **ARNULF,** English prelate: b. France, 1040; d. 15 March 1124. He was appointed prior of Canterbury by Anselm and was subsequently abbot of Peterborough (1107) and bishop of Rochester (1114). He was equally remarkable for skill in canon law and personal saintliness, and compiled a great collection of documents about his own Church, laws, papal degrees, etc. He is alluded to in Sterne's 'Tristram Shandy.'

EROICA SYMPHONY, The, a famous symphony by Beethoven, first given at Vienna in 1805, under the title of 'Bonaparte.' It was afterward renamed *Sinfonia eroica*. See BEETHOVEN.

EROS, the Greek god of love, from which the Romans derive their Cupid (cupido, desire). In this sense Eros is a fiction of later-day poets. Hesiod is the first to mention Eros, whom he asserts to be the fairest of the gods who rules over the minds and the councils of gods and men. It was he who brought order and harmony out of chaos. In this cosmogonic sense he is used by many of the early writers. In Orphic poetry and in Plato he is conceived of as the oldest and most powerful of all the gods. In some instances he is described as the son of Kronos and Ge, and in others he is of independent origin. The Eros of the later poets, which is familiar to us, is conceived as a son of Aphrodite (Venus) and Hermes; or of Venus and Zeus; or of Zephyrus and Iris; or of Aphrodite and Ares (Mars). He is depicted as a wanton mischievous boy, no longer the god of harmony, but of sensual love. He is represented with wings, bows and arrows, etc. See CUPID.

A creature called ANTEROS was generally connected with Eros, first as opposed to Eros and fighting against him, and later as the avenging Eros who punished those who did not return the love of others.

Among the places distinguished for the worship of Eros, Thespiæ in Bœotia stands foremost, where his worship was very ancient. Here a festival was celebrated in honor of the god. At Sparta, Samos, Parion and at Athens, where he had an altar at the entrance of the Academy, the god was also worshipped. At Mezora he stood with Himeros and Pothos in the temple of Aphrodite. His statue was represented at first by a crude stone, which developed into the perfect beauty of the boy-figure by Praxiteles, now in the Capitoline Museum, and undoubtedly the source of all the later representation of Eros as a chubby boy. Among the things sacred to Eros and accompanying him are the rose, wild beasts, the hare, the cock and the ram. See PSYCHE.

EROS, in astronomy, one of the minor planets, discovered photographically by Witt in 1898, at the Urania Observatory, Berlin. The orbits of most of the other known asteroids lie wholly beyond that of Mars; but Eros approaches much nearer to the sun, and at times it may be within 13,500,000 miles of the earth. It is this fact which gives the planetoid its great astronomical interest. The relative dimensions of the solar system are known with high precision, and if any dimension can be accurately measured in miles, all the other dimensions become known at once, in terms of the same unit. It is apparently possible to determine the parallax of Eros (and hence its distance from the earth in miles) with relatively high precision and a correspondingly accurate determination of the absolute dimensions of the solar system in general will result. As Eros approaches the earth more closely than any other heavenly body except the moon, its parallax is relatively large; and the fact that its diameter does not exceed 20 miles, so that it appears in the telescope as a mere point of light without a sensible disk, indicates that extremely precise micrometric measures of its position on the heavens may be had. Astronomers are keenly alive to the possibilities offered by this seemingly insignificant little planet, and at every favorable opposition Eros will be studied with exceeding care.

The planet itself is known to be a little world, nearly round, which revolves about the sun in a period of 643 days. A very remarkable fact about it is that it is found to vary periodically in brightness; when brightest it is more than three times as bright as when faintest, the period of a complete variation being somewhat more than five hours. It was suggested that the apparently single planet is, in fact, two planets, so close together that they appear to us as one, the time of their revolution about their common centre of gravity being twice the period of the apparent variation in brightness. More careful photometric study, however, renders it certain that the planet is single, having one side much brighter than the other, and that its variation in brightness is due to its axial rotation.

An asteroid very similar to Eros was discovered by Wolf on 4 Feb. 1918, and although the orbit of this new body is far larger than that of Eros, the eccentricity is so great (0.553), that when nearest to the earth it is but little more than 17 millions of miles from us. Thus this asteroid and Eros come nearer to us than any other planets of the solar system. It happens that the time of nearest approach for both of these bodies is toward the beginning of the year 1931. It is probable that from observations made at this time the distance of the sun will be ascertained with an accuracy far transcending that available at present.

EROSION, or DENUDATION, the process of slow removal in air or water of the products of rock decay whereby the surface features of the earth are obliterated. It includes the destructive work of winds, of streams, of glaciers and of the ocean. Its various aspects may be considered under two heads: (1) subaërial; (2) marine.

1. Under subaërial erosion comes the action of air and water on all land surfaces above sea-level, first in making rock material fine, weathering, and second, in its removal, transportation. Chemical processes, due to moisture and CO_2 in the air, break up the rock-minerals. Changes of temperature crack off flakes from rock-ledges and reduce them to smaller flakes. Water, freezing in cracks, forces apart large blocks of rock. In a climate with dry seasons the dust may be swept away by the winds (deflation), leaving the larger pebbles. Stony deserts have thus been formed in Arizona and other parts of the world. The dust-charged winds can carve and wear down rock surfaces. Instances are common in the arid regions of the West and in the desert of Sahara. Glaciers scour out their valleys powerfully and carry away much material.

The erosive action of water begins with the raindrop. If a piece of soft ground with small stones lying about be examined closely after a shower, it will be found that soil has been beaten down and washed away from the areas not protected by stones. This action sometimes takes place on a larger scale in semi-arid climates when rock-decay is slow and curious pillars of earth or soft rock capped by protecting boulders are formed. Examples may be found in the Garden of the Gods, Colorado. When the raindrops unite to form tiny rivulets the process of river-erosion has begun. In fact, a patch of soft ground on a hillside during a shower shows many of the phenomena of stream-formation, as likewise does even a dust-covered street. The work of surface water is continuous. Some rock-constituents are dissolved and borne away in solution; other particles are carried away in suspension and, by abrasion on rocks below, help the stream carve its channel deeper. When the current slackens some of the waste from the higher lands may be deposited, the coarser materials first. Thus mountains are worn down and plains formed. The higher the mountains, the deeper the valleys can be carved; but even the highest mountains are ultimately deeply dissected, and finally worn down so that the current of the river may not be strong enough to transport the detritus. The carving of the Grand Canyon of the Colorado, a stupendous piece of work as it is, is but a beginning in the complete leveling of the region. A country thus worn down is said to have reached a base-level of erosion, and its nearly level surface forms a peneplain. If such a region be uplifted the streams will start work again vigorously, and a new cycle of erosion will begin. A region reduced to its base-level, if neither elevated nor depressed, can remain unchanged through millions of years.

The amount of waste brought down by some rivers is enormous. Thus the Po in flood carries one part sediment to every 300 parts of water; the Ganges one part sediment to 835 parts of water. These may seem small ratios of sediment, but the total amount of material discharged annually by the Ganges is calculated to be 378,100,000 tons, while the Nile annually brings down 150,000,000 tons. The Mississippi annually brings to the Gulf of Mexico 406,250,000 tons of material in suspension, enough to lower its whole basin one inch in 300 years. It is calculated that the average amount of material removed as sediment annually by streams over the whole land surface is 600 tons per square mile.

2. Marine erosion is continually wearing away the continents. Waves undermine cliffs, grind up sand and boulders, and working with the undertow, drag the materials out and deposit them in the ocean. Some geologists even hold that marine planation is more important than river work in the destruction of continents.

EROSTRATUS, Ephesian incendiary. To perpetuate his name as the destroyer of one of the seven wonders of the world he set fire to the magnificent temple of Artemis (Diana), at Ephesus, on the night Alexander the Great was born (356 B.C.). The indignant Ephesians decreed that whoever pronounced his name would be put to death, a sure means of insuring his fame.

EROTIC (Greek *erōs*, love) **POETS,** the name applied to certain modern French fictionists, and in Greek literature, particularly to a class of romance writers, and to the author of the 'Milesian Tales.' These writers belong to the later periods of Greek literature, and abound in sophistical subtleties and ornaments. The best of them are Achilles, Tatius, Heliodorus, Longus, Xenophon of Ephesus and Chariton. The word erotic is used in two closely related senses, (1) amorous, treating of love or inspired by love; (2) a love poem or composition.

EROTOMANIA, a kind of paranoia in which there is present a morbid ideation toward a real or imaginary object of love. See PARANOIA.

ERPENIUS, ĕr-pē'nĭ-ŭs (Latinized from *Van Erpe*), **Thomas,** Dutch Orientalist: b. Gorkum, Holland, 11 Sept. 1584; d. Leyden, 13 Nov. 1624. His fame rests principally on his acquaintance with the Oriental languages. To extend his knowledge of them he visited England, France, Italy and Germany, and became acquainted with the most eminent scholars. He learned at the same time the Persian, Turkish and Ethiopian languages. He returned, in 1612, to Leyden, and was appointed professor of Arabic and other Oriental languages. He established a press, at great expense, for the printing of works of Oriental literature. In 1619 a second Hebrew professorship was founded at Leyden, and committed to Erpenius. Soon after he received the office of Oriental interpreter to the states-general. The most learned Arabs admired the elegance with which he expressed himself in their language, so rich in delicate peculiarities. His reputation as a perfect master of the Arabic became universal, and he was repeatedly invited by the king of Spain to explain inscriptions on the Moorish buildings and monuments. The works of Erpenius (some of which were published after his death), are held in the highest estimation. Besides his 'Grammatica Arabica,' his 'Grammatica Hebraica,' and other grammatical works, his most valuable and celebrated publication is his 'Historia Saracenica' (1625).

ERRANTE, Vincenzo, vēn-chĕnd'sō ĕr-răn'tē, Italian poet and statesman: b. Palermo, 16 July 1813; d. Rome, 29 April 1891. He was many years an exile for his share in Sicilian politics. His works are two volumes of 'Tragedies and Lyrics' (1874); the dramas 'The Feast of Saint Felix' and 'Suleiman the Great'; the poems 'The Ideal' and 'Liberty.' He wrote also a 'History of the Osmanli Empire from Osman to the Peace of Carlowitz' (1882–83).

ERRANTIA, ĕr-ăn'shĭ-a, an order of annelids of the sub-class Polychæta, characterized by their not dwelling in fixed tubes, but wandering about freely, seeking animal food. They have a well-developed head, with protrusible pharynx usually armed with chitinous jaws, and efficient locomotory organs. A typical genus is *Nereis*, with many familiar species.

ERRARD, ăr-răr, **Charles,** French painter and architect: b. Nantes, 1606; d. Rome, 15 May 1689. He was instructed in painting by his father, Charles Errard, known as the elder, and perfected his knowledge at Rome. On his return to France he gradually rose to eminence in his profession. In 1648 he became one of the 12 founders of the Academy of Painting. He was engaged in the decoration of the Palais Royal, Louvre and other palaces. His chief claim to notice rests, however, upon his connection with the foundation of the French academy at Rome, which was projected by him and carried into effect in 1666, with 12 pupils, and of which he was the first director.

ERRATA, ĕ-rā'ta (Latin, the plural form of *erratum*, an error), the list of errors and corrections placed at the end or at the beginning of a book. Before the invention of printing, and for a short time after, the errata were corrected on the page where they occurred, but this was found to be inconvenient when the art became a little more developed. The first known example occurs in an annotated edition of 'Juvenal,' published at Venice in 1478, which contains a list occupying two pages. 'The Vulgate,' published in 1590, at Rome, by Sixtus V, and of which the proofs were revised by that Pope himself, contains, instead of a table of errata, a bull which excommunicated those who would dare to make any alterations in the text. The book, however, was found to contain so many blunders that it was afterward suppressed, and the Papal bull had no other effect than that of amusing the learned and creating a demand for the copies still existing, some of which have been sold for about $200. See BULL; MISTAKE.

ERRATICS, or ERRATIC BLOCKS, in geology, boulders or large masses of angular or subangular rock which have been transported to a distance from their original outcrop by the action of ice during the Glacial Period. Thus on the slopes of the Jura Mountains, in France, immense blocks of granite are found which have traveled 60 miles from their original situation and in northern United States, boulders are found, the nearest source of which must be over 200 miles distant from the present location. See GEOLOGY; GLACIER; GLACIAL PERIOD.

ERRERA, ĕr-rā'rā **Alberto,** Italian political economist: b. Venice, 21 April 1842. He was educated at Padua and has held the professorship of political economy and statistics in the schools of several Italian cities, including Venice, Milan and Naples, and also at the University of Naples. Among his works are 'Storia e statistica delle industrie Venete' (1870); 'Storia della economia politica nei secoli XVII, e XVIII negli stati della repubblica Veneta' (1877); 'Demographia' (1892); and 'Lezione di economia politica' (1892).

ERRETT, Isaac, American clergyman: b. New York, 2 Jan. 1820; d. near Cincinnati, Ohio, 19 Dec. 1888. In 1840 he entered the ministry of the "Christian Church," a sect founded by Alexander Campbell, and held pastorates in Pennsylvania, Ohio, Michigan and Chicago, Ill. For a time he assisted Campbell in the editorship of the *Millennial Harbinger*, in 1866 he established the *Christian Standard*, and published it until his death. He was president of Alliance College 1868–69; filled many offices in his Church, and wrote 'Brief View of Christian Missions' (1857); 'First Principles, or the Elements of the Gospel' (1867); 'Jerusalem' (1872); 'Talks to Bereans' (1875); 'Letters to a Young Christian' (1877); 'Evenings with the Bible' (1884–87); 'Our Position; the Plea Urged by the People Known as Disciples of Christ' (1885). Consult Lamar, 'Isaac Errett' (Cincinnati 1894).

ERRHINES, er'rīnz, medicines administered locally to produce sneezing, and so relief from catarrh by a discharge from the nostrils. The term is not generally used at present.

ERROR, (Latin errare, to wander) (1) *In astronomy* errors or differences in calculations and observations, to correct which recourse is had to a system of reduction known as the method of least squares. To correct errors of instrument measurement is of the greatest importance in all scientific work, and great care and pains are taken to secure these corrections. (2) Clerical error, a mistake in writing, a slip of the pen. (3) Joiner in error, in law; the taking of issue on the suggestion of error. (4) Writ of error, in law, a process issued by a court of review, to an inferior court, suggesting that error has been committed and requiring the record to be sent up for examination; now commonly known as an appeal. (5) Court of error, a court exercising appellate jurisdiction by means of writs of error. (6) Assignment of error, in law, specification of the error suggested or objected to. For ordinary errors, see BULL; MISTAKE.

ERROR, Personal. See EQUATION, PERSONAL.

ERSCH, ersh, **Johann Samuel,** German bibliographer: b. Grossglogau, 23 June 1766; d. Halle, 16 Jan. 1828. He was principal librarian and professor of geography and statistics at Halle, and is credited with being the founder of modern German bibliography. Among his publications are a 'Dictionary of French Writers'; 'Manual of German Literature'; and, in connection with Gruber, the 'Universal Encyclopædia of Arts and Sciences' (1818). This latter is a work of great merit.

ERSE, ĕrs, a corruption of the word Irish; a name applied to Irish Gælic people, and also to the lowlanders of Scotland. See CELTIC LANGUAGES; CELTIC LITERATURE.

ERSKINE, David Stewart, 11th EARL OF BUCHAN, Scottish author and antiquarian: b. 1742; d. 1829. He received his education at the University of Glasgow and in 1780 founded the Society of Scottish Antiquaries. He published 'An Account of the Life, Writings and Inventions of Napier of Merchiston' (1787); 'Essays on the Lives of Fletcher of Saltoun and the Poet Thomson' (1792); 'Anonymous and Fugitive Essays' (1812).

ERSKINE, Ebenezer, Scottish clergyman and founder of the Secession Church in Scotland: b. Dryburgh, Berwickshire, 22 June 1680; d. Stirling, 2 June 1754. He was ordained to the parish of Portmoak, Kinrosshire, in 1703, in which charge he remained 28 years, when he was translated to Stirling (1731). His attitude during the "Marrow" controversy as well as his opposition to the system of patronage in the Church, led to a sentence equal to deposition being passed in 1733, which was recalled in the following year; in 1733 he with a few others made a formal act of secession; in 1737 he was joined by his brother, Ralph (q.v.); but it was not till 1740 that he was finally deposed from the ministry and his church closed to him. The Secession Church was split in twain in 1747 on the question of subscription to the civic oath then taken by the burgesses of Edinburgh, Glasgow and Perth, those who maintained its lawfulness, led by the Erskines, being called Burghers, and their opponents Anti-Burghers. So keen did feeling rise, that Erskine was formally deposed from the ministry by the Anti-Burghers. The breach in the ranks of the seceders was not healed until 1820. Erskine was the author of several volumes of sermons. His 'Life and Diary' were published in 1845. Consult his 'Life' by Ker, J., (1881); and MacEwen, 'The Erskines' (1900).

ERSKINE, Henry, Scottish barrister: b. Edinburgh, 1 Nov. 1746; d. Almondell, West Lothian, 8 Oct. 1817. He twice held the office of lord-advocate, was for long the leader of the Scottish bar and had a high reputation as a wit.

ERSKINE, John (of Dun), Scottish reformer: b. 1509; d. 1591. He came of a noble family of which several members perished at the battle of Flodden Field. His early education was gained at King's College, Aberdeen. Having accidentally killed a priest his family sent him abroad to complete his education. On his return he introduced the study of Greek into Scotland. That he was one of the earliest supporters of John Knox is gathered from the fact that he was one of the signers of the first covenant of the Scottish reformers. He attended the marriage of Queen Mary in France as one of the special commissioners appointed for this purpose. Later Erskine assumed the rôle of mediator between Knox and the Queen. He was one of the compilers of 'The Second Book of Discipline' (1578).

ERSKINE, John, of Carnock, afterward of Cardross, Scottish jurist: b. 1695; d. near Dumbarton, 1 March 1768. He was called to the Scotch bar in 1719, was professor of Scots law in the University of Edinburgh, 1737–65, and was author of 'Principles of the Law of Scotland' (1754), and the 'Institutes of the Law of Scotland' (1773), both authorities.

ERSKINE, John, Scottish theologian: b. Edinburgh, 2 June 1721; d. there, 19 Jan. 1803. He was educated at the University of Edinburgh and at 22 received his license to preach. In 1744 he was ordained minister of Kirkintilloch, where he remained nine years, when he removed to Culross parish in Dunfermline presbytery. Five years later he removed to New Greyfriars, Edinburgh, and in 1767 to Old Greyfriars. He was for many years the leader of the evangelical party. He wrote many sermons and pamphlets of a theological nature. Consult Wellwood, 'Life of John Erskine' (Edinburgh 1818).

ERSKINE, John, American educator: b. New York, 5 Oct. 1879. He was graduated at Columbia University in 1900, and in 1909 became associate professor of English there. In 1903–09 he was instructor and associate professor of English at Amherst College. After 1909 he was adjunct professor, and after 1916 professor of English at Columbia. He has published 'Actæon and Other Poems' (1907); 'Leading American Novelists' (1910); 'Written English,' with Helen Erskine (1910, rev. ed., 1913); 'Selections from the Idylls of the King' (1912); 'Poems of Wordsworth, Shelley and Keats,' with W. P. Trent (1914).

He has edited 'Contemporary War Poems' (1914); 'The Moral Obligation to be Intelligent and Other Essays' (1915); 'Interpretations of Literature by Lafcadio Hearn' (1915). He contributed also to magazines and to the 'Encyclopedia Americana.'

ERSKINE, Ralph, Scottish seceder: b. 15 March 1685; d. Dumfermlin, 6 Nov. 1752. He was a brother of Ebenezer Erskine (q.v.). He was ordained to the collegiate charge of Dunfermline in 1711, and in 1737 joined his brother, who had seceded from the Established Church. His 'Gospel Sonnets' and other religious works were once very popular.

ERSKINE, Thomas, Baron Erskine, Scottish jurist: b. Edinburgh, 21 Jan. 1750; d. Almondell, West Lothian, 17 Nov. 1823. First in the navy and then in the army, he finally decided on a legal career at the suggestion of Lord Mansfield. He became a noted forensic orator and jurist, attaining early renown as a pleader in support of the accusations of corruption made against Lord Sandwich; later he added to his success by his defense of Stockdale, Lord George Gordon, Hardy, Thomas Paine, Horne Tooke and others. Some of his greatest successes were obtained in combating the doctrine of constructive treason, by which it was sought to make persons who aimed at effecting a change in the sovereign's constitutional character and position guilty of the capital offense of «compassing the king's death.» His acceptance of a brief for Tom Paine resulted in his dismissal from the office of attorney-general to the Prince of Wales. He was a member of the House of Commons in 1790–1806, but achieved no success there. He was created Baron Erskine of Restormel, on becoming lord chancellor in 1806, holding office till the following year.

ERSKINE, Thomas, Scottish theological writer: b. Edinburgh, 1788; d. 1870. He studied law at the University of Edinburgh and practised this profession from 1810 to 1816, when he abandoned it for the literary field. Many of his views in matters of theology were unorthodox, such was especially the case with his theories of the atonement and universal restoration. He propounded his views so skilfully, however, that they impressed a great number very favorably. He was expelled from the Kirk in 1831 because of his heterodoxy. His writings include 'Remarks on the Internal Evidence of the Truth of Revealed Religion' (10th ed., 1878); 'The Unconditional Freedom of the Gospel' (1828); 'The Doctrine of Election' (1837; 2d ed., 1878); 'Spiritual Order and Other Papers' (1871). Consult his 'Letters,' edited by William Hanna (1877).

ERTEL, ār'tĕl, Jean Paul, German composer: b. Posen, 1865. He studied composition under E. Tauwitz and piano under Liszt and Brassin. He is teacher at the Brandenburg Conservatory, Berlin, and musical critic of a Berlin newspaper. He collaborated on various publications and edited the *Deutsche Musikerzeitung* 1897–1905. His compositions include the symphonies 'Harald,' 'Maria Stuart,' 'Der Mensch,' 'Belsazar,' 'Pompeii'; besides several concertos and ballads.

ERUPTION, a term applied to a local disturbance in the skin characterized by the formation of redness or scaliness, blistering or pustulation. In one class of affections, known as the eruptive fevers, a characteristic form of skin-eruption is diagnostic. Thus the fine red rash of scarlet fever, the bluish red rash of measles, the irregular rash of chickenpox and the pustulate rash of smallpox are readily recognized. The popular notion that an eruption is an indication of something evil within the body finding its way out belongs to the mediæval days of superstition and ignorance, when disease was regarded as an evil spirit to be exorcised, and gave notice of its evacuation by means of an eruption on the skin. At the present time we know that most eruptions are either of purely local occurrence, due to localized irritants, as in the case of pimples, boils, etc., or that they represent a disturbance of the nerve-centres, whose end-filaments are distributed to the epithelial structures of the body. Thus in measles, not only the skin, but also the mucous membranes of the respiratory tract are affected, the poison affecting the nerve-structures being evidenced by nerve-irritation at the periphery of the body. The popular idea that it is necessary to bring an eruption out in acute infectious diseases such as measles and scarlet fever is trustworthy, but an interpretation is frequently given to it that is not sound. The presence of an eruption on the surface of the body in these affections is an indication of the protective energies of the human organism in its fight with the infection and poisoning. The inability of the body to counteract the poison of the disease may prevent the development of the eruption, and thus its bringing out, being the sign of the body's ability successfully to cope with the poison, is the warrant for the popular idea of the efficiency of the eruption. Many drugs locally applied, or taken internally, cause the formation of eruptions. These eruptions may be due to purely nervous influences, or they may be of local origin. Drug-eruptions following the use of the iodides and bromides are of this latter character. As the drug is eliminated through the skin, its passage there causes local irritation and the formation of an eruption. See Dermatitis; Measles; Skin and Skin Diseases.

ERUPTIVE ROCKS. See Igneous Rocks.

ERWIN VON STEINBACH, fōn stīn'baн, German architect: b. Steinbach, Baden; d. 17 Jan. 1318. The principal tower of the cathedral of Strassburg had been completed in the 7th century. It was partly built of wood and was reduced to ruins by lightning and successive fires. The nave, begun in 1015, was only completed in 1275. Erwin was then requested to furnish designs for the decoration of the interior of the church and for the construction of two new towers and a façade upon the site of the ruins of the old tower. The foundation stone of the new structure was laid 25 May 1277. The architect died when the work was only half finished. It was continued by his son Johannes (d. 18 March 1339), and subsequently continued chiefly after his designs, still preserved at Strassburg. His daughter Sabina assisted him in the decoration of the interior of the church; and another of his sons, Winhing (d. 1330), was also an architect of some distinction. The remains of this family of architects are interred within the cathedral.

ERXLEBEN, ārks'lā-ben, Johann Christian, German naturalist: b. Quedlinburg, 1744; d. 1777. He was educated at the University of Göttingen and in 1771 was appointed professor of natural philosophy there. He published 'Aufangsgründe der Naturgeschichte' (4th ed., 1791) and 'Aufangsgründe der Naturlehre' (6th ed., 1794). Erxleben's mother, Dorothea Christine Erxleben, was the first woman to obtain the degree of M.D. in Germany.

ERYMANTHUS, in ancient geography, a river (now called Douana) and mountain (now Olonos) of Arcadia, in Greece. The river, according to some the modern Dimitzana, rises on the frontiers of Arcadia and Elis, and flows into the Alpheus. The mountain, situated to the east of the river, formed the western point of the northern barrier of Arcadia, and was covered with forests. It was in this mountain that Hercules chased and killed the famous wild boar.

ERYNGIUM, ę-rĭn'jĭ-ŭm, a genus of plants of the parsley family (*Apiaceæ*). The generic name from the Greek refers to their thistle-like appearance. There are about 220 species in the genus, of which about 22 are found in America. Rattlesnake-master, or button-snakeroot (*E. aquaticum*) grows in wet soil and in the pine-barrens, from New Jersey south to Florida and west of Texas, Missouri and Minnesota. Its common names are given to it because of its supposed efficacy as an antidote to the venom of snakes. A number of species are cultivated, both on account of the steel-blue color of the stem and branches, and of the unusual manner of growth. Eryngo (*E. maritimum*), sea holly, is a native of Europe. It frequents sandy shores, and is distinguished by its rigid, spiny, glaucous, veined leaves and its dense heads of blue flowers. The roots are sometimes candied, and are reputed to be stimulating and restorative. Falstaff speaks of its use as a confection and its aphrodisiac qualities, either real or supposed, are mentioned by dramatists from Jonson to Prior.

ERYON, a fossil crustacean found in the rocks of the Mesozoic period in Europe. Six species have been identified of which *E. propinquus* is the best known. Consult Crustacea; Fossils.

ERYOPS, a genus of fossil amphibians of the Pemican rocks of Texas, which is of great interest as the ancestor of the extension order of labyrinth-odonts, according to the latest general opinion. Several species have been described, of which the best known (*E. megacephalus*) was six to eight feet in total length. It was sluggish, a water-and-shore living animal, in form something like a Californian horned toad and crept about on legs so short as hardly to lift its belly off the mud. Its skull was entirely encased in bone, save small holes for nostrils and eyes, and showed no sutures. The feet were broad and spreading and the tail short and contracted into a terminal pointed coccyx. Its ribs did not encircle the body, and it «probably swallowed air like a frog.» «This animal,» says Osborn, may be regarded as a collateral ancestor of the labyrinthodonts; it belongs to a type that spread all over Europe and North America, and persisted into the *Metopias* of the Triassic. Consult Osborn, 'Origin and Evolution of Life' (New York 1917); Gadow, 'Amphibia and Reptiles' (New-York 1901); Woodward, 'Guide to Fossil Reptiles' (in the British Museum, London 1905).

ERYSICHTHON, ĕr-ĭ-sĭk'thŏn, son of King Triopas, and himself a legendary king of Thessaly. He cut down trees in a sacred grove and he was cursed by Demeter with such unsatisfiable hunger that he devoured his own flesh. He is said to have repeatedly sold his own daughter; but each time she returned to him. She had received from Poseidon the power of self-transformation.

ERYSIMUM, ē-rĭs'ĭ-mŭm, a genus of plants of the family *Brassicaceæ*, chiefly biennials, with narrow entire leaves, and yellow, often fragrant, flowers. There are about 85 species, natives of northern, temperate and cold countries. *E. cheiranthoides*, a native of Europe, with small yellow flowers, is found in waste places, along streams, and in fields from southern New England to Newfoundland, and westward to the Pacific coast.

ERYSIPELAS, an acute infectious disease of the skin and subcutaneous structures caused by a streptococcus. Whether the *Streptococcus erysipelatis* of Fehleisen, or the *Streptococcus pyogenes* is considered the causative factor or not, the fact remains that bacteriologically it is probable that these two forms of bacteria are identical. The reaction of the tissues to the streptococcus and its poisons causes the acute inflammation with redness, puffiness and sometimes gangrene. This local swelling is attended with fever, headache, general constitutional symptoms, nausea, vomiting, and at times with toxic delirium. Occasionally the streptococcus wanders into the blood-stream, and general septicemia or pyemia results. At other times a streptococcic invasion of the joints produces an acute rheumatism with secondary heart complications. Erysipelas may affect any part of the body, but is very frequently over the face and head. It is extremely contagious, the organism finding entrance through minute wounds. Patients who have had recent erysipelas should on no account be allowed to come anywhere near women in childbirth, as puerperal fever may result. The treatment of erysipelas is by means of tonic — iron and quinine being favorites—nutritious and easily assimilable diet, milk, cod-liver oil and some form of alcohol. In those patients in whom abscess formation occurs, prompt surgical evacuation is imperative. Local treatment by ichthyol and similar antiseptics is widely employed with some benefit.

ERYSIPHACEÆ. See Mildew.

ERYTHEMA. See Dermatitis.

ERYTHIA. See Hesperides.

ERYTHRÆAN (ĕr'ĭ-thrē'an) **SEA,** in ancient geography a name given to what is now called the Indian Ocean, but including the Persian and Arabian gulfs. The name was latterly restricted to the Arabian Gulf.

ERYTHRIC ACID, a white, crystalline, tasteless and odorless powder, readily soluble in alkalis and alcohol obtained from lichens.

ERYTHRINA. See Coral-tree.

ERYTHRITE, or «cobalt bloom,» a native hydrous cobalt arsenate. It has a beautiful peach-blossom red color, whence its name from the Greek, *erythros,* red. It occurs in monoclinic crystals, but more commonly in globular or stellate masses or earthy. It occurs at Schneeberg, Saxony; in Cornwall, England; in Chile, and in some parts of the United States.

ERYTHRONIUM, a genus of small plants of the lily family, common in damp, shady woods, of which a well-known and widespread species (*E. americanum*) in the United States, is the «dog-tooth violet» or «adder's tongue»—both unfortunate names. It is among the earliest of spring flowers, appearing as two radical leaves, usually handsomely mottled, between which rises a slender, naked stem (scape) three to four inches high, bearing a single bell-shaped flower of six distinct lanceolate segments, pale yellow, often spotted near the base. About a dozen other species are known in the United States, some bearing several flowers on the scape, and of various tints, as purple, rose-color, or pinkish white.

ERYTHROPLŒUM, ĕ-rĭth-rō-plē'um, a genus of tropical trees, of the pea family, containing five species, found in Africa, Asia and Australia. *E. guineense* of Africa has a poisonous red juice, which is used by the natives as a test of innocence or guilt, and hence the name ordeal-tree. The natives of Guinea and the Gold Coast employ the same juice to poison the points of their arrows.

ERYTHROSIN. See COAL-TAR PRODUCTS.

ERYTHROXYLON, a genus of plants of the family *Erythroxylaceæ.* The genus contains about 90 species, composed almost exclusively of trees and shrubs growing in tropical regions. The flowers are small and lack color; the fruit is a drupe. The red dyewood of Brazil is *E. suberosum,* and the oil-wood of Mauritius is *E. hypericifolium.* The chief member of the genus and family is *E. coca.* See COCA.

ERYX, ē'rĭks, ancient name of a city and mountain in the west of Sicily, about six miles from Drepanum and two from the seacoast The mountain, now Monte San Giuliano, rises direct from the plain, unconnected with any other range, and hence possesses a much greater altitude in appearance than in reality, its height being only 2,184 feet. It was anciently believed to be the highest mountain in the island after Etna, and is frequently alluded to by Virgil and other poets. On the summit stood a celebrated temple of Venus, from which the goddess received the epithet of Venus Erycina. All traces of the ancient town of Eryx have now disappeared, and its site is occupied by the modern town of San Giuliano; but some remains of the temple still exist in part of the substructure of the castle.

ERZBERG, ārts-bĕrg, a mountain in Styria, Austria, near the town of Eisenerz. It rises about 5,000 feet above sea-level. It has valuable deposits of iron ore, reaching as high as 40 per cent metal, which is taken out annually to the amount of over 1,000,000 tons. Aragonite is also found in considerable quantity.

ERZERUM, ĕrz'room, **ERZEROUM,** or **ERZEROOM,** Armenia, a large city of, and, after the annexation of Kars by Russia, the chief place of resistance by Old Turkey to a Russian advance, about 100 miles southwest of Trebizond. Its fortifications have been repaired and much improved since 1864. The inhabitants consist of Turks, Armenians and Persians and are very industrious; and, in addition to important manufacture, especially in copper and iron, carry on a very extensive trade. This is greatly favored by the position of the town, standing at the junction of several important roads leading from Transcaucasia by way of Trebizond, and communicating with different parts of Asia Minor, with Persia, Kurdistan, Mesopotamia, etc. Erzerum is a place of great antiquity. Anatolius, commander of the Emperor Theodosius II, here built the citadel of Theodosiopolis, northwest of the open Syro-Armenian trading town of Arsen. On the destruction of this town by the Seljuks, in 1049, the inhabitants removed to Theodosiopolis, which received from them the name of Arsen-er-Rum, that is, Arsen of the Romans. Hence the modern name Erzerum. In 1241 it fell into the hands of the Mongols, and in 1517 into those of the Turks, notwithstanding whose mismanagement it continued to be the most important commercial emporium of the Armenian plateau, and had a population of 100,000. In 1829 it was taken by the Russians, but was restored to Turkey by the Peace of Adrianople. Many of the inhabitants, however, quitted the town and settled in the Russian territory. In the winter of 1877 it was besieged by the Russians, who reduced the defenders by famine, until in February 1878 it was surrendered, and held by the Russians for several months. It was again, however, restored to the Turks. In the European War Erzerum fell a prize to the armies of the Grand Duke Nicolas, on 16 Feb. 1916, after an assault lasting five days. Turkish prisoners to the number of 13,000 were taken and 323 pieces of cannon. See WAR, EUROPEAN.

ERZGEBIRGE, ārts'gĕ-bēr-gĕ (German, Ore Mountains), a range of low mountains about 100 miles long on the boundary between Saxony and Bohemia. It is about 25 miles wide, and has an average elevation of 2,500 feet and a maximum of 4,060 (Mount Keilberg). On its sides are extensive forests, among which are many summer resorts. Like the Blue Ridge Mountains in the United States and the Highlands of Scotland, they are an ancient range, worn down and again uplifted. As the name implies, the Erzgebirge contain valuable deposits of minerals and form an old mining region. Silver ores were mined there as long ago as 1150 and mines of lead, copper, tin, cobalt, nickel and iron ore have also been sunk there.

ERZINGAN, ĕr'zĭng-an, Armenia, town and capital of a district in the province of Erzerum, 85 miles south of Erzerum. It is situated in a plain at 3,900 feet above sea-level and is of importance as a garrison town. It has a military hospital, large barracks, government buildings, a mosque, a bazaar, an Armenian normal school, and other Armenian schools. It has manufactures of cotton, canvas, silk, copper and clothing. The government maintains several tanneries in the neighborhood. In 1784 most of the place was destroyed by an earthquake. In ancient times it was called Arsinga. Pop. 18,000, about equally divided between Armenian Christians and Mohammedans.

ESARHADDON, king of Assyria and son of Sennacherib. He reigned from 681 to 668 B.C. When his father was slain by his brothers, Esarhaddon proclaimed himself governor of Babylonia and set about avenging his father's death. Within a year he succeeded in having himself acknowledged king of Assyria. He conducted several campaigns against foreign enemies, first against the Chaldæans, capturing Sidon and razing that city. In 673–670 B.C. he made two campaigns in which he brought Egypt under his yoke. He died while on the way to repress an insurrection in Egypt in 668 B.C. He designated Assurbanipal as king of Assyria. He did much for the rebuilding of Babylon and planned many great building enterprises. His liberality has caused him to be considered one of the most beneficent kings of Assyria.

ESAU, the eldest son of Isaac, and twin brother of Jacob (Gen. xxv, 24–26). His name (which signifies rough, hairy) was due to his singular appearance at birth, being «red, and all over like a hairy garment.» The struggle for precedence between the brothers was foreshadowed the moment of their first appearance in the world. Esau, the father's favorite, became a cunning hunter; Jacob, the favorite of the mother, became a peaceful shepherd. One day, as Esau returned famished from the chase, he found his brother preparing some lentil pottage, and asked for a share of it. Jacob, taking advantage of his brother's distress, offered him the pottage if he would give up his birthright. Although this meant yielding up the headship of the tribe and the greater share of the family property, Esau nevertheless consented. He was named Edom (red) in consequence, from the color of the pottage; and the name was given to the land he settled in. The next episode in his history is when Jacob, instigated by his mother, personated Esau, and succeeded in getting his father's covenant blessing. The indignation of Esau at the base trick was natural; and Rebekah sent Jacob out of the way for a time, to escape his brother's vengeance. On his return from a protracted stay Jacob succeeded in mollifying Esau by presents and flattery. After a subsequent meeting of the brothers, on the death of their father, we hear no more of Esau.

Many biblical scholars are inclined to look upon this story of Esau and Jacob as symbolical of the relationship existing between the Israelites and the Edomites. The characteristics of the former are well represented by Jacob and those of the latter by Esau. Edom, which was older than Israel, was subjected by David. See EDOM.

ESBJERG, ĕs'byĕrg, Denmark, seaport, 56 miles west of Fredericia, with a large export trade in cattle and dairy products, mostly to England. Its harbor, the only one of importance on the west coast of Jutland, was constructed by the state at great expense in 1868–74; and in 1887 an annual subsidy was granted by government for steam communication with Great Britain. A submarine cable connects with Calais. Pop. 18,208.

ESCALADE, ĕs-kā-lādd', in war, a furious attack of a wall or a rampart, carried on with ladders, to pass the ditch or mount the rampart, without proceeding in form, breaking ground, or carrying on regular works to secure the men. See WAR.

ESCALANTE, ās-ka-lān'tā, **Juan,** Spanish soldier and explorer: d. 1519. He accompanied Cortés to Mexico and by the latter was made high constable of Villa Rica de Vera Cruz. He destroyed, on order of Cortés, the fleet which had brought the Spaniards from Spain and with 150 men, remained on the coast while Cortés marched against Mexico City. When two of his company were assassinated by the Indians Escalante set out with 50 whites and thousands of Indian allies to make reprisals on the hostile tribes. In the ensuing battle his forces were successful but he and seven of his white followers were slain.

ESCALATOR, the name applied to a continuous carrier designed for conveying passengers from one level to another within a limited time. The various units making up the escalator are so arranged that on the incline they present the familiar zigzag appearance of an ordinary stairway, and may be used as such. The escalator consists of an endless series of steps connected together by a heavy sprocket chain which, at the proper place, engages with the driving sprocket wheel. Each step is essentially a four-wheel truck, bolted to a shaft, which, in turn, is connected to the links of the driving chain. There are two wheels at each end of the truck traveling on separate tracks, so placed that the steps remain horizontal at all points of the ascent. At the landing, at the top and the bottom of the escalator, the trucks travel in the same plane so that the steps there become a moving platform. Ample opportunity is thus given, even to the infirm, to board the device before the ascent begins and at the top to step off again. A traveling hand-rail moving at the same speed as the steps further simplifies its use. Should a person fail for any reason to step off at the upper landing, a device called a shunt removes him from it. This consists of a box-like affair, triangular in plan, placed about 10 feet from the top of the escalator with the apex pointing against the direction of the moving platform. In the lower part, set in a vertical position, are two belts running backwards from the apex. Anything coming in contact with these belts is gently brushed to one side. Every part of the escalator is made to micrometer measurements of one thousandth of an inch by special machinery designed for the purpose. As a result of this unusual precision, the various steps fit together so nicely that a piece of paper cannot be forced between them. To secure practically noiseless operation, the wheels on which the trucks move are deadened, rawhide pinions are used in driving gear, and the tracks are built up of wood and steel. The links of the sprocket chain are made of two 18-inch cast steel shrouds, with 1½-inch steel pins between them at 3 inches between centres. The ends of the links are bushed with phosphor-bronze in which graphite is inlaid, thus providing lubrication of the bearing surfaces, and the heels are similarly provided with a constant lubrication of graphite. The escalator is driven by an electric motor located within the structure of the upper landing and suitably geared to the large driving sprocket wheel by a combination of worm and spur gearing. All parts of the running gear are made of crucible cast steel, the axles and link pins being of cold drawn steel. Each casting is subjected to a test of many times the working-strain to come upon it.

While there are no mechanical limitations to the rate of speed with which the escalator may be driven, it has been found that a speed of about 100 feet per minute is satisfactory to the public. At this rate of driving, 4,000 steps per hour arrive at the landing and the maximum capacity of the machine depends upon the width of the steps used. The escalators which have been installed for railroad stations, large department stores and other localities where a large capacity is necessary, have been a little over five feet in width and as each step readily accommodates three people the maximum capacity of such a construction is 12,000 people per hour. For the smaller department stores and for use in railroad stations where the traffic is not heavy the escalator is made of such width as to accommodate one person on each step, and the capacity is therefore 4,000 per hour. It should be noted that the escalator is a perfectly reversible machine, operating equally well in either direction. In the «duplex» type, the steps during the descent are again guided into the familiar zigzag position by suitably placed tracks and thus the same machine serves to carry passengers both up and down. In a third modification of the device designed especially for the London underground railroad, where the difference between levels is considerable, the steps ascend in one spiral and descend in another spiral below the first.

ESCALOP, or SHELL, an heraldic symbol used to signify that the bearer has voyaged much on the sea. See HERALDRY.

ESCANABA, Mich., city and county-seat of Delta County, on Little Bay de Nouquette, an inlet of Green Bay; on the Chicago and Northwestern, and the Chicago, Milwaukee and Saint Paul railroads; 52 miles northeast of Marinette. Owing to its excellent and picturesque situation, it enjoys considerable reputation as a summer resort. The harbor has an eight-mile frontage and there is steamboat connection with several lake ports. Much of the Lake Superior iron ore is shipped from here. It contains eight ore docks, in which are handled over 4,000,000 tons annually, and there is, moreover, a large trade in coal, fish and lumber. There are manufactories of flooring, furniture and wooden ware, a plant for crushing iron ore, and large railroad repair shops. The United States census of manufactures for 1914 showed within the city limits 45 industrial establishments of factory grade, employing 921 persons; 777 being wage-earners receiving $469,000 annually in wages. The capital invested aggregated $1,354,000 and the year's output was valued at $1,507,000: of this, $771,000 was the value added by manufacture. The buildings of note are the public library, hospital, high school, courthouse and city hall. The city was settled in 1863, and was incorporated in 1883 and received its city charter in the same year. Pop. (1920) 13,103.

ESCANDON, Guillermo de Landa y, Mexican statesman: b. Mexico City. He was educated in Stonyhurst University, England; was several years a member of the national Senate, representing the states of Chihuahua and Morelos; from 1900–02 he was mayor of Mexico City and became governor of the Federal District in 1903. Under his administration many very important reforms have been introduced and carried to successful results, among them the restriction or practical discontinuance of gambling; the improvement of the public carriage service; the enactment of rules restricting the speed of automobiles; the protection of the peon or Indian class; the improvement of the prisons of the capital city and its suburbs, and also of the public buildings and military barracks; the bettering of the sanitary condition of the correctional schools, the theatres and other places of amusement, and of the entire city; the adoption of a system of street sweeping and sprinkling; the placing of proper restrictions on the sale of alcoholic beverages, etc.

ESCAPE, the liberation of a person from lawful custody without lawful authority. When accomplished by the prisoner it is known as prison breach, but if accomplished by others and with force, it is known as rescue. Prison breach with force is a felony, but, if without force, merely a misdemeanor. In most modern jurisdictions a prisoner who effects his escape loses all commutation of sentence earned by him in any manner whatsoever. His aids in the escape, or even attempt to escape, are guilty of the same grade of crime as the prisoner and are liable to the same punishment. Officers who voluntarily permit an escape are considered as aids and punished as such. When guilty merely of negligence they are punished for a misdemeanor. See CRIMINAL LAW.

ESCAPEMENT, a part of the machinery in a watch or clock. See CLOCK; WATCHMAKING.

ESCARP, or SCARP, the slope of a ditch next the parapet. In permanent fortifications the escarp is usually faced with mason work behind which are erected casemates. See FORTIFICATION.

ESCARPMENT, the abrupt descent, which may or may not be a cliff, from a plateau to lower land. Particularly famous are the Helderberg escarpment near Albany, and the Niagara escarpment, the latter responsible for Niagara Falls. The Allegheny Front is another well-known escarpment. See MOUNTAINS; CLIFF.

ESCARS. See ESKERS.

ESCAUT, ĕs-kō, the French name for the river Scheldt.

ESCHALOT. See SHALLOT.

ESCHAR, ĕs'kär, a portion of dead tissue; also the artificial slough produced by the use of caustics.

ESCHATOLOGY. The teaching in regard to the last things (Greek *ta eschata*). It deals with man's condition after death, the destiny of nations, and the end of the world. Speculation concerning the fate of the individual appears to have started in a very early period of man's career. Archæological remains indicate the presence of certain customs already in the paleolithic age which seem to reveal a nascent conception of survival after death. The disposal of the lifeless body so as to provide it with a shelter, the pictorial representation of men disguised by the heads of animals, and the cremation of the dead scarcely

permit any other interpretation. Sepulture, even in its simplest form, apparently implies the idea of something within man that may be temporarily absent but still demands a measure of sustenance and protection for the body. According to primitive notions among peoples surviving until to-day in stone age conditions, some of those that once lived in a neighborhood and, possessed of extraordinary power, created things may return in the guise of totems for the increase and strengthening of the tribe. The desire to have the double within, whose existence had been suggested by many an experience, united with the element of fire, for whose permanent possession man had so long struggled, is likely to have given rise to the incineration of the body. In the neolithic age specially constructed tombs, offerings of solid food and blood to the dead, and other customs testify to the growing belief in a survival dependent upon such ministrations. It is probable that the satisfaction of immediate needs, impulses, and passions precluded, in these remote ages, any serious concern about the future of the tribe, while the nomadic habits which allowed only a loose attachment to any particular place tended to prevent a local catastrophe from conjuring up the thought of an impending destruction of the whole world.

In various centres the early civilizations developed along different lines these ideas concerning the future. The Egyptians continued through thousands of years the practices of the neolithic age, though with some modifications. Tombs were differently constructed, bodies were embalmed, painted food was substituted for real, the mortuary ritual was enriched, but the underlying conception remained the same. Even when the Osirian theology gave a larger measure of independence to the soul, which had to appear before the judges in the nether world, the connection with the entombed body was never lost in popular thought. In periods of foreign invasion and social disorder the need was felt of some guarantees of a better future. While the Prophecies of an Egyptian Sage in a papyrus of the Middle Kingdom do not contain any distinctly predictive element, there is at least the suggestion of eschatological thought in the desire for a «shepherd of all the people, who has no evil in his heart.» The freedom of the Nile valley from any devastating natural catastrophes was not conducive to ideas of an approaching end of the world. Our knowledge concerning the Ægean and Hittite civilizations is still too scanty to allow any definite conclusions on these points except such as may be inferred from the archæological remains. The belief in a survival through protection and care of the body is clearly evidenced by tombs and cultic performances. Whatever ideas the Greeks may have brought with them into their new home, they are likely to have been much influenced at the outset by their predecessors. In the Homeric Age it was thought that all souls pass at death to a shadowy and undesirable existence in Hades, unless for special reasons a hero is translated to dwell with the gods. This subterranean realm may be visited by an Odysseus still in the flesh. Speculation upon successive ages, symbolized by gold, silver, copper and iron appears in Hesiod, together with the suggestion that the process of degeneracy will end in destruction of the last race. As the thought of a moral retribution beyond the grave asserted itself, the Orphic and Eleusinian mysteries offered to the initiated assurance of a blessed life after death and salvation from future punishments adjusted to the crimes committed. Among the Pythagoreans the idea of transmigration, probably of Eastern origin, was added to the Orphic conceptions. The primitive notion seems to have been that at death the soul is carried hither and thither by the wind until it enters another body. Plato developed this eschatological thought in various directions. He based immortality upon the essential nature of the soul as an eternal «idea» existing before birth and subsisting after death. While accepting the Orphic scheme of retribution, he emphasized the positive value and moral significance of life. He adopted the idea of the *annus magnus*, the cosmic year, thus anticipating the end of the present world; and he sought the realization by practical efforts of a society patterned upon the ideal, always limited, however, by the Greek conception of the city-state. Aristotle's attitude towards this development was on all points negative or agnostic.

In Babylonia, the Sumerians thought of the dead as going to a land below the earth whence there was no return, though some semi-divine heroes, like Engidu and Enmeduranki, might be spared the common lot and translated to be with the gods, and a Gilgamesh might find his way thither. Their mythical lore and astronomical observations furnished Akkadians, Amorites, Aramæans and Chaldæans with material for later speculation. But even these peoples do not seem to have developed any new type of thought concerning the future of the individual. While the growth of a peculiar astrological system, perhaps already in the Kassite period, may here and there have suggested the idea of the soul rising to life again, and apparently led to the conception of the great cosmic year, there is as yet no unmistakable evidence either that the inhabitants of Babylonia, Assyria and Mesopotamia before the Persian period became deeply concerned about existence after death, or considered intensely the future of the nation beyond some immediate emergency, or transferred the mythical imagery from the beginning to the end of the world. This was subsequently done in Syria. But even there the Hebrew writings reveal for long periods substantially the same ideas. The soul passes at death to a subterranean Sheol where there is no moral distinction. Only exceptionally an Enoch or Elijah may escape the universal fate and be translated. But the ethical fervor and insight of the great prophets, men like Amos and Hosea, Isaiah, Micah and Jeremiah, brought to the fore a conception of the nation as having a spiritual function, independent of the maintenance of the popular religious cult and the changing fortunes of the state. The extraordinary longevity of the Davidic dynasty tended to raise the expectation of a return of political independence and power under a scion of the old line. In some circles the thought, so touchingly expressed in the book of Job, that, from a longing for the work of his hands, the Creator might bring man back again from Sheol seems to have been entertained, though the author of that great poem resolutely brushes aside this "hope of man." But the way was prepared for a new growth of eschatology through contact with Persian thought.

The Aryans of the Iranian plateau and India followed primitive tendencies into different directions. A religious practice of promptly returning the body to the various elements, rather than of preserving it, in connection with a growing demand for future retribution, seems to have led the former to the view that the body would ultimately be restored by the elements. Although the duty of exposing the dead and the doctrine of a physical resurrection, so strongly insisted upon in the later Avesta, are not alluded to in the Gathas, and the Achaemenian kings were buried, it is probable that they had long been maintained in certain Mazdayasnian circles, and they appear to have been known to Herodotus in the 5th and Theopompus in the 4th century B.C. That the world will pass through a final ordeal by fire is taught in the Gathas. The later Avesta divides the world-year, not according to the precession of the equinoxes into 25,868 years, but into 12 millennia, placing the advent of Zarathushtra at the end of the 9th, that of the Saoshyant, or Savior, who will raise the dead, at the end of the 12th. In India, on the other hand, the doctrine of transmigration became strongly entrenched, while a tendency toward pantheism excluded the idea of a creation and precluded the growth of eschatology. There are no last things in a pantheistic philosophy, though the infinite stretches of divine manifestation may be divided into *kalpas, yugas,* or epochs. The doctrine of metempsychosis renders it possible to introduce in the future life of the individual the nicest moral adjustments, implying both rewards and punishments in terms of character, and the possibility of rising and sinking in the scale of being according to present conduct. But this never-ending series of births and deaths may come to be felt as an intolerable evil, and Buddhism offered deliverance from the infinite wheel of existence in Nirvana. It is interesting to observe that the Aryanized people of Northern Europe not only believed in the assembly of all souls, except those translated to be with the gods, in Hel's subterranean realm, but also in punishments for the wicked, a destruction by fire of earth's crust, a new earth people by the descendants of the pure children Lif and Lifthraser, and a new dynasty of gods. The practical character of the Chinese has preserved ancestor worship, with its conservative influence, and given an ethical rather than metaphysical turn to philosophical thought, discouraging speculation about the future. How similar ideas may grow up, apparently without historical contact, from the natural operation of the human mind, is strikingly shown by the fact that the ancient Peruvians and Aztecs looked forward to the destruction of the world, analogous to its destruction by various agencies in past epochs, and also, it would seem, to a future restoration of the body.

The blending of Greek thought and Oriental speculation that followed the conquests of Alexander gave a powerful impulse to eschatology. Plato's idea of immortality, involving pre-existence as well as post-existence, and emphasizing deliverance from the prison-house of matter, spread in the East, while the Persian doctrine of a resurrection found its way to Syria, and in some Hellenistic circles a spiritual resurrection immediately after death was accepted as a compromise. The colorless existence in Sheol was reduced to an intermediate state between death and the final assize, while the Orphic pictures of heaven and hell helped to give a distinctive character to man's ultimate fate in the other world. Stoic philosophers set forth a theory of cycles according to which each cosmic year ends with a universal conflagration, leaving only the elements out of which a new world rises to pursue its course in exact repetition of its predecessor. Jewish apocalypses described a succession of world-empires and laid down a definite program of the last things with many features ultimately borrowed from Babylonian mythology. Sometimes the coming kingdom of heaven was thought of as ruled directly by God; some times a theocratic ruler on earth was expected, either a high-priest "of Aaron and Israel," as in the Zadokite Documents, or a king of the family of David and the tribe of Judah, as in the Psalter of Solomon and later works. Similar eschatological expectations of a heaven-sent ruler and savior of the world are found in the Fourth Eclogue of Virgil, the Priene inscription to Augustus, Sibylline oracles, probably of pagan origin, and elsewhere. In this atmosphere Christianity grew up. Jesus himself appears to have believed in a spiritual resurrection immediately after death of those accounted worthy of it, cherished no ambition to become a king or in other ways to exercise lordship, and looked for the kingdom of heaven essentially as a reign of righteousness in the life of man. But the belief that He had been raised from the dead according to the Scriptures and would return upon the clouds of heaven as the Messiah to take vengenance upon His enemies, raise the dead, and establish His kingdom on earth affected profoundly the thought of the early Church. When the expected return was delayed, the interest gradually shifted from the idea of a righteous kingdom on earth to the perfected society in heaven, which the travelers through purgatory might be assisted in attaining, but from which the denizens of hell are forever excluded. Yet in the greatest of all apocalypses Dante gives a glimpse of the final order of things on earth at the top of the mountain of purgatory in which all external authority has at last ceased. The poet realized, however, that before this stage can be reached when a citizen of the world may be left in freedom, righteousness and sanity to "crown and mitre" himself, a political organization of the whole human race under the same law would be necessary, and in 'De monarchia' suggested the need of an expansion of the empire to all parts in order to guarantee a general security and growth. When the Lutheran, Anglican and Reformed churches rejected the doctrine of a purgatory, they considered man's destiny to be fixed irrevocably at death. This tended to make the closing scenes of the last judgment and the resurrection of less practical importance, to eliminate the premillennial coming of Christ, and to present the millennium as a result of a long development of Christian life. Among Baptists and other radicals there was a reaction against this toward universalism or millennianism. A great crisis in the history of nations naturally produces a certain eschatological mood which leads some minds to seek new interpretations of old prophecies, and others to make forecasts of the future.

The Jewish and Christian doctrines of a final judgment, a resurrection of the dead, and everlasting punishments and rewards were adopted by Islam, and the eschatology was enriched, after the prophet's time, by contact with Persian thought. The idea of a reincarnation of some great representative of Allah in the past has exerted a particularly strong influence, and the expectation of some Imam or Mahdi to reveal the truth more fully or to change the conditions of life on earth has from time to time stirred profoundly the Mohammedan world. In later Judaism the denial by Maimonides of a physical resurrection found support at the time and has led more recently to a wide-spread hope for an immortal life independent of a resuscitation of the body. The disillusionment that has followed every Messianic movement has, no doubt, had something to do with the less prominent place held to-day even among orthodox Jews by speculation as to the advent of the Messiah. Neither conservatives nor liberals who are interested in the establishment of a Jewish state in Palestine seem to contemplate a monarchical constitution; and the fundamental difference between Jewish cosmopolitans and nationalists does not even affect the conviction that Israel has a particular function to fulfil in the regeneration of the human race.

Modern thought, freeing itself from the authority of tradition, has earnestly endeavored to test the foundations and appraise the value of the various eschatological conceptions, and to find out how far, and on what grounds, it is possible to formulate any views concerning the future that shall be in harmony with scientifically ascertainable facts. There is a disposition to examine objectively and impartially any evidence that is adduced, whether from the correspondence of the phenomena of consciousness to the operations of special parts of the brain or the alleged communications with the dead, the kinship of cerebral functions in man and animal or the intrinsic worth of human self-consciousness, the potentiality in all or the high degree of realization in some. Scientific inquiry, unable to go beyond a *non liquet,* may not find any ground for vetoing the assumption of an idealistic philosophy that the inmost self in man may be an indispensable unit in a spiritual universe. But there can be no question that the characteristic modern attitude, affected by science, is one of unwillingness to dogmatize, readiness to hold the judgment in suspense, and disinclination to regard knowledge in this field as essential. That the individual continues to live in the race is capable of demonstration, and to the consciousness of this fact a strong moral appeal is possible. An intelligent patriotism is to-day obliged to consider the future of the nation in connection with the whole system of sovereign and independent states. The political integration of these states into an all embracing league of nations is felt to be indispensable to the general security and looked forward to with confidence. Eschatological thought is intensely occupied at present with the changes, political, industrial, economic, social, and religious, that are likely to follow the world war. It attaches itself again to the destiny of the earth. Barring an accident, which is always within the bounds of possibility, our planet may be expected to run its course through long ages before it passes away or ceases to be inhabitable. A new glacial period, however, probably lies in a much more immediate future. Living in an interval between two such periods particularly favorable to the development of civilization, we are threatened by the exhaustion of some supplies on which that civilization particularly seems to depend. A careful husbanding of all our natural resources, an equitable distribution to men and nations according to their needs, and a just regard for the necessities of coming generations will be called for. In the efforts to realize the eschatological ideals a moral energy may be released which shall constitute the most precious spiritual harvest of the life of man on earth.

NATHANIEL SCHMIDT,
Professor of Semitic Languages and Literature, Cornell University.

ESCHEAT, ĕs-chēt' (old French eschet, spoil, rent, that which falls to a person), the reversion of property to the sovereign. The law considers that all property must have an owner; so if a person die intestate and without issue, the property, in England, escheats to the king, and in America to the state as sovereign. In some jurisdictions, before the sovereign receives title there is a certain kind of proceeding to determine whether or not there are any heirs, while in other jurisdictions the sovereign gets the title on the death of the owner; but even in these cases the sovereign's title is defeasible until there are proceedings to determine that the deceased had no heirs. When the sovereign obtains title by escheat it acquires all the rights and privileges of the last owner, and the statutory requirements must be strictly followed, both as to the disposal of the property and as to the use of the fund derived from the sale, in case a sale is necessary. In the United States the powers and duties of the sovereign in relation to escheated property are controlled by statute in the different States. Formerly an escheat might arise through the failure of heirs or forfeiture for treason. In England the word escheat also signifies the district within which the king or lord is entitled to escheats; a writ to recover escheats; the escheated possessions of the state or lord; hence, generally, a return or reversion; and, more generally, that which falls to a person.

ESCHENBACH, ĕsh'ĕn-bäн, **Wolfram von,** German mediæval poet: b. Eschenbach, near Ansbach, Bavaria, about 1165; d. about 1220. He was one of the most prominent minstrels at the court of Hermann, Landgraf of Thuringia, where he spent part of his time, the other part being spent in Wildenberg (Wehlenberg). He was a contemporary of another very famous poet with whom he came into frequent contact at court. This was Walther von der Vogelweide (q.v.). According to his own statement he could neither read nor write but he had a very tenacious memory which enabled him to treasure up all the learning that came his way so that he soon became a marked character and finally was invited to the court and ultimately acquired all the education of the layman of his day. His work shows chivalry at its best. His epics rank among the greatest German imaginative works. Besides several love songs he wrote 'Parzival'; 'Wilhelm von Orange,' and 'Titurel, or the Guardian of the Graal.' See PARSIFAL.

ESCHENBURG, ĕsh'ĕn-boorg, **Johann Joachim,** German scholar: b. Hamburg, 1743; d. 1820. He received his education at the universities of Leipzig and Göttingen and in 1767 began his lifelong connection with the Collegium Carolinum in Brunswick, of which he was director after 1814. He published the first complete German translation of Shakespeare, 'Shakespeares theatralische Werke' (13 vols., 1782) and many other translations from English authors. He published also 'Handbuch der klassischen Litteratur' (1783); 'Entwurf einer Theorie und Litteratur der schönen Wissenschaften' (1783); 'Biespielsammlung zur Theorie und Litteratur der schönen Wissenschaften' (8 vols., 1788–95); 'Lehrbuch der Wissenschaftskunde' (1792); 'Denkmäler altdeutscher Dichtkunst' (1799), and the hymns 'Ich will dich noch im Tod erheben,' and 'Dir trau'ich, Gott, und wanke nicht.'

ESCHENMAYER, ĕsh'ĕn-mī-ĕr, **Adam Karl August von,** German philosopher: b. Neuenburg, July 1768; d. 1852. He was educated at the Caroline Academy, Stuttgart, and the University of Tübingen. He was for many years engaged in the practice of medicine at Sulz and Kirchheim. In 1811 he was appointed extraordinary professor of medicine and philosophy at Tübingen and in 1818 became ordinary professor of practical philosophy. He resigned in 1836, removed to Kirchheim and thereafter devoted himself to philosophical study. He was inclined to a belief in mysticism as an aid to philosophy and took a deep interest in animal magnetism. In his later years his beliefs degenerated into a lower form of supernaturalism. He wrote 'Die Philosophie in ihrem Übergange zur Nichtphilosophie' (1803); 'Versuch die scheinbare Magie des thierischen Magnetismus aus physiologischen und physischen Gesetzen zu Erklären' (1816); 'System der Moralphilosophie' (1818); 'Psychologie in drei Theilen, als empirische, reine, angewandte' (2d ed., 1822); 'Religionsphilosophie' (3 vols., 1818–24); 'Die Hegelsche Religionsphilosophie verglichen mit dem christlichen Princip' (1834); 'Der Ischariotismus unserer Tage' (1835); 'Konflikt zwischen Himmel und Hölle, an dem Dämon eines bessessenen Mädchens beobachtet' (1837); 'Grundriss der Naturphilosophie' (1832); 'Grundzüge der christlichen Philosophie' (1840); 'Betrachtungen über physischen Weltbau' (1852).

ESCHER, esh'ĕr, **Johann Heinrich Alfred,** Swiss statesman: b. Zürich 1819 d. there, 6 Dec. 1882. He studied law at Zürich, Bonn, Paris and Berlin and in 1844 became a member of the Cantonal Council of Zürich. In the following year he issued a summons for a general convention to be held at Unterstrass and having in view the expulsion of the Jesuits. As member of the Council of Education to which he was elected in 1846 he did much to place the educational system of the canton of Zürich on a truly modern basis. In 1847 Escher was made president of the Grand Council and in 1848 was elected to the Federal Diet. In 1849 he became president of the National Council and in 1856–57 and 1861–62 he served as vice-president and was later president of the Confederation for several terms. A bronze statue to his memory was erected by the citizens of Zürich. Consult Scherr, 'Alfred Escher' (1883).

ESCHER VON DER LINTH, Arnold, Swiss geologist: b. Zürich, 8 June 1807; d. 12 July 1872. He was the son of Hans Conrad Escher (q.v.). He was appointed professor of geology at the Zürich Polytechnic School in 1856. He made extensive researches which have caused him to be considered one of the foremost of the founders of Swiss geology. In 1852–53, in collaboration with Studer, he published the first detailed geological map of Switzerland. He wrote 'Geologische Bemerkungen uber das nördliche Vorarlberg und einige angrenzenden Gegenden' (1853).

ESCHER VON DER LINTH, Hans Conrad, Swiss statesman: b. Zurich, 1767; d. 1823. He studied at the University of Göttingen in 1786–88 and from 1798 to 1802 was a member of the Legislative Assembly of Switzerland and at about the same period was editor of the *Schweizerischer Republikaner.* He retired from politics in 1802. In 1807–22 he served as president of the board of inspection of the canalization of the upper Limmat, known as the Linth. The improvement reclaimed hundreds of acres of fertile arable lands. Escher's popularity was at its height and his family received the surname of Von der Linth in 1823 as a recompense and recognition of his services to the republic. Consult Holtinger, 'Life of H. K. Escher von der Linth' (Zürich 1852).

ESCHERICH, ĕsh'er-iн, **Karl Leopold,** German entomologist: b. Schwandorf, 1871. He received his education at the universities of Munich, Würzburg, Leipzig and Heidelberg. Beginning in 1892 he made several tours including Tunis (1892), Asia Minor (1895), Algeria (1898), Abyssinia (1906), Ceylon (1910), and North America (1911). At Strassburg in 1901–06 he served as privatdozent and in the latter year was appointed professor at Tharandt Forestry Academy. He has published 'System der Lepismatiden' (1905); 'Der Ameise' (1906); 'Ferienreise nach Erythrea' (1908); 'Die Termiten oder weissen Ameisen' (1909); 'Termitenleben auf Ceylon' (1910); 'Die angewandte Entomologie in den Vereinigten Staaten' (1913); 'Die Forstinsekten Mitteleuropas' (Vol. I, 1913).

ESCHRICHT, ĕsh'riнt, **Daniel Frederik,** Danish zoologist: b. Copenhagen, 1798; d. 1863. He studied medicine in his native city, practised his profession for about three years, after which he studied physiology and comparative anatomy in France and Germany. After 1836 he held a chair at the University of Copenhagen. He published 'Haandbog i Physiologie' (1851) and 'Folkelige Foredrag' (1859). He left a valuable collection which now rests in the Zoological Museum.

ESCHSCHOLTZ, ĕsh'ōlts, **Johann Friedrich,** Russian naturalist: b. Dorpat, government of Riga, 12 Nov. 1793; d. there, 10 May 1831. He studied medicine in his native city, and in 1819 became professor of anatomy and director of the zoological museum of the University of Dorpat. In 1815–18 and 1823–26 he accompanied Otto von Kotzebue in the latter's exploring tours around the world, collected a large number of natural history specimens and made valuable scientific studies on the lower organisms of deep-sea life. The results of his studies were published in Kotzebue's account of the expedition (1821), and he presented his collections to the University of Dorpat 1826. His catalogue of over 2,000 animals was published in Kotzebue's 'Neue Reise um die Welt' (Vol. II, 1830). Adelbert von Chamisso, another member of these expeditions, named a botanical species *Eschscholtzia* in his honor, and Eschscholtz Bay, on the Alaskan coast, is also named after him. He published 'Ideen zur Aneinanderreihung der rückgrätigen Tiere' (1819); 'System der Akalephen' (1829); 'Zoologischer Atlas' (5 parts, 1829–33), containing plates and distributions of new species of animals.

ESCHSCHOLTZIA, ĕ-shōlt'sĭ-a, or **CALIFORNIA POPPY,** a genus of annual and perennial herbs of the natural order *Papaveraceæ,* natives of the Pacific slope of the United States. The species, of which there are about a dozen, are distinguished by much dissected alternate leaves, yellow or white, showy flowers (the sepals united to form a deciduous hood), and a long capsular fruit resembling a silique. The best-known species is probably *E. californica,* a perennial which is widely cultivated as an annual in flower gardens, and is a beautiful orange-colored flower, one of the most showy in the whole floral kingdom. It is gregarious in habit, and in California it covers large areas with an almost unbroken orange-yellow bloom of striking beauty when seen on the gray-green slope of a treeless hillside. It is easily raised, especially if the seed be sown soon after gathering in the fall, and the young plants protected in cold climates.

ESCHWEGE, ĕsh'vā-gĕ, Germany, a town of the Prussian province of Hesse-Nassau, on the Werra, 26 miles east-southeast of Cassel. It is a walled and well-built town, with a castle, dating back to 1386, and long the residence of the landgraves of Hessen-Rotenberg, but now used as a public building. It is an important industrial centre and has manufactures of woolen and linen cloth, several large tanneries, glue-works, oil and other mills, and a trade in meal, fruit, lard, ham and sausages. Pop. about 13,000.

ESCHWEILER, esh'vī-lĕr, Germany, town in the Prussian Rhine province, nine miles east-northeast of Aix-la-Chapelle, at the confluence of the Inde and Dente. It has manufactures of articles in iron and tin-plate, zinc and copper, machinery, boilers, railway plant, needles, wire, rolling-mills, smelting furnaces, belting and other leather goods, beer and birches. Calamine and lead, as well as productive coal-mines, are worked in the vicinity. Pop. 25,000.

ESCHYNITE. See ÆSCHYNITE.

ESCOBAR Y MENDOZA, Antonio, ăn-tō'nē-ō ĕs-kō-băr' ē mĕn-dō'thä, Spanish casuist: b. Valladolid, 1589; d. 4 July 1669. Entering the order of Jesuits in 1604, he became celebrated as a preacher and writer. At his death he left more than 40 volumes in folio, mostly in theology and morality, the principal being the casuistical 'Liber Theologiæ Moralis' (1646), which has several times been printed, and 'Summula Casuum Moralis' (1626). He seems to have been a man of exemplary moral character, but his writings unfortunately drew to themselves the ridicule of La Fontaine, Molière, Boileau, Pascal and other witty French writers, who represented him as a person of extreme moral laxity, of which the French word «escobarderie» became a strong and appealing symbol. They represented him as advancing the doctrine that the moral value of an action is to be found in the intention lying behind it, and that purity of purpose, may justify others contrary to the commonly accepted moral code. His writings were censured by the papal authority.

ESCOBEDO, Mariano, mä-rē-ä'nō ĕs-kō-bä-dō, Mexican soldier, popularly known as «orejones,» big lugs, on account of his enormous ears: b. Dos Arroyos, New Leon, 12 Jan. 1827; d. Tacubaya, 22 May 1902. When the war between Mexico and the United States broke out he was a muleteer in charge of a string of pack mules belonging to his father. He converted his muleteers into a band of guerrillas, attacked small detachments of the American troops wherever he found them and took part in the battles of Palo Alto and Resaca. Juárez commissioned him colonel in 1859. In 1861, upon the establishment of Juárez' government in the City of Mexico, Escobedo was made a brigadier-general and sent in pursuit of the Clerical forces under Márquez and Mejia, but was surprised, taken prisoner after an heroic defense, sentenced to be shot, but escaped and returned to Juárez. He took a prominent part in the war against the French which followed the intervention of Napoleon III in Mexican affairs. He repulsed them at Puebla, 5 May 1862, took part in the long siege of that place and when it was captured by the French, 17 May 1863, was taken prisoner, but succeeded in escaping. When Maximilian's empire was established, Escobedo took up his headquarters in Texas, secretly purchased arms and ammunition in New Orleans, 1865, organized and equipped a force of Mexican refugees, American negroes and ex-Confederate soldiers, led them into Mexico, captured the Imperial garrison at Monterey, November 1865, and swept everything before him. Juárez appointed him commander-in-chief of the Army of the North; he continued his victorious course until all the chief cities were in the hands of the republicans and finally besieged and defeated the Emperor at Queretaro, 15 May 1866. It is said that Maximilian offered his word of honor to Escobedo, on surrendering his sword, to leave the country at once if conducted to the nearest port; but Escobedo refused, probably on orders from Juárez, who ordered a court-martial, and the Emperor was condemned and executed. In 1874 Escobedo quelled an uprising against the government of Juárez, but was unsuccessful in putting down the revolution started by General Porfirio Díaz. He fled to Texas, issued a manifesto against Díaz, of whom he became a close friend and strong supporter later, and, later during his administration, president of the supreme military court of justice 1882–83. He also held other important offices of trust under Díaz.

ESCOIQUIZ, es'kō-ē-keth', **Juan**, Spanish ecclesiastic and politician: b. Navarre, 1762; d. Ronda, 27 Nov. 1820. He began life as a page at court in the reign of Charles III. He took holy orders and held a prebend at Saragossa. Through Godoy he advanced himself to the position of tutor to Ferdinand, the heir-apparent. His efforts in literature at this time consisted of a translation of Young's 'Night Thoughts' (1797) and a worthless epic on the conquest of Mexico (1798). He gained an ascendancy over his pupil, afterward Ferdinand VII, and he led the opposition to Godoy's plans for a French alliance. He was banished from court but maintained correspondence with Ferdinand. In 1807 he was implicated in the conspiracy of the Escorial, was imprisoned but later released with the other conspirators. After 1808 he became the trusted adviser of Ferdinand and prevailed on the latter to meet Napoleon at Bayonne, of which meeting he gives a vivid account in 'Idea Sencilla de las razones que motivaron el viage del Rey Fernando VII à Bayona' (1814). When the Spanish royal family was imprisoned by Napoleon, Escoiquiz accompanied Ferdinand. At the Restoration he was minister for a short period, but Ferdinand had tired of him, he soon fell into disgrace, was imprisoned in Murcia, recalled for a time and later exiled to Ronda.

ESCORIAL, or **ESCURIAL**, a royal palace of Spain, distant from Madrid about 24 miles (by rail 32 miles) in a northwesterly direction and situated on the acclivity of the Sierra de Guadarrama, the range of mountains which divide New from Old Castile. The Escorial combines a monastery, a church and a mausoleum with a royal palace. Everything about the Escorial — situation, plan and purposes — bears the stamp of the sombre temperament and unpractical mind of its originator, Philip II. Not the least remarkable of its peculiarities is its site. Away from cities, amid the seclusion of mountain scenery, it stands at a height of 2,700 feet above the level of the sea. It was built in commemoration of the battle of Saint Quentin, which was fought on Saint Lawrence's Day (10 August) 1557 and to whom it is dedicated. The building is a rectangular parallelogram measuring 744 feet in length by 580 in breadth. The interior is divided into 13 courts, the plan supposedly in outline of the gridiron on which Saint Lawrence was broiled, while a projection 460 feet in length contains the chapel and the royal palace. The building, which is in the Greco-Roman style, was begun in 1563 by Juan Bautista de Toledo, a Toledan architect, and finished in 1584 by his pupil, Juan de Herrera. It is irregular in its proportions and thus loses much of the effect which, from its great magnitude, it ought to have. The innumerable windows (said to be 11,000 in honor of the Cologne virgins) give it the aspect of a large mill or barrack. The doors are also numerous. The material of the building is gray granite found in the neighborhood, which preserves its fresh and clean appearance. The church, which dominates the entire design, fronts on a central court, which was formerly opened only to admit the king on his first visit and a second time to receive his dead body for burial. The characteristic is majestic simplicity. It is 340 feet long by 234 wide; the central dome, 70 feet in diameter, is 320 feet high externally. Under the high altar is the Pantheon or burying-place of the kings of Spain. Its interior is lined with dark marble beautifully veined. One of the most interesting parts of the building is the cell of Philip II, from which the king in his last illness was enabled to witness the celebration of mass. The monasterial part of the building contains a valuable library, especially rich in Greek and Arabic manuscripts, and there was formerly a superb collection of pictures scattered through various parts of the building. During the French occupation the books, 30,000 in number, were removed to Madrid, but were sent back by Ferdinand minus 10,000 volumes. The Escorial was partly burned in 1671, when many MSS. were destroyed. It was pillaged by the French in 1808 (when the books were removed) and in 1813. It was restored by Ferdinand VII, but the monks, with their revenues which supported it, have long since disappeared, and the building, which from its situation requires to be kept in repair at considerable expense, has fallen into some decay, though repairs are executed from time to time. On 2 Oct. 1872 it was struck by lightning and was in consequence seriously injured by fire. The monastery portion of it is now a seminary in which youths receive a secular education. Consult Calvert, A. F., 'The Escorial; a Historical and Descriptive Account' (New York 1907); Hay, John, 'Castilian Days' (New York 1875).

ESCORT (French escorte), a guard, a body of armed men which attends an officer or baggage, provisions or munitions, conveyed by land from place to place to protect them. This word is sometimes used for naval protectors; but the proper word in this case is convoy. In the United States escorts are of two kinds, funeral escorts and escorts of honor. The troops assigned for escort duty may consist of infantry, cavalry or artillery or all of them. The army regulations fix the character and size of escorts according to the military prominence or title of the individual. According to the United States Army Regulations of 1913, the funeral escort of a general of the army or the Secretary of War shall consist of a regiment of infantry, a squadron of cavalry and one battalion of field artillery; that of a lieutenant-general or the assistant Secretary of War, a regiment of infantry, a squadron of cavalry and a battery of field artillery; that of a major-general, a regiment of infantry, two troops of cavalry and a battery of field artillery; that of a brigadier-general, a regiment of infantry, a troop of cavalry and a platoon of field artillery; that of a colonel, a regiment; a lieutenant-colonel or major, a battalion or squadron; a captain, one company; a subaltern, a platoon.

ESCOSURA, ĕs-kō-soo'rä, **Patricio de la**, Spanish novelist and poet: b. Madrid, 5 Nov. 1807; d. there, 22 Jan. 1878. After various political and military ups and downs and being twice exiled, in 1855 he was sent as a special envoy to the Portuguese court, became Under-Secretary of State, Minister of the Interior and afterward Ambassador to Germany, 1872. He wrote the historical novels 'The Count de Candespina' (1832); 'Neither King nor Pawn' (1835); and 'The Patriarch of the Valley'; the epics 'The Bust in Black Cloak' and 'Hernan Cortés at Cholula'; several dramas, the most successful of which was 'Hernan Cortes' Debaucheries'; and several historical works, among them a 'Constitutional History of England' (1859).

ESCROW, in law, a written document sealed and delivered to the keeping of a third party to be held by him pending the fulfilment of certain conditions. Such an instrument is not a perfect deed and usually does not take effect until delivered by the custodian. Exceptions to the general rule are made when justice requires, or when the rights of outside parties are in need of protection. See DEED; DELIVERY.

ESCUAGE, ĕs'kū-āj. See SCUTAGE.

ESCUERZO, a Spanish term for toad, specifically applied in the valley of La Plata to a large local toad-like frog (*Ceratophrys ornata*) noted for its varied colors, laid on like those of a Persian carpet. This patchwork thoroughly conceals the toads as they lie half-buried in the ground. «If there is not enough green vegetation,» says Gadow, «they throw, with their feet, little lumps of earth upon their backs, the skin of which becomes at the same time more wrinkled and assumes duller tones. There the creature lies, perfectly concealed, betrayed only by the metallic, glittering eyes, waiting for some unfortunate creature to pass into the trap represented by the enormous mouth, which opens and shuts with lightning rapidity and an audible snap.» These frogs are of the Cystignathine group (see FROG) and closely allied to the monstrous «horned toads» of Brazil. They live chiefly on frogs and are sometimes cannibals.

ESCUINTLA, ĕs-kēn'tlä, Guatemala, one of the southern departments of that republic; chief products, sugar cane, cacao and coffee. Its chief town, also called Escuintla, situated at an altitude of 1,269 feet above the level of the sea, on the line of the Central Railroad 30 miles southwest of Guatemala, has good hotels and apartment houses, and, owing to its baths, is a favorite winter resort. Pop. of Escuintla city 18,000.

ESCULAPIANS, a Catholic order, founded at Rome in 1614 and devoted to the education of poor and neglected children. At present it numbers about 2,000 members and has charge of 150 schools. See ORDERS, RELIGIOUS.

ESCULENT SWALLOW. See SALANGANE.

ESCULIN, ESCULINE. See ÆSCULIN.

ESCURIAL. See ESCORIAL.

ESCUTCHEON, ĕs-kŭch'ŏn, in heraldry, is derived from the Old French *escusson*, French *écusson*, and that from the Latin *scutum*, a shield. It signifies the shield whereon coats of arms are represented. See HERALDRY.

ESDRAELON, ĕs-drä-ē'lŏn or ĕs-drā-ę-lŏn (Merdj-Ibn-Amer), the famous and beautiful plain in Palestine, situated between the mountains forming the western watershed of the Jordan and the Mediterranean Sea. In the Old Testament it is called Jezreel, valley of Megiddo, the Great Plain; in the New Testament, Armageddon. It is triangular in form, 36 miles in length, with an average width of 15 miles. On its boundary are: on the northeast Mount Tabor, the southeast Mount Gilboa, and on the southwest Mount Carmel. The principal streams are Nahr-el-Djalood, which flows into the Jordan, and the Kishon (Nahr-el-Moukataa) which flows into the Bay of Acre just north of Mount Carmel. Other streams traverse the plain, but are chiefly branches of the two streams mentioned. The soil is fertile and when cultivated with care yields good crops. When Esdraelon was traversed by caravans crossing Palestine from the rich countries east and west, grains, vegetables and fruits were raised in abundance. Agriculture is again receiving attention. Some of the noted places on this plain are Djeneen (probably the old town of Engannin), at the entrance to the plain and 984 feet above the sea. Tradition says this is where the 10 lepers were cured (Luke xvii); Zerlin, known by the residents as Zeraeen, called by the Crusaders Petit-Guérin, is now a large village. Near it is the fountain, Ain-Maeetch, supposed to be where Saul camped when at war with the Philistines (1 Sam. xxxi). Ain-Djalood, said to be the place where Gideon selected the 300 men who fought and defeated the Midianites (Judges vii). On the south side of the Kishon are the villages of Afooleh, El-Fooleh and Zerin. Afooleh is the old town of Aphec, one of the places where the Assyrians and Egyptians met in battle. At El-Fooleh was once a fortress built by the Templars, but destroyed by Saladin in 1187. Here in 1799 a battle between French troops under Napoleon, 4,000 in number, and the Mohammedans, 35,000 in number, left the French the victory. Ruins of the fort exist. For the ancient history of Esdraelon consult the Old Testament; many of the important places mentioned in the New Testament are in a good state of preservation. Nazareth, Nain and all the surrounding section west of Mount Tabor are usually included in the plain, and must be so considered if Mount Tabor is accepted as on the northeast boundary. Consult Costello, 'The Gospel Story'; Thomas, 'Two Years in Palestine'; Sayce, 'Patriarchal Palestine'; Smith, 'Historical Geography of the Holy Land. See ARMAGEDDON.

ESDRAS, Books of, two apocryphal books, which, in the Vulgate and other editions, are incorporated with the canonical books of Scripture. In the Vulgate the canonical books of Ezra and Nehemiah are called the first and second, and the apocryphal books the third and fourth books of Esdras. The Geneva Bible (1560) first adopted the present nomenclature, calling the two apocryphal books first and second Esdras. The subject of the first book of Esdras is the same as that of Ezra and Nehemiah, and in general it appears to be copied from the canonical Scriptures. The second book of Esdras is supposed to have been either of much later date, or to have been interpolated by Christian writers. This book takes its name from the supposed writer, a priest and doctor of the law, called Ezra by the Hebrews.

ESERINE, or **PHYSOSTIGMIN,** a drug obtained from Calabar-bean, the active principle of this plant, used as a remedy in cases of tetanus (lockjaw). A solution of eserine dropped into the eye causes contraction of the pupil, and hence its use in some eye ailments, as, for instance, glaucoma.

ESHER, Reginald Baliol Brett, 2D VISCOUNT, English writer: b. London, 30 June 1852. He was educated at Eton and Cambridge, and was private secretary to the Marquis of Hartington 1878–85. He was member of Parliament for Falmouth 1880–85; from 1895 to 1902 was secretary to H. M. Office of Works; and was chairman of the Territorial Forces Association, county of London, 1909–13. He succeeded his father as viscount in 1899. He has written 'Footprints of Statesmen' (1892); 'The Correspondence of Queen Victoria' (1907); 'To-day and To-morrow' (1910); 'The Girlhood of Queen Victoria' (1912); 'Influence of King Edward: Essays' (1914).

ESHER, William Baliol Brett, 1ST VISCOUNT, English jurist: b. Chelsea, 13 Aug. 1817; d. London, 24 May 1899. He received his education at Westminster and at Caius College, Cambridge, and was called to the bar in 1840. He entered Parliament in 1866 as a Conservative and two years later was made solicitor-general and within a few months was appointed justice of the Court of Common Pleas. He was made lord justice in 1876 and in 1883 succeeded Jessel as master of the rolls. In 1885 he entered the House of Lords as Baron Esher. In 1897 he retired from the bench and a viscounty was bestowed on him. Several of his decisions were severely criticized and while an able lawyer he was on the whole reactionary and his judgments belong to an earlier and more conservative age.

ESHER, England, village in Surrey, 15 miles southwest of London. Claremont Park, where the Princess Charlotte resided and died, and the ruins of Esher Palace, built in the 15th century, are in the neighborhood. Pop. of parish 2,609.

ESK (Celtic for water), the name of two small rivers in England, one in Cumberland and one in Yorkshire; and of several in Scotland, the chief being the Esk in Dumfriesshire; the North Esk and South Esk in Forfarshire; and the North Esk and South Esk in Edinburghshire.

ESKER, a narrow winding ridge of stratified glacio-fluvial sand and gravel, frequently extending across the country for miles with little regard for hills and valleys. Eskers are believed to have been formed by deposition from subglacial streams in tunnels under the ice. They are also known as osars or sometimes as Serpentine kames.

ESKI-SAGRA, ĕs'kĭ-sä'grä, or **EZKI ZAGHRA,** Bulgaria, a town in eastern Rumelia, on the south slope of the Balkans, about 100 miles northwest of Adrianople. It is near the chief passes of the Balkan Mountains, and its advantageous location is favorable to its trade. The mineral springs and extensive rose gardens nearby are sources of wealth for the town. Some of the manufactures are carpets, coarse linen, leather and rose oil. It was one of the South Balkan strongholds of the Turks which repelled the Russians in 1877. Pop. 22,003.

ESKI-SHEHR, ĕs'kĭ-shĕhr' (ancient DORYLÆUM), Turkey, town 90 miles southeast of the sea of Marmora. It has warm mineral springs, and manufactures of meerschaum pipes from the deposits of meerschaum in the neighborhood. The surrounding region is noted for the quantity and quality of the meerschaum deposit. About two-thirds of the people are Mohammedans and the remainder are Christians. Pop. 20,000.

ESKI-ZAGRA. See STARA-ZAGORA.

ESKILSTUNA, ĕsk'ĭl-stoo-nä, Sweden, city 57 miles west of Stockholm, on the river of Eskilstuna, connecting Lake Maelar with Lake Hjelmar. It has daily communication with Stockholm, both by steamer and rail. On an island in the river is a large gun factory, and its manufactures of iron and steel products are so great that it is called the «Sheffield of Sweden.» The place takes its name from Saint Eskill, an English missionary of the 11th century, who, it is said, suffered martyrdom here. Pop. 28,485.

ESKIMO DOG, sledge dog, the draught animal of the Arctic regions. It is a wolfish-looking dog, largely or sometimes wholly derived from the wolf, tinged with yellow or with a grayish color, having an outer coat of long hair, and an undercoat of soft wool. Its short pricked ears and bushy tail add to its wolf-like appearance. Its cry is not a bark, but a long melancholy wail. This dog is trained to hunt the polar bear and to drag the Eskimo's burdens over the rough ice, when harnessed in trains to sledges, and is highly prized in the frozen North.

ESKIMO, ESKIMOS (Abnaki, Eskimantsic: Ojibway, Askkimey, eaters of raw flesh), or **ESQUIMAUX,** es'kĭ-mō, the name of the inhabitants of the northern coast of the American continent down to lat. 60° N. on the west, and 55° on the east, and of the Arctic islands, Greenland, and about 400 miles of the nearest Asiatic coast. They prefer the vicinity of the seashore, from which they rarely withdraw more than from 20 to 80 miles. Their number scarcely amounts to 40,000. Nevertheless they are scattered as the sole native occupants of regions stretching 3,200 miles in a straight line east and west, to travel between the extreme points of which would necessitate a journey of no less than 5,000 miles. This distance, taken in connection with their homogeneous nature and manners, makes their small bands the most thinly scattered people of the globe. Their extraordinary persistency in maintaining their language and habits must be due to the difficulties they have had to face in procuring subsistence. They call themselves *Innuit Yuit, You-Kouk* (the people).

Race.— They used to be classed among nations of the Mongolian stock; but now they are considered as akin to the American Indians. Their height is from five feet two inches to five feet six inches. They appear comparatively taller sitting than standing. Their hands and feet are small, their faces oval, but rather broad in the lower part; their skin is only slightly brown; they have coarse black hair and very little beard. The skull is high.

Habits.— The Eskimos get their subsistence mostly from hunting by sea, using for this purpose skin boats where the sea is open, and dog sledges on the ice. From the skin, blubber, and flesh of the seal and the cetaceous animals, they procure clothes, fuel, light and food. Their most interesting as well as important invention for hunting is the well-known small skin boat for one man, called the kayak. It is formed of a framework covered with skin, and, together with his waterproof jacket, it completely protects the man against the waves, so that he is able to rise unhurt by means of his paddle, even should he capsize. In winter the Eskimos are stationary. But, during the summer, when sufficient open water is found, they roam about in their large skin boats. Their winter dwellings vary with regard to the materials of which they are built, as well as in their form. In the farthest west they are constructed mostly of planks, covered only with a layer of turf or sod; in Greenland the walls consist of stones and sod; in the central regions the houses are formed merely out of snow. In Alaska the interior is a square room, surrounded by the sleeping places, with the entrance on one side, while a hearth with wood as fuel occupies the middle of the floor. The number of inhabitants at an Eskimo station or village is generally under 40, but in rare cases more than 200 are found. A funnel-shaped, half-underground passage forms the entrance of the narrow dwellings.

Dress.— The dress of the Eskimos is almost the same for the women as for the men, consisting of trousers or breeches and a tunic or coat fitting close to the body, and covering also the head by a prolongation that forms the hood. For women with children to carry, this hood is widened so as to make it an excellent cradle, the amaut. Tattooing has been general among all the tribes. The ordinary materials of which clothes are made are the skins of seals, land animals and birds.

Language.— The language is characterized by the power of expressing in one word a whole sentence in which are embodied a number of ideas which in other languages require separate words. The Greenland dictionary contains 1,370 radicals and about 200 affixes. A radical may be made the foundation of thousands of derivatives, and a word can be composed which expresses with perfect distinctness what in our civilized languages might require 20 words. In Greenland and Labrador the missionaries have adopted the Roman letters for reducing the native language to writing. The printed Greenland literature, including what has been published by the Moravian Brethren, amounts, with pamphlets and the like, to what might make 70 to 80 ordinary volumes.

Sociology.— It is doubtful whether an organization like that of the Indian «families» has been discovered among the Eskimos. But a division into tribes, each with their separate territories, actually exists. The tribe again is divided into groups constituting the inhabitants of the different wintering places. Finally, in the same station, the inhabitants of the same house are closely united with regard to common housekeeping.

Religion.— The inhabitants of Danish West Greenland, numbering about 10,000, the greater part of the Labradorians, and the southern Alaskan Eskimos are christianized. As for the rest, the religion of the Eskimos is what is generally designated as Shamanism.

The Eskimos are believed by some to have come from the interior of America, and, following the river courses, to have arrived at the Arctic sea, where they have developed their abilities as an Arctic coast people. The Eskimos may be divided into the following groups: (1) The Western Eskimos, inhabiting the Alaska territory and the Asiatic side of Bering Strait; (2) the Mackenzie Eskimos, or Tchiglits, from Barter Island to Cape Bathurst; (3) the inhabitants of the central regions, including the Arctic Archipelago; (4) the Labradorians; (5) the Greenlanders; a side branch inhabiting the Aleutian Islands, speak a dialect considerably different from that of the rest of the Eskimo people.

The Christianized natives still preserve their ancient folklore. It represents at the same time their original poetry, religious ideas and history, praising the deeds of their great men in braving the dangers to which their race has been continually subjected. The 'Tales and Traditions of the Eskimo' (1875) comprises a collection of 150 tales founded on versions supplied by about 50 narrators from different parts of Greenland, and a few from Labrador. A valuable collection has since been acquired from East Greenland, some tales from Baffin Land, and a number of the simplest fragments of the same from Bering Strait. See ALASKA; POLAR RESEARCH; ETHNOLOGY; GREENLAND; LABRADOR.

raphy of the Eskimo Language› (1888); Peary, ‹My Arctic Journal› (1893); Nansen, ‹Eskimo Life› (1894); Thalbitzer, ‹A Phonetical Study of the Eskimo Language› (Copenhagen 1914); Stefansson, ‹My Life with the Eskimo› (London 1913); Morillot, ‹Mythologie et Légendes des Esquimaux de Greenland› (Actes de la Société Philologique, 1874); Richardson, ‹Polar Regions› (1861).

ESLA, a river in Spain, which rises in the Cantabrian Mountains and flows south for 150 miles through León and Zamora and empties into the Duero, 20 miles below Ciudad Zamora.

ESLAVA, Miguel Hilarion, Spanish composer: b. Burlada, 1807; d. 1878. He was appointed mæstro in Ossuña cathedral at the age of 21. Later he became a priest and in 1832 removed to Seville. Queen Isabella appointed him court mæstro at Madrid in 1844. He produced the operas ‹El solitario› (1841); ‹Las treguas de Tolemaida› (1842); ‹Pietro el crudele› (1843); the collections ‹Museo orgánico español›; ‹Lira sacro-hispaña› (1869); also 150 masses, psalms, etc.

ESLAVA, Sebastián de, Spanish soldier: b. Navarre, 1714; d. Madrid, 1789. He was one of the first graduates of the Real Academia Militar of Barcelona. He won distinction in the campaigns undertaken by Philip V, was made lieutenant-general in 1738 and two years later viceroy of New Granada, the present republic of Colombia, South America. He strengthened the fort at Cartagena and defended it successfully against the English under Sir Edward Vernon in 1741. He returned to Spain in 1748, was advanced to the grade of captain-general and in 1750 made governor of Andalusia. Four years later he was made War Minister and retired from public life on the accession of Charles III.

ESMANN, ĕs'män, **Gustav Frederik**, Danish dramatist: b. Copenhagen, 17 Aug. 1860; d. 1904. After a short period of legal study, he abandoned law for literature and his first work was a volume containing two short stories, ‹Gammel Gjaeld› (1885). Thereafter he devoted himself mainly to dramatic composition and a notable series of plays, which have been acted with great success throughout the Scandinavian countries, have come from his pen. They are: ‹I Stiftelsen› (1886); ‹Enkemænd›; ‹For Bryllupet›; ‹I Provinsen› (1890); ‹Den Kære Familie› (1892); ‹Magdalene› (1893); ‹Den Store Maskerade› (1895); ‹Vandrefalken› (1898); ‹Det Gamle Hjem› (1899); ‹Sangerinden› (1901).

ESMARCH, Johannes Friedrich August, yō-hän'nĕs frēd'riн ow'goost ĕs'marн, German military surgeon: b. Tonning, Schleswig-Holstein, 9 Jan. 1823; d. 23 Feb. 1908. He received his medical and surgical education in the universities of Kiel and Göttingen, and in 1860 was appointed director of the Kiel Hospital. In 1870 he was a member of the hospital commission of the Prussian army, physician-general and consulting surgeon of the army and introduced a system of bloodless operations and originated noteworthy improvements in ambulances and barrack hospitals. In the autumn of 1888 he made a trip to the United States. He was an authority on gunshot wounds. Among his published works are ‹Ueber Resektionen nach Schusswunden› (1851); ‹Beitrage zur praktischen Chirurgie› (1853–60); ‹Ueber chronische Gelenkentzündungen› (1867); ‹Ueber den Kampf der Humanität gegen die Schrecken des Kreges› (1869); ‹Der erste Verband auf dem Schlachtfelde› (1899, 3d ed.); ‹Verbandplatz und Feldlazarett› (1871); Ueber künstliche Blutteere bei Operationen› (1873); ‹Handbuch der kriegchirurgischen Technik› (1877); ‹Die erste Hilfe bei plötzlichen Unglücksfällen› (1901).

ESMENARD, Joseph Alphonse, French editor and poet: b. Pélissane, Bouches du Rhône, 1769; d. 1811. He came to Paris about 1797 and became coeditor of *La Quotidienne* and in the following year of *Le Mercure de France*. He was secretary to Villaret-Joyeuse, governor of Martinique under the Consulate, and in 1804 was consul in the island of Saint Thomas. In 1805 he published ‹La navigation,› a poem inspired by his early travels in America. In 1810 he was elected to the Academy. Soon afterward a caustic article on Russia in *Le Journal de l'Empire* so annoyed Napoleon that he banished Esmenard from France.

ESMERALDAN, a linguistic stock of aborigines of South America, who formerly dwelt along the Esmeraldas River in northern Ecuador. Consult Rivet (in *L'Année linguistique*, 1908–10) and Seler, ‹Geschichte Abh. zur amerikanischen Sprach-und Altertumskunde› (Vol. I, pp. 49–64, Berlin 1902).

ESMOND, Henry V., (real name, Jack), English actor and dramatic author: b. Hampton Court, 1869; d. 17 April 1922. He was educated by private tutors, went on the stage in 1885 but later abandoned it for the dramatic field. He produced ‹Rest›; ‹Bogey› and ‹The Divided Way›; ‹One Summer's Day› (1897); ‹Grierson's Way› (1899); ‹The Wilderness› (1901); ‹When We were Twenty-one› (1901); ‹The Sentimentalist›; ‹My Lady Virtue› (1902); ‹Billy's Little Love Affair› (1903); ‹The O'Grindles› (1907); ‹Under the Greenwood Tree› (1907); ‹A Young Man's Fancy› (1912). Consult Winter, W., ‹The Wallet of Time› (2 vols., New York 1913).

ESNAMBUC, Pierre Belain d', French navigator: b. Allonville, 1585; d. 1636. While commanding a vessel in the Caribbean he seized the island of Saint Christopher and so established his title as founder of the French settlements in that region. He suggested a plan for dividing the island between France and England which was approved. He brought about 500 immigrants there in 1626 and in the remaining years of his life founded colonies on Martinique and other islands of the Antillean group. He was the founder of the town and fort of Saint Pierre, which was annihilated by a volcanic eruption on 8 May 1902.

ESNEH, ĕs'nē, or **ESNE**, a town in upper Egypt, about 30 miles above Thebes on the left bank of the Nile. It is a seat of manufactures, produces blue cotton cloth and pottery and is a depot of caravans from Abyssinia and Sennaar. The town was anciently called Latopolis; and was the centre of worship of the fish latus, a species of carp. Among the ruins of this once populous city is the temple, whose portico is in good preservation, having 24 beautiful columns and a zodiac on the ceiling. Coptic remains are in the neighborhood. The Christians here suffered severely in the persecution under Diocletian (A.D. 303).

ESOCIDÆ, ē-sŏs'ĭ-dē. See LUCIIDÆ.

ESOP. See ÆSOP.

ESOPUS FORMATION. See CAUDA-GALLI GRIT.

ESOPUS WAR, a long-continued and desultory conflict between the Dutch and the Indians at a place in Ulster County, N. Y., known to the Indians as Esopus, but now called Kingston. This series of skirmishes began in 1658, when the Dutch fired upon some Indian farm hands, who were drunk and riotous. Esopus, which the Dutch called Wiltwyck, was at last destroyed by the aborigines, who carried off 40 women and children and killed 21 men. Governor Stuyvesant sent out a strong force to punish the Indians, and in May 1664 a treaty of friendship was ratified.

ESOTERIC, ĕs-ō-tĕr'ĭk (Gr. ἐσωτερικὸς «inner»), a term used in opposition to exoteric. In reference to the teaching of Pythagoras, Aristotle, and other ancient philosophers, it refers to those doctrines which they expounded to their select disciples, in contradistinction to those which they published to all the world (exoteric). The distinction does not necessarily imply that the esoteric doctrines were kept secret as a mystery, but only that they were of a higher and more difficult order. (See ARISTOTLE; PYTHAGORAS). Consult Christ-Schmid, ‹Geschichte der Grieschischen Litteratur› (Munich 1908).

ESPALIER, ĕs-păl'yėr, in gardening, a sort of trellis-work on which the branches of fruit-trees or bushes are extended horizontally, with the object of securing for the plant a freer circulation of air as well as a full exposure to the sun. Trees thus trained are not subjected to such marked nor so rapid variations of temperature as wall-trees. The term is most commonly used in France, where it is applied to a row of trees planted along a wall. See TRELLIS.

ESPARSETTE. See SAINFOIN.

ESPARTERO, Baldomero, băl'dō-mä'rō ĕs-păr-tā'rō, DUKE OF VITORIA, Spanish statesman: b. Granatula, 27 Feb. 1792; d. Logrono, 9 Jan. 1879. The son of a wheelwright, he was educated for the priesthood, but joined the army as a volunteer in 1808 and continued with it fighting against Napoleon until 1814. Shortly afterward he went to South America where he served in the army of Spain against the revolting colonists. He returned in 1824 and took a leading part in the conflict with the Carlists and was one of the most prominent men in Spain during several decades of the 19th century. He was lieutenant-general and commander-in-chief on two separate occasions. In this capacity he twice held Madrid against the Carlists (in 1836 and 1837); and by the Agreement of Vergara (1839) entered into with Maroto, he forced Don Carlos to withdraw from Spain. In reward for these services to the Crown he was granted the titles of Duke of Vitoria, Duke of Morelia and grandee of Spain. In 1841, on the resignation of the regency by the Queen Mother, Maria Christina, he became regent. Two years later he was forced into exile, which he spent in England. He returned to Spain in 1848 and became again head of the government in 1854–56. In 1868 his name was put forward in the Cortes as a candidate for the throne, but the proposal was unsuccessful and the closing years of his life were spent in retirement.

ESPARTO (Gr. σπαρτος; Lat. *spartum*), a grass, the *Stipa tenacissima*, growing in Spain and Africa, known to the ancients and applied by them to the manufacture of cordage, matting, etc., and still more extensively used at the present day. Numerous species of *Stipa* are found in North America, chiefly in the western part. Esparto grows in tufts and bunches, like rushes, to a height of from two to four feet, and has a long flat blade, which becomes cylindrical when the ripened plant begins to dry. It is pulled up by the roots, dried in the sun and packed in bundles for exportation. Besides the various uses already indicated, esparto has for some time been applied to the manufacture of paper. Formerly the supply of esparto was almost wholly obtained from Spain, but a closely allied fibre called alfa (*Stipa arenaria*) is now obtained in still larger quantity from Algeria, while a third fibre, dis (*Festuca patula*), is imported for the same purpose from Tripoli and Tunis. See FEATHER BUNCH-GRASS; FIBRE.

ESPATOLINO. See SAB OR ESPATOLINO.

ESPERANTO LANGUAGE. «Esperanto,» successor to «Volapuk» in the effort to establish an international language, has made considerable progress. The latest reports show that a substantial and lasting interest in this linguistic enterprise now exists. In 1887 Dr. Zamenhof, a Russian physician, issued his first pamphlet concerning a suggested new international language, to be called «Esperanto.» Only small progress was made during the first 10 years of the movement. The idea first took root in the originator's native country. Russian educators and other men of culture looked upon the innovation with favor. After the lapse of a decade, a start was made to introduce the Zamenhof idea among the Norwegians and Swedes. They, too, showed a friendly attitude. Then France manifested great interest, and almost immediately became prominent as a stronghold of Esperantism. From France the movement extended to Germany, thence to Austria, Switzerland, Italy and England. In the latter country 30 societies of Esperantists were organized within a year of the system's introduction. During the past years, active missionary work has been undertaken in the United States looking toward the promulgation of the Zamenhof plan for use in commercial, educational and other fields. There is little doubt as to the success of the outcome, indorsed as it is by some of the greatest philologists in Germany, Austria, England, France, Russia and the United States. Advocates of an international language have in the past included numerous philosophers and scientists, including Roger Bacon, Descartes, Pascal, Leibnitz, Locke, Condillac, Voltaire, Diderot, and, more recently, Tolstoi, who unqualifiedly supported the Esperanto movement and learned its grammar rules in an hour. Only of late years have the linguistic theories of these famous thinkers been molded into anything like practical shape.

Occasions Calling for the Use of an International Language.— One of the principal reasons for renewal of interest in the direction of one universal language is the necessity for producing a vehicle of common expression among delegates representing various countries at congresses and on similar occasions. It has been found difficult for individuals, acting for their respective nations, to keep in touch with the proceedings from day to day. The extended use of Esperanto and the widespread appreciation manifested in its development indicates that the method of Dr. Zamenhof offers a feasible solution of what has, hitherto, been an unsolved problem. In addition to the advantages of having a common language for cosmopolitan assemblages, the transaction of voluminous mercantile affairs between nations and merchants of various nations, requires some such system to facilitate the making of purchases and adjustment of mercantile accounts. For educational purposes, as in other ways, the availability of a means whereby educators can compare systems and processes without encountering the difficulties connected with proper and complete translation is very evident.

Present Uses of the Esperanto Language. — From a recently published review it is learned that among the books in the Esperanto language, are translations from every known national tongue in common use, and many original novels. The number of periodicals, including national propaganda journals, scientific and official organs of various international societies, such as the Good Templars, the Free Masons, the Roman Catholics, Peace Associations, etc., printed in the international language, before the outbreak of the European War exceeded 200. Since August 1914 many of the magazines in the smaller countries — notably, Belgium, Poland, Bulgaria, Roumania, etc.— have been forced temporarily to suspend publication, although the official organs are still appearing regularly in England, France, Russia, Germany, Holland, Norway, Sweden, Italy, Spain, United States and several of the South American countries. On the continent of Europe and in the United States representative daily and weekly newspapers regularly publish articles in Esperanto, many courses of study have been furnished by the press and editorial endorsements are most frequent. Esperantist clubs and societies are operating in practically all of the European cities and have large membership. Among the most important are those of Paris, with 3,000 members, Marseilles, Lyons, Bordeaux, Havre, Lille, London, Moscow, Berlin and Dresden. The Esperanto Association of North America reports affiliated clubs in nearly all of the large cities and in many of the smaller ones in both the United States and Canada.

Several French, English and American publishers have undertaken in an extensive way to publish Esperanto works, conditional on the possession of exclusive rights, while the various national Esperanto publishing houses turn out many books annually. A library of over 5,000 volumes—constantly increasing—including textbooks, translated and original works, is now found listed in the Esperanto catalogues. Quite a number of large commercial concerns are using the system for cable and telegraphic purposes. Courses of study in Esperanto form an attractive feature in commercial schools, clubs and public institutions, some of which make a special feature of teaching the blind to read by the new system. Several of the standard typewriters are equipped with Esperanto keyboards, and in that connection many stenographers are learning the use of the language for shorthand purposes.

In the colleges and schools, Esperanto is commanding considerable attention. One of the Esperantist triumphs was the delivery of an address in the Esperanto language by Mr. Moch, the famous peace advocate, at the International Peace Congress, Lucerne. At the Boulogne Universal Esperanto Congress, 1,200 delegates from 22 countries spoke the Esperanto language freely and understood each other thoroughly. A complete test was made by means of speeches, discussions, concerts, dramatic performances and religious services. During that congress the work of Dr. Zamenhof was officially noticed by the French government. The Minister of Public Instruction extended thanks in behalf of the president of the republic and of the people of France. In the course of the proceedings a reception was tendered to the creator of Esperanto at the Hotel de Ville, Paris. If further proof were needed that the Esperanto language is a practical spoken tongue — 11 universal congresses have been scheduled — two having taken place in the United States. The largest on record was arranged for Paris, in August 1914, at which over 5,000 delegates representing every nation on the globe had already enrolled. A large majority, including a number from the United States, had arrived in Paris for the Congress week, when the declaration of war was made known — 11 universal congresses have been scheduled — meeting of one of the largest and most unique international gatherings ever known. The 11th Universal Congress was held in San Francisco, August 1915, in conjunction with the Eighth National Convention of the Esperanto Association of North America. The value and use of Esperanto in the war have been attested in many ways. Striking instances of the use of the international tongue between Austrian prisoners and their Russian captors; between Russian captives of the Austrians and Germans, etc., have been made known. Esperantists have sent several fully equipped Red Cross Esperanto ambulances into the field with personnel. Esperanto is being taught in the prison and internment camps, so that there may be a common language. There is an Esperanto repatriation bureau maintained in Geneva, Switzerland, through which disrupted families are brought together, correspondence forwarded, and much other good of like nature accomplished. Statements relating to justification for the war were issued in Esperanto by governments, notably the French and German — the latter also issuing official war bulletins in Esperanto for international distribution. Keys, weighing but five grams, though containing the elements of the language and vocabulary of more than 2,000 words, are published in practically all languages, for international conversational and correspondence purposes. A similar series of Esperanto Red Cross booklets is published, and much other work is being accomplished along these lines. In short, Esperanto is proving its great value for its intended purposes and it is the best passport in warring countries that one may possess.

Method of the Esperanto Language.— In the general plan of Dr. Zamenhof the aim is to omit all accidental words in the language of each nation, retaining only such words as are common to all nations. Sounds peculiar to any one language are eliminated. The English *th* and *w*, appearing in English words, but not in those of the French or German languages, are, therefore, according to the rule of the originator of Esperanto, dropped. The French *u*, the German *u* and the French nasals not used in English are left out, also the Spanish *n* and *j*, and the German *th*. The pursuance of this plan removes all difficulties as to pronunciation. Phonetic spelling is the Esperanto rule, a certain letter having the same sound always. Mute and double letters are cut out. The letter *x* becomes *ks*, *ph* becomes *f*, *ch* becomes *k* for the guttural sound, and *ĉ* — *c* remaining for the ordinary sound in words like *cigar*. The *g* is used for the guttural (gril, garb), and *ĝ* is used for the sibilant *aĝ* which is equal to *age*. New signs introduced are *ĉ* and *ĝ*. But these are for sounds already recognized. A third sign takes the place of a double letter, viz., *ŝ* for *sh* (*ŝip* equals *ship* and *ŝi* equals *she*). Further details regarding the vocabulary, prefixes and suffixes — in fact, the whole grammar — have been issued in separate form and can be readily obtained by students. It will suffice to say here that the Esperanto vocabulary is much smaller than that of any other language, containing only about 3,000 *root* words, exclusive of scientific and technical words, as compared with 32,000 in the French language, a considerably larger number in the German language, and over 100,000 in English. The simplicity of the Esperanto grammar, comprising 16 fundamental rules, with no exceptions, is quite remarkable. The majority of those who undertake the study of Esperanto, diligently, with the proper textbooks or instruction, master it in a short time. See UNIVERSAL LANGUAGE; SCIENCE OF LANGUAGE.

ESPERSON, Pietro, Italian jurist: b. Sassari, Sardinia, 1833. He was educated at the university of his native place and in 1860–65 was instructor in law there. In 1865 he became professor of international law at Pavia. He published 'Rapporti giuridici tra i belligeranti e i neutrali' (1865); 'La questione Anglo-Americano del "Alabama,"' discussa secondo i principii del diritto internazionale' (1869); 'Giurisdizione internazionale maritima' (1877); 'L'Angleterre et les capitulations dans l'île de Chypre au point de vue du droit international' (1879); 'Le legge sulla naturalizzazione in Italia' (1886); 'De' dritti di autore sulle opera dell' ingegno ne' rapporti internazionali' (1899).

ESPINAL, Colombia, town in the department of Tolima, about 70 miles south of the capital, Bogotá. It has industries of tobacco and pottery. Pop. about 8,000.

ESPINAS, Alfred Victor, āl-frā vĕk-tōr ā-spē-nä, French sociologist: b. Saint Florentin, Yonne, France, 23 May 1844. After teaching philosophy in the lycées of Bastia, Chaumont, Havre and Dijon, he became successively professor of philosophy in the universities of Douai, Lille and Bordeaux and in the latter was dean of the faculty of letters 1887–90. Since 1894 he has been professor of the history of social economy on the Chambrun foundation, in the faculty of letters of the University of Paris. Besides contributing largely to the *Revue Philosophique*, he has translated (with Ribot) Herbert Spencer's 'Psychology' (1874), and written 'Des sociétés animales' (1877–78); 'La philosophie expérimentale en Italie' (1880); 'Histoire des doctrines economiques' (1893); 'Les origines de la technologie' (1897); 'La philosophie sociale du XVIIIe siècle et la révolution' (1898).

ESPINASSE. See L'ESPINASSE.

ESPINASSE, Esprit Charles Marie, French soldier: b. Castelnaudary 1815; d. Magenta 1859. He invaded the National Assembly at night and seized the quæstors which enabled Louis Napoleon to effect his *coup d'état* of 2 Dec. 1851. For this service he was made general and aide-de-camp to the emperor. He fought in the Crimean War, was Minister of the Interior in February–June 1858, and in this office presented to the chamber the "Law of Public Safety". Later he was appointed senator. He was killed at the battle of Magenta.

ESPINEL, Vicente Martinez, Spanish novelist and poet: b. Ronda, December 1551; d. 1624. He studied at Salamanca, was expelled from the university there in 1572, served in the army in Flanders and about 1584 returned to Spain. In 1587 he took holy orders, in 1591 was appointed chaplain at Ronda. He lost this charge through absenting himself without permission, but his musical ability secured for him the position of choirmaster at Plasencia. In 1591 appeared his 'Diversas Rimas,' which showed considerable ability. He revived the metre known as décimas — a stanza of 10 octosyllabic lines — and since popularly known as *espinelas*. He is said to have added a fifth string to the guitar, but this is disputed, although the evidence against it is far from conclusive. Espinel is best remembered, however, for his picaresque novel, 'Relaciones de la vida del Escudero Marcos de Obregón' (1618). This work is an autobiography with considerable embellishment. From it, all to the contrary notwithstanding, Le Sage borrowed about one-fifth of his 'Gil Blas.' Many poems of Espinel have remained unpublished owing to their licentious character. Consult Perez de Guzman's edition of 'Marcos de Obregón' (Barcelona 1881); Claretie, Leo, 'Le sage romancier' (Paris 1890).

ESPINOSA, Aurelio Macedonio, American educator: b. Carnero, Colo., 12 Sept. 1880. He was educated in the public schools at Veteran and Del Norte, Colo., at the University of Colorado and the University of Chicago. In 1901–02 he was assistant in Romance languages at the University of Colorado, and from 1902 to 1910 was professor of Spanish and French at the University of New Mexico. In 1910 he was appointed associate professor of Spanish at Leland Stanford University. He was founder and special collaborator of the Société Internationale de Dialectologie Romaine and is honorary member of the Chile Folklore Society. He is the author of 'Metipsimus in Spanish and French' (1911); 'La cosecha humana' (Spanish trans. of Jordan's 'Human Harvest,' 1912); 'El Imperio Invisible' (Spanish trans. of Jordan's 'Unseen Empire' 1915). He edited Echegaray's 'El gran galeoto' (1903); and 'El Poder de la impotencia' (1906); Ayalas' 'Consuelo' (1911); Sierra's 'Teatro de Ensueño' (1917); and 'Canción de Cuna' (1918); Benavente's 'El principe que todo lo aprendió en los libros' (1918); with C. G. Allen, 'Elementary Spanish Grammar' (10 eds., 1915–17); 'Elementary Spanish Reader' (1916); 'Advanced Spanish Composition and Conversation' (1917); Radin's 'Folklore de Oaxaca' (1916). He is a frequent contributor to the *Revue Hispanique, Journal of American Folklore, Revista Ilustrada, Revista Positiva,* the *Monitor,* etc.

ESPIONAGE ACT OF 1917. When the United States entered the European War in 1917 it immediately became apparent that extraordinary legislation was needed to keep in check treasonous action by certain citizens, but more especially by sympathizers with the enemy, resident in the country. To this end the Espionage Act was passed, 15 June 1917. The first provision was that whoever was in any way instrumental in the gathering of information, pictures, sketches, etc., on government property with the intent of using them in a way detrimental to the interests of the United States was liable to a fine of $10,000 and to imprisonment for two years. This was, of course, designed to check enemy aliens who had access to navy yards, wireless stations or places where construction work was going on. The transmission of such information to a foreign country, or its representative, in time of war, was made punishable by death, or 30 years' imprisonment, and this applied to any sort of information that might be useful to an enemy. The circulation of false reports for the purpose of causing insubordination, disloyalty, mutiny, etc., including obstruction of enlistment, was made punishable by not over $10,000 fine and 20 years' imprisonment. Conspiracy with a view to doing any of these things carried the same punishment to all conspirators, whether or not the things were accomplished. The harboring or concealing of any one guilty of such treasonable offense involved a possible fine of $10,000 and two years' imprisonment.

The Espionage Act also gave power to the President, in case of emergency, to regulate the anchorage and movements of vessels in United States waters, and provided not over $10,000 fine and two years' imprisonment for any one failing to comply with or interfering with the carrying out of such regulations. A similar provision was made with reference to the harboring of enemies on vessels in United States waters. The injury of vessels engaged in foreign commerce, as by setting fire to them or placing bombs, carried a fine not exceeding $10,000 and 20 years' imprisonment. Any other form of violent obstruction of exportation called for not over $10,000 fine and 10 years' imprisonment.

For the enforcement of neutrality the Espionage Act carried a long list of prohibitions. On reasonable cause any vessel might be detained in port, to prevent the unlawful shipment of supplies or dispatches. The sending out of armed vessels without permission was strictly prohibited. Very careful regulations were made to prevent any sending of goods where they might be transshipped to an enemy, and statements had to be filed with the collector of customs to aid in carrying out such orders. The taking of a vessel out of port in violation of the rules laid down involved a fine of not over $10,000, plus five years' imprisonment, and forfeiture of the vessel and goods. Any interned alien escaping or attempting to escape was liable to $1,000 fine and a year in prison. Being engaged in any unauthorized or filibustering military expedition carried a possible fine of $3,000 and three years in prison. The President was authorized to use the army or navy as necessary to carry out any of the provisions specified.

The seizure of arms and other articles intended for export was provided for, and the same forfeited to the United States, and the method of trying such a case before a competent court was set forth. The President was also given power, during the war, to declare certain exports unlawful, such as in his discretion might be harmful to the United States, and the penalty was placed at not over $10,000 fine and two years in jail. Directors and officials of transportation companies were made personally liable. The disturbance of foreign relations was provided against by making criminal any harmful statements to or about foreign officials, under certain conditions, or the impersonation of a foreign official, or the acting as an agent of a foreign government except as a regularly appointed consul or attaché, was punishable. Conspiracy in this country to destroy property in a foreign country was covered under this clause, and carried not over five years' imprisonment and $5,000 fine. All abuses of the passport privilege were severely dealt with. The counterfeiting of the government seal, or mutilation or alteration of any document bearing such seal, involved a possible $5,000 fine and 10 years' imprisonment.

The act included a very long section as to the issuing of search warrants. This permitted judges of District Courts as well as of State and Territorial courts to issue search warrants for either property or papers embezzled contrary to a law of the United States. Probable cause had to be shown, supported by affidavits, the rights of citizens being carefully protected, but when the warrant was issued and in the hands of the proper officer he had the right to break and enter as might be necessary to carry out the search. Such officer had to give a receipt and inventory of the property so taken, under oath, and a copy must be placed with the person from whom the property or papers were taken. Restoration of the property in case of error was provided for. Obstruction of such search warrant officers in their duty involved a fine of not over $1,000 and a year's imprisonment.

The use of the mails was prohibited for any papers, etc., in violations of the provisions of the Espionage Act, but only a search warrant authorized the opening of a sealed letter addressed to another. All treasonable matter was declared non-mailable, and the mailing or attempting to mail such carried a possible fine of $5,000 and five years' imprisonment.

The Espionage Act was framed so as to include not only the United States proper but all its territories, as the Philippine Islands and the Canal Zone, and all its waters, continental or insular. The act is a document of over 10,000 words, under 13 titles, and was modeled more or less on the experiences of Great Britain in dealing with the same sort of difficulties during the earlier years of the war. It proved quite effective in checking the evils at which it was aimed, and after the first year of the war there was very little enemy activity in the United States and all surreptitious treason was effectively stamped out except, of course, that which occurred sporadically and not as the result of organized bands of conspirators.

ESPINOSA, Gaspar de, Spanish soldier: b. Medina del Campo, about 1484; d. 1537. He studied law and entered into practice in Spain. In 1514 he came to America with Pedrarias Dávila and was made chief justice at Darien. He presided over the tribunal which condemned Balboa to death, but only passed sentence on the latter at the express command of Dávila. He resigned his judicial office and led several expeditions against the aborigines, whom he treated most inhumanely. He founded Panama in 1518, returned to Spain a few years afterward and was sent out soon again as a Crown officer in Santo Domingo. He backed Pizarro in his second expedition against Peru and accompanied him to the latter country, where he died at Cuzco.

ESPIRITO-SANTO, ĕs-pē'rē too-sân'tō, Brazil, a state bounded on the north by the state of Bahia, on the east by the Atlantic Ocean, on the south and west by the states of Rio de Janeiro and Minas Geraes. Area 17,312 square miles. The coast lands are swampy, but in the interior mountains rise to a height of 7,000 feet; the highest of these, Mestre Alvares, is one of the most conspicuous landmarks on the Brazilian coast. The temperature, which is tropical, is moderated by the state's proximity to the sea. The state has immense forests, and is noted for the valuable woods found in them and the rare drugs which are distilled. The Doce River flows through some of the richest of the hinterlands, but is navigable only for very small craft. São Matheus, in the northern part of the state, is surrounded by coffee and mandioca plantations, the products of which are shipped from this port, officially known as Conceição de Barra. A number of small ports intervene between the Doce River and the spacious bay of Espirito-Santo, which has given its name to the state. Coffee, the chief agricultural product, is largely exported. Other exports are sugar, tapioca, cotton, cocoa, hides and skins, and woods. There are valuable marble deposits, which are not mined. A railway is being built to connect Ouro Preto, on the upper waters of the Doce, with the coast. Cotton goods are manufactured in the town of Pessanha. The population of the state, which was 135,997 in 1890, increased to 430,000 in 1913, this growth being due to European immigration. A few years ago the city of Victoria (pop. 15,000) had almost no maritime trade, as its port was too shallow to admit large vessels. Recently improvements have been made in the harbor, which now accommodates transatlantic steamers, and both trade and immigrants have sought it. It was first visited by the Portuguese in 1535. Colonies of Germans, Poles, Swedes, Tyrolese, Portuguese and Italians are established near Anchieta, Alfredo Chaves, Itapemirim and Cachoeiro — chiefly in the southern part of the state. Some of these colonies are under government protection, receiving annual subsidies of seed and cattle; but the majority of the colonists already own lands which they work without government aid. Education, though well subsidized by the government, is, so far as the native population is concerned, in a very backward condition. The state returns four representatives to the Chamber of Deputies.

ESPLANADE, ĕs-plâ-nād', in fortification, the wide open space left between a citadel and the nearest house of the city, to prevent an enemy from being able to assail it under cover of these houses. The term is also frequently applied to a kind of terrace, especially along the seaside, for public walks or drives and also to a wide city street.

ESPOUSAL (SPONSALIA), or BETROTHAL, according to Church law consists of a deliberate mutual promise of marriage, expressed by outward signs, between two persons, both of whom may lawfully and validly enter into such an engagement. When such promise is made and accepted on both sides, neither party can lawfully withdraw from it without the other's consent or unless something occurs or some circumstance comes to light which, had it been known in time, would have hindered the engagement. Formerly such engagements used to be made with some solemnity *coram ecclesia* or at least in presence of witnesses; now they are usually made without ceremony or publicity. See MARRIAGE. Consult Mielziner, 'The Jewish Law of Marriage and Divorce' (Cincinnati 1884).

ESPRIT DES LOIS. See SPIRIT OF THE LAWS.

ESPRITS FORTS (bold spirits), the name of the French school of writers better known as freethinkers, which included D'Alembert, Diderot, Helvetius and Voltaire. This school aimed not to establish general toleration for all forms of speculation, but sought to improve their own views of religion and philosophy. They recognized pure reason as the only dependable guide; their motto might have been «L'esprit prime tout» (Intellect is supreme). They had a wide influence on their time, and their doctrines have borne fruit ever since, the quality varying greatly among the different races and peoples. Their extreme radicalism may be said to have paved the way to socialism; while their less radical principles have helped build the democracies of our day.

ESPRONCEDA, José de, Spanish poet: b. Almendralejo, (Badajoz) 1810; d. Madrid, 23 May 1842. His father was a colonel of cavalry, and the boy was born in the army for his mother insisted on following her husband during his campaigns. At the close of the war young Espronceda was put into school in Madrid; and there he soon distinguished himself by his precocity, his love of poetry, his enthusiasm and his good literary taste. At the age of 14 he was already known as a poet of great promise. He was filled with democratic and revolutionary ideas; and he was arrested for his boldly advocated ideas in his 15th year, and confined in a convent in Guadalajara, where his parents were then living. There he began the composition of his celebrated poem 'El

Pelayo.' On his liberation from prison he went to Madrid; but feeling that his every movement was watched by agents of the government, he went to Gibraltar, and from there to Lisbon, London and Paris. Later he fought in the revolutionary ranks in Paris (1830). He then joined an expedition sent to help Poland. After long wandering and exile from home, often with the most limited means of subsistence, he finally took advantage of the act of amnesty of 1833 and returned to Spain. There he might have lived in peace and followed his poetical inclinations, but his revolutionary bent kept him in constant trouble. Through family influence he obtained a commission in the Queen's Guards (1833); but he was soon dismissed from the army and again forced into exile, on account of his interference in politics. The following year he was permitted to return to Madrid, where he again plunged into militant politics, and into the insurrectionary movements of 1835–36. From this on he became the most ardent of the Spanish advocates of republicanism; and in 1840 his was the most listened to voice in revolutionary Spain. In December 1841 he was sent as secretary of legation to The Hague by the Republicans who had secured possession of the government, a position he retained a very short time because of his election as deputy for Almeria. Already ill from his residence in the damp and cold climate of Holland, he hastened back to Madrid only to die of a severe inflammation of the throat.

Espronceda is the greatest of the passionate, patriotic poets of Spain. With him patriotism was a passion and hatred of autocracy an obsession which mastered him. There is no more passionate and compelling voice in all Spanish literature than his. He runs all the gamut of feeling; love of the most passionate kind; the fiercest hatred of oppression and injustice; the deepest patriotism, expressed in the most compelling words; the wildest visionary delight in socialism; the passion of great aspirations and pure and noble purpose; and the depths of despair of atheism and of vanished hopes and disappointed aspirations. On account of his vivacity, his burning imagery, his wonderful power of word painting, his simple direct methods in literature and his ever youthful mind, Espronceda has been called in Spain «the poet of youth and of democracy.» No other writer in Spanish literature or Spanish life had, at his age, at his death (32), such a hold over his followers and admirers as José Espronceda. His companion and fellow poet, Enrique Gil, who paid his last poetic tribute to him at the graveside, broke down and sobbed like a child; and many an eye was wet among the mourners for the bright particular light of democracy that had just been extinguished in Spain. No definitive edition of Espronceda's works has been published for the reason that his efforts were spread over such a wide field of endeavor, and his writings appeared in newspapers, journals, reviews and pamphlets. Yet numerous editions of the best known of his literary productions have been issued in Spain and in several foreign countries. In these editions the following works appear: 'El Palayo'; 'Don Sancho Saldaña' (1834); 'El Estudiante de Salamanca'; the drama 'Ni el Tio ni el Sobrino,' written in collaboration with Antonio Ros de Olano (1834); many short poems of a social, political, reflective or amatory nature; 'El Diablo Mundo' (1841); and many of the best lyrics in the Spanish language. His literary work has the form of Hugo and the spirit of Byron with an originality that is Espronceda's alone. The first edition of his collected writings appeared in Paris in 1840, the second in Madrid in 1846; and the Hartzenbusch edition, with a biography by Ferrer del Rio, in Paris two years later. A more complete edition than any of these was published by Espronceda's only daughter, Blanche Espronceda de Escosura in 1874. A fairly complete edition of his poetical works also appeared in Barcelona in 1883. See El Estudiante de Salamanca.

ESPY, James Pollard, American meteorologist, the founder of modern meteorology: b. Washington County, Pa., 9 May 1785; d. Cincinnati, 24 Jan. 1860. He was graduated at Transylvania University 1808. The name «storm-king» was given to him for his originating a theory of storms which involved him in much controversy. He studied law at Xenia, Ohio, and was principal of the academy at Cumberland, Md., for five years (1812–17). From there he went to the Franklin Institute, Philadelphia, as professor of classical languages (1817–53). In 1836 he won the Magellanic prize for an essay on the theory of storms; and four years later he visited England and France where he explained at length his storm theories before the chief scientific societies of both countries. On his return home he was appointed by the United States Congress meteorologist to the War Department, and later to the Navy Department also. His 'Philosophy of Storms' which was published in 1841 gained him a great reputation in his special field. His meteorological doctrine on the point of how atmospheric disturbances commence was approved by the French Academy, but his views as to the mechanics of storm are contrary to received fact, and have been exploded. His principal contribution to practical meteorology was his institution of a system of telegraphic weather bulletins, which should converge at the capital and give daily intelligence of the weather in different widely separated points, and it may be justly claimed that he thus laid the foundation of all sound theory on the subject of weather prediction. Consult *Monthly Weather Review* (Vol. XXXV, Washington 1907); and *Appleton's Popular Science Monthly* (April 1889).

ESQUILACHE, Don Francisco de Borja y Aragón, Príncipe de (Francisco de Borja y Acevedo), Spanish poet: b. Madrid, about 1581; d. there 1658. From 1614 to 1621 he was viceroy of Peru, after which he returned to Spain and lived at the court of Madrid. He wrote 'La pasión de Nuestro Señor,' a sacred poem (1638); 'Nápoles recuperada,' celebrating the conquest of Naples (1651); a translation of Thomas à Kempis (1661), and many poems. Selections of his works are included in 'Biblioteca de Autores Españoles.'

ESQUILINE HILL (*mons Esquilinus*), the highest of the seven hills of Rome. It is between the Viminal and the Cælian hills, is 246 feet in height and under Augustus was laid out in pleasure gardens, known as the Gardens

of Mæcenas. Soon after it was the fashionable residential section of the city. Virgil, Horace, Mæcenas and Propertius are the most celebrated of its residents at this period. The baths of Titus and Nero's golden palace were on the Esquilinus and many of the ruins have been uncovered only to be at once destroyed in the course of erecting new buildings. In the modern city the Esquiline is a new modern portion with fine streets and buildings. Consult Platner, 'The Topography and Monuments of Ancient Rome' (2d ed., New York 1911).

ESQUIMALT, ĕs-kwī'malt, Canada, naval base in British Columbia, on the southeast coast of Vancouver Island, and on the Strait of San Juan de Fuca and the Esquimalt and Nanaimo Railway, four miles from Victoria. The harbor is extensive and capable of receiving vessels of the greatest size, and was the British navy station for this part of the Pacific coast. It has a navy yard, and a large dry dock built in 1888. The defenses were greatly strengthened by the British government, and a British garrison was stationed here until in 1905, on the Canadian government undertaking to look to the defenses of Canada, it was withdrawn. The drydock was transferred to the Canadian government in 1910.

ESQUIMAUX. See Eskimo.

ESQUIRE, *escuyer*, old French; *escudero*, Spanish; a shield-bearer or armor-bearer, an attendant on a knight; hence, in modern times a title of dignity next in degree below a knight. In Great Britain this title is given properly to the younger sons of noblemen, to officers of the king's courts, and of the household, to counsellors at law, justices of the peace while in commission, sheriffs, gentlemen who have held commissions in the army and navy, and in fact to anyone save tradesmen, mechanics and peasants. It is usually given to all professional and literary men, both there and in the United States. In heraldry the helmet of an esquire is represented sideways with the visor closed. The title, however, no longer exists as a creation of letters patent.

ESQUIROL, Jean Etienne Dominique, zhŏñ ā-tē-ĕn dō-mē-nēk ĕs-kē-rōl, French physician: b. Toulouse, 4 Jan. 1772; d. 12 Dec. 1840. His life was chiefly given to improving the methods of treating the insane, and he contributed greatly toward the abolition of the barbarous methods so long in vogue. In 1799 he founded a model asylum at Paris; visited all the asylums in France 1808; was appointed physician to the Saltpetrière 1811; and in 1826 became head of the private asylum at Charenton, which he had largely planned. In 1817 his public revelations of the abuses current in French asylums led the government to appoint an investigating commission. His studies included the architecture and construction of asylums, and the best of the earlier 19th century buildings for the insane in France, such as those at Rouen, Nantes and Montpelier, were built in accordance with his plans and instructions. He wrote 'Des Illusions chez les Aliénés' (1832; English trans. 1833); 'Des maladies mentales' (1838); and articles in the 'Dictionnaire des sciences médicales,' and the 'Encyclopédie des gens du monde.'

ESQUIROS, Henri François Alphonse, ŏñ-rē frăñ-swä äl-fŏns ĕs-kē-rōs, French poet and miscellaneous writer: b. Paris, 23 May 1812; d. Versailles, 12 May 1876. His first work, a volume of poetry, 'Les Hirondelles,' appeared in 1834. This was followed by numerous romances, and a socialistic commentary on the life of Christ, 'L'Évangile du peuple' (1840), for which he was prosecuted and imprisoned, and 'Charlotte Corday' (1840). He then published 'Les chants d'un prisonnier' (1841), poems written in prison; 'Les vierges folles' (1842); 'Les vierges sages' (1842); 'L'histoire des Montagnards' (1847). Having to leave France in 1851, he resided for years in England, and wrote a series of essays for the '*Revue des Deux Mondes*' on English life and character, which were translated under the title of 'The English at Home,' and were very popular. He also wrote a similar work on the Dutch. Other works of his are 'Le droit au travail' (1849); 'La vie future au point de vue socialiste' (1857); 'Histoire des martyrs de la liberté' (1851); 'La Morale Universelle' (1859); 'Religious Life in England' (1867, published in English); 'Les paysans' (1877); 'Le château enchanté' (1877), a novel.

ESQUIVEL, Juan de, hoo-än' dä ĕs-kē-vĕl, Spanish soldier: b. 1470; d. 1519. He was the companion of Ovando when the latter went to Hispaniola to succeed Bobadilla as governor. Ovando sent him as leader of an armed expedition against the uprising of the native chief, Cotabanamá, in Higuey province in 1504. In 1509, at the instance of Diego Columbus, he conquered the island of Jamaica and settled it as a Spanish possession. The colony flourished under his administration, and he founded there the city of Sevilla Nueva.

ESS, Johann Heinrich von, yō-hän hīn'rīh fŏn ĕs (better known by his Benedictine name «Leander»), German theologian: b. Warburg, 15 Feb. 1772; d. Affolderbach in the Odenwald, 13 Oct. 1847. He entered the Benedictine abbey of Marienmünster as a novice 1790; was pastor at Schwalenberg 1799–1812; and professor of theology at the seminary in Marburg 1812–22. In 1807, with his cousin Karl, he published a German translation of the New Testament, the circulation of which was forbidden by the Pope. The following year he published a defense of his views as to Bible reading by the people, a new edition of which was issued in 1816 entitled 'Gedanken über Bibel und Bibellehre.' After 1822 he gave his whole time to circulating his Bible versions among the people, to spreading his doctrines and to the composition of a German version of the entire Scriptures, which he finished in 1840. Others of his publications are 'Was War die Bibel den Ersten Christen?' (1816); 'Die Bibel Nicht ein Buch für Priester' (1818); an edition of the Vulgate (Tübingen 1822–24); of the Septuagint (1824; new ed. 1887) and of the Greek New Testament (1827).

ESSAAD EFFENDI, Mohammed, Turkish historian: b. Constantinople, 1790; d. 1848. He was appointed historiographer of the empire, editor of the official state journal, and for some time served also as Ambassador to Persia. Caussin de Perceval published some of his work under the title, 'Précis historique de la destruction du corps des Janissaires' (Paris 1833).

ESSAD, Pasha, Albanian soldier and adventurer: b. about 1865. The descendant of a powerful and wealthy family — the Topdani — who maintain to this day a sort of feudal authority and splendor, Essad began his varied career in the Turkish army. His elder brother, Ghani, became a secret instrument of Abdul Hamid II for the noiseless removal of obnoxious personages. A relative of one of his victims murdered Ghani, and was in turn shot down by Essad on Galata bridge in broad daylight. Combining the profession of a bandit chief with that of a soldier, Essad Pasha had at all times a host of Albanian clansmen at his command. He espoused the cause of the Young Turks in 1908 and, after the revival of the constitution, was sent to Constantinople as a deputy from Durazzo, the Albanian capital. It was Essad Pasha who announced to the sultan that the committee had decided to depose him. On the outbreak of the Balkan Wars (q.v.) he was appointed commander-in-chief to defend Albania with some 18,000 troops. With the garrison of Janina he defended that place for three months when he surrendered to the Greeks with 30,000 men on 6 March 1913; six weeks later he surrendered Scutari to the Montengrins. It appears that Essad Pasha cherished ambitions to create Albania an independent state with himself as ruler, and there were strong grounds to believe that the two capitulations — of Janina and Scutari — were the price he paid for eventual recognition, in addition to which he received a handsome fee from Russia. The selection by the powers of Prince William of Wied to be king of Albania nullified the hopes of Essad Pasha, who now became Minister of War under the new régime. Before long, however, he was fomenting an insurrection and was deported. The king of Albania had soon to flee from the country himself, and Essad Pasha, under Italian protection, returned to Durazzo in October 1914 in the rôle of dictator. He was elected president of the Albanian provisional government. He dismissed the Austrian Minister — whose government had supported the claims of Ismail Kemal Bey for the kingship — and strengthened the remnants of the Serbian army with his own forces against the Austrians and Bulgarians. In 1916 it was reported that Essad Pasha had fled to Italy.

ESSAY. The term essay is used in various loosely defined ways, but usually describes a brief prose composition of an expository character. Originally and properly, the word implies a tentative and suggestive, as distinguished from a formal and complete, discussion; and this use is applicable to the «familiar» essay, the most purely literary of all the types. Dr. Samuel Johnson, from the same standpoint, defined the essay as «a loose sally of the mind, an irregular, indigested piece.» On the other hand, the term is equally applicable, in modern use, to formal expository compositions, and has even been extended to cover treatises of an extensive character, as Locke's 'Essay Concerning Human Understanding' (1690). In the 18th century it was also extended to compositions in verse, notably Pope's 'Essay on Man' 1734. Essays are sometimes classified, for convenience, as (1) gnomic or aphoristic, (2) personal or familiar, and (3) critical or didactic. The first type, which may be regarded as the original or primitive, represents the making of an essay by the process of bringing together gnomic sayings or aphorisms having to do with the same subject,— a process well exemplified by certain portions of the biblical book of Proverbs. Thus, while the greater part of that book is made up of brief separate proverbs or epigrams, these are developed into what may well be called essays in such passages as the account of Wisdom (chap. 1, verses 20–33) or of the Virtuous Woman (chap. 31, 10–31). The second type represents the treatment of a particular subject from a distinctively individual standpoint, and at times reaches a point of development closely analogous to the personal lyric in poetry. The third type represents a more utilitarian purpose, and has been most fruitfully developed in the pursuit of literary criticism. But the several types are not infrequently blended, and others might well enough be added if the classification were made complete.

In ancient classical literature the essay was not a recognized literary form; its functions may be said to have been accomplished largely by the epistle and the dialogue. Thus Bacon said that «Seneca's epistles to Lucilius, if one mark them well, are but essays»; and one might say that certain of Plato's Dialogues mark the highest reach of the method of the essay in any language. To a later philosopher, Theophrastus, were attributed the «Ethical Characters,» descriptive of various character types, which we shall see gave rise in modern times to a kind of essay form. The closest approach in antiquity, however, to what we now call the essay is to be found in the late Greek period, when the biographer and philosopher Plutarch (1st century A.D.) wrote a number of compositions, traditionally called *Opera Moralia* (Moral Works), on such subjects as «The Right Way of Listening,» «How a Flatterer may be Distinguished from a Friend,» «On Chance,» «On Superstition,» and «On Exile.» Analogous to these writings, in Latin literature, are the partly philosophic, partly personal 'Tusculan Disputations' of Cicero, the epistles and other moral disquisitions of Seneca, and — closest to the essay in their informal discursiveness — the 'Meditations' of the Emperor Marcus Aurelius. Some influence on later types of essay literature may also be traced to the miscellanies — anecdotal and otherwise — of Valerius Maximus and Aulus Gellius; the work of the former is called 'Books of Memorable Deeds and Utterances,' that of the latter 'Attic Nights.'

In the mediæval period the essay cannot be recognized as a separate type; some approximation to it may be noted in the successors of the miscellanies just mentioned, and in various collections of wise sayings («sententiæ» or sentences). In particular, writers in the service of the Church made a practice of bringing together incidents and utterances illustrative of particular virtues, vices and spiritual truths, which, though they were more likely to develop into homily or sermon than into essay, sometimes furnished method or materials for later essayists. In France the form called Moral Lesson (*leçon morale*) has been thought to form a link between these mediæval writings and the essays of Montaigne.

The modern conception of the essay as a distinct literary form, and the use of the word «essay» to describe it, have their origin with definiteness in the work of Montaigne, who in 1580 published a volume of *essais* at Bordeaux; a second edition, with important additions, followed in 1588. A considerable portion of these essays of Montaigne is in the classical and mediæval tradition,— discourse on moral themes, illustrated with anecdotes and aphorisms collected from a wide range of reading. But from this type of essay Montaigne developed the more personal type, discoursing on whatever subject came to hand from the standpoint of his individual experience and mood; so that he could say in his address «to the reader»: I have no respect or consideration at all either to thy service or to my glory. . . . Myself am the groundwork of my book. It is then no reason thou shouldest employ thy time about so frivolous and vain a subject.» To this sort of mood, and the essays that represent it, the whole later development of the «familiar» essay is universally traced.

Montaigne's essays were translated and widely read in England, and the new form became more important across the Channel than in its native land. In 1597 Francis Bacon borrowed the name Essay for a little collection which bore the subtitle 'Religious Meditations', — only 10 in all; in the edition of 1612 the number was increased to 38, in that of 1625 to 58. This collection also became popular, and has remained a classic; but Bacon held rather to the older tradition of the aphoristic essay than to the newer type of Montaigne. In his later writings he gives more unity, and sometimes more personality, to the form, yet never to the point of becoming «familiar.»

Sir William Cornwallis, a contemporary of Bacon's, followed his work with a succession of essays on moral themes (1600, 1610, etc.). The chief successors of Bacon and Cornwallis, in the 17th century, were Felltham (who called his essays *Resolves*, about 1620), Cowley (who included 11 essays in his collected works of 1668), and Sir William Temple ('Miscellanea,' 1680, etc.). In the Restoration period Dryden may be said to have originated the modern critical essay, in the various prefaces on literary subjects which he was fond of prefixing to his writings. He also revived the dialogue form for the same purpose, in his 'Essay of Dramatic Poesy' (1667). Near the close of the century Defoe began to develop the essay form for the discussion of social, political and educational questions, notably in the 'Essay on Projects' (1697). One may also note two other literary types which, going back to much earlier periods, were highly valued in the 17th century and contributed to the art of the essay. The first of these is the «character,» originated, as has been mentioned, by the Greek, Theophrastus, whose quasi-essays were now revived and imitated in both England and France,— notably by Joseph Hall ('Characters of Vices and Virtues,' 1608), John Earle ('Microcosmographie, or a Piece of the World Discovered in Essays and Characters,' 1628), and Jean La Bruyère ('Les caracteres, ou les mœurs de ce siècle,' 1688). The second type is the epistle, also, as we have seen, of long-standing importance, and newly cultivated in the Renaissance and the succeeding age; notable examples of the development of this form in the direction of the literary essay are the Spanish letters of Guevara (d. 1545), which were translated into English more than once, and came to be called the «Golden Epistles»; the French letters of Jean de Balzac (1624); and James Howell's 'Epistolæ Ho-Elianæ, Familiar Letters Domestic and Foreign' (1645–55). Finally, for the 17th century, it should be observed that the 'Religio Medici' (1642) and 'Urn Burial' (1658) of Sir Thomas Browne exemplify some of the most delightful qualities of the familiar essay, in expanded form, though not called by that name.

The early 18th century saw a highly important development of the essay in connection with the growth of periodical literature. The beginnings of this movement may be observed in the work of Defoe and even earlier, but its first conspicuous representatives were Steele and Addison, in the several periodicals which they issued singly or jointly; indeed one might say that the new periodical essay was born in Steele's *Tatler*, which began to appear in 1709. Addison presently became Steele's coadjutor, and in the *Spectator*, begun March 1711, his influence was paramount. The type of essay developed in these periodicals was of fairly fixed length, suited to reading at the breakfast table, and combined in an important way the qualities of the familiar and didactic essay: that is, its purpose was the serious and profitable discussion of social, ethical and literary topics, but the point of view was distinctly personal, being represented as that of a sagacious but whimsical character, named «Mr. Bickerstaff» in the earlier periodical and simply «The Spectator» in the later. The influence of these periodical essays of Addison and Steele can scarcely be exaggerated, and it persisted throughout the century, not only in England but on the continent. More than 200 English journals or essay-series of the *Spectator* type have been counted for the century 1709–1809, and in France, Germany, Italy and even Russia it was also imitated. In France Marivaux first wrote Addisonian essays for the *Mercure*, then (1722) issued a *Spectateur Français*. In Zürich appeared the *Discourse der Maler* (1721), essays written by the members of a club headed by Johann Bodmer, under pen-names adopted from famous artists; in Hamburg an essay-periodical called *Der Patriot* appeared in 1724, and at Leipzig in 1725 Gottsched's *Vernünftige Tadlerinnen* («Sensible Fault-finders»). In the direction of literary criticism perhaps the finest results of the movement in Germany are to be found in certain essays of Lessing's, such as the series called *Litteraturbriefe* (1759–65) and the *Dramaturgie* (1767–69). In England the most distinguished successors of Steele and Addison were Dr. Samuel Johnson, who issued *The Rambler* in 1750–52 and later wrote various series of essays for other periodicals, and Oliver Goldsmith, who contributed essays to *The Bee, The Public Ledger*, etc. (1759–61). Goldsmith's work in the combined familiar and didactic essay is the only rival of the *Spectator* at its best, whether in charm of manner or quality of substance; in particular, he developed skilfully, in a series of essays called *The Citizen of the*

World, an amusing method of commenting on contemporary life from the assumed standpoint of a foreigner, which had been availed of by earlier critics, notably Montesquieu in the *Lettres Persanes* (1721).

The development of the essay in the early 19th century was again due largely to the evolution of periodical types, and in English literature one distinguishes clearly two of these types, the magazine and the critical review, which gave new opportunity for the familiar and the critical essay respectively. Most important of the former were *Blackwood's* and the *London Magazine*, founded in 1817 and 1820; of *Blackwood's* John Wilson («Christopher North») soon became the leading essayist, while the *London Magazine* had the distinction of printing some of the most brilliant work of Lamb, DeQuincey and Hazlitt. The brothers John and Leigh Hunt were also concerned in the publication of a number of periodicals, some (like the *Examiner*) being of a newspaper type, but offering space for literary essays, others (like the *Indicator*) continuing the *Spectator* tradition. For all these Leigh Hunt was a leading writer,— with the possible exception of John Wilson, the most prolific of the 19th century essayists. The Elia essays of Charles Lamb, which appeared in the *London Magazine* 1820–25, are by universal consent the finest examples of the familiar type produced since Montaigne's; some of Hazlitt's, however (to be found in his collections called *The Round Table*, 1817, and *Table Talk*, 1822), are not far beneath them, and of substantial literary criticism (as in the papers called *Characters of Shakespeare's Plays*, 1817) Hazlitt gives us far more than Lamb. Of the second newly developed type of periodical, the critical, the leading representatives are the *Edinburgh Review* and the *Quarterly Review*, founded in 1802 and 1809 respectively; these gave rise to a new form of literary essay, called a «review,» which normally took its origin in an account of some recent publications, but became an independent discussion of the subject suggested by the work in hand. The typical examples of this form are to be found in the essays of Francis Jeffrey, long editor of the *Edinburgh*, and John Gibson Lockhart, long editor of the *Quarterly*; but their work, important as it seemed, has proved insignificant in comparison with that of Thomas Babington Macaulay, who began his career as reviewer in the *Edinburgh* with his famous article on Milton, 1825, and remains the most brilliant and prolific of English critical essayists.

We cannot here follow the course of the essay throughout the 19th century. In general, England has continued to produce the most distinguished work in the familiar type; its best representative in recent times was Robert Louis Stevenson ('Familiar Studies,' 1882, and 'Memories and Portraits,' 1887). English writers have also done fine work in the critical essay, notably Matthew Arnold ('Essays in Criticism,' 1865, 1888) and Leslie Stephen ('Hours in a Library,' 1874–79); but here the palm must be yielded to the French, who have used the essay most characteristically for this purpose, notably Sainte-Beuve ('Causeries du Lundi,' 1851–72), Brunetière ('Questions de Critique, 1889), and Anatole France ('La Vie Littéraire,' 1907). American literature includes, for the early period, one notable representative of the Addison tradition, Washington Irving ('Sketch Book,' 1820). By far the most distinguished American essayist is Emerson, who revived to some extent the method of the aphoristic essay, emphasizing the single utterance rather more than the whole composition ('Essays,' 1841–44). In the critical type the work of James Russell Lowell remains unexcelled ('Among my Books,' 1870–76). Other noteworthy American essayists of the 19th century are E. P. Whipple, Edgar A. Poe, Donald G. Mitchell ("Ik Marvel"), Thomas Wentworth Higginson, George William Curtis and Charles Dudley Warner. In the 'Autocrat of the Breakfast Table' (1858), Oliver Wendell Holmes made wise and witty use of the method of the familiar essay, though in an expanded and discursive form which belongs to no definite type.

Bibliography.— The best account of the familiar essay is to be found in the introduction to Bryan and Crane's collection called 'The English Familiar Essay' (Boston 1916). For the English essay as a whole, consult Walker's 'The English Essay and Essayists' (London 1915); MacDonald, W. L., 'Beginnings of the English Essay' (University of Toronto Studies); Wylie, Laura T., 'The English Essay' (in Social Studies in English Literature,' Boston 1916). For the reviews and the critical essay, consult the introductions to Gates's 'Selections from the Essays of Jeffrey' (Boston 1894), and Haney's 'Early Reviews of English Poets' (Philadelphia 1904); also Saintsbury's 'History of Criticism' (Edinburgh 1904). For the character-writers, consult Morley's 'Character Writings of the 17th Century' (London 1891); for the letter-writers, Hansche's 'English Familiar Letter-writers and their Contribution to the English Essay' (Dissertation of the University of Pennsylvania, 1902). For the *Spectator* and its influence, consult Beljame's 'Le public et les hommes de lettres en Angleterre au 18e siècle' (Paris 1881). There is a convenient collection of essays by British writers in the Everyman's Library series, and a similar collection of American essays has been edited by Brander Matthews (Oxford Press 1914).

RAYMOND M. ALDEN,
Professor of English, Leland Stanford Junior University.

ESSAY ON CRITICISM, An, a didactic poem in heroic couplets by Alexander Pope (q.v.) in which he explains and propounds the canons of verse structure, poetic taste and criticism. The poem, Pope's first really original work, was written either in 1707 or 1709, more likely in the latter year. It was first published anonymously on 15 May 1711 and sold so well that another impression was made the same year. The second edition, published in 1713, gave as the name of the author «Mr. Pope.» Since then it has been included in practically every edition of Pope's works. The most exhaustively critical and most carefully annotated edition is that edited by J. W. Croker, W. Elwin and W. J. Courthope (London 1871–89) where it will be found in the second volume. It has been translated into Latin, French, German, Italian, Spanish, Portuguese, Hungarian, Polish and Russian. Opinions concerning the merits of the poem are divided. In its own days it was praised very highly by such astute critics as Addison and Dr. Johnson. Of the next generation of critics, Hazlitt continues to sing its praises, but DeQuincey criticizes it harshly.

The fact remains, however, that, though metrically by far the least polished of Pope's poems, it was a remarkable performance for a youth of 21, both in regard to its poetical value and in respect to its contents. Its imagery, though very uneven, at points reaches heights which were never surpassed by the author and many of its striking passages have become familiar quotations. It is one of Pope's longer works, consisting of 744 verses, divided into three parts. With it began the long series of literary quarrels in which Pope was involved throughout his entire career as a result of his biting satire. In the 'Essay on Criticism' he attacked particularly vigorously and outspokenly a critic and playwright of that day, J. Dennis (q.v.) who replied in a pamphlet, called 'Reflections upon a late Rhapsodic, called "An Essay upon Criticism" in which he in turn criticized very sharply and in places with considerable justice Pope's work. Consult Graner, K., «Die Übersetzungen, von Pope's Essay on Criticism,» etc. (Aschaffenburg 1910). See POPE, ALEXANDER.

B. H. GOLDSMITH.

ESSAY ON THE HUMAN UNDERSTANDING, An. John Locke's 'Essay on the Human Understanding' is the classic of English common sense empiricism. Subsequent philosophy and psychology and English thought in general are weighted with its terminology and opinions.

Locke's purpose, so he tells us, was «to inquire into the origin, certainty and extent of human knowledge, together with the grounds and degrees of belief, opinion and assent.» He would determine the powers of the understanding by an «historical» method, that is, by tracing the growth of knowledge in the individual. As a result of his analysis Locke decided that mind is conversant only with «ideas» and their relations, which ideas it acquired through sensation and through reflection on its own operations. These ideas, «whatever is the object of the mind when a man thinks,» are the *copies* of things — the effects produced in us by objects. He never questioned their representative character so far as the primary qualities, such as extension, motion, etc., are concerned and considered them sufficient evidence of an external world.

Knowledge is the perception of the agreement or disagreement of ideas and arises in three degrees: intuitive, by which we perceive immediately the relation between two ideas; demonstrative, i.e., a chain of intuitions; sensitive, which gives us knowledge of particular things. The limitation thus imposed leaves outside the realm of knowledge most of the matters with which the mind is generally occupied in the conduct of life. These must be determined by probable «judgment.»

Locke was very uncritical and avoided the logical extremes to which his argument is obviously subject and which are to be found in the idealism of Berkeley and the sensationalism of Condillac. His doctrine of representative ideas as the ultimate data of knowledge clearly expresses an epistemological position which may be regarded as the fundamental principle or fundamental fallacy of subsequent philosophy, according to one's metaphysical preferences.

The 'Essay' has probably run to more editions than any other modern philosophical classic and almost every subsequent philosopher has taken it at one time or another as a topic. Leibnitz's 'Nouveaux Essais sur l'entendement humain' (1761) is a running commentary on Locke. The best critical edition is that by Prof. C. Fraser (1894).

WALTER B. VEAZIE.

ESSAY ON MAN, The, one of the later works (1733–34) of Alexander Pope, shares with the 'Essay on Criticism,' the 'Rape of the Lock,' the 'Dunciad,' the 'Epistle to Dr. Arbuthnot' and a few other poems the position of foremost place among his original works. It is a didactic poem of some 600 heroic couplets grouped into four epistles and dedicated to Lord Bolingbroke, with whose brilliant but somewhat trivial philosophy it is in substantial agreement. There is probably a fixed order in the universe and definite gradations among all living things, including man, but it is presumption in man to attempt to define himself and to determine his place in the universe; he can only humbly submit to the decrees of Providence. The proper study, therefore, of mankind is man, in whom the outstanding characteristic is a mixture of two principles, self-love and reason, which are expressed in varying combinations of virtue and vice, which by giving men different characters, serve the ends of Providence. Reason and self-love operate in the formation of Society, and its institutions are according to the divine purpose. This universal aim is human happiness which, though obscured by false notions of the means of attaining it, consists in the acquisition of virtue. This is the general law, which it is folly to think will be altered to suit man's desires for prosperity, honors and the many objects of ambition of men. The philosophy is not particularly moving or consistent, and the poem is to-day best remembered for the large number of familiar quotations that it has contributed to the common stock — «Whatever is, is right,» «Pleased with a rattle, tickled with a straw,» «Order is heaven's first law,» «An honest man's the noblest work of God,» «The wisest, brightest, meanest of mankind,» etc. A good account is to be found in Chapter VII of Leslie Stephen's 'Pope' in the English Men of Letters.

WILLIAM T. BREWSTER.

ESSAYS OF BACON. Bacon's 'Essays' were practically the first things in English literature to be called by the name «Essay.» That word, in the 16th century, generally carried the idea of attempt or trial and it was in some such sense that Bacon used it. In the 10 essays first published he gave, not finished treatments but rather tentative reflections. He himself calls them «certain brief notes set down rather significantly than curiously (i.e., suggestively rather than carefully), which I have called Essays.» Montaigne had used practically the same word in French a few years before and almost immediately after Bacon's collection it began to be common. The essay developed into several forms in the 17th century, but in the earlier essays there was something of the experimental, incomplete character which we do not generally have in mind when we think of the essay at present. The subject matter of Bacon's 'Essays' was also informal and familiar. His own often-quoted words are that the 'Essays' have been "the most current" of his works because "as it seems, they come home to men's business and bosoms." The 'Essays' are, in fact, the sincere and natural thoughts of a great man, not elaborately molded into a monumental work, but set down much as they may have come to his mind when he had leisure to think of the things that interested him. Bacon was a great figure in the development of philosophy and science, but it is not for such reasons that his 'Essays' have been read. The subject matter of the 'Essays' is mostly the thoughts and ideas that come to the private heart of man as he thinks of himself, of how he gets on in the world, and how he stands with eternity and with God. There is in them much that belongs especially to the private thought of Bacon, who lived the life of a courtier and a man of affairs as well as that of a scholar. But everyone finds something of interest in the 'Essays,' for they give the natural reflections of a powerful mind as it considered the things that are likely to occur to everybody. In style the 'Essays' are generally less familiar than in substance. In the matter of expression they are concise and polished, by no means the sort of thing that a man could write offhand. Though, each as a whole, they do not make complete and finished treatments, yet the separate sentences are condensed and often proverbial and seem carefully corrected, as a comparison of the different editions shows they are. The 'Essays' were first published in 1597, when 10 only appeared, dedicated to his brother. In 1612 appeared a new edition containing 38 essays, nine of them of the earlier collection. In 1625 the last edition in Bacon's life contained 19 essays more. There have been numberless editions since, among which are E. Arber's 'Harmony,' and the editions with annotation by R. Whately, W. A. Wright and J. Spedding.

EDWARD E. HALE.

ESSAYS FROM THE EASY CHAIR. In 1854 George William Curtis began to write familiar and personal essays in a department of *Harper's Magazine* called "The Easy Chair." He continued to do so for the 38 remaining years of his life, writing approximately 2,500 in all. In these essays he dealt with every sort of imaginable subject — "with worthies ancient and modern, with early impressions and striking contemporary situations, with poets and novelists and orators and actors and musicians, with every aspect of the social comedy as viewed by the most genial of spectators, with all matters that seemed to lend themselves to his purpose of unobtrusive didacticism — a purpose so veiled by animated and fanciful discourse that the reader is hardly conscious of its existence." From these essays three volumes of representative essays were selected and republished after his death. They not only throw interesting side-lights upon his own life and personality, but together they constitute a series of invaluable incidents and interpretations of American life for nearly half a century.

Curtis has many of the characteristics of the men who from Montaigne to Stevenson have made of the personal type of essay one of the permanent and most delightful forms of literature. The light touch, personal likes and dislikes, character sketches, delicate humor and pathos, suggestive bits of wisdom, are all found in his essays. He suffers most by contrast with Lamb in his lack of felicitous literary allusion and in his failure to secure the more permanent effects of rhetoric, in the better sense of that word. He is perhaps more like Addison, or Goldsmith, or Irving, though less final in his power of expression than any of them.

A typical volume of these essays gives some idea of the range of his topics. He has reminiscences of Edward Everett, Emerson, Dickens, Thoreau, Wendell Phillips, Jenny Lind, Thackeray and Browning, each of whom is recalled in some typical lecture or conversation or dinner. The theatre figures in an account of Jefferson as Rip Van Winkle and in reminiscences of Fanny Kemble and John Gilbert. That he was fond of music is suggested in "The Opera in 1864," "Thalberg and Other Pianists" and "Cecilia Playing." Typical sketches of social life and of various aspects of New York are to be found in "Shops and Shopping," "Mrs. Grundy and the Cosmopolitan," "Easter Bonnets" and "The Town."

At the time Curtis was writing such essays for *Harper's Magazine* he was writing editorials for *Harper's Weekly* and delivering addresses throughout the country of an entirely different character. It is surprising that the man who was a leader in the movement for civil service reform, who helped to inaugurate the independent movement in American politics, and who at an earlier date took a prominent part in the organization of the Republican party, should have been able to detach himself from the stream of affairs as he did in his charming essays. In this respect, as in many others, he was like his friend James Russell Lowell, who wrote to him words that best give an interpretation of his personality:

> "Had letters kept you, every wreath were yours;
> Had the world tempted, all its chariest doors
> Had swung on flattered hinges to admit
> Such high bred manners, such good natured wit."

EDWIN MORRIS.

ESSAYS OF ELIA. Charles Lamb's Essays, the most famous and delightful of his works, were written in the spare hours of his busy life, and were originally published chiefly as contributions to the *London Magazine* from 1820 to 1833. The first collected volume, 'The Essays of Elia,' appeared in 1823; the second, 'Last Essays of Elia,' 10 years later. The signature Elia, which Lamb adopted from the name of a former clerk in the South Sea House where he had been employed, served as a thin disguise, under the cover of which the author revealed in an intimate way his own experiences and thoughts, distorting the actual facts of his life only so much as was necessary to preserve a semblance of anonymity.

The substance of many of the essays consists in reminiscences of Lamb's early years, toward which he looked back with a tender and romantic yearning. He describes, for example, in the essay entitled "Christ's Hospital Five-and-Thirty Years Ago," his schoolboy life and his first association with Samuel Taylor Coleridge; in "Blakesmoor in H——shire," a visit with his sister, Bridget Elia (Mary Lamb), to an old mansion in the country in his childhood; in "My First Play," his earliest sensations in the theatre; in "Old Benchers of the Inner Temple," the curious personalities of the antique lawyers with whom he had become acquainted in his boyhood home in London. In these essays and others which refer to the circumstances of his own life, Lamb admits us freely to the inner circle of his thought. He frankly confesses his weaknesses and his prejudices. He pictures in "The Superannuated Man" his sensations on finding himself at last free from the business routine of a lifetime; he even writes the "Confessions of a Drunkard," speaking seriously and truthfully of his own experience. Finally, in that most beautiful of all the essays, "Dream Children," he indulges in a vision, regretful but not unmanly, of what might have been had the circumstances of his sad life been different. In all this Lamb is lovable and charming. If a tender melancholy pervades some of the essays, others, like the famous "Dissertation on Roast Pig," are full of hilarious fun. In the majority of his sketches humor and pathos go hand in hand. The sentiment is relieved by brilliant flashes of wit which make Lamb rank as one of the chief of English humorists; the laughter is tempered by kindly sympathy.

Lamb's romantic love of bygone things is apparent everywhere in the essays. He complains of "the decay of beggars in the metropolis," writes "the praise of chimney-sweepers," describing with delightful humor the annual dinner given in their honor by his friend Jem White. He confesses to an almost feminine delight in old china, prefers the sun-dial to the clock and the old type of schoolmaster to the new. In human personality Lamb is most interested in out-of-the-way characters, with some peculiar humor or bias, "odd fishes," like the old-fashioned clerks of the South Sea House or the immortal, whist-playing Sarah Battle. A number of the essays deal with literary matters, particularly with the drama, in which he was much interested, and with those older authors like Sir Thomas Browne, toward whom he was drawn by his antiquarian instinct and by his liking for the unusual and piquant in literature as in life. As a critic Lamb is appreciative and informal, relishing his favorite authors rather than judging them. He is the best and most enthusiastic of all book-lovers.

Whatever his subject Lamb casts upon it the magic of a style rich in personality, picturesque, brilliantly witty and singularly responsive to the author's mood. Quaint turns of phrase and antiquated words, borrowed from the older writers of whom Lamb was fond, give a touch of oddity to his language which suits his highly individual type of humor.

The 'Essays of Elia' are the most attractive example in our literature of the personal or informal essay, compounded of wit and sentiment, observation and reflection, familiar in tone, whimsical and unexpected in idea, but richly human and often touching by way of intimation and suggestion on the deepest truths.

Consult 'The Works of Charles and Mary Lamb' (ed. E. V. Lucas, 1903–05); 'The Essays of Elia' (In 'Everyman's Library'), and 'The World's Classics' (Oxford); essays on Lamb in Walter Pater's 'Appreciations'; A. Birrell's 'Obiter Dicta' (2d series); G. E. Woodberry's 'Makers of Literature,' and C. T. Winchester's 'A Group of English Essayists.' For bibliography, consult 'Cambridge History of English Literature' (Vol. XII).

JAMES H. HANFORD.

ESSAYS AND REVIEWS, a work issued in 1860 by seven members of the Church of England, six of whom were laymen. It was severely criticized by the clerical body and in 1864 was condemned by convocation. Two of the seven contributors were sentenced to suspension of one year by the ecclesiastical courts, but the Privy Council reversed this sentence.

ESSEG. See ESZEG.

ESSEN, Hans Henrik, Count, Swedish statesman: b. Kaiås, West Gotland 1755; d. 1824. He received his education at the University of Upsala and entered the army in the service of Gustavus III. In 1795 he was made governor of Stockholm and five years later governor-general of Swedish-Pomerania and Rügen. In 1807 he defended Stralsund against the French and two years later was made a count and a councillor of state. Charles XIII made him Ambassador to France in 1910 and he was successful in having Napoleon restore Pomerania to Sweden. In 1811 he was made field marshal, campaigned in 1813 against Norway, of which he was governor in 1814–16. In 1817 he was transferred and made governor-general of Skåne. Consult the life by Wieselgren (Malmö 1855).

ESSEN, Germany, town of Rhenish Prussia, 18 miles northeast of Düsseldorf. It has recently greatly increased in population and manufactories. The cathedral, founded in the 10th century, is one of the oldest in Germany. It is celebrated for the steel and iron works of the Krupps (q.v.) the most extensive in Europe, employing 70,000 workmen in their various undertakings. This great establishment was started in 1811, with only two workmen. The rifled steel cannon made here were supplied to most of the armies of the world. In the suburbs are the "colonies"— cottages, churches, schools, stores, libraries, places of amusement, homes for superannuated and disabled workmen, etc., established by the Krupps for their workmen who, however, on pain of dismissal, are forbidden to become associated with any socialist or trade union organization. During the European War, Essen was frequently attacked and bombed by allied air squadrons. (See WAR, EUROPEAN). The town was founded in the 9th century, when the Benedictine abbey was established here, and for some time it was under the control of the Abbess of Essen. In the 10th century the Abbess Hagona gave the town municipal privileges. In 1803 it was incorporated into Prussia. The town of Ruttenscheid was annexed to Essen in 1905 and the commune of Huttrop in 1908. Pop. 295,000.

ESSENCE, in metaphysics, originally the same as substance. Later, substance came to be used for the undetermined substratum of a thing, essence for the qualities expressed in the definition of a thing; or, as Locke put it, "Essence may be taken for the being of anything, whereby it is what it is." ('Essay Concerning Human Understanding,' Book III, Chapter III, Section 15). It is now used in a wider sense, to designate the intrinsic nature of a thing. In chemistry, and in popular parlance, essences are solutions of the essential oils in alcohol, and may be prepared by adding rectified spirit to the odoriferous parts of plants, or to the essential oils, and distilling; or simply by adding the essential oil to the rectified spirit, and agitating till a uniform mixture is obtained. The term has, however, received a wider significance, and is applied to any liquid possessing the properties of the substance of which it professes to be the essence. Thus essences of coffee and beef contain in a concentrated form the virtues of coffee and beef, and in some circumstances may be substituted for them.

ESSENCE DE PETIT GRAIN (essence of small grain), a perfume produced by the distillation of small oranges while in an unripe state. The oranges for this purpose are taken when about the size of a cherry.

ESSENES, ĕs-sēnz', a sect or society of Hyper-Pharisaic Jews, in existence 150 years B.C., and which existed till the 2d century, the remnant then returning to Pharisaic or orthodox Judaism or entering the Christian communion. They are not mentioned in the Bible or rabbinical literature. Josephus the historian (1st century) describes their manner of life in some detail; Philo Judaeus has a notice of it, so too has Pliny in his 'Historia Naturalis.' Josephus was in his youth a probationer of the society, but lived among them only a short time and was unacquainted with the details of their system, which were strictly withheld from novices; but his narrative has the marks of authenticity. In essentials Josephus and Philo are in accord, and with them agrees Pliny in the one peculiarity of this society which he notices — their celibate life. The Essenes were stern ascetics and in that respect were the prototype of the Christian Solitaries, who in the 3d and 4th centuries peopled the Nubian deserts; withal, they were both in name and in deed Friends — for such was one of the appellations of the brethren. Among themselves they had all things in common, like the first Christians, and they were open-handed and hospitable to strangers. They are supposed never to have numbered more than 4,000 souls. There were groups of Essenes in all the towns of Judea, but their institute had opportunity for full development only in their communal settlements on the western shore of the Dead Sea, where they devoted themselves to their peculiar religious observances and to agriculture and a few simple handicrafts. Their food was of the simplest, taken at the common board, their only drink, water; their attire was of the plainest white linen material. None possessed more than one tunic or more than one pair of shoes. They rose at daybreak for prayer; after prayer and a hymn they went about their customary occupations. (Here we are reminded of what Pliny wrote to Hadrian concerning usages of the Christians in Bithynia: "They met on a stated day before daybreak and chanted a hymn to Christ as God.") At the 5th hour (11 A.M.) they again assembled in one place and bathed their faces in cold water, after which they put on pure white garments and repaired to the common simple meal, which was preceded by a blessing, a prayer and a hymn; and after the repast there was again prayer and a hymn. Then the brethren put off the ceremonial garb of white linen, put on their workday attire, and went back to their employments. No women were admitted to the order; like some of the modern Shakers they adopted young boys and brought them up in their own simple way of living; on attaining maturity they might, if willing, be admitted to membership after a term of probation; or they were free to return to the world. But they also received accessions of life-weary grown people. "Thus," says Pliny, "here is a people that never dies out (*æterna est*) yet in which there are no births; so fruitful for them is others' 'disgust of life'" (*Tam fecunda illis aliorum vitæ pœnitentia est*). They were opposed to trading as leading to covetousness, and to the making weapons of offense, and rejected animal sacrifices. Like the Society of Friends they forbade oaths; and they held that a man whose word needed to be confirmed by oath was not to be believed at all. Nevertheless the postulant for admission into the society was required to take "terrible oaths" that he would pay worship to God, be just to men, injure none, hate the unjust, be faithful and true to all, especially rulers, for none bears rule save by God's will. Pliny writes of a similar oath taken by the Christians.

There were four degrees of membership resembling in some respects the castes of the Hindus. If a person in a higher degree so much as touched one of a lower grade, he was thereby defiled and was bound to make himself clean in cold water. Their severely abstemious life, their contempt for riches and honors, their deep conviction of the immense superiority of their religion gave them all the heroic courage in face of persecution and torture which distinguished the Christians in the ages of martyrdom. So scrupulous were they in avoiding everything like idolatry, that some of them would never enter any city because of the images erected at the gates; nor would they touch a coin that bore the likeness of any ruler.

Bibliography.— Pliny, 'Historia Naturalis'; the writings of Josephus and Philo Judacus; also *Philosophumena*, or 'Refutation of all Heresies,' written in Greek 230 A.D., author unknown; Lightfoot, 'Colossians and Philemon' (3d ed., London 1879); Fairweather, 'The Background of the Gospels' (New York 1908); Pfleiderer, 'Primitive Christianity' (Eng. trans., New York 1912); and Hastings, 'Encyclopedia of Religion and Ethics.'

ESSENTIAL OILS are those volatile aromatic constituents of certain flowers, fruits, seeds, etc., which contain their specific odors and flavors — that is, the properties which delight the senses of smell and taste. The object aimed at in the manufacture of these essences is that they may be transferred to other combinations, through which the pleasure they afford may be enjoyed to a far greater extent. The delicacy of the methods to be employed may be better appreciated when it is remembered that these oils are products of the living plants,

and that immediately upon harvesting the plant the essences begin to deteriorate, the loss varying with the period which elapses between the time when the life of the plant is halted and the time when the essential oil is finally secured in a permanent form. Another point to be carefully attended to is that each essence is at its best at a certain time in the growth of the plant, and that it must be taken at that time — neither immature nor past maturity. Other conditions are liable to affect the product injuriously, and heat is one of these. The delicate essence of the strawberry is quickly dissipated if the sun beats down hot upon it, and many other essential oils are as sensitive to heat. And this peculiarity of course prevents the use of the chief refining process of the chemist, that of distillation, for these particular oils. An example of this condition is presented in winning the oil of lemon from the peel. Any attempt to obtain this oil by heat results in a product of low quality. The fine flavor has to be gained by cold pressing of the raspings of the surface. The banana, peach and pineapple are in the same class with the strawberry and the lemon in this respect. This difficulty is overcome in large measure by dissolving out the essential oils with alcohol, and distilling the alcoholic solution under vacuum — which so reduces the degree of heat needed that the delicate flavors are preserved. Another condition likely to injure these sensitive substances is undue exposure of the plants or fruits to the air after harvesting. Some oils quickly become rancid, and in the case of others fermentation of the source of the oil completely destroys it. The class of flavors and odors which are injured by fermentation is practically the same as that which is supersensitive to heat. In the case of some other essences, as of the apple and cherry, fermentation of the fruit serves to accentuate its particular flavor.

Volatile oils consist of two component groups, the taste-carriers and the terpenes. In addition to these there may be varying proportions of waxy and resinous matters. The aim of the manufacturing processes is to eliminate all but the taste-carriers' constituents, for it is solely upon these that its market value depends.

The methods employed in making essential oils are (1) expression; (2) distillation; (3) extraction. The first makes use of simple pressure; the second uses distillation with water or steam, and subsequent rectification to remove the water; the third is carried on by dissolving out the desired oil with a solvent, such as alcohol, chloroform, benzol, etc., these solvents being afterward distilled off at a low temperature under vacuum. The terpenes are removed from some kinds of oil by the vacuum process, being the first to pass over on the rise in temperature. The sesquiterpenes follow. At a slightly higher degree the true flavor carrying oil comes over. When it is necessary to raise the temperature again, the fractions which then distil over are gathered separately, as not of the highest quality. Another method of removing the terpenes used with a class of oils which cannot be worked by the first process, is by alcoholic distillation. In this process one part of the oil to be treated is mixed with five parts of 43 per cent alcohol. Upon heating this mixture vapors containing about 80 per cent alcohol and 20 per cent water, together with the vapors of the oil, pass over into a receiver where they are condensed. The terpenes separate as they are insoluble in alcohol of that strength. The essential oils remain in solution with the alcohol. The process is continued until the collecting terpenes cease to increase in quantity. The oil thus purified is dried by agitation with anhydrous sodium sulphate, and placed in lightproof and airproof bottles. From these essential oils are made the so-called "essences," tinctures, flavoring extracts, syrups for soda water, perfumes, cordials, liqueurs, etc. Many of the essential oils are used as medicine, or in medicinal preparations, ointments and liniments.

The United States Census of Manufactures for 1919 reported 78 establishments engaged in the manufacture of essential oils, employing 497 persons, of whom 321 were wage-earners receiving annually $391,000 in wages. The capital invested totaled $6,380,000, and the year's output was valued at $5,698,000; of this, $1,795,-000 was the value added by manufacture. Nine other establishments reported making essential oils as a subsidiary product and the value of their production was placed at $199,066. See OIL.

ESSENTUKI, or **ESSENTUKSKAYA**, Russia, a health resort in the territory of Terek, northern Caucasus, 10 miles north of Pyatigorsk. It is 2,000 feet above sea-level and is widely known for its cold alkaline springs. Pop. 8,000.

ESSEQUIBO, ĕs-sē-kē'bō, the largest river of British Guiana, draining about one-half of the area of the colony. It rises in the northern slope of the Akarai Mountains, which marks the watershed between it and the Amazon, takes an irregular northerly course, and flows into the Atlantic west of Georgetown by an estuary 20 miles in width. Its whole length is about 600 miles. It is navigable for some distance from the ocean. The district or division of Essequibo, which is in the basin of the Essequibo River, is well cultivated and extremely fertile, producing coffee, cotton, cocoa and sugar. Its principle tributaries are the Mazaruni, Cuyuni, Potaro, Siparuni and Rupun. A portion of the basin of this river was included in the disputed territory claimed by the Venezuelan and the British governments in 1896. The claims were settled by an arbitration of treaty 2 Feb. 1897, and the award made 3 Oct. 1899. Pop. 36,000.

ESSEX, Arthur Capel, 1st (CAPEL) EARL OF, English statesman: b. January 1632; d. 13 July 1683. At the Restoration he was created Viscount Malden and Earl of Essex. He became troublesome to Charles II and to be rid of him the latter sent him as Ambassador to Denmark. His conduct in Denmark restored him to favor and in 1672 he was made privy councillor and lord-lieutenant of Ireland. His subsequent administration lasted five years and was most successful and honest. He kept a just balance between the Catholics, Presbyterians and the members of the Church of England. His opposition to corruption in the administration made him many enemies, who through intrigue brought about his recall. He joined the so-called Country Party under Lord Halifax and again became noted for his opposition to the Crown. With Shaftesbury he supported the Exclusion Bill, designed to keep James from the throne. In 1683 he was arrested and placed in the Tower. His spirits appear to have been cast down and about a month after his arrest he was found with his throat cut. Consult ‹Dictionary of National Biography› and ‹Essex Papers› (Camden Society 1890).

ESSEX, Robert Devereux, 2D EARL OF, English courtier: b. Netherwood, Herefordshire 19 Nov. 1566; d. London, 25 Feb. 1601. He was educated at Trinity College, Cambridge, and appeared at Court in 1577. He greatly distinguished himself at the siege of Zütphen in 1786. On Leicester's death 1588, he became the chief favorite of Elizabeth. In 1590 he married the widow of Sir Philip Sidney, and in 1591 was sent to support Henry IV against Spain, but the expedition effected nothing of importance. About this time Essex was on terms of close friendship with Francis Bacon, who assisted him greatly by advice on political and other matters. In 1596 he commanded an expedition to Spain, and greatly distinguished himself at the capture of Cadiz. In 1597, after an unsuccessful expedition to the Azores, he, with Howard and Raleigh, made extensive captures of Spanish ships. He became earl marshal and chancellor of the University of Cambridge. Next year he quarreled with the queen, who struck him on the ear and bade him "go and be hanged." After some months a reconciliation took place, and he was appointed lord-lieutenant of Ireland (1599), then in a state of rebellion. He returned to England in September, having been entirely unsuccessful in his government and made a humiliating truce with the rebels; was made a prisoner in his own house, and was shortly afterward (June 1600) tried by special court. The charges against him were that he had exceeded his instructions in the Irish campaign, and had deserted his post without leave; and he was deprived of all his offices, and sentenced to imprisonment, but not long afterward was set at liberty. He now conceived a deep resentment against the queen's councillors particularly Cecil and Raleigh, who, he imagined, had biased her against him. Being summoned before the council, he assembled his friends in his house, and proceeding to the city, endeavored to enlist the citizens to enforce dismissal of the queen's ministers. After a skirmish with a party of soldiers he returned to his house, but after a short defense was compelled to surrender, and sent to the Tower. He was tried for treason on 19 February and executed on 26 Feb. 1601. Consult Croxall, ‹Memoirs of the Unhappy Favorite› (1729); Spedding, ‹Bacon› (1881); Abbott, ‹Bacon and Essex› (1877).

ESSEX, Robert Devereux, 3D EARL OF, English soldier: b. 1591; d. 14 Sept. 1646. When 11 years old he was restored by James I to the rank and titles held by his father, the 2d earl. He served in the army of the elector palatine in Holland 1620–23, was vice-admiral of an unsuccessful naval expedition against Cadiz in 1625, and lieutenant-general of an army sent by King Charles against the Scotch Covenanters in 1639. He, however, was opposed to the arbitrary measures of the king, refused payment of the forced loan in 1626, supported the Petition of Right, and in spite of attempts to detach him, favored the execution of Strafford. Espousing the cause of the Parliament against the king, he was appointed to the command of the parliamentary army at the beginning of the civil war, was victorious over Charles at Edgehill in 1642, captured Reading in 1643, and relieved Gloucester, but his invasion of Cornwall in the following year was a failure; the greater part of his army surrendered at Lostwithiel, and he was obliged to escape by sea. He dissented from Cromwell's measures against the Scots as likely to stir up ill will between the two nations, and resigned in anticipation of the Self-Denying Ordinance in 1645.

ESSEX, Thomas Cromwell, Earl of. See CROMWELL, THOMAS.

ESSEX, Walter Devereux, 1ST (DEVEREUX) EARL OF, English soldier: b. 1541; d. 1576. He served as high marshal under Warwick and Clinton in 1569 and rendered valiant service in putting down the rebellion in the north. In 1572 he was created Earl of Essex as a reward for his zeal in the queen's service. In 1573 he offered to subdue and colonize a portion of the province of Ulster. His offer was accepted with some modifications and he set out in July 1573 with a force of about 1,200 men. Storms delayed the expedition and sickness, death and desertions cut the force to about 200 men. Meanwhile Essex was in difficulty with the lord deputy, Fitzwilliam, his operations consisted of raids and brutal assaults on the O'Neills. By treachery he captured Sir Brian MacPhelim, leader of the O'Neills, slaughtered his attendants, and executed him, his wife and brother at Dublin. He next prepared to attack the Irish chief, Tirlogh Luineach, defeated him and massacred several hundreds of the followers of Sorley Boy McDonnell, mostly women and children whom he found hiding on Rathlin Island. In 1575 he was recalled, retired from public life, but returned to Ireland the year following as earl marshal. He died in Dublin soon after his arrival.

ESSEX, Canada, a town in the province of Ontario, on the Michigan Central Railroad, 15 miles southeast of Windsor. Electric tramways connect it with Leamington, Kingsville and Windsor. It contains flour and planing mills, brick and tile yards and a large canning establishment. Natural gas is plentiful in the district. Pop. 1,353.

ESSEX, Conn., a town in Middlesex County, on the New York, New Haven and Hartford Railroad, and on the Connecticut River, 30 miles southeast of Hartford. It contains a large piano factory, a tool factory and a public library. Pop. 2,745.

ESSEX, England, a maritime county, on the southeastern coast; area, 1,530 square miles, of which 80 per cent is under cultivation. In the northwest wheat and barley are the principal crops; fringing the coast were formerly swamps, now turned with excellent grazing land; there are no great manufactures, but the fisheries are important. The Stour, Colne, Blackwater, Lea and Thames are the principal rivers. The chief towns are Chelmsford, the county town, Colchester, Maldon and Harwich. Essex is one of the six "Home Counties," and took its name from the East Saxons, whose monarchs reigned over it from A.D. 617 to 823, when the kingdom was absorbed by the West Saxons. It was recognized as Danish territory by Alfred the Great at the Peace of Wedmore in 879, but was reconquered by his son, Edmund the Elder. In 1045 it was a part of the earldom of Harold, but passed into the hands of the Norman conquerors. The county was rich in monastic foundations, of which few traces remain; and has some noteworthy ancient churches and other ecclesiastical antiquities. The county for parliamentary purposes is divided into eight divisions, each returning one member. Pop. 1,350,881.

ESSEX, Vt., town in Chittenden County, on the Central Vermont Railroad, 10 miles northeast of Burlington. It is the seat of the Essex Classical Institute. Agriculture and dairying are the only industries. Pop. 2,714.

ESSEX AND ALERT, Naval Action Between the, in the War of 1812. On 3 July 1812 the American frigate *Essex*, rated as a 32 but carrying 44 guns, under Capt. David Porter (q.v.) and with David G. Farragut (q.v.) as a midshipman, left New York and after capturing a brig containing 197 soldiers on 10 July, came up with (30 August) and was chased by the British sloop of war *Alert* (rated at 16 guns, but carrying 2 long 12's and 18 short 32's), under Capt. Thomas L. P. Langharne. Deceived as to the nature of the *Essex*, the *Alert* closed up and opened fire, whereupon the *Essex* nearly sank her with a broadside and after five minutes of fighting compelled her to strike her colors. The *Alert* was then converted into a cartel and Porter's prisoners were sent in her on parole to Saint John's, Newfoundland. After taking a few more prizes and being chased by two British ships, Porter returned to port 7 September. Consult Cooper, J. F., ‹Naval History› (Vol. II, pp. 52–55); Farragut, Loyall, ‹Life of Farragut› (pp. 15–17); James, William, ‹Naval Actions› (pp. 5–6); Maclay, E. S., ‹History of the Navy› (Vol. I, pp. 326–31); Roosevelt, ‹Naval War of 1812› (pp. 52–82); Spears, John R., ‹Life of Farragut› (pp. 47–51), and ‹History of Our Navy› (pp. 33–50).

ESSEX HOG. See HOGS.

ESSEX JUNCTION, Vt., village in Chittenden County, seven miles east of Burlington, on the Central Vermont Railroad. It contains Fort Ethan Allen and a national army post. It has also grain and lumber mills, brickyards, a corn-canning factory and a butter factory. Its agricultural interests are extensive. The village owns its water plant. Pop. (1920) 1,410.

ESSEX JUNTO, a name applied about 1778 by John Hancock to the group of Massachusetts political leaders resident in or connected with Essex County, Mass.— the northeastern county, from just north of Boston to the New Hampshire boundary. Its coast was a line of commercial and fishing towns and its interests therefore overwhelmingly in favor of a strong national government to protect them from foreign countries and their sister states. This made its leaders, whose great ability gave them powerful influence, the vanguard of the ultra Federalists and adherents of Hamilton, whom they followed in his split with John Adams. The latter revived the old nickname, charged them with being a "British faction" and forcing on a war with France and for years after his retirement assailed them in the press. When the embargo (q.v.) and the later war solidified all New England Federalism in a common self-defense, all the opposition and the suspected treason were attributed by outsiders to the Essex Junto. Its chief members were George Cabot, Timothy Pickering, Theophilus Parsons (State chief justice), the Lowell family, Stephen Higginson and Benjamin Goodhue. The "Junto" disappeared with the War of 1812 as far as its influence on national affairs was concerned. It held on for a few more years in some New England States, but by 1823 its candidates were defeated even in Essex County. Consult Brown, C. R., ‹The Northern Confederacy according to the Plans of the Essex-Junto› (Princeton 1915).

ESSEX, PHŒBE AND CHERUB, Battle of the, in the War of 1812. On 28 Oct. 1812, the *Essex*, under Capt. David Porter (q.v.), passed the Delaware Capes and ran south to meet the *Constitution*, but failing in this continued her voyage and on 12 December, a little south of the equator, captured the British frigate *Norton*, which was dispatched to the nearest American port but which on the way was recaptured by the *Belvidere*. Porter then sailed around Cape Horn, arrived at Valparaiso, Chile, 14 March 1813, supplied his ship and in the next few months cleared the seas of British whalers and warships, one of which he turned into a 20-gun ship and renamed the *Essex Junior*. After numerous adventures the two ships put in at Valparaiso, where on 8 Feb. 1814, they were found and blockaded by the British frigates *Phœbe* (13 long 18's, 1 long 12, 1 long 9, 7 short 32's and 1 short 18), Capt. James Hillyar, and *Cherub* (2 long 9's, 2 short 18's and 9 short 32's). The *Essex* was armed with 17 short 32's and 6 long 12's so that while she could overpower the *Phœbe* at short range, the latter's long range 18 pounders would enable her completely to destroy the *Essex* from a position beyond reach of the latter's guns. For a month Porter lay practically idle, but, on learning of the approach of several other ships, had decided to run the blockade when on 28 March 1814, the *Essex* parted her port cable; he thereupon attempted to escape but a mishap compelled him to return. As he was anchored in a small bay a short distance from shore, Porter supposed the British would respect the neutrality of the port and had begun to make repairs when the *Phœbe* and *Cherub* bore down on him and a few minutes before 4 o'clock opened fire. As the *Phœbe* was on her stern and the *Cherub* off her starboard bow, the *Essex* could not reply effectively with her broadside, but Porter ran two long 12's out of the stern ports and at 4.30 compelled the *Phœbe* to haul off to repair damages. Since Porter's long guns could not be brought to bear and his carronades could not reach them, the British ships then proceeded leisurely to pound the *Essex* to pieces, the *Phœbe* anchoring and firing her broadsides of long 18's into the quarter of the *Essex* while the *Cherub* kept under way and threw solid shot from her bow guns. Porter then attempted to run his vessel ashore but was prevented by a shift of the wind; accordingly he let an anchor go, brought the head of his vessel around and gave the *Phœbe* a broadside that crippled her and caused her to drift away with the tide. Unfortunately at this moment the hawser of the *Essex* parted and, a helpless wreck, she aimlessly floated toward her antagonist; twice she took fire, part of her powder exploded, she had been hulled at almost every shot, and at 6.10 her colors were hauled down, though the British did not cease firing until 6.20. The *Essex* lost 58 killed and 66 wounded and 28 drowned or missing out of her crew of 255, while the British loss was only five killed and 10 wounded. The *Essex Junior* was converted into a cartel and Porter and the survivors were sent to New York, arriving in July 1814. Consult Adams, 'United States' (Vol. VIII, pp. 174–181); Barnes, James, 'Naval Actions of the War of 1812' (pp. 171–87); Cooper, J. F., 'Naval History' (Vol. II, pp. 76–97); James, William, 'Naval Actions' (pp. 78–82); Maclay, E. S., 'History of the Navy' (Vol. I, pp. 543–75); Mahan, A. T., 'War of 1812' (Vol. II, pp. 244–52); Porter, 'Journal of a Cruise made to the Pacific Ocean by Capt. David Porter in the United States Frigate Essex' (2 vols., 1815); Porter, David D., 'Life of Porter'; Roosevelt, 'Naval War of 1812' (pp. 293–309); Spears, J. R., 'History of Our Navy' (Vol. III, pp. 1–53); Wiley and Rines, 'The United States' (Vol. V, pp. 486–93); and biographies of D. G. Farragut, by Loyall Farragut, J. R. Spears, A. T. Mahan, James Barnes and P. C. Headley.

ESSEX SKULL. See MAN, PREHISTORIC TYPES OF.

ESSIPOFF, Annette, Russian pianist: b. Saint Petersburg 1851. She studied under Leschetitzky, of whom she was the most brilliant pupil. In 1874 she began her career in Saint Petersburg, made successful tours in Europe, and in 1876 visited the United States, where she also achieved a large measure of success. She married Leschetitzky in 1880, but the pair soon separated and were divorced. She taught piano at the Saint Petersburg Conservatory from 1893 to 1908.

ESSLINGEN, or **ESSLING,** Austria, a village about six miles east of Vienna, famous as the scene of a battle between the French and Austrians on 21–22 May 1809. It is sometimes known as the battle of Aspern.

ESSLINGEN, ĕs'ling-ĕn, Germany, town in Würtemberg, on the Neckar, seven miles east-southeast of Stuttgart. It was founded in the 8th century and was long a fortified, Imperial free town. There are three noteworthy churches of the 12th, 13th and 15th centuries respectively. Originally Esslingen belonged to the duchy of Swabia and the Swabian League of Swabian cities and governments was formed here in 1488. There are great railway workshops, manufactories of machinery, cutlery, cotton, dye-works, paper and beer. Pop. 32,364.

ESSON, William, British mathematician: b. 1838. He received his education at the Inverness Royal Academy and at Oxford. In 1860–97 he was Fellow of Merton College and also of New College. In 1894–97 he served as deputy Savilian professor and after the latter year was full professor at Oxford. He was elected member of the Royal Society, in whose 'Transactions' appeared his 'Laws of Connection between the Conditions of Chemical Change and its Amounts' (1864, 1866, 1895) and 'Variations with Temperature of Rate of Chemical Change' (1912).

ESSONITE, or **HESSONITE,** a variety of garnet (q.v.), also often called Cinnamon-stone (q.v.).

ESSONNES, es'son, France, town in the department of Seine-et-Oise, 20 miles southeast of Paris. Its industries comprise iron foundries, linen and paper manufactories and machinery. Pop. (commune) 9,348.

ESTABLISHMENTS, Ecclesiastical, religious bodies having prescribed relations to the state in return for which they enjoy various privileges and are obligated to certain duties. The origin of the custom harks back to the period when the religious belief of a nation was unanimous and there existed much less of a mixture of faiths such as we witness to-day among practically all modern nations. In England, the connection between Church and State grew up prior to any formal legislation on the subject, and at the Reformation, as in other countries which then changed their spiritual affiliation, passed to the new denominations. In Ireland the Protestant Church, though in a minority, enjoyed all the privileges of an established church until 1870. The usual connection between an established religion and the state is seen in the appointment of higher church officials by the secular power, by taxation for the support of the clergy, by regulation of religious property, by the maintenance of ecclesiastical courts in which the canon law is enforced, and by the founding of a system of education under the general supervision of the clergy. England, Greece, Sweden, Norway, Prussia and other German states, and until 1917 Russia, have established churches. In certain republics of Latin America the Catholic Chuch enjoys special privileges, but the nearest approach to an established church in America is to be found in the Province of Quebec. For the particular relations existing between the church and these states see articles on the various countries.

ESTAING, ĕs-tăṅ, **Jean Baptiste Charles Hector,** COMTE D', Marquis of Saillans, French army and navy officer: b. Auvergne, 1729; d. Paris, 28 April 1794. He entered the French army as colonel of infantry; was promoted to brigadier-general in 1757, and in 1777 became vice-admiral in the French navy. In 1778, in accordance with the treaty between France and the United States, France fitted out a fleet of 12 ships of the line and four frigates to aid the latter in the struggle against Great Britain and Estaing was placed in command. He sailed 13 April, reached Delaware Bay in July, and proceeded to New York. He captured some prizes off the coast of New Jersey, agreed to assist in a land and sea attack on Newport to expel the British from Rhode Island; reached the harbor late in July; and hearing of the approach of a fleet, put to sea to meet it. He was overtaken by a severe storm, which caused him to put into Boston for repairs and the projected attack failed. Subsequently he captured Saint Vincent and Grenada, West Indies, and in 1779 co-operated with General Lincoln in an ineffectual attempt to capture Savannah, Ga. He returned to France in 1780. He commanded the allied fleets of France and Spain in 1783; was chosen admiral of the navy in 1792. He was in favor of the French Revolution, and was one of the Assembly of Notables. In 1789 he was commander of the National Guard, and three years later admiral by the selection of the Legislative Assembly. Two years later, probably because he had tried to save the life of Marie Antoinette, despite his eminent military and naval services to France he was condemned as a royalist and guillotined. Estaing had ambition to shine as a literary man and he wrote poetry, a drama and a work on the Colonies.

ESTAMPES, or **ETAMPES, Anne de Pisseleu,** DUCHESSE D', French adventuress, mistress of Francis I: b. 1508; d. 1585. She was maid of honor to Louise of Savoy, the mother of Francis, who fell under her charms in 1526 soon after his return from Spain. At the age of 28 she was married formally to Jean de Brosse and received the title of Duchesse d'Estampes. She wielded a powerful influence over Francis, but there soon arose a rival in the person of Diane de Poitiers, the mistress of the Dauphin. Political parties gathered about these two courtesans but the accession of Henry in 1547 totally eclipsed the Duchesse d'Estampes who retired to her estates. She embraced Protestantism and was a staunch supporter of the Huguenot cause. Consult Paris, Paulin, 'Etudes sur François Ier' (Paris 1885).

ESTANCIA, ĕs-tanthē-ā, Philippines, a pueblo of the province of Iloilo, situated on the eastern coast of the island of Panay, 66 miles north of the town of Iloilo. The main portion of Estancia is one mile inland, connected by a good road with the coast and anchorage ground. Pop. 12,700.

ESTATE, a term sometimes used to indicate property generally, whether personal or real. Sometimes it includes land alone. It signifies in law the interest which a person may have in property. It denotes the time during which ownership may exist, as for a year, for life or forever. At common law estates in land are divided, as regards the quantity of interest, into two kinds, (1) freehold estates, and (2) estates less than freehold. A freehold is an estate which may last for life or longer. An estate which is circumscribed within a certain number of years, or one in which the possessor has no fixed right of enjoyment, is less than freehold, and although in fact it may last longer than the life of its first possessor, still the law regards it as a lower estate than a freehold; it is personal property in the eye of the law, and does not descend to heirs, although it may pass to executors or administrators.

Freehold estates are divided into estates of inheritance, which pass to heirs, and estates not of inheritance; the former are again divided into estates in fee simple and estates in fee tail. An estate in fee simple is the estate which a man has where lands are given to him and his heirs absolutely without any end or limit put to his estate, and it is the most extensive and the highest interest a man can have in land. If not aliened or devised, it passes to heirs generally. On the other hand, a fee tail is an estate which is limited to certain particular heirs or to a certain class of heirs, to the exclusion of the others; as to the heirs of one's body, which excludes collateral heirs, or to the heirs male of one's body, which excludes females.

In the United States fee tails have had only a limited existence, and are now in general abolished. They were changed into estates in fee simple in New York as early as 1782. Freeholds not of inheritance are for life only, either for the life of the tenant or of some other person or persons; when the estate is called an estate *pour autre vie.* Life estates are created by operation of law, or by the act of the parties. An example of an estate created by act of the parties is where A conveys land to B for the term of his natural life, or where A conveys land to B without mentioning the duration of the term. Here under the common law B would take only a life estate; but by statute in many of the States — among them New York — a grant or devise of real estate possesses all of the interest of the grantor or testator, unless the intent to pass a less estate or interest appears by express terms or by necessary implication.

Dower and curtesy are estates created by operation of law. An estate by the curtesy is that estate to which a husband is entitled upon the death of his wife in the lands or tenements of which she was seized in possession in fee simple or fee tail, during their coverture, provided they have had lawful issue born alive, and possibly capable of inheriting her estate. An estate in dower is an estate which a widow has for her life in some portion of the lands of which her husband was seized at any time during coverture, and which her issue might have inherited if she had any, and which is to take effect in possession from the death of her husband.

Estates less than freehold are divided into estates for years, at will and by sufferance. An estate for years is an interest in lands by virtue of a contract for the possession of them for a definite and limited period of time. Such estates are ordinarily called terms. The length of time for which the estate is to endure is of no importance in ascertaining its character, unless otherwise declared by statute. An estate at will is where one man lets land to another to hold at his will, as well as that of the lessee. An estate of this kind is terminated by either party on notice. Out of estates at will a class of estates has grown up called estates from year to year, which can be terminated only by six months' notice, expiring at the end of the year. An important element in creating this estate is the payment of rent. An estate at sufferance is the interest of a tenant who has come rightfully into possession of lands by permission of the owner, and continues to occupy the same after the period for which he is entitled to hold by such permission. This estate is not of frequent occurrence, but is recognized as so far an estate that the landlord must enter before he can bring ejectment against the tenant. If the tenant has personally left the house, the landlord may break in the doors, and the modern rules seems to be that the landlord may use force to regain possession, subject only to indictment if any injury is committed against the public peace.

Estates may depend upon condition; that is, their existence may depend on the happening or not happening of some event whereby the estate may be created, enlarged or defeated. A term for years, a freehold or a fee may thus be upon condition. The condition must either be precedent, that is, must happen before the estate can vest or be enlarged; or must be subsequent, when it will defeat an estate already vested.

Estates may also be divided into estates which are legal and those which are equitable. Estates are termed equitable when the formal ownership is in one person, while the beneficial ownership is in another. In another form of expression it may be said that a trust is created. The nature of the estate is not affected by this distinction. For example, a trust estate may be an estate for life or a fee, and in the latter case is transmissible to heirs as though it were a legal estate.

Estates are divided into estates in possession and estates in expectancy, in regard to the time of enjoyment. An estate in possession is one in which there is a present right of enjoyment. Estates in expectancy are those which give either a vested or contingent right of future enjoyment. Estates are also divided, in regard to the number of owners, into estates in severalty, in joint tenancy, in common and in coparcenary. An estate in severalty is one which has only a single owner. An estate in joint tenancy is an estate owned jointly by two or more persons, whose title is created by the same instrument. The right of survivorship is the distinguishing characteristic. When a tenant dies his interest is extinguished, and the estate goes to the survivors. Where an estate is conveyed to two or more persons, at common law, without indicating how it is to be held, it is construed to be in joint tenancy. In most of the United States, however, this rule has been changed by statute, and persons to whom an estate is conveyed or given take as tenants in common, unless they hold as trustees. An estate in common is an estate held in joint possession by two or more owners at the same time by several and distinct titles. An estate in coparcenary is an estate which several persons hold as one heir, whether male or female. This estate has the three unities of time, title and possession. The interests, however, of the coparceners may be unequal. In the United States this estate is essentially extinguished, and heirs take as tenants in common.

ESTATE DUTIES. See Death Duties.

ESTE, ĕs-tā, the name of an illustrious and ancient Italian family. Albert Azzo II is considered the founder of the greatness of his house. He inherited or acquired Este, Rovigo, Montagnana, Casal Maggiore and other places in Italy; and was made governor of Milan by Henry III in 1045. One of his sons became Duke of Bavaria in 1071, by the title of Welf I. He was the ancestor of the German branch of the house of Este, the dukes of Brunswick and Hanover from whom the royal house of Great Britain, also called Este-Guelphs, trace their descent. Albert Azzo died 1097, having previously resigned his Italian possessions to his son Fulk, and retired to Burgundy. Fulk I was attacked by his brother Welf, who compelled him to become tributary to him to the extent of a third of his revenues. He was succeeded (1137) by his son Obizzo I, who joined the Lombard league against Frederick Barbarossa in 1167. He d. 1193, and was succeeded by his son, who in the annals of the family is called Azzo V. Either he or Oberto acquired by marriage Ferrara, with its dependencies in Romagna, and with a feud which became hereditary with the house of Torello, for a member of which house the bride, violently carried away by the Estes, was intended. The house of Este thus became vassals of the Church as well as of the Empire. He was succeeded by Azzo VI (d. 1212). He was constantly engaged in war with the Torelli, by whom he was thrice driven from Ferrara. Aldobrandino, his son, died young, and was succeeded by his brother Azzo VII, a minor, in 1215. He was engaged in protracted wars with the Ghibelline party. Honorius VII invested him with the marquisate of Ancona. He d. 1264, and was succeeded by his grandson, Obizzo II, who was chosen lord of Modena and Reggio. We may pass over his successors to Niccolo III, who succeeded in 1393 at the age of nine. During his reign, and those of some of his predecessors, the house of Este became patrons of literature. Niccolo died at Milan 26 Dec. 1441. Lionel, his son (1441–50), receives a high character from Muratori for justice and piety, and for his patronage of letters. He mediated a peace in 1450 between the Venetians and Alfonso, king of Sicily, and died in November of the same year. He was succeeded by his brother, Borso (d. 20 Aug. 1471), who received new accessions of dignity from the emperor, and was created Duke of Ferrara by Pope Paul II. His reign was peaceable and prosperous. Ercole I, his brother (d. 25 Jan. 1505), succeeded, to the prejudice of his son Niccolo. His usurpation caused a war, which was unsuccessful in deposing him. He had Milan and Florence for allies, the Pope and Venice for adversaries. After the conclusion of peace in 1484 he maintained neutrality in his estates for the remainder of his reign, while the rest of Italy was convulsed with wars and revolutions. He had for his minister Boiardo, the famous author of the 'Orlando Innamorato'; and Ariosto, born near the commencement of his reign, grew up under his patronage. Alfonso I, his son, d. 31 Oct. 1534. His reign was a contrast to the peaceable one of his father. In 1509 he joined the League of Cambrai, and commanded the Papal army as gonfalonier. While conducting the operations of the allies elsewhere, his estates were ravaged by the mercenary troops of Venice, whose atrocities are described in the 36th canto of the 'Orlando Furioso.' Alfonso continued in the French alliance after the Pope had joined the Venetians. He assisted in the battle of Ravenna, and took prisoner Fabrizio Colonna, the general of the Pope. After the French had been driven from Italy he endeavored to make peace with the Pope; but Julius continued implacable. Leo X restored him to his possessions, with the exception of Modena and Reggio, but afterward excommunicated him. He joined in the wars between Francis I and Charles V on the side of the French king, but was afterward reconciled with the emperor, who confirmed him in his possessions, against Pope Clement VII (1530). He married as his second wife the famous Lucrezia Borgia (q.v.). His brother, the Cardinal Ippolito, was the patron of Ariosto. Alfonso was succeeded by his son, Ercole II, who died 3 Oct. 1559. He married Renée of France (daughter of Louis XII) in 1528. She favored the Reformation, and made the court of Ferrara the resort of the few advocates of that cause in Italy. Calvin visited it in 1535. Ercole at first adhered to the imperial party, but in 1556 joined the league of Paul IV and Henry II of France against Spain, and was made general of the allied forces; but did not push the war with vigor, and made peace with Spain in 1558. Leonora, his daughter by Renée, was the object of the unfortunate attachment of Tasso. He was succeeded by his son, Alfonso

II, the patron and persecutor of Tasso, who died 27 Oct. 1597. He was succeeded by his cousin Cesare (d. 11 Dec. 1628), whom by his testament he had made his heir; but this disposition was annulled by the Pope, Clement VIII, who excommunicated Cesare and deprived him of Ferrara, with the dependencies of the Church. Cesare was obliged to content himself with Modena and Reggio, which depended on the empire. From this period the political importance of the house of Este greatly diminishes. Alfonso IV, who lived in the latter half of the 17th century, was distinguished for his patronage of the fine arts. His daughter, Mary of Modena, was married to James II of England. Rinaldo (1655–1737) by his marriage with the daughter of the Duke of Brunswick-Lüneburg, reunited the German and Italian branches of the house. By the death of his grandson in 1803 the male line became extinct. His only daughter was married to the Archduke Ferdinand of Austria, third son of Francis I, who founded the Austrian branch of the family which existed until 1875. The last sovereign of the house was Francesco V, who succeeded in 1846. In 1859, the dynasty was deposed by the National Assembly, the duchy was annexed to Sardinia by the Treaty of Zurich, 10 Nov. 1859, and has consequently been incorporated with the kingdom of Italy. Consult Browning, 'Guelfs and Ghibellines' (1893); Gardner, 'Princes and Poets of Ferrara' (1904); Noyes, 'The Story of Ferrara' (1904); Sismondi, 'Italian Republics' (Eng. trans., 1832); Symonds, 'The Renaissance in Italy' (1875–76).

ESTE, Italy, town in the province of Padua, 17 miles southwest of Padua; the ancient Adeste. Its chief industries centre in pottery, cordage and ironware products. The leaning tower, or campanile, is an interesting feature of the town, as is the battlemented mediæval fortress, known as the Rocca. Here once ruled the Este family, one of the most ancient and illustrious families of Italy. In the 11th century the house of Este became connected by marriage with the German Welfs, or Guelphs, and founded the German branch of the house of Este, the dukes of Brunswick and Hanover. The reigning house in Great Britain descends from this family. The sovereigns of Ferrara and Modena were also of this family, several of them being famous as patrons of letters. The lives of Boiardo, the author of 'Orlando Innamorato,' Ariosto and Tasso were closely connected with members of this house. The last male representative of the Estes died in 1798. His daughter married a son of the Emperor Francis I of Austria, who founded the Austrian branch of the house of Este, of which the male line became extinct in 1875, his title then passing to the Archduke Francis Ferdinand, heir to the Austrian throne. Pop. 11,700.

ESTEBANEZ, Calderon, Don Serafin, Spanish author, best known as «El Solitario»: b. Malaga, 27 Sept. 1799; d. Madrid, 5 Feb. 1867. He studied for the legal profession at the University of Granada, was called to the bar and settled for some time in Madrid. In 1822 he was appointed professor of poetry and rhetoric at the University of Granada, and in 1831 under his pseudonym of «El Solitario» he published a volume of verses. He wrote several articles on Andalusian customs for *Cartas Españoles*, and in 1834 became auditor-general of the Legitimatist army of the north. Two years later he was made mayor (*Jefe-politico*) of Logrono, but before entering on his new duties an accident obliged him to retire to Madrid where he set about collecting manuscripts of the national literature of Spain. In 1838 he was made jefe-politico of Seville and thereafter served several terms as deputy. In 1856 he was elected to the Council of State. In 1847 appeared his greatest original work, 'Escenas andaluzas,' inimitable as records of a life most of which has now gone. His manuscript collections are now the property of the Spanish government. Consult Canovas del Castillo, 'El solitario y su tiempo' (2 vols., Madrid 1883).

ESTELLA, Spain, town in the province of Navarre, 20 miles southwest of Pamplona. It is a well-built city with fine streets and many interesting churches, some of which are many centuries old. Its trade and manufactures are also considerable and it is a place of military importance. The town was taken by the Carlists in 1835, and in 1839 was executed here the Carlist leader, Maroto, with five other generals of that party. Again in the seventies it was the scene of spirited conflicts and the stronghold of Don Carlos. When the latter lost the town in 1876 his cause suffered a complete collapse. Pop. 5,638.

ESTEPA, Spain, town in the province of Seville, 60 miles east of the city of that name, and situated in a hilly region. It contains a famous old Moorish castle and has fine broad streets. Agriculture and stockraising are its principal interests but it has also manufactures of oil soap. Jasper quarries in the neighborhood give employment to a large number of persons. Estepa is the ancient Astapa, which came into prominence during the Second Punic War for the heroic resistance of its citizens who chose to die by fire rather than surrender to the Roman besiegers. Later it was a flourishing Roman colony. Ferdinand III took it from the Moors in 1240. Pop. 8,234.

ESTEPONA, Spain, seaport in the province of Malaga, on the Mediterranean coast, 25 miles northeast of Gibraltar. It is situated in a fertile region which produces fruits, grain, vegetables and wine. Its coast trade is hampered by the lack of adequate harbor facilities but its fishing interests are considerable and it has distilleries, leather-curing establishments, rope and cork works and brick and tile yards. Pop. 9,613.

ESTERHAZY. See Eszterhazy.

ESTERIFICATION. See Esters.

ESTERS (an arbitrary modification of ether). Compound ethers, or ethereal salts, are compounds in which one or more alcohol or basic radicals are united to one or more acid radicals. They are analogous to the salts of the metals. Thus $CH_3COO.H$ is acetic acid and if the typical hydrogen of this acid is replaced by the monad radical ethyl, the resulting compound, $CH_3COO.C_2H_5$, is known as ethylacetic ester. Chemically, this substance is analogous to potassium acetate, $CH_3COO.K$, obtained by replacing the hydrogen of the acetic acid by potassium. The word ester was originally applied by Gmelin to compounds of the alcoholic radicals with oxygenated acids; but it has now been extended so as to include all the salts of the alcoholic radicals. Ethyl bromide, $C_2H_5.Br$, for example, is now included among the esters. Some of the esters are prepared by the direct action of the acid upon the alcohol. In other cases a mixture of the acid and the alcohol is distilled with the addition of sulphuric acid, zinc, chloride or other dehydrating agent. The esters may also be prepared by treating the iodide of the alcohol radical with the silver salt of the acid, the iodine and silver combining to form iodide of silver, while the liberated alcoholic and acid radicals combine to produce the desired ester. The esters of the organic acids occur in fruits and flowers and are also prepared artificially for flavoring purposes and for improving the bouquet of wines. The fats and oils which contain glycerine in combination with oleic, margaric and other acids may be regarded as esters, since glycerine is a triatomic alcohol. Much attention has been paid to the esters in connection with theoretical chemistry, since they are well adapted for the study of the laws of mass-action. See EQUILIBRIUM, CHEMICAL; ETHER.

ESTES, Dana, American publisher: b. Gorham, Me., 1840; d. 1909. He received his education in the public schools, for many years was engaged in mercantile affairs and served in the Union army in the Civil War. He became a member of the publishing firm of Degen, Estes and Company, and afterward that of Lee and Shepard. In 1872 he became a partner in the firm of Estes and Lauriat, which in 1898 became known as Dana Estes and Company. He was also a traveler of note, being the first American to explore the region of the Nile as far as Uganda and the Kongo. He also helped organize the International Copyright Association, of which he became the first secretary. He wrote 'Chimes for Childhood' (1868); 'Spectrum Analysis Examined' (1872); and was the editor of 'Half-Hour Recreations in Popular Science' (2d ed., 1879).

ESTEVAN, Canada, town in Assiniboia District, on the Canadian Pacific Railway and on the Souris River, 145 miles southeast of Moosejaw. Flour mills, lumber and brick yards, grain elevators are its principal industries. It has also a government coal-testing plant and there is a large trade in coal and brick. The electric-light plant is the property of the town. Pop. 4,000.

ESTHER, or HADASSAH (Heb. myrtle; Babylonian, Ishtar), the name of a Jewish maiden, chosen by Xerxes to be his queen. She was one of the heroines of Hebrew history and maintained the rights of her nation at the court of the king of Persia. Esther gave her name to the 'Book of Esther,' one of the books of the Bible. According to the account given in the latter, Esther belonged to the tribe of Benjamin. Much controversy has been expended over the character of Esther whom the more radical Biblical critics have been inclined to look upon as a purely mythical personage evolved from the Jewish knowledge of the Babylonian goddess, Ishtar, a name which, in later Babylonian, becomes Estrâ. The Jewish account of the life of Esther states that she was the daughter of Abihail who died while she was quite young, leaving her to the care of her cousin Mordecai in Susa, then the capital of Persia. When she had grown to be a young woman, Xerxes (Ahasuerus) divorced his queen, Vashti, and made Esther queen in her place. But according to Herodotus Xerxes had only one queen, Amestris, whose character and history in no manner resemble those of Esther. Moreover, it has been pointed out by critics that the Persian sovereigns were bound by a certain court etiquette, and by Persian custom, to select their legal wives from the Persian royal family or from the daughters of foreign royal families in order to maintain the purity of the blood of the Persian sovereign. This was looked upon as of great importance in an age when the royal family was believed to be the direct blood descendants of the gods. Vashti is said to have been divorced because she refused to unveil herself publicly at a banquet. It has been suggested that there is some connection between this statement and the fact that Ishtar (Estrâ) was called the naked goddess, and was looked upon as the great mother deity and the "queen of heaven." As the Persian king was the earthly representative of heaven, his queen was also styled the queen of heaven and thus probably represented the deity of the same title. Hence the more advanced Biblical scholars have concluded that Esther was never the queen of Xerxes; and that she could have been nothing more than the chief favorite of his harem, if she ever had any real existence.

Notwithstanding this attitude of modern critics, the Jews never had any doubt as to the truth of the Biblical account of the life and doings of Esther, who is credited with delivering the Jewish people from the exactions and cruelty of Xerxes' vizier and effecting the final overthrow of the latter. This belief is as strong to-day as in the past, and the deliverance effected by Esther is still celebrated in the Feast of Purim. Consult the Biblical 'Book of Esther'; ISTHAR; PURIM; and ESTHER, BOOK OF.

Bibliography.— Cheyne, 'Founders of Old Testament Criticism' (London 1893); Debaeza, 'Historia Esther'; de Lagarde, 'Purim' (Göttingen 1887); Gunkel, 'Schöpfung und Chaos' (Göttingen 1895); Hughes, 'Esther and her People' (London 1846); Jampel, 'Das Buch Esther'; Nowack, 'Archäologie'; Sayce, 'Introduction to Esther' (London 1885); Toy, 'New World' (Vol. 5, 1887); Tyrwhitt, 'Esther and Ahasuerus' (London 1868).

ESTHER, Indian chieftainess. See MONTOUR.

ESTHER. (1) Drama on the life of Esther, the personage of the Old Testament, written by Racine at the instance of Madame de Maintenon. The pupils of Saint-Cyr performed the drama before King Louis XIV in 1689. (2) An oratorio by Handel based on the drama of Racine, first performed in 1720. The words were by Humphreys.

ESTHER, Apocryphal Books of. See APOCRYPHA.

ESTHER, Book of. The book of Esther was written for the primary purpose of giving an account of the supposed circumstances of the origin of the feast of Purim. This was put in the reign of the Persian king Ahasuerus, is certainly to be identified with Xerxes, who reigned from 487 to 466 B.C.

The first question is concerning the historical character of the book. The author had a general acquaintance with Persian customs, and some of the statements made are confirmed from other sources. But some of the details of the book are certainly inaccurate, and many others probably so. Xerxes' queen from the seventh to the twelfth year of his reign was not Esther, as represented in the book, but Amestris, a Persian; no captive of Nebuchadrezzar's was chief minister of Xerxes; and the chronology is incorrect. The book, therefore, is not accurate history; it is probable that there is no historical element in the book. This appears especially from a consideration of the feast of Purim. This is stated in ix, 26, see iii, 7, to have been derived from the presumably Persian word Pur, meaning lot. No such Persian word is known. The feast of Purim is first mentioned, under the name of the day of Mordecai, in 2 Maccabees xv, 36, 2 Maccabees being written in the 1st century B.C. This makes it unlikely that the feast was established as early as the time of Xerxes, and hence makes improbable any historical basis for the book. The book, therefore, is of the nature of a romance, giving a current story concerning the origin of the feast.

The actual origin of the feast would seem, therefore, to have been unknown to the writer and his time. This gives a presumption that it was of foreign origin. The indications are that the origin was in Babylonia. The name Mordecai is quite evidently a form of Marduk, the name of the head of the Babylonian pantheon, and Esther is Ishtar, the principal Babylonian goddess. Haman, further, is Humman or Humban, the chief Elamite god, and Vashti is probably to be identified with Mashti, a vaguely known Elamite deity. Originally, therefore, the story seems to have been a myth, giving an account of a conflict between the principal deities of Babylonia and Elam. It is not possible, however, to find any probable identification of the feast of Purim with any known Babylonian feast. The Babylonian account of the feast has here been put into a Jewish form. It is, of course, quite possible that the mythical nature of the story had been obscured before it reached the writer.

The indications point to a late writing of the book. The author was living in the time of the observance of the feast of Purim, which was probably late, as has been indicated. The omission of Esther and Mordecai from the long list of Hebrew worthies in Eccl. xliv–xlix, written about 180 B.C., strongly suggests that the book had not then been written. It has been suggested that the attitude of hostility to the Gentiles which appears in the book might be due to the experiences of persecution by Antiochus Epiphanes. But the absence of any specific references to the Maccabean period makes it probable that the date was before 168 B.C. The language of the book is late, although there are no words which are certainly to be identified as Greek. The author speaks of the reign of Xerxes in a way which indicates that it was long past. It is probable that the book was written after 180 B.C. and before 168.

The absence of the name of God from the book has been the occasion of much perplexity. The explanation has been suggested that it was due to the fact that the book was designed to be read at the celebration of the feast of Purim, this being a festival of such mirth, due principally to drinking, that there would be danger of the profanation of the name of God if it occurred in the reading. The principal religious teaching of the book is that of the providence of God over his people, which is conceived, however, in a spirit of national bigotry. The interest of the writer is not primarily religious but national.

The moral tone of the book is not high. No character portrayed in the book is an admirable one. Esther and Mordecai have the desire for revenge, as well as other qualities rather ignoble than exalted. The book in its general spirit is below the level of most of the Old Testament.

GEORGE R. BERRY,
Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

ESTHERIA, bivalve crustacean of the order of Brachiopods, found as a fossil in fresh water deposits dating from the Devonian to the Pleistocene periods. There are about 24 living species and about the same number of fossil species. In the former the shell is from one-eighth to one inch in length and is rounded and flat with beaks near the hinge. The surface is marked with folds and ridges which serve to distinguish it from the small pelecypods. Consult Jones, 'A Monograph of the Fossil Estheriæ' (in 'Monographs of the Palæontological Society,' London 1862).

ESTHERVILLE, Iowa, city and county-seat of Emmet County, 140 miles northwest of Des Moines, on the Des Moines River, and on the Minneapolis and Saint Louis and the Chicago, Rock Island and Pacific railroads. It has extensive agricultural and stock raising interests and contains flour mills, grain elevators, railroad repair shops, machine shops, tub factories and cement works. It has also a Carnegie library and a fine school building and owns the waterworks and electric-lighting plants. Pop. (1920) 4,699.

ESTHONIA, ĕs-thō'nĭ-a, a maritime republic, bordering on the Gulf of Finland and the Baltic. On the east is the Russian government of Petrograd; on the south Lake Peipus and the republic of Latvia. Most of the territory included in Esthonia is low and swampy or cut up by streams and lakes; and cold, raw winters and hot summers are the rule. Live stock raising and agriculture are the chief occupations of the inhabitants, who are industrious, enterprising and given to the use of modern methods of farming and stock raising. Among the growing industries of Esthonia are machinery, iron and steel, liquors and cotton. Considerable trade is also carried on with neighboring countries and with the interior of Russia. It includes several islands, of which the most important are Dagoe and Oesel; area, about 23,160 square miles. The peasantry are almost all of Finnish origin and speak a Finnish dialect. In the 10th and 12th centuries it belonged to Denmark; it was afterward annexed by Sweden and in 1710 was seized by Russia. On 24 Feb. 1918 it became an independent republic. The chief seaport, Reval, which is connected by rail with Petrograd, has extensive shipping. (See REVAL). Pop. 1,750,-000. Consult Vincent, 'Norsk, Lapp, and Finn.'

ESTHS. See ESTHONIA.

ESTIENNE, ā-tē-ĕn, or **ETIENNE** (Lat. STEPHANUS), **Henri,** ŏñ-rē, French painter and scholar: b. Paris, 1528; d. Lyons, March 1598. He was a son of Robert Estienne (q.v.) and continued his work. Besides compiling the noted 'Thesaurus linguæ Græcæ' (1572), he wrote 'Apologie pour Hérodote' (1566); 'Traité de la conformite du Francais evec le Grec', etc.

ESTIENNE, or **ETIENNE** (Lat. STEPHANUS), **Robert,** rō-băr, French printer and scholar: b. Paris, 1503; d. Geneva, 7 Sept. 1559. In 1526 he established a printing house in Paris and in 1539 was appointed royal printer to Francis I. He removed to Geneva about 1552. He published many editions of the Greek and Latin classics and compiled numerous other works. His son Henri took up his father's work on the death of the latter and was also a writer of note. He died in Lyons in 1598.

ESTIVATION, the dormancy or «summer-sleep,» induced in some of the lower plants and animals by heat and drought, and the means by which in summer they resist these unfavorable conditions, as they do others in winter by hibernation. The two states are comparable, though induced by opposite conditions. In summer the principal danger to which such organisms are exposed is the deprivation of water. Some of the lowest are able to endure this to an extreme degree. Certain bacteria and other low plants and various animalcules will survive prolonged baking and may blow about in the dust of dried-up ponds for a long period, ready to revive when dampened. Among land-snails estivation is a common phenomenon, the snails protecting themselves from excessive loss of moisture, not only by burrowing into the ground, but by throwing one or several epiphragms of hardened, sometimes chalky, mucus across the aperture of the shell, thus shutting themselves into an air-tight case, where they remain inactive until better conditions arrive. In a similar manner certain fishes and amphibians bury themselves in the muddy bottom of ponds or river-pools evaporated by drought, where they preserve sufficient dampness about them to keep alive. Turtles, on the other hand, are often compelled to leave their pools in the tropics, because the water becomes so hot and full of fermentation and seek cool spots under rocks, and the like, where they sleep torpidly until autumn. Even a few mammals of extremely hot regions, such as the deserts of Australia, go into a summer-sleep during the height of the hot season, substantially as their congeners hibernate in the midwinter of northern climates. See HIBERNATION.

ESTLANDER, Carl Gustav, Finnish author: b. 1834; d. 1910. In 1868 he was appointed professor of æsthetics in the University of Helsingfors and in 1876 founded the *Finland Review* of which he became the editor. His many works were of great importance to the artistic literature of his country; they include 'The History of the Plastic Arts from the Middle of the Eighteenth Century to our own Time' (1867); 'The Development Past and Future of the Art and Industry of Finland' (1871); 'Richard Coeur de Lion in History and Poetry' (1858); 'The Robin Hood Ballads' (1889); and researches into the Tristan romance, published in French (1866).

ESTOC, a small dagger, known in the 16th century as a «tuckle» and usually worn at the girdle.

ESTOILE, or **STAR,** a bearing in heraldry, differing from the mullet in that it has six wavy rays instead of the five plain waves of the latter. See HERALDRY.

ESTON, England, town in the North Riding of Yorkshire, four miles east of Middlesborough. It has large manufactories of steel rails. Pop. 12,026.

ESTOPPEL, the preclusion of a person from asserting a fact by previous conduct, inconsistent therewith, on his own part or the part of those under whom he claims, or by an adjudication upon his rights which he cannot be allowed to call in question; a preclusion, in law, which prevents a man from alleging or denying a fact, in consequence of his own previous act, allegation or denial of a contrary tenor; a plea which neither admits nor denies the facts alleged by the plaintiff, but denies his right to allege them. According to Blackstone, it is a special plea in bar, which happens where a man has done some act or executed some deed which precludes him from averring anything to the contrary. Where a fact has been asserted or admitted for the purpose of influencing the conduct or deriving a benefit from another, so that it cannot be denied without a breach of good faith, the law enforces the rule of good morals as a rule of policy and precludes the party from repudiating his representations or denying his admissions. (Rawle, Cor. 407.)

This doctrine of law gives rise to a kind of pleading that is neither by way of traverse nor of confession and avoidance; that is, a pleading which, waiving any question of fact, relies merely upon the estoppel, and, after stating the previous act, allegation or denial of the opposite party, prays judgment if he shall be received or admitted to aver contrary to what he before said or did. This pleading is called a pleading by way of estoppel. Until a recent period questions regarding estoppel arose almost entirely in relation to transfers of real estate and the rules in regard to one kind of estoppel were quite fully elaborated. The principle is now applied to all cases where one by words or conduct wilfully causes another to believe in the existence of a certain state of things, and induces him to act on that belief or to change his own previous situation.

Estoppels operate not only on present interests, but on rights subsequently acquired. They operate, however, only between parties and privies and the party who pleads the estoppel must be one who was adversely affected by the act which constitutes the estoppel. An estoppel may be by record, and by record in this connection is meant the record of a tribunal of a judicial character. An admission made in a pleading in a judicial proceeding cannot be contradicted by the person making it. So, ordinarily, the judgment of a court of competent jurisdiction cannot be impeached. If it determines the status of a person or thing, it is binding on all persons, whether rendered by a domestic or a foreign court. Judgments of this character are judgments *in rem.* If the judgment is *in personam,* it is conclusive if rendered by a domestic tribunal, and is conclusive in some instances if rendered by a foreign tribunal. Legislature records also import absolute verity. (Bigelow on Estop. 33.)

An estoppel by deed is such as arises from the provisions of a deed. It is a general rule that a party to a deed is estopped to deny anything stated therein which has operated upon the other party, as the inducement to accept and act under such deed, including a deed made with covenant of warranty, which estops even as to a subsequently acquired title. The deed must be good and valid in its form and execution to create an estoppel, and must convey no title upon which the warranty can operate in case of a covenant.

Estoppels must be reciprocal. An estoppel *in pais,* or equitable estoppel, occurs when a party to an action has by his act or declaration induced the other party to do some act or acts which otherwise would not have been done, or to omit to do some act or acts which he would have done, and by means of which he has been injured. The principle underlying such estoppels is, that it would be a fraud in a party to assert what his previous conduct and admission have denied, when, on the faith of that denial, others have changed their situation. There must, however, as a rule, be some intended deception in the conduct or declarations of the party to be estopped, or such gross negligence on his part as to amount to constructive fraud, by which another has been misled to his injury.

ESTOTILAND, a mythical land, placed by the old geographers where are now portions of Newfoundland, Labrador, and that part of British America bordering on Hudson Bay. It was said to have been discovered by two Friesland fishermen driven out of their course by a storm, two centuries before the time of Columbus. In 1497 the Cabots set sail from England for Estotiland, but discovered instead Newfoundland.

ESTOURNELLES DE CONSTANT, Paul Henri Benjamin, BARON D', French author: b. La Flèche, Sarthe, 1852. He was educated at the Louis-le-Grand Lyceum, Paris, and at the School of Oriental Languages, joined the diplomatic service, in which he served as secretary to the commission for the boundaries of Montenegro, afterward becoming chargé-d'affaires in that country. He served also at The Hague and in Tunis and London. In 1895–1904 he was deputy from Sarthe and in the latter year was elected senator. He become conspicuous for his advocacy of international peace, was elected member to The Hague conferences and of the international court. His efforts to bring about a better feeling between France and Germany were untiring and in 1909 he was awarded the Nobel prize for peace. He has published frequently in reviews in England, France and America, has written on modern Greece and made translations from the modern Greek tongue, published reports of The Hague conferences and prepared papers for the Parliamentary Union, etc. Other works are 'Les congregations religeuses chez les Arabes' (1887); 'La politique française en Tunisie' (1891); and 'Les Etats-Unis d'Amerique' (1913), an account of his impressions during his visits to America in 1902, 1907, 1911 and 1912.

ESTOVERS, in law, (1) wood which a tenant may legally use, as for repairs or firewood. It is a principle of both English and American law. It includes to-day, in the absence of express covenants to the contrary, any wood which a tenant for life, for years, from year to year, or at will may use from the estate to repair the house, fences, implements, etc., thereon, in addition to that which he uses for fuel. (2) Formerly, alimony allowed a divorced wife; also, a widow's allowance.

ESTRADA, Spain, town in the province of Pontevedra, 15 miles southeast of Santiago de Compostela, on the Ulla. It has extensive agricultural and stock raising interests and contains lumber yards and manufactories of linens and woolens. Mineral springs are in the neighborhood. Pop. (commune) 27,898.

ESTRADA CABRERA, Manuel, Guatemalan statesman: b. Quezaltenango, 1857. At first he devoted himself to the study of law and philosophy and practised his profession. He was appointed district judge and finally attained the supreme bench. About 1885 he began to take an active interest in politics and was elected to the National Assembly; he was appointed Secretary of State in 1892 and six years later, on the assassination of President Barrios, became acting President. Within a few months he was elected to a full presidential term and secured re-election for a second term in 1905. His administration was very progressive; he did much to place the finances on a sound basis, promoted agricultural and industrial enterprises, aided education and promoted in general the well-being of his country. Several attempts were made on his life by the bitter enemies he had made. For the third time he was elected to the presidential chair in 1911.

ESTRADES, Godefroi, COMTE D', French soldier: b. Agen, 1607; d. 1686. He served as a page at the court of Louis XIII and in 1646 was sent to Holland on a special mission. He was commissioned a colonel of infantry and in 1647 was made field marshal. He was sent as Ambassador Extraordinary to England in 1661 to negotiate the cession of Dunkirk to France; he also served as ambassador to Holland and distinguished himself at Wesel and Liege. In 1678 he represented France at the Peace of Nymwegen. His 'Lettres, Memoires et negotiations' (9 vols., Paris 1758, and a tenth volume, London 1763) were published after death. Consult Lauzun, Philippe, 'Le Mareschal d'Estrades' (Agen 1896).

ESTRAY, in law, any animal not *feræ naturæ* and the subject of property which is found at large without ostensible owner in any place other than the land of the owner. If found on private land such animal in most jurisdictions may be impounded at the cost of the owner. In England an estray becomes subject to the lord of the manor who acquires a right therein which becomes absolute in case the animal is not reclaimed by the owner after due proclamation by the lord of the manor. In some States the finder of an estray may after due advertisement sell same at public or private sale and the purchaser will acquire a good title therein. The proceeds of the sale after the finder's expenses have been deducted are as a general rule paid into the town treasury. Consult Burn, 'Justice of the Peace and Parish Officer' (30th ed., London 1869).

ESTREAT, in law, a copy or extract of an original record, particularly of fines: common in the phrase *estreat of a recognizance,* or the removing of such recognizance from among the other court records and sending it to the exchequer to be enforced. In England, if a recognizance is forfeited by violation of a condition, it is estrated, whereupon the parties become indebted to the Crown to the amount named in the recognizance.

ESTREES, Gabrielle d', French court favorite and mistress of Henry IV: b. about 1573; d. 1599. She was the daughter of the Marquis Antoine d'Estrees, Governor of L'Isle de France. In 1590 she met Henry IV at her father's castle and he fell a slave to her charms. Her father, having learned of the king's infatuation and fearing a scandal, forced Gabrielle into a marriage with M. d'Amerval de Liancourt but the king annulled the marriage and called her to court. Henry made her Marchioness de Monceaux and Duchess of Beaufort. She had several children by Henry and was the recipient of the greatest favors at his hand. To make her queen he even had in mind to divorce Margaret of Valois and was only hindered from so doing by the sudden death of Gabrielle. Consult Desclozeaux, 'Gabrielle d'Estrees' (Paris 1889).

ESTRELLA DE SEVILLA, a comedy of Lope de Vega, which by many critics is considered his best work.

ESTREMADURA, ĕsh-tra-mä-doo'rä, Portugal, maritime province divided by the Tagus into two nearly equal parts, of which the north is the more mountainous. Wines and olives are the principal products. The chief city is Lisbon. Area, 6,876 square miles. Pop. 1,438,726.

ESTREMADURA, ā-strā-mä-doo'rä, a division of southwestern Spain, consisting of two provinces, Badajoz and Cáceres. The northern part has large forests, and in the central and southern parts are some good agricultural lands. Deposits of coal, copper and silver are found in the mountains; but the mines are not well developed. Area, 16,162 square miles. Pop. 990,990.

ESTREMOZ, Portugal, town in Alemtejo province, 30 miles northeast of Avora. It is 1,500 feet above sea-level and contains the ruins of two ancient forts. The porous clay of the district is much used in the manufacture of the earthenware which has made Estremoz famous throughout the peninsula. Wool is exported in large quantities from here and marble of varied color is quarried nearby. Pop. 7,857.

ESTREPEMENT, the waste of lands committed by a tenant, in which sense the word has been supplanted by the term «waste.» It survives, however, as the name of an ancient writ of common law to restrain the commission of waste. In most modern jurisdictions the writ has become obsolete through the development of the functions of the courts of equity, but it still exists in Pennsylvania, where there are no courts of equity, as a remedy for the prevention of waste.

ESTRUP, Jacob Bronnum, Danish statesman: b. Soro, 1825; d. 1913. He was elected to the Landsthing in 1864 and in due time became leader of the Agrarians, and also was active in the preparation of the new constitution of 1866. He served as Minister of the Interior in 1865–69 and did much to improve the railway service of the country. He was chosen president of the council in 1875 and at the same time accepted the portfolio of Minister of Finance. After 1877 he acted very arbitrarily in issuing provisional acts and for several years, from 1885 to 1894, financed the government through provisional budgets. All this involved him in difficulties with the Folkething and his resignation in 1894 may be said to mark the passing of power from the upper house to the lower. He soon lost his influence and his opposition to the sale of the Danish West Indies in 1902 and later to electoral and tax reforms were little heeded.

ESTSÁNATLEHI, the ever-self-renewing goddess of the Navajos, wife of the sun and mother of the two war gods. See NAMOUNA.

ESTUARINE DEPOSITS, sediments laid down in estuaries along a coast. They are frequently formed on great mud flats or tidal flats that are above the ocean water part of the time and part of the time submerged. As a result they often partake both of the nature of marine sediments (q.v.) and of terrestrial sediments (q.v.).

ESTUARY. Where a shore-line is sinking or has been recently depressed, the rivers, unless large and heavily charged with sediments, have their valleys drained by the encroaching sea, forming roughly funnel-shaped bays. Such bays are called estuaries and are common along the sinking Atlantic Coast of North America. Illustrations are seen in Passamaquoddy and Narragansett bays, the mouth of the Hudson River, Delaware and Chesapeake bays. Owing to their shape, estuaries frequently have strong tidal currents, due to the height of the tides, and the rising tide rushes in as waves, the most remarkable examples of such surf-like tidal waves, or bores, being found in the Bay of Fundy. The rivers entering estuaries drop much of their fine sediment there because of the checking of their currents and the precipitating effect of salt water. The strong tidal currents sweep away and rearrange these sediments. Hence conditions on the bottoms of estuaries are often unfavorable for the growth of organisms, and the estuary deposits of past ages are seldom rich in fossils, but may contain remains of land organisms brought down by the old river; and the tidal mud-flats have preserved the prints of raindrops, the traces of worms and the tracks of birds and reptiles. See RIVERS.

ESZEK, es'sĕk, or **ESSEG,** Jugoslavia, an important city in Croatia and Slavonia, capital of the county of Virovitica, on the Drave, about 63 miles west-northwest of Peterwardein. It consists of the town proper, partially fortified, and three suburbs, and is the seat of an appeal court for three centuries. Its public buildings of note are the Capuchin and Franciscan monasteries, the town hall, county court building, and commandant's residence, a gymnasium, and training school for teachers. It has manufactures of flour, silk goods, leather, glass, etc. There is a considerable trade in grain and meat and other products of the district. The four annual fairs, chiefly for corn, cattle and hides, are important. As a Roman colony, founded by the Emperor Adrian, under the name of Mursia, it became the capital of Lower Pannonia, and in 335 was made a bishop's see by Constantine. In 1848 the Hungarians under Batthyânyi, held out for some time in this city before submitting to the Austrians. Pop. 31,388, mostly Germans.

ESZTERGOM, Hungary, royal free town and capital of the county of Esztergom, 25 miles northwest of Budapest, on the Danube. Agriculture is the principal industry of the inhabitants and there is a large trade in wine. It has manufactures of brick and ironware and hot medicinal springs have made it a health resort. The town is the seat of the Prince Primate of Hungary; its handsome cathedral has a dome like Saint Peter's, Rome, and is an imposing structure in the Italian Renaissance style. Another noteworthy church is Saint Anne's and the primate's palaces, the ecclesiastical seminary, the museum, gymnasium and town hall are well deserving of notice. In the cathedral is a library of 113,000 volumes and many manuscripts, some of which are invaluable. The town is one of the oldest in Hungary; here was borne Saint Stephen, the first king of Hungary, who established a bishop's see here soon after his conversion in the year 1000. It was long of importance as a commercial centre, but its destruction by the Tatars in 1241 caused its decline and it never regained its former splendor. From 1543 to 1683 it was in possession of the Turks. Pop. 17,881.

ESZTERHAZY, âs-târ-ä-zē, or ĕs'tĕr-hä-zĭ, **Marie Charles Ferdinand Walsin,** forger: b. Austria, 16 Dec. 1847. He served in a regiment of Papal Zouaves during the latter part of the French Empire; was promoted commander, a rank equivalent to major in other armies, in 1892. In the early part of 1897 he was retired from the army. He became notorious through his connection with the trial of Capt. Alfred Dreyfus (q.v.), whom he accused as being the writer of the famous «bordereau,» alleged to have been sent to certain German military officers revealing French military secrets. In December 1894 Dreyfus was tried by court-martial and convicted as the author of the document, and on 5 Jan. 1895 was publicly degraded and a little later sent as a prisoner to Devil's Island. In 1896 Colonel Picquart, the head of the intelligence bureau of the war office, made certain discoveries which pointed to Major Eszterhazy as the author of the «bordereau.» These discoveries led to further investigation and Dreyfus was brought from his prison and given a new trial in 1899, but was again convicted, although much of the evidence gathered pointed to Eszterhazy as the forger of Dreyfus's handwriting and as the real traitor. So strong did this opinion become that Eszterhazy was compelled to leave France. He is said to have died at Harpenden, England, 21 May 1923.

ESZTERHAZY VON GALANTHA, a family of Hungarian magnates, afterward princes of the German Empire, whose authentic genealogy goes back to the first half of the 13th century. It traces its origin to Salamon von Estoras, whose two sons, Peter and Illyés, founded respectively the families of Zerhâzy and Illyeshâzy about 1240. The latter branch became extinct in the male line with the death of Count Stephen Illyeshazy in 1838. Peter's descendants took from their domain the name of Zerhazy, till Francis Zerhazy (b. 1563; d. 1595), vice-regent of the county of Pressburg and the first of the family to take a definite place in history, changed his name to Eszterhazy in 1584, on the occasion of his being named Lord (Freiherr) of Galantha, an estate acquired by the family in 1421.

Francis left three sons, of whom DANIEL (d. 1654), founded the house of Czesznek; PAUL (d. 1641), founded the Altsohl branch, and MIKLÓS, who founded the Farchtenstein branch, which occupies a prominent place in the history of Hungary.

Miklós (b. 8 April 1582; d. 1645), was in early life a Protestant but subsequently went over to the Catholic party. He was made count of Beregh by Matthias II and in 1625 was made Palatine of Hungary. He was a staunch supporter of the Habsburg dynasty as a means of banishing the Turks from Hungary.

His third son, PAUL (b. 1635; d. 1713), a general and literary savant, founded the princely branch of the family. He fought against the Turks, and in 1683 took part in the liberation of Vienna from the Turkish yoke. He wrote several religious works. His grandson, Nicholas Joseph (b. 1714; d. 1790), was a great patron of the arts and music, founder of the school in which Haydn and Pleyel, among others, were formed, and a brilliant soldier. Joseph II conferred the princely title on all his descendants, male and female. His grandson, Prince Nicholas Eszterhazy (b. 1765; d. 1833) was distinguished as a field marshal, but left the army to enter on a diplomatic career and was employed by his sovereign as extraordinary ambassador on several occasions. He gathered a priceless collection of paintings and engravings and erected several palaces. He refused the overtures of Napoleon for the crown of Hungary, maintaining the traditional loyalty of his family to the Habsburgs. His son, Prince PAUL ANTONY (b. 1786; d. 1866), was a distinguished and able diplomatist, serving his sovereign successively at Dresden, Rome and London. In 1848 he was Minister of Foreign Affairs.

ETA, or AETA. See NEGRITOS.

ETAMPES (ancient STAMPÆ), France, a town in the department of the Seine-et-Oise, at the confluence of the Etampes and Juine, 32 miles southwest of Paris. It has four Gothic churches, one of them a remarkable structure of the 13th century; tanneries and bleacheries, and a considerable trade in corn, flour and prepared wool and garden produce. Pop. 9,454.

ETANG, ā-tāṅ, a French geographical term applied to the remarkable salt lagoons and marshes on the south and west coasts of France. The stagnant seawater is generally utilized, as in Brittany and in the department of Bouches-de-Rhone, for the manufacture of salt. The principal lagoons of this character in France are the Etangs de Berre, de Sigean, de la Palme, and de Leucate on the south, and de Heurtin, de Cazan and de Parentes on the west coast.

ETAWAH, ē tä'wä, India, town in the northwest provinces, 70 miles southeast of Agra, capital of the district of Etawah, situated on the left bank of the Jumna River. It was once the residence of many of the Mogul grandees, and it is now an important trade centre. Pop. 45,350.

ETCHEMIN. See MALECITE.

ETCHING: ITS TECHNIQUE AND GREAT MASTERS. An etching is the *proof* or picture an artist obtains by printing from a prepared plate of copper or zinc on which the lines and forms of a subject had been scratched by him and then *bitten-in* by the action of an acid. It is evident that to produce satisfactory work, the etcher must be a good draughtsman, must have an active imagination, and a keen knowledge of the technique of etching and printing. He must, moreover, be acquainted with the works of the masters of the art. In this article, therefore, the various processes used in producing an etching will first be described, and then the works of the master-etchers will be reviewed.

I. TECHNIQUE OF ETCHING.

Materials Employed in Etching.— The following articles which can be procured at any artists' supplies store are now generally used in the practice of the art:

Copper plates	Etching-ground
Etching needles	Stopping-out varnish
Burnisher	Nitric acid
Scraper	Turpentine
Dabber	Wax tapers
Roller	Charcoal
Hand-vise	Crocus powder
Porcelain trays	Tracing paper
Acid hydrometer	Emery paper
Plate-warmer	Whitening

The Processes of Etching.— The several steps taken in the production of an etching embrace: grounding and smoking the plate; marking the outline; biting-in by means of an acid; and printing.

Method of Grounding and Smoking the Plate.— After thoroughly cleaning the plate — first with turpentine and a soft clean rag, and then with a little whitening — a handvise is firmly screwed on to the middle of one of its long edges. To prevent the jaws of the vise from scratching the surface of the plate, a piece of thin cardboard is inserted between them and the plate.

The plate is then uniformly heated throughout over the flame of a small gas jet or spirit-lamp and is covered with what is known as *etching-ground* — a gummy preparation in the form of a ball, wrapped in a piece of silk, and composed of mastic gum 30 parts; white wax 30 parts; and asphaltum 15 parts.

As it is desirable that the ground be spread over the plate in an even and thin film, it is dabbed all over with the *dabber.* This tool consists of a circular pad of horse-hair with cardboard backing, enveloped in two wrappers, an inner one of cotton-wool, and an outer one of silk fabric, the latter stretched tight, gathered and tied in the back to form a handle.

The next step is to smoke the ground. The plate is again evenly heated and then held over a flame of three or four wax tapers twisted together. Care must be taken to have only the tip of the flame touch the ground, while the plate is kept constantly in motion, until the whole ground is blackened. The etcher must also see to it that the flame is not playing too long on the same spot of the ground or it will be burnt. When an area of the ground, no matter how small, does get scorched, the whole ground becomes useless. After the process of smoking is completed, the back of the plate is covered with some stopping-out varnish, to protect it against the action of the acid during the subsequent process of etching. When the plate has been prepared in the manner described, it is ready to receive the outline.

Method of Marking the Outline on the Ground.—A careful drawing of the subject, the size of the plate, is first made on ordinary paper, from which a tracing is made on tracing paper. After rubbing some lead on the back of this tracing, it is fastened, face upward, to the smoked ground of the plate; and with a hard pencil the outline is gone over, pressing lightly. Upon removing the paper from the plate, the lines will be found transferred to its surface. On this pencil impression as a guide, the etcher next freely redraws the subject with an etching needle, putting into it all the art at his command as regards beauty of line, form and composition generally.

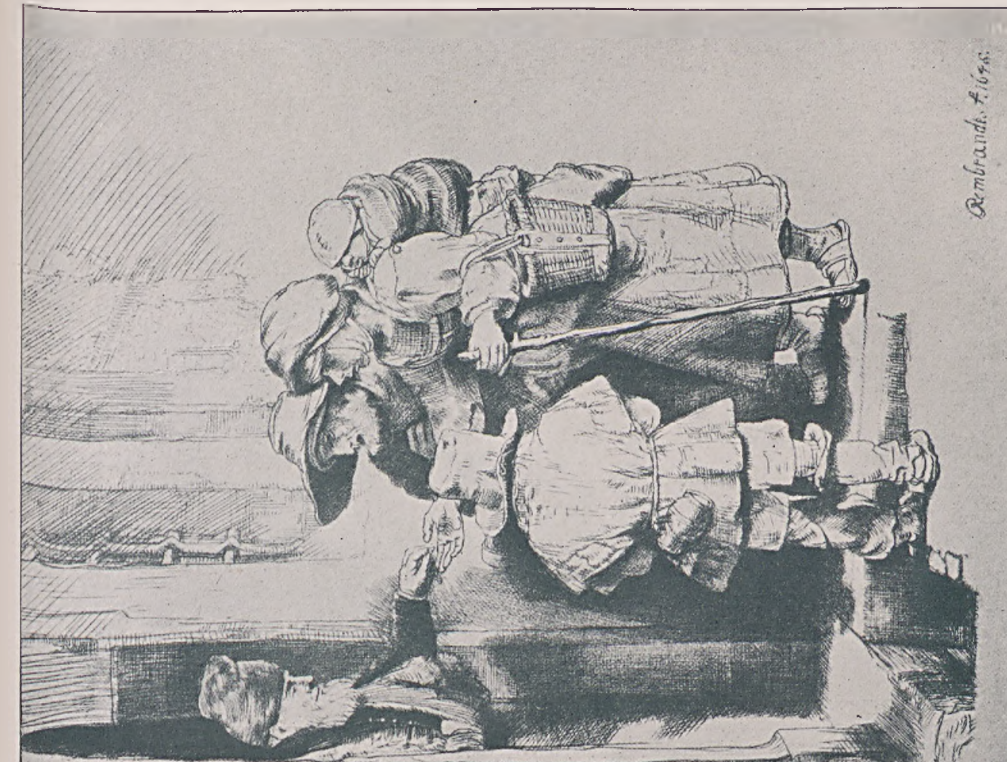
The needles used to etch with are generally made for the purpose, and may be held in a handle specially contrived. A needle with a fine oval-shaped point is used for putting in the delicate lines, such as are required in the treatment of skies or distances; and one with a blunt point for the deeper lines. The point is used with sufficient pressure to remove the ground, expose and faintly scratch the bare copper along its track. This faint outline, made by the needle, is then *bitten-in* to the required depth by immersing the plate in a porcelain tray containing an acid solution, called a *mordant.*

The Mordants Used in Etching.— The two mordants now generally used are the nitric and the hydrochloric acid baths. The nitric mordant is composed of nitric acid equally diluted with water. The hydrochloric bath, known as the Dutch mordant, is composed of chlorate of potash, 2 parts; hydrochloric acid, 10 parts; and pure water, 88 parts. The nitric mordant is more liable to vary in its action than the hydrochloric; but it has the great advantage of being decidedly more rapid, thus affording the artist the opportunity of watching the process of biting and checking it when necessary. For this reason, it is preferred by many etchers.

The action of either mordant may be retarded or accelerated by the varying conditions of the weather; it is advisable, therefore, to keep it at a uniform temperature (about 60° Fahrenheit) throughout the biting. This is best regulated by performing the etching on a *plate-warmer* — an iron box with gas-jets beneath.

Method of Biting-in the Sketch.— There are two methods now used in etching the plate. One way is by the process of *stopping-out.* The

ETCHING



2 A Group of Beggars (Rembrandt)

1 La Vieille aux Loques (Whistler)

plate is immersed in the acid bath for about five minutes, if in the nitric mordant and three times as long in the hydrochloric. This will suffice for the lightest tints to be bitten-in. After withdrawing the plate from the bath, it is washed, and dried between blotters, and the light lines are painted over with *stopping-out varnish* — a combination of resin dissolved in turpentine to which a little lamp-black had been added.

When dry, the plate is returned to the bath and kept there for about 10 minutes. As after the first biting, the plate is again taken out, washed, dried and the next deeper tones stopped-out. The process is repeated four or five times until the darkest tints have been produced. About 30 minutes in the nitric mordant is sufficient to bite-in the deepest lines.

A more satisfactory way of etching the plate consists in taking several different proofs during the process of biting. This method is as follows: The etcher makes his drawing on the grounded plate with the needle, putting in only the lines representing the middle and dark tones, and leaving the light lines for subsequent treatment. The plate is immersed in the mordant for about 15 minutes — just long enough to bite-in the middle tint. After removing the ground with turpentine and thoroughly cleaning it, a proof is taken and the parts intended to be darker are rebitten in the same lines. This of course necessitates the regrounding of the plate without filling up the lines already bitten-in. To accomplish this, a very thin film of ground is spread upon another heated plate, and the roller, thinly charged with it, is lightly passed over the etched plate, also warmed for the purpose. When the plate has been rebitten, another proof is taken, and if the middle tint then proves to be satisfactory, successive bitings are made, and proofs taken to obtain the dark tones. The middle and dark tones settled, the etcher next completely covers the plate with transparent etching-ground or stopping-out varnish so as to fill up the lines and protect the spaces between them, and draws in the delicate lines intended to represent the pale tints. These are bitten-in and the final proofs taken.

Correcting Processes.— Light lines that have been over-bitten may be reduced by rubbing with a piece of charcoal moistened with olive oil. Deep erasures are made with the *scraper* — a kind of a knife, triangular in section, and coming to a point. The polished surface in an erased area is regained by the use of the *burnisher* — a polished tool, made of steel and tapering to a point. The burnisher is also used to slightly reduce an over-bitten passage by rubbing it on the plate, pressing, thereby, the copper more together into the lines.

Auxiliary Processes.— Etched plates are frequently finished and enriched with what are known as *dry-point* and *soft ground etching.* Dry-point is the name given to a form of engraving in which the lines are cut directly into the *dry* plate by means of the needle, and without the use of a mordant. It is remarkable for yielding rich and velvety proofs, which is due to the *burr* or rough edge of the copper, produced by the point as it cuts the plate. Dry-point is employed to deepen foreground tones, and with the burr removed by means of the scraper) it is also useful for putting in the delicate markings in a composition. Prints are often made of plates produced entirely by dry-point. In soft ground etching, the plate is covered with etching-ground mixed with tallow, to prevent it from hardening, and a piece of slightly rough paper is laid over it on which the artist makes his drawing with a lead pencil. When the paper is removed it brings off with it etching-ground, exposing the copper in such a manner that when bitten-in and printed, the plate will yield a proof having much of the quality of a pencil drawing.

Method of Printing.— The apparatus and articles necessary for printing include:

A printing press	Printer's canvas
A plate-warmer	Soft old muslin
Printing ink	Whitening
A printer's dabber	Paper
A palette knife	Printer's blankets

Proofs are made from the etched plate in the following manner: After thoroughly cleaning it, first with turpentine and then with a little olive oil, the printer, by means of the dabber, covers the whole plate with thick oily ink, usually of a brownish tint, taking care to fill up the lines. With coarse canvas he then wipes out the superfluous ink from the surface. In that portion of the sketch where a sombre and mysterious effect is desired, he allows a thin film of the ink to remain on the surface of the plate; in another part which should be light, sharp and vivid, he wipes the surface of the plate dry and clean until it shines. In an area where the lines should be soft and velvety, he draws the ink out of the lines and over their edges by means of a piece of soft old muslin. When the plate has been inked and wiped it is laid face upwards on the platform of the press upon which had been first spread several printing blankets of soft woolen cloth. A dampened piece of Japan paper or vellum is then laid over the plate and covered with more blankets. The press is slowly set in motion, and the plate, covered by the paper and blankets, passes under the heavy revolving roller. The pressure causes the inked lines and tones in the plate to be transferred to the paper.

II. The Great Masters of Etching.

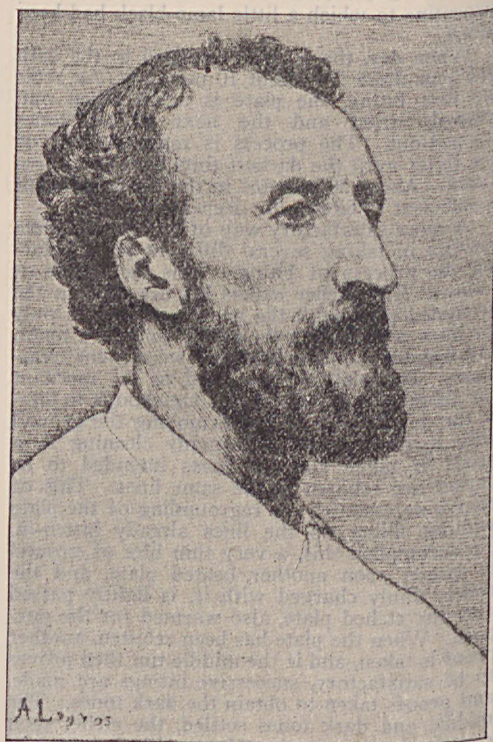
Of all the graphic and plastic arts, the art of etching has always had a profound fascination for the true artist, painter or sculptor. When weary of the more exacting arts of painting or sculpture, he frequently finds diversion in the joys of handling the copper plate and etching needle. Since the early part of the 16th century when etching was originated, it has steadily risen into high artistic favor, so that now some of the very greatest names in the art history of England, France, Germany, Holland, Spain and the United States appear in the list of those who have enriched the world with improvisations in this medium.

Etching in England.— England has produced many great painter-etchers. The most significant are Turner, Haden and Brangwyn. In the etchings of J. M. W. Turner (1775–1851) which were published in his 'Liber Studiorum,' he makes the same appeal to the imagination as in his famous paintings, by casting an indefinable glamor over the bits of nature he interpreted. Technically, he was remarkable for having the power of selecting the main lines of a subject which he rendered boldly, depending upon mezzotinting for the delicate tones. Sir Francis Seymour Haden (1818–1913), who was a London physician professionally, practised the art of etching merely as a pastime. Nevertheless, he ranks as one of the greatest of modern landscape etchers. He was very skilful in depicting the poetry of still waters, the movement of clouds, and the beauty of trees, silhouetted against the sky. On purely technical grounds he is incomparable, having invented several processes which he employed in the production of his works. His masterpieces for which he was knighted by his sovereign are 'The Agamemnon,' 'Whistler's House' and 'Harlech.' Frank Brangwyn, although still a young man, has already won for himself first rank among the British contemporary painters and etchers. His prints of Italian, French and English subjects are famous for vigor of handling, rich blacks, and clever adjustment of tones.

Etching in France.— France has given the world a legion of etchers, including Claude Lorrain, Delacroix, Daubigny, Jacque, Millet, Jacquemart, Méryon and Legros. But all of these have attained greater fame in painting, with the exception of Méryon and Legros, who rank very high as etchers pure and simple. Charles Méryon (1821–68) etched for the most part the quaint old buildings and streets of Old Paris, depicting them with such depth of poetic feeling that they give one the same overwhelming sensation that he experiences in list-

Le Petit Pont (Méryon)

ening to Beethoven's 'Heroic Symphony' or in viewing Michael Angelo's 'Day.' His etchings are indeed the sublime expression of a great and inspired soul. And yet, this rare genius was so little appreciated during his lifetime that his finest proofs sold for only 30 cents each. He took this public indifference much to heart, and one day, in a moment of despair, he destroyed some of his most magnificent plates. Finally, through adverse fortune, he became mentally unbalanced and died in an insane asylum. And now that the master is at rest, some of his proofs sell for thousands of dollars each. Alphonse Legros (1837) has produced etchings



Portrait of Dalou (Legros)

which are austere and gloomy in sentiment and simple in execution. His portrait of the sculptor Dalou and "The Death of the Vagabond" are considered his best prints.

Dürer and Etching in Germany.— The great pictorial genius of Germany is Albrecht Dürer (1471–1528) who excelled in painting, engraving and etching. He was among the first to practise the art of etching in which, as in the other arts, he shows himself a man of intense seriousness, of powerful but somewhat morbid imagination, and of a philosophical turn of mind. His best work in this medium is 'Saint Jerome,' etched in 1512 and now in the British Museum.

Etching in Holland.— The painters of Holland who also practiced the art of etching are Ostade, Paul Potter, Ruysdæl, Everdingen and Rembrandt Van Ryn (1606–69), the greatest painter and etcher who has ever lived. It is common knowledge that he was a great painter, but many are the critics who are of the opinion that he is even greater as an etcher. This "Wizard of the North," as Rembrandt has been called, was a robust and versatile genius, having such keen powers of observation and great technical skill, that with a few lines he could depict the life history of a human being or the spirit of a landscape. The subjects of his etchings range from the humble and lowly to the majestic and sublime; from 'A Group of Beggars' to 'Christ Healing the Sick'; but in all we feel the same master hand and mind.

Etching in Spain.— The one artist in the history of Spanish art who has especially distinguished himself as an etcher is Francisco de Goya (1746–1828). He was a man of great physical energy and courage, and an open revolutionary in religion and politics; but possessed of a morbid imagination. All these personal characteristics found expression in his etchings which he produced in several series. The most noted are 'The Caprices' (80 plates), which have an important philosophical bearing; and 'Disasters of War' (80 plates), with which he tried to make men disgusted with war.

Etching in the United States.— The art of etching in the United States was first practised by William Dunlap about 1830. Since then very many painter-etchers have appeared, including Peter Moran, Farrer, Falconer, Gifford, Smilie, Parish, Church, Bacher, Whistler and Pennell. Of these, Whistler and Pennell have won international fame. James A. McNeill Whistler (1834–1903) as an etcher is ranked with Rembrandt and Méryon. His subjects include figure compositions, Holland, Venetian and Paris street scenes and London wharves, which he etched with consummate skill and refinement. Of his street scenes, his most famous are 'A Street at Savern' and 'The Unsafe Tenement.' His 'La Vieille aux Loques' is considered his best figure print. Joseph Pennell (1860 —) has etched a series of plates of Spanish, Italian, London, Philadelphia and New York subjects, which are remarkable for spontaneity and spirited execution. His proofs of the New York 'sky-scrapers' are particularly famous. See ENGRAVING.

A. G. SCHULMAN,
Department of Art, College City of New York.

ETCHMIADSIN, a celebrated Armenian monastery in the Transcaucasian province of Erivan, 10 miles west of Erivan. It consists of three groups of buildings, surrounded by a high brick wall and from a distance has the appearance of a fortress. It contains a theological seminary, a library, with Armenian manuscripts, and several churches, of which the Shoghakath is said to have been founded by Saint Gregory. It has a Byzantine cupola and its walls are decorated in Persian style. The monastery is the seat of the Armenian primate and after the Russian occupation also of the Armenian Holy Synod. The monastery was founded in the 6th century and was ceded to Russia after the Russo-Persian War of 1827.

ETEOCLES, ē-tē'ō-klēz, and **POLYNICES**, pŏl-ĭ-nī'sēz, two heroes of ancient Greek legend, sons of Œdipus, king of Thebes. After their father's banishment from Thebes, Eteocles usurped the throne to the exclusion of his brother, whom he drove from Thebes, an act which led to what was known as "The Expedition of the Seven Against Thebes," Polynices being one of the seven leaders. Polynices went to the court of Adrastus, king of Argos. There he married the daughter of the latter and induced his father-in-law to help him against Thebes. The two brothers fell by each other's hand. The interment of Polynices was forbidden under penalty of death, but Antigone (q.v.), his sister, braved the doom decreed. Racine has dramatized this story with some poetical variations in his 'Frères Ennemis,' but the story was famous long before he took it up, having already played a part in Greek epic second only to that of the Siege of Troy. Æschylus used it in his 'The Seven Against Thebes,' and Euripides in his 'Phœnissœ' while it enters into the story plot of other Greek writings. Consult Bethe, 'Thebanische Heldenlieder' (Leipzig 1891). See ADRASTUS.

ETERNAL CITY, The, Rome, the capital of Italy. Legend states that it was raised by or under the immediate supervision of the immortal gods. The term is frequently to be met in classic literature. 'Ave, Roma Immortalis' is the title of a historical work on the Italian capital, by Francis Marion Crawford. 'The Eternal City' is the title of a novel by Hall Caine, published in 1901, the scene of which is laid in Rome. It was dramatized and produced simultaneously in England and in the United States in 1902. (See ROME). Consult Moore, F. G., 'Urbs Æterna and Urbs Sacra' (*Transactions of the American Philosophical Association,* Vol. 25, 1894).

ETERNITY, Cape, headland on the left bank of the Saguenay River, Canada, about 40 miles up the river. It has an elevation of about 1,800 feet and is a prominent feature of the landscape.

ETESIAN WINDS, winds blowing at stated times of the year; applied especially to north and northeast winds which prevail at certain seasons in the Mediterranean regions. They are due to the heat of the African Sahara, which causes a huge displacement of air due to superheating. This is supplied by the cooler air from Southern Europe.

ETEX, Antoine, äṅ-twäṅ ā'tĕks, French sculptor, painter, architect, engraver and writer: b. Paris, 20 March 1808; d. Chaville, 16 July 1888. He studied under Ingres, Dupaty, Pradier and Duban. He took the second grand prize of Rome (1829) with his 'Dying Hyacinthe'; and became a member of the Legion of Honor (1841). Among his other works in sculpture are 'Cain and His Cursed Race' (1833); 'Resistance of France to Coalition of 1814,' and 'Peace,' for the Arc de l'Etoile; group, 'City of Paris Imploring God for Victims of Cholera'; 'Charlemagne'; equestrian statue of Charles I. Among his paintings are 'Romeo and Juliet'; 'Faust and Marguerite'; 'Allegorical Glory of the United States,' for City Hall, New York (1853). Among his literary works are 'Notes on Paul Delaroche' (1857); 'Study of Life and Works of Ary Schæffer' (1859); 'Textbook for the Polytechnical Association, for Students and Workmen' (1861).

ETHANE, C_2H_6, a gaseous hydrocarbon belonging to the paraffin series and constituting its second member (the first being methane, or marsh-gas). It occurs in the gases that are given off by crude petroleum, and it may be prepared by heating methyl iodide with metallic zinc in closed tubes at 300° F.; the iodide of methyl that is required being obtained by acting upon methyl alcohol (see ALCOHOL) with iodine, in the presence of phosphorus. Ethane is also liberated at the anode, together with carbon dioxide in the electrolysis of a concentrated solution of sodium acetate. It is a colorless gas, which burns with a pale flame and combines with water, under pressure, to form a crystalline hydrate. Chlorine combines with ethane rapidly, in diffuse daylight, with the formation of ethyl chlorid, C_2H_5Cl; but if excess of chlorine is present, higher substitution products are also formed, terminating with hexachlorethane, C_2Cl_6. Ethane is also known as «ethyl hydrid.»

ETHE, (Karl) Hermann, German Oriental scholar: b. Stralsund 1844. He received his education at the universities of Greifswald and Leipzig. In 1867 he was appointed privatdozent in Arabic, Persian and Turkish in Munich. Five years later he visited Oxford for the purpose of cataloguing the Oriental manuscripts in the Bodleian Library there, the first volume of his catalogue making its appearance in 1889. He was made professor of German and Oriental languages at University College, Aberystwyth, Wales, in 1875. His varied labors include a catalogue of the Persian documents in the India office library, a critical text of 'Yûsuf and Zalikhâ' (1908); 'Grundriss der ivanischen Philologie,' and articles on professional topics in the *Athenæum*, etc.

ETHELBALD, or ÆTHELBALD, king of Mercia: b. date unknown; d. 757. He was the son of Alweo and succeeded to the throne after the death of Ceolred in 516. Within 15 years he succeeded in making subject to him all the princes and peoples of the southern and central parts of England as far as the Humber. In 740 he invaded Northumbria and two years later led a successful campaign against the Welsh. In 752 he was vanquished at Burford by Cuthred, king of the West Saxons. It is supposed that Ethelbald was murdered by his guards. Consult Green, 'Conquest of England' (New York 1884).

ETHELBALD, king of Wessex: d. 860. He was a son of Ethelwulf, king of the Anglo-Saxons; was present with his father at the victory over the Danes at Ockley in 851, and obtained the throne of Wessex in 856. While Ethelwulf was making a journey to Rome, Ethelbald formed the project of seizing the throne. A civil war was prevented only by the moderation of Ethelwulf, who resigned to his son the dominion of Wessex and confirmed that portion of the kingdom to him in his will. The reign of Ethelbald was peaceful, but he excited general disapprobation by marrying, contrary to the canonical law, his stepmother, Judith.

ETHELBERT, king of Kent: b. about 552; d. 616. He married Bertha, the daughter of Charibert, king of the Franks, and a Christian princess, who, stipulating for free exercise of her religion, brought over with her a Frankish bishop. Her conduct was so exemplary as to prepossess the king and his court in favor of the Christian religion. In consequence, Pope Gregory the Great sent a mission of 40 monks, headed by Augustine, to preach the gospel to the Saxons (597). They were well received and numbers were converted; and the king himself at length submitted to be baptized. Civilization and knowledge followed Christianity, and Ethelbert, about 600, enacted a body of laws, which was the first written code promulgated by the northern conquerors. At the time of the landing of Augustine he had acquired a supremacy over all the English south of the Humber. Ethelbert founded the see of Rochester in 604 and built the first cathedral, and afterward that of London, and built the church of Saint Paul. He was succeeded by his son, Eadbald.

ETHELBERT, king of Kent and Wessex: d. 866. He was the third son of Ethelwulf and succeeded to the government of Kent about 855, and in 860, on the death of his brother, Ethelbald, became king of Wessex. His reign was much disturbed by the inroads of the Danes and Gaulish pirates, whom he repulsed with vigor, but without permanent success as, whenever they were driven from one part of the country, they ravaged another.

ETHELFLEDA, or AETHELFLA' ED, eldest daughter of Alfred the Great, king of England, and often referred to as the Lady of the Mercians. She was born about 870; d. Tamworth, 12 June 918. In 886 she was married to Aethelred, Earl of Mercia, and with him she held Mercia when her brother Edward ascended the throne. They fortified Chester in 907 and with the Danes held off the Norwegians when the latter besieged Chester in 909. Later, with the Scots (Irish) and Welsh, she formed an alliance to resist the barbarians from the north. Her husband died about 911 and Ethelfleda lost Middlesex and Oxfordshire to her brother but managed to hold the rest of her territory. In 916 she led an expedition against the Welsh, took Derby in 917 from the Danes and Leicester and York in 918. She was buried in Saint Peter's, Gloucester. Having wielded almost royal authority the title of queen is frequently given her by the chroniclers. Consult 'Saxon Chronicle'; 'Fragments of Irish Annals,' edited by D. O'Conor.

ETHELRED I, king of England: d. 871. He was the fourth son of Ethelwulf and succeeded, his brother, Ethelbert, in 866. Assisted by his brother, Alfred the Great (by whom he was succeeded), Ethelred drove the Danes from the centre of Mercia, where they had penetrated, but the Mercians refusing to act with him, he was obliged to trust to the West Saxons alone, his hereditary subjects. Notwithstanding various successes, especially a great victory at Ashdown, the menace of the invaders continually increased.

ETHELRED II, king of England: b. 968; d. London, 23 April 1016. He succeeded his brother, Edward the Martyr, in 978, and, for want of sound judgment and sagacity, was surnamed the «UNREADY» (without *rede* or counsel). About 981 the Danes, who had for some time ceased their inroads, renewed them with great fury. In his reign began the practice of buying them off with ever-increasing presents of money. After repeated payments of tribute (see DANEGELD) he effected, in 1002, a general massacre of the Danes in England. Such revenge only rendered his enemies more violent; and in 1003 Sweyn and his Danes carried fire and sword through the country. They were again bribed to depart; but, upon a new invasion, Sweyn obliged the nobles to swear allegiance to him as king of England; while Ethelred, in 1013, fled to Normandy with his family. On the death of Sweyn, in 1013, he was invited by the national council to resume the government. Ethelred, in 1002, married, as his second wife, Emma, sister of the Norman Duke Richard II, by whom he was father of Edward the Confessor. His reign is described by Freeman as the worst and most shameful in English annals.

ETHELREDA, Saint, East Anglian princess: b. Exning, Suffolk; d. Ely, 23 June 679. Although twice married she never lived in wedlock with either of her husbands but kept her monastic vow. She finally became abbess of Ely, and the county fair held in the Isle of Ely on her day, after her canonization as Saint Ethelreda or Audrey, gave rise to the expression «tawdry,» as indicating something cheap and fine, such as would be offered for sale in a village booth.

ETHELWULF, king of England: d. 858. He succeded his father, Egbert, in 839, and soon after his accession associated his son Athelstan with him, giving him the sovereignty over Essex, Kent and Sussex. In 851 the Danes poured into the country in such numbers that they threatened to subdue it; and though opposed with great vigor by Athelstan, they fixed their winter quarters in England, and next year burned Canterbury and London. After inflicting a great defeat on the Danes at Ockley, he went on a pilgrimage to Rome, and on his return found his son Ethelbald in revolt against him. In order to avoid a civil war, he gave up the western division of the kingdom to his son, retaining Kent for himself. The youngest of his children was Alfred the Great.

ETHENDUN, Battle of, the victory which Alfred the Great gained over the Danes (878), and which led to the treaty with Guthrum, the Danish king of East England. The locality where the battle was fought is supposed to be at Edington, in Wiltshire.

ETHER, ETHYL ETHER, DIETHYL ETHER, or SULPHURIC ETHER. When the term ether is used without qualification, diethyl ether $(C_2H_5)_2O$, is universally understood to be meant, just as ethyl alcohol is understood, when alcohol is mentioned without qualification. Ether is prepared by distilling a mixture of five parts of 90 per cent alcohol and nine parts of concentrated sulphuric acid, at a temperature of 285° F., alcohol being fed continuously into the retort during the operation. The distillate is treated with lime to remove traces of sulphuric acid, and dried with calcium chloride, and is then redistilled. The substance so obtained is a mobile, colorless, inflammable liquid of agreeable odor, with a specific gravity of about 0.72 at ordinary temperatures. It volatilizes rapidly with the production of great cold. Its vapor mixed with air is highly explosive. It will not mix with water to any great extent, but will mix readily with many organic fluids, and also with liquid carbon dioxide. It dissolves bromine and iodine, sulphur and phosphorus sparingly, guncotton, rubber, most of the resins and fats, and many of the alkaloids. It boils at 95° F., under a pressure of one atmosphere, and at 200° F. below zero it freezes into a crystalline solid, which melts again at about 180° F. below zero. A hydrate of ether is obtained by evaporating aqueous ether on blotting paper. It becomes solid at 26° F.

The inhalation of the vapor of ether produces insensibility and it is used for this purpose in surgical operations. Ether is also used anæsthetically in the form of a spray producing an intense cold with inhibition of pain locally. See ETHERS.

ETHER, The, or COSMICAL ETHER, in physics and astronomy, postulated material substance, which is assumed to fill all space, and to penetrate freely among the ultimate particles of which all matter is composed. It is not in any way related to the substance known as «ether» to the chemist, and the identity in name is unfortunate. The physicist has the advantage of priority, however, and cannot be expected to change the name because the chemist subsequently appropriated it for something else. Although it has not been possible to determine the properties of the ether of physics, the admission of its existence seemed a necessity of scientific reasoning. For we know that light is some kind of a periodic disturbance, and we know that it travels through interstellar space with a definite, finite speed. It appears absurd to suppose that a motion of any kind could take place in a void, in which there was nothing to be moved; and hence, as has been said, it appears to be a logical necessity to assume the existence of some kind of a luminiferous (light-bearing) ether throughout space. As soon as we begin to inquire closely into its nature, however, we encounter difficulties that have proved insuperable. Obviously our conclusions in this respect depended to a large extent upon a study of the phenomena of light and, later, of electricity, and of the kind of motion that would be competent to produce those phenomena. Naturally the assumption was first made that the ether, when submitted to stress, conforms to the same laws of elasticity that hold true in ordinary matter. (See ELASTICITY). In that case the full mathematical theory of the motion of the ether would involve no less than 21 numerical coefficients, if the ether were anisotropic. And it is as reasonable to believe that, whatever its nature may be, it is the same in all its parts, and that its properties, whatever they may be, are the same in all directions. If these two facts are admitted — that is, if the ether be admitted to be isotropic—then the number of constants involved in the theory reduces to two. These, as is explained in the article ELASTICITY, are (1) the modulus of compressibility, and (2) the modulus of rigidity. If the ether were analogous to a liquid or a gas, its modulus of rigidity would be zero. It is found, however, that the equations of motion that are obtained by making the modulus of rigidity zero are not at all competent to explain the acual phenomena of light; for in this case the ether-waves would be merely waves of alternate compression and rarefaction, like those of sound in the air, and there could be no such phenomenon as polarization. It must therefore be admitted that the modulus of rigidity of the ether has a definite, finite value, if the ether itself is to be regarded as analogous to other kinds of matter, so far as its general mechanical deportment is concerned. If it be also admitted that the modulus of compressibility of the ether has a definite, finite value, the conclusion is reached that the ether can transmit two essentially different kinds of waves, one of which involves distortions of its parts, while the other involves changes in its density. Of these the first would admit of polarization, while the second would not. Moreover, the two kinds of waves would have, in general, different velocities of propagation; and the fact that all ether-disturbances appear to be propagated at the same speed indicates that only one kind exists, and that we must therefore make one of the three following assumptions with regard to the compressibility of the ether: (1) The modulus of compressibility of the ether is infinite; or (2) it is zero; or (3) the circumstances under which the atoms (or their component electrons) impress their motions upon the ether are such that the modulus of compressibility is not involved in any way. The first of these alternatives implies that the ether is absolutely incompressible, and this is the one that has been most favorably regarded by physicists in general. The second implies that the ether yields indefinitely, even to the smallest compressive forces, so that it is essentially unstable. This view has been developed in recent years by Lord Kelvin, but it is hard to regard it as more than a mathematical possibility. The mind cannot be brought to admit that it corresponds to the actual state of affairs in space. The third of the suggested alternatives must also be regarded as improbable, although, for lack of exact knowledge, we can hardly pronounce it impossible. On the whole, therefore, it is plain that if the elastic behavior of the ether is analogous to that of ordinary bodies, we have to admit (tentatively, at least) that so far as elastic properties are concerned, the ether resembles an absolutely incompressible solid.

According to the elastic-solid theory of the ether, light consists of a periodic or wave-like disturbance in a jelly-like medium, the waves traveling in straight lines with a uniform velocity of about 186,000 miles per second, and the direction of oscillation of the ether being at right angles to the direction in which the wave progresses, just as the direction of oscillation of the various points of a rope along which a wave is passing is at right angles to the rope. This view of the case accords very well with most of the observed phenomena, but there are some that do not appear to be reconcilable with it. We assume that the ether penetrates all bodies, and fills up the spaces between their molecules (or electrons); and as the phenomena of refraction show that the velocity of light is less in a transparent solid (say in glass) than it is in a vacuum, it follows that the ether in the glass has either a greater density or a less rigidity than it has in free space. Either of these suppositions will fit this simple case equally well; but there are other phenomena that will not be satisfied so easily, and it has been found to be impossible to make any single set of consistent assumptions which shall reconcile the "elastic-solid" theory of the ether with all the known facts. For example, when we come to investigate certain problems in partial reflection from transparent media, and others relating to diffraction from small particles, we are obliged to conclude that it is the density of the ether that varies, the rigidity remaining practically constant. On the other hand, the phenomena of double refraction require us to admit that the rigidity of the ether in a doubly refracting body is different in different directions; and hence we conclude that the rigidity of the ether is modified by the presence of molecules of matter — a conclusion at variance with that previously reached by considering the phenomena of diffraction and partial reflection. Other difficulties have been encountered in the application of the elastic-solid theory of the ether to the phenomena of light, and although reference to it is common, because it is definite enough to present a clear image to the mind, and so is helpful in many ways, the general opinion among physicists of the present day is that it is no longer tenable as an accurate description of the real properties of the ether. It has been abandoned in favor of the "electro-magnetic" theory of Maxwell, and in abandoning it we also abandon his method of estimating the density and rigidity of the ether.

Faraday was convinced, many years ago, that there is some mechanism by which magnetic and electric forces are enabled to make themselves felt through a space apparently vacuous. "Such an action," he said, "may be a function of the ether; for it is not unlikely that, if there be an ether, it should have other uses than simply the conveyance of radiation." Maxwell, after reading Faraday's writings, became so impressed by the ideas which they advanced that he applied his own ingenious and powerful mind to the problems whose solution Faraday had dimly glimpsed, and succeeded in completely revolutionizing our ideas with regard to light and the ether. His now famous "electro-magnetic theory" is given in his masterly but exceedingly difficult 'Treatise on Electricity and Magnetism' and a popularized account of it may be found in Oliver J. Lodge's 'Modern Views of Electricity.' He agrees with previous writers that light is some sort of a periodic disturbance in some sort of an ether, and that the displacements that occur are indeed perpendicular to the direction in which the light-wave travels; but he teaches us that these displacements are not analogous to those that are produced in an elastic solid when that solid is deformed. He considers that they are of an electrical nature, and that we must learn about them not by observing the behavior of elastic bodies under stress, but by observing the phenomena exhibited by electrified bodies. Maxwell has given us the fundamental equations that must be satisfied when an electrical disturbance is propagated through the ether, and by means of these equations the entire theory of light can be constructed on the new basis. The theory thus constructed agrees well with the facts of observation, and it is free from the objections that beset the old elastic-solid theory. Moreover, it successfully withstood the searching experimental tests devised and executed by Hertz and his followers, whose labors have shown us that electrical radiations are propagated with the same speed as light, and that they can be reflected, refracted, diffracted, polarized, and made to interfere; so that we are now quite ready to admit that light consists in a rapid succession of such radiations. It is not at all essential to Maxwell's theory that we should know precisely what an "electrical displacement" really is, and hence it does not teach us so much about the nature of the ether as we might desire. It does teach that the elastic-solid analogy is probably not

correct, and it strongly suggests that the ether is incompressible, and that there is some kind of an ethereal rotation going on in a magnetic field; but it has not yet been made to furnish a means of estimating the density of the ether, nor of obtaining any of its other constants.

We do not even certainly know whether the ether is continuous, or whether it is molecular in structure. Some writers find it difficult to think of a displacement of any kind, in a space that is entirely filled with matter, especially if the matter is incompressible. Others hold that this objection is without weight.

Faraday's idea that magnetic and electric induction are propagated by the same medium as light proved to be exceedingly fruitful, and it is by no means unlikely that the ether possesses still other functions, which will throw further light upon its nature, when they are understood. The various kinds of radiations that have been discovered in recent years ("cathode rays," "Becquerel rays," "X-rays," and the like) were at first believed by many authorities to consist in ethereal motions different from those constituting light, and it was even thought that some of them might correspond to the waves of ethereal compression that had been so earnestly sought. Some of these radiations, however, are now believed to be nothing but ordinary light of exceedingly short wave-length, and others are believed, at least tentatively, to consist in the actual emission of storms of corpuscles, or "electrons," from the bodies from which they proceed. (See ELECTRON; RADIUM; RADIATION). Gravitative action has also been attributed to ether stresses, and it is not impossible that this is its real nature. No mechanical explanation of gravitation, as an ether-phenomenon, has yet been offered, however, to which serious objections cannot be urged. In Maxwell's theory of gravitation it is assumed that bodies produce a stress in the ether about them, of such a nature that there is a pressure along the lines of gravitative force, combined with an equal tension in all directions at right angles to those lines. "Such a state of stress," says Maxwell, "would no doubt account for the observed effects of gravitation. We have not, however, been able, hitherto, to imagine any physical cause for such a state of stress." He calculates that to produce the actual effects of gravity, as observed at the surface of the earth, the ether would have to be subject to a pressure of 37,000 tons per square inch in a vertical direction, and a tension of the same numerical magnitude in all horizontal directions.

One of the most obvious difficulties in the way of the ether-theory is that the planets, and even the atoms, move through space as though it were absolutely empty. According to modern ideas, however, the atom may be only an aggregate of smaller "electrons," each of which may transpire to be nothing but a state of strain in the ether; and if this proves to be the case, we are certainly not in position at present to say that the ether would oppose in the slightest degree the transmission of such a state of strain through its own substance. The difficulty with the theory of aberration is more formidable. If a shower of rain is falling vertically, the drops will appear to an observer to descend vertically so long as he remains stationary. If he moves forward, however, the drops will strike him in the face and will therefore appear, to him, to come from some point slightly in advance of the zenith, rather than from the zenith itself. A similar phenomenon is observed in connection with light and is known as aberration. Every star is seen in its true position when the earth is moving directly toward it; but three months later, when the earth is moving at right angles to this direction, the observer's telescope will have to be inclined slightly toward the direction in which the earth is moving, in order that the light from the star may come down through the instrument centrally. The maximum displacement that a star can have, from this cause, is known by observation to be about 20.47 seconds of arc on the heavens. If the ether were motionless, the analogy with the raindrops would be perfect, and the "constant of aberration," whose value has just been given, could be calculated from the known velocity of light, and the known velocity of the earth's orbital motion. It is found, however, that the theory of aberration is exceedingly complicated when the possibility of currents in the ether is admitted, and hence physicists have been much concerned to know whether or not the earth drags the adjacent ether along with it, in its motion around the sun. As long ago as 1859 Fizeau showed, by a justly celebrated experiment, that the ether is apparently dragged along by a current of water flowing through a tube; and Michelson and Morley have since shown, by an even more ingenious experiment, that there is evidence that the ether in the immediate vicinity of the earth participates in the earth's motion to such an extent that any difference that may exist does not amount to the twentieth part of the whole motion. Lodge, on the other hand, found no evidence of any "ether drag" in the space between two rapidly whirled steel plates that were separated by an interval of one inch. (Consult Preston, 'Theory of Light'). The whole subject of the "drag" of the ether is still unsettled; but the observed value of the constant of aberration appears to require that the ether is not disturbed by the motion of the earth through it.

As indicative of confused condition of thought in regard to the ether, even among the most illustrious scientific minds, the following quotations are appended. Sir William Thompson (Lord Kelvin) says: "The luminiferous ether is an elastic solid, for which the nearest analogy I can give you is this jelly which you see." Fitzgerald remarks upon this, "I cannot conclude without protesting strongly against Sir William Thompson's speaking of the ether as like a jelly." Alfred Sang remarks, "Some of the most eminent physicists have adopted the view that the universal medium must be solid. We are asked to conceive our planet moving at the rate of 18 miles per second through it, and, what is still more incredible, that this takes place without any friction." Sir William Ramsey says, "It is almost universally held that all phenomena are 'mechanical,' that is, they are the result of matter in motion, and can be pictured to the mind in a concrete form; that some kind of 'machine' can be imagined which, if it existed, would reproduce the phenomena in question." And, further, "It has not yet been found possible to think out a structure and mode of motion of the ether which will explain or make it possible to realize as a kind of machine, all the phenomena in which the ether appears to play a part.» J. Clerk Maxwell offers the hypothesis that the constitution of ether is made up of elastic centres or vortices in close proximity, but goes on to say, «No theory of the constitution of the ether has yet been invented which will account for such a system of molecular vortices being maintained for an indefinite time.»

It has more recently been postulated of the ether (Erwin 1916), that it is structureless, incompressible, motionless, but capable of taking on motion, non-elastic, and capable of indefinite subdivision, and that the subdivided parts can be moved over each other without friction. On the other hand such eminent physicists as Einstein, Ritz and Poincaré deny the necessity for any such suppositional substance as the ether. It is a fact that scientific inquiry is attacking this and similar problems along quite a different line, upon the hypothesis that matter has no existence otherwise than as a mode of motion

ETHEREAL SALTS. See Esters.

ETHEREGE, Sir George, English dramatist: b. Oxfordshire, about 1635; d. Paris, probably late in 1691. He is said to have spent some time at Cambridge, but this is probably not the case, since we have it on high authority (Dennis) that he was unacquainted with either Latin or Greek. He traveled much abroad and spent some time in Paris, where it is probable that he saw the performance of the early comedies of Molière. Returning to England he studied law for some time. After 1660 he wrote ‹The Comical Revenge, or Love in a Tub,› which was produced in 1664 at the Duke's theatre. It was very successful and brought the author the patronage of the court. In 1668 he produced ‹She Would if She Could,› a rather frivolous and immoral work, but which attained a great success. For many years Etherege neglected literature but returned in 1676 with ‹The Man of Mode, or Sir Fopling Flutter,› a splendid comedy of intrigue. It added to the author's fame and fortune, but his dissolute mode of life soon dissipated the latter. He was knighted about 1680 and soon afterward married a rich widow. Charles II sent him on a mission to The Hague and in 1685 he was Minister at Regensburg. He remained there for three and one-half years, but never liked Germany. Consult the edition of his works by Verity (1888) and Gosse, ‹Seventeenth Century Studies› (London 1895); ‹Cambridge History of English Literature› (ib. 1907–13).

ETHERIDGE, Emerson, American statesman: b. Carrituck County, N. C., 28 Sept. 1819; d. ——. When 13 years of age he removed to Tennessee, received a public school education, studied law and was admitted to the bar in 1840. He was a member of the legislature in 1845–47, and a candidate for speaker, and was then sent to Congress as a Whig and re-elected by the «American» party, serving from 1853 to 1857. He was defeated for the next Congress but was re-elected in 1858 and served again in 1859–61, in which session he was chairman of the Committee on Indian Affairs. He was then elected clerk of the House of Representatives and served from 4 July 1861 to 8 Dec. 1863. On his return to Tennessee he devoted himself to the practice of his profession and the study of philosophy. He served in the Tennessee Senate in 1869–70 and was twice nominated for the governorship of his State, being defeated once and declining the second nomination. He was the last Whig that served in Congress. He published ‹Speeches in Congress› (Washington 1857).

ETHERIDGE, John Wesley, English nonconformist clergyman: b. near Newport, Isle of Wight, 24 Feb. 1804; d. Camborne, 24 May 1866. He was educated by his father and later acquired a thorough knowledge of Hebrew, Greek, Latin, Syriac, German and French. In 1826 he attempted to enter the ministry and after a period of probation was received in full connection at the conference of 1831. Thereafter he spent two years at Brighton, when he removed to Cornwall. In 1838 his health began to fail and he was pensioned and went to live at Caen and Paris. His health improving, he accepted the pastorship of a Methodist church at Boulogne in 1842. Four years later he returned to his native land and was successively on the circuits of Islington, Bristol, Leeds, Penzance, Penryn, Truro and Saint Austell in Cornwall. Heidelberg conferred on him the degree of Ph.D. He published ‹The Apostolic Ministry and the Question of Its Restoration Considered› (1836); ‹Misericordia, or Contemplations of the Mercy of God› (1842); ‹Horæ Aramaicæ› (1843); ‹The Syrian Churches: Their Early History, Liturgies and Literature› (1846); ‹The Apostolical Acts and Epistles from the Peschitto, or Ancient Syriac, to which are Added the Remaining Epistles and Book of Revelation from a later Syriac Text› (1849); ‹The Targums of Onkelos and Jonathan ben Uzziel on the Pentateuch, with the Fragments of the Jerusalem Targum› (2 vols., 1863); ‹Life of Rev. Adam Clarke› (1858). Consult memoir by T. Smith (London 1871).

ETHERIDGE, Robert, English geologist: b. Ross, Hereford, 3 Dec. 1819; d. Chelsea, London, 18 Dec. 1903. He engaged in mercantile pursuits and devoted his spare time to natural history study. He became curator of the museum attached to the Bristol Philosophical Institution, was made assistant paleontologist in 1857 and paleontologist six years later of the Geological Survey. In 1881 he was transferred to the geological department of the British Museum, where he was assistant curator for 10 years. He published ‹Catalogue of Fossils in the Museum of Practical Geology,› in collaboration with Huxley (1865); ‹Fossils of the British Islands, Stratigraphically and Zoologically Arranged› (Vol. I, 1888).

ETHERS, in chemistry, those compounds which may be regarded as derived from water by the replacement of each of the hydrogen atoms by a basic or alcoholic radical. The ether is «simple» if the basic radicals that are so substituted are alike, and it is «mixed» if they are unlike. The formation of a simple ether may be conveniently illustrated by the case of common, or «diethyl» ether, $(C_2H_5)_2O$. This may be prepared in various ways, but the sulphuric-acid method will serve best to illustrate the nature of the compound. When alcohol, $C_2H_5.OH$, is heated to 285° F. with sulphuric acid, H_2SO_4, one of the hydrogen atoms of the acid, is replaced by the alcohol radical ethyl C_2H_5, according to the equation $C_2H_5.OH + H_2SO_4 = (C_2H_5)HSO_4 + H_2O$, the compound $(C_2H_5)HSO_4$ being known as hydrogenethyl-sulphate, or «sulphovinic acid.» When the hydrogen-ethyl-sulphate comes in contact with another molecule of the alcohol, it undergoes a second transformation, by which another ethyl radical is taken up, and a molecule of sulphuric acid again set free, as indicated by the equation $(C_2H_5)HSO_4 + C_2H_5.OH = (C_2H_5)_2O + H_2SO_4$. It will be seen that although a molecule of sulphuric acid is used up in the first part of the process, it is regenerated in the second part, so that on the whole there has been no change in the quantity of acid present. The water produced in the first stage, and the ether, $(C_2H_5)_2O$, produced in the second stage, pass off in the state of vapor, and the apparatus is ready for the admission of a new supply of alcohol. The process by which an ether is formed, as here illustrated, is called etherification; and the etherification is said to be «continuous» if it can go on, as in this case, by merely passing a stream of the alcohol into one end of the apparatus, and withdrawing the vapor of ether and water at the other end Methyl ether, for example, can be formed by the action of sulphuric acid upon methyl alcohol in a manner precisely analogous to that explained above. The equations in this case are $CH_3.OH + H_2SO_4 = H_2O + (CH_3)\ HSO_4$; $(CH_3)HSO_4 + CH_3OH = H_2SO_4 + (CH_3)_2O$; where $CH_3.OH$ is methyl alcohol, $(CH_3)_2O$ is methyl ether, and $(CH_3)HSO_4$ is hydrogen-methyl-sulphate.

As an illustration of a mixed ether, the case of methyl-ethyl ether may be cited. If ethyl alcohol be heated with iodine in the presence of phosphorus, a substance known as ethyl iodine is formed. Thus: $5C_2H_5.OH + 5I + P = 5C_2H_5.I + H_3PO_4 + H_2O$. On the right of this equation, H_3PO_4, is phosphoric acid, and $C_2H_5.I$ is ethyl iodide, which is a liquid boiling at 152° F., readily separable from the phosphoric acid by distillation. Now if ethyl iodide be mixed with potassium ethylate (obtained by dissolving metallic potassium in absolute ethyl alcohol), the following reaction occurs, and ethyl ether is formed: $C_2H_5.I + C_2H_5.OK = KI + (C_2H_5)_2O$. But if the ethyl iodide is mixed with potassium *methylate*, $CH_3.OK$, which is obtained by dissolving metallic potassium in absolute methyl alcohol, then the ether that is formed contains the radical methyl, CH_3, and also the radical ethyl C_2H_5, and hence is a mixed ether; $C_2H_5.I + CH_3.OK = KI + C_2H_5.O.CH_3$. The mixed ether, $C_2H_5.O.CH_3$, is known as methyl-ethyl ether. The reactions that have here been given at some length are typical of similar ones that hold true very generally of the alcohols and ethers. In all the more familiar cases the iodide of a given alcohol radical can be prepared by treating the corresponding alcohol with iodine and phosphorus; and a potassium «alcoholate» can be formed by dissolving metallic potassium in the corresponding (anhydrous) alcohol. Then if we wish to prepare a proposed mixed ether, we have only to treat the iodide of one of its radicals with the potassium compound of the other one, as indicated above. The commoner ethers, both simple and mixed, strongly resemble one another in their general properties. Thus they will not mix with water, nor combine with ammonia nor other alkalies, nor with metallic sodium, nor with dilute acids. The resemblance is also close in other respects. For «compound ethers» see Esters.

ETHICAL DETERMINISM. See Determinism.

ETHICAL MOVEMENT AND ETHICAL SOCIETIES IN AMERICA AND ABROAD. The first Ethical Society was established and the Ethical Movement inaugurated in 1876 in New York by Felix Adler, then a lecturer at Cornell University. In response to a call, several hundred persons met in May at Standard Hall and at the conclusion of Professor Adler's address, outlining the purpose and spirit of the proposed organization, the Society for Ethical Culture of New York was constituted. In this address he appealed to his auditors to unfurl a new flag of peace and conciliation over the bloody battlegrounds where religions had fought in the past; he laid stress upon the urgent need of a higher and sterner morality to cope with the moral perils of the hour, especially noting the growing laxity that accompanied the decline of discredited forms of religious belief; and he placed peculiar emphasis upon the duty of caring for the moral education of the young. The society thus initiated grew rapidly, and soon gave practical effect to his program. Within a few years it had established a free kindergarten for the children of the poor, the first of its kind in New York; and this developed into a workingman's school, based upon the Froebelian pedagogy, which was the first school to introduce manual training and systematic ethical instruction into the curriculum. It also inaugurated a system of trained nurses for the poor, which has since become an adjunct of dispensary out-door relief in the city. Nor were the larger social and political applications of morality to contemporary life neglected: its leader devoting special attention in his platform utterances to the labor problem and specific social reforms, as being at bottom great moral issues. His vigorous exposure of the evils of the tenement houses bore fruit in the creation of the Tenement House Commission of 1884, of which he was appointed a member. He also was among the first advocates of small parks in the congested districts, of public playgrounds and public baths; and, above all, of greater justice and humanity in the relations between labor and capital, employer and employed. The Labor party here found a new type of advocate; and reformers and politicians a platform from which the issues of the hour were brought to the touchstone of ethical first-principles.

Meanwhile, the society filled more and more the place of a church in the lives of its hitherto unchurched members. It did not neglect the problems of the personal life, but aimed to illuminate and inspire its members in their dealings with the problems of the home and the vocation, family relations, marriage, the training of the young, etc. Its position as a distinctive religious organization became better understood and its religious appeal more forcibly felt, while its practical educational and philanthropic activities continued to multiply. Its schools, testifying to its conviction that moral improvement must begin with the care and education of the young, expanded until kindergarten normal and high school departments were added. These expansions necessitated greatly enlarged quarters; the society therefore erected at Central Park West and 63d Street a thoroughly modernized school building, next to which an appropriately dignified meeting place and society-house were later on added. This thoroughly equipped schoolhouse has enabled the society to fulfil its cherished aim of having a model and experimental school, standing for the highest ideals of non-sectarian education and the most efficient pedagogical method of realizing them. Many significant developments have taken place including unique Arts High School. What distinguishes these from many other similar schools is their democratic organization and spirit; like the public schools, they educate children both of the well-to-do and of the poor, a generous proportion of free pupils being admitted under a system of free scholarships endowed by the society.

To give further effect to its conception of a religious society as a body of workers, bent upon learning by doing and promoting piety by service, the society opens to its members many other fields of education and philanthropic activity. Here the women of the society take a prominent part. Most of the philanthropies are affiliated under a general representative body, known as the Women's Conference. Fortunate in drawing an unusual number of young men to its ranks, the society has a strong Young Men's Union which contributes largely to the support of two neighborhood houses: the Hudson Guild on the West Side, of which Dr. John Lovejoy Elliott, one of Professor Adler's associate lecturers, is the head worker; and the Down-Town Ethical Society, on the lower East Side. The Union also owns and supports a summer home on its farm of 70 acres at Mountainville, N. Y., where a farm school is held, and a summer holiday is given to groups of the boys and girls who belong to the Neighborhood clubs. The larger policies and relations of all the working bodies of the society are considered and shaped by a Council of Fifty, composed of representatives from all of them. One other event in the history of the society that calls for mention is the recent appointment of Professor Adler to the newly created chair of political and social ethics at Columbia University. As the chair was endowed with a view to Professor Adler's tenure of it at the instigation of some members of the well-known Committee of Fifteen appointed by the chamber of commerce to deal with the social evil in New York, of which committee Professor Adler was an active member, this appointment is a remarkable public tribute to the large public place which the founder of the ethical movement has won for himself and for it.

Early in the history of the society, a number of young men, including William M. Salter and Walter L. Sheldon, were attracted to it, and, after a period of apprenticeship in New York, went forth to found societies in Chicago, Philadelphia and Saint Louis, and across the seas to London. To these have been added organizations in Brooklyn, Newark, the Bronx and Wilmington, Del., the heads and lecturers of these being in New York, Dr. Felix Adler, Dr. John Lovejoy Elliott, Dr. David Saulle Muzzey and Mr. Alfred Martin; in Philadelphia, Mr. E. Burns Weston; in Saint Louis, Mr. Percival Chubb; in Chicago, Mr. Horace J. Bridges; in Brooklyn, Dr. Henry Neumann; in Newark Mr. George E. O'Dell. These American societies, while loosely federated in a union, maintain an individuality of their own, and have developed different forms of activity according to local needs and circumstances. Local settlement work was done in Saint Louis as early as 1889, when "Wage Earners' Self Culture Clubs" were established in four sections of the city. They all hold Sunday exercises, which consist for the most part of music, readings and an address. All admit to membership on a simple declaration of devotion to the ethical ends. All attach great importance to the moral and religious education of the young, and maintain well-organized Sunday schools and associations and clubs of young men and young women devoted to the same end and to various kinds of practical work. From the publishing and literary headquarters of the Ethical Union in New York is issued monthly, *The Standard*, the organ of the movement. Among the literary products of the American societies are Professor Adler's 'The Religion of Duty,' 'Moral Instruction of Children' and 'Life and Destiny,' etc. Mr. Salter's 'Ethical Religion'; Mr. Sheldon's 'An Ethical Movement'; 'An Ethical Sunday School'; 'Old Testament Bible Stories as a Basis for Ethical Instruction of the Young,' etc., several volumes by Mr. Martin and others.

That the movement initiated in America expressed no merely local phase of religious development is evident by its still more rapid spread in Europe. American influences led to the establishment in 1886 of the London Ethical Society with which Professors Muirhead, Bosanquet, Bonar and others, upon whom the ethical influence of Thomas Hill Green of Oxford had been profound, were identified; and under its auspices lectures were given at Toynbee Hall and elsewhere by many men at the universities and in public life who felt the importance of the new ethical propaganda, such as Seeley, Caird, Leslie Stephen, etc. About the same time Dr. Stanton Coit went over from New York to assume (*vice* Mr. Moncure D. Conway) the leadership of the congregation at South Place Chapel, then renamed the South Place Ethical Society, which, after a brief pastorate, he resigned to push the ethical cause in other ways.

Under his leadership ethical societies multiplied rapidly in London and in the provinces. A union of ethical societies (14 or more), and a moral instruction league (to introduce systematic non-theological, moral instruction into all schools), since become a separate organization, were established. There has also been a considerable output of literature. Special mention should be made of the valuable series of books of ethical instruction by Mr. F. J. Gould.

The new movement was finding, meanwhile, favorable soil on the Continent. A centre of activity was established at Berlin, where Professor Gizycki, Prof. William Foerster, and others identified themselves with the cause. Other societies were in time established in Germany, and in Austria at Vienna, in Italy at Venice and Rome, in Switzerland and Zürich and Lausanne; and in France through the Union pour L'Action Morale (1891) which found spokesmen in M. Emil Desjardins (notably in his stirring brochure 'Le Devoir Present'), and in other well-known writers. In Germany the movement languished until only a small group in Berlin under the courageous leadership of Professor Foerster became the only noteworthy survivor.

The early activity of these European centres led to the establishment of an international organization with a central station at Zurich where in September 1896 an International Congress was held which issued a representative manifesto. It is largely colored by a continental sense of the urgency of applying ethical principles in the domain of social and political affairs. It announced its sympathy with the efforts of the populace to obtain a more human existence; but recognized as an evil hardly less serious than the material need of the poor, the moral need which exists among the wealthy, whose integrity is often deeply imperiled by the discords in which the defects of the present industrial system involve them. It demanded that the social conflict should be carried on within the lines prescribed by morality, in the interest of society as a whole, and with a view to the final establishment of social peace. It declared for universal peace, and against militarism and the national egotism and jealously which precipitate war. Finally, it urged upon all ethical societies not simply to concern themselves with these practical issues, but to devote their utmost energy to the building up of a new ideal of life in harmony with the demands of modern enlightenment. This first international manifesto is still significant because it expresses the almost universal interest of ethicists in the social question, and their desire to bring theories, policies and measures of reform to the test of ethical principle; it expresses also their interest in promoting peace and an education animated and unified by an ethical purpose. It does not, however, lay the stress which would to-day be laid upon the relation of the movement to modern liberalism, its frank acceptance of the spirit and results of modern science, and its repudiation of the supernatural, miraculous and priestly elements in religion; nor does it voice the deeper religious seriousness and spirituality of the movement. By some of the leaders this latter is very strongly emphasized; and some of the ethical societies are primarily churches for inspiration and guidance in the difficult effort to lead the good life. What effect the Great War will have on the international movement it is impossible to predict. So far it has crippled or handicapped the smaller societies. In England there has been a brave struggle to maintain them. Perhaps after the war their great opportunity will come. In America they continue to move forward.

While the inception of the ethical movement was due to the insight and prevision of Felix Adler, and its first powerful impact due to his attractive eloquence and personal power, its slow but steady growth is evidence that it met a deep and widespread need. It was fitly born on American soil; for a new ethical religion and ethical church for America had been definitely prophesied and sketched by Emerson in his latter essays on 'Worship' and 'The Sovereignty of Ethics.' He had said: "The progress of religion is steadily to its identity with morals. . . . It accuses us that pure ethics is not now formulated and concreted into a cultus, a fraternity with assemblings and holy days, with song and book, with brick and stone. . . . America shall introduce a pure religion. . . . There will be a new church founded on moral science; at first cold and naked, a babe in a manger again, the algebra and mathematics of ethical law, the church of men to come, without shawms, or psaltery, or sackbut; but it will have heaven and earth for its beams and rafters, science for symbol and illustration; it will fast enough gather beauty, music, picture, poetry." The development of advanced Unitarianism through Channing and Parker had been in this direction. It had two practical outcomes — the Free Religious Association, which still holds annual sessions; and the Ethical Movement. As distinguished from the Free Religious Association, which expressed vaguely the libertarian tendencies of Emerson's thought, the Ethical Movement gave effect to the positive and constructive tendency which found clear utterance in his prophecy. Although this positive spirit was present in the religious society conducted in New York by Octavius B. Frothingham — who was wont to say, after he had retired and it had disbanded, that its legitimate successor was the Society for Ethical Culture — it was not until Felix Adler brought to the new movement at once an ethical outlook and philosophy learned chiefly in the school of Kant, an impassioned Hebraic sense of religion as righteousness of life, and a practical sense of the urgency and ethical import of the great impending moral issues in the social, industrial and political world, that conditions existed for the full birth of the new ethical religion.

The most distinctive feature of this new phase of religious development was that it did not propose to add to the religions of the past, in the way in which these had multiplied, namely, on the basis of differences of speculative belief. Instead, it announced the basic importance and the priority of the ethical factor in religion. It approached religion, not from the credal, but from the practical moral standpoint; and it saw, in a common affirmation of this priority and supremacy of virtue and the good life, a ground of union for people of varying philosophical convictions, or none. Following Emerson, it asserted that character and conduct condition creed and thought; and that it is only by sowing a worthy character that men can reap a vital and meaningful creed. It contended that no certain and lasting basis of union can be found in anything so variable and personal as one's philosophical view of the world; and that no one should pledge his intellectual future by subscribing to-day to a creed which to-morrow he may outgrow. What a man thinks is the result of what he is — the outcome, therefore, of his action, his experience, his effort and his love, far more than it is the outcome of his deliberate thought and accumulated knowledge. This position differed from that of the Comtian Positivists because theirs assumed a final, definite, and in some respects, very negative philosophy. The new movement allowed for the greatest individual differences in men's philosophical interpretation of life, save in the one tenet that all must acknowledge the sacred obligation imposed by man's moral nature to live the good life and to follow without swerving the dictates of duty according to the best light that is in each.

On the basis of this moral earnestness and this attitude of moral resolve men may safely and hopefully work backward into a philosophy and forward into a faith. Their philosophy and their theory of moral sanction may be what it will, theistic or pantheistic, materialistic or idealistic; it may or may not issue in a faith in immortality, conditional or absolute. This is a personal concern, and the statements on such matters frequently made by the leaders of ethical societies who differ much in their philosophies, are merely expressions of personal conviction, and not made as in any way committing the societies. This is to make a clear distinction between the private and the public factors of religious belief; and to find as the only possible basis for religious union, for those who would jealously guard their intellectual integrity, a moral aim by which any man should be ashamed not to be bound.

The ethical movement has been criticized as lacking in imaginative color and appeal, and therefore unlikely to spread among the masses of the people. Perhaps Emerson was right in emphasizing the austerities of the new religion in its early protestant phases. But at heart it is genial and passionately human. It has nothing sensationally novel to offer; it does not compete with picturesque claimants like Theosophy, Christian Science, Vedantism, etc., and it may be a fact that "plain goodness," "mere morality," "the beauty of holiness," will not yet draw many with their old-new evangel. And yet one finds among its adherents nothing less than a new type of the religious temperament, voicing a new imaginative sense of the hidden mysteries and wonders of the moral personality, the new unrevealed heights and depths of the moral life, the unrealized joyousness of devotion to duty and to service.

PERCIVAL CHUBB,
Leader of the Ethical Society of Saint Louis.

ETHICS (from Gr. ἠθικά, having to do with conduct, from ἦθος, character, lengthened form of ἔθος, custom, manners; *cf.* morals, from Latin, *mos mores*, customs), that branch of the theory of conduct which is concerned with the formation and use of judgments of right and wrong, and with intellectual emotional, and executive, or overt, phenomena, which are associated with such judgments, either as antecedents or consequents. As a branch of the theory of conduct, it is generically akin to the sciences of jurisprudence, politics and economics; but it is marked off from such sciences in that it considers the common subject matter of human conduct from the standpoint of rightness and wrongness. Such terms as good and evil, the dutiful or obligatory, might be used in the definition as substitutes for the terms "right" and "wrong," but good and evil are somewhat too wide in scope, including, for instance, economic utilities, commodities and satisfactions; while duty is somewhat too narrow an idea, emphasizing the notion of control at the expense of the idea of the good and desirable. "Right" and "wrong" designate exactly those phases of good and evil to which the idea of the obligatory is also applicable. The terms moral philosophy, moral science, and morals have also been used to designate the same subject of inquiry.

In its historical development, ethics has been regarded as a branch of philosophy, as a science, and as an art — often as a composite of two or all of these in varying proportions. As a branch of philosophy, it is the business of ethics to investigate the nature and reality of certain conceptions in connection with fundamental theories of the universe. It is the theory of reality in its moral aspect. The term good is taken to denote or describe a property of ultimate and absolute being. As such, it is usually co-ordinated with two other fundamental properties of reality, the true and the beautiful; and the three philosophic disciplines are defined as ethics, logic and æsthetics. Even when so much emphasis is not thrown upon the place of the good in the general scheme of the universe, ethics may still be regarded as a branch of philosophy, because concerned with the ideal, with what ought to be, or with what is absolutely desirable, as distinct from the actual, the existent, the phenomenal. From this point of view, ethics is regarded as *normative* in character, that is, concerned with establishing and justifying certain ultimate norms, standards and rules of action.

In contrast with such functions, ethics as a science is concerned with collecting, describing, explaining and classifying the facts of experience in which judgments of right and wrong are actually embodied or to which they apply. It is subdivided into social, or sociological, ethics, and individual, or psychological, ethics. (*a*) The former deals with the habits, practices, ideas, beliefs, expectations, institutions, etc., actually found in history or in contemporary life, in different races, peoples, grades of culture, etc., which are outgrowths of judgments of the moral worth of actions or which operate as causes in developing such judgments. Up to the present, social ethics has been developed mainly in connection, (1) with discussion of the evolution of morality, either by itself or in connection with institutions of law and judicial procedure, or of religious cult and rite; or (2) with problems of contemporary social life, particularly with questions of philanthropy, penology, legislation, regarding divorce, the family and industrial reform — such as child-labor, etc. In both aspects it is closely connected with the science of sociology. It is sometimes called inductive, or in its second aspect, applied ethics. (*b*) Psychological ethics is concerned with tracing in the individual the origin and growth of the moral consciousness, that is, of judgments of right and wrong, feelings of obligation, emotions of remorse, shame, of desire for approbation; of the various habits of action which are in accord with the judgment of right, or the virtues; with the possibility and nature, from the standpoint of the psychical structure of the individual, of free, or voluntary, action. It gathers and organizes psychological data bearing upon the nature of intention and motive; desire, effort and choice; judgments of approbation and disapprobation; emotions of sympathy, pity in relation to the impulse of self-preservation and the formation and reformation of habit in its effect upon character, etc. In other words, it treats behavior as an expression of certain psychical elements and groupings, or associations: psychological analysis.

Ethics as an art is concerned with discovering and formulating rules of acting in accordance with which men may attain their end. These rules may be considered as of the nature either of injunctions or commands, which prescribe as well as instruct; or as technical formulæ which indicate to the individual the best way of proceeding toward a desired result, thus not different in kind from rules of painting, or of carpentry. Which view is taken depends usually upon the kind of philosophy with which ethics as an art is associated. Ethics as an art may also be an outgrowth of either a general philosophy of conduct, or of a scientific analysis of it. Thus, from the philosophic point of view, a recent writer, Sorley, in the Dictionary of Philosophy and Psychology (Vol. I, p. 346, 1902), says of ethics: "It has to do not merely with actual conduct, but with right or good conduct, and accordingly with an ideal from which rules may be laid down for actual conduct." It is clear that the philosophical establishment of the ideal is considered to terminate in rules for its attainment. On the other hand, Jeremy Bentham in his 'Principles of Legislation' (1789), having before insisted that ethics is a science whose truths are to be discovered "only by investigations as severe as mathematical ones, and beyond all comparison more intricate and extensive," goes on to define ethics "as the art of directing men's actions to the production of the greatest possible quantity of happiness," and says it is the business of private ethics "*to instruct* each individual in what manner to govern his own conduct in the details of life." Thus as an art ethics may be grounded upon either a philosophy or a science.

As may readily be inferred from the above account, some of the most serious problems of ethics at present are concerned with defining and delimiting its own scope, basis and aims. From a purely abstract point of view, all three conceptions can exist harmoniously side by side. It is possible theoretically to regard certain topics as assigned to ethics as a branch of philosophy, others to its scientific phase, and others to the practical, or to ethics as an art. But no consensus as to these various possible assignments exists. Usually those who insist that ethics is a branch of philosophy deny that it can be anything else; they deny that any descriptive and explanatory account of *actual*, as distinct from ideal, conduct, deserves the name of ethics. What we have above treated as belonging to the science of ethics is by them treated as really a matter of history, sociology and psychology, not of ethics proper at all. Thus Green, 'Prolegomena to Ethics' (1883), begins by attempting to prove that a natural science of ethics is inherently impossible, because moral conduct by its nature implies an ideal that transcends actual conduct which alone can be made a matter of observation and experiment, and sets up an obligation which in its absoluteness transcends all the sanctions of experience. On the other hand, those who have occupied themselves with the scientific analysis of moral behavior and character, have usually denied the legitimacy of the philosophic aspect. Thus Bentham expressly regards all philosophical inquiries as doomed to result in sterility, in mere dogmatic personal assertions, or, as he calls them, "*ipse dixits*." A more recent writer, Leslie Stephen, 'Science of Ethics' (1882), without absolutely denying the possibility in the remote future of a metaphysics of conduct, says that the metaphysical view is entirely irrelevant to a scientific treatment. Along with this uncertainty as to the defining aim and characteristic methods of ethics, are naturally found a large number of subordinate and secondary controversies and divisions of opinion.

As a matter of fact, however, in every historical period there have been found in ethical theories some connection with general philosophic thought, and with the data of behavior exhibited in experience (or the scientific aspect) and with the further direction and conduct of life — the practical aspect. Historically, ethics has passed through three epochs: (1) the Græco-Roman; (2) the Patristic-Mediæval; (3) the Early Modern; terminating with say the French Revolution, and may now be regarded as having entered upon a fourth stage. In each period, a certain practical interest is uppermost in social life and this interest serves to concentrate and direct attention toward certain relevant theoretic problems. An adequate account of ethical thought accordingly is possible only in connection with the larger civilization and culture of which it is a part. Brief characterizations of the main problem of each epoch in its wider social tendencies will serve, however, to point out (*a*) the philosophic, (*b*) the scientific, (*c*) the practical centre of ethics in each period.

The Græco-Roman period was characterized by the disintegration of local custom, tradition and institution, civil and religious, coincident with the spread of cosmopolitan learning and the formation of an inclusive political organization taking effect in both legislation and administration — Greek culture and the Roman empire. With the disintegration of the habits and modes of life which had previously defined the sphere of legitimate individual satisfaction, and which supplied the sanctions of the moral life, there was necessarily coincident an inquiry which attempted to establish through reflection adequate substitutes for the waning institutional modes of control. One of the results of modern historical science is the proof of the extent and stringency of the force of custom in early life. It is custom which defines the morally right and obligatory, and it is custom which enforces its own demands. In it are bound together morals, law and religion, and all are bound into the very life of the people, emotional and intellectual, as well as practical. Where custom rules, moral theory is unnecessary and indeed impossible. In the 6th and 5th centuries before Christ, this régime of custom was irretrievably shaken in the Greek world, and with a twofold result upon morals. Many thought that all sanctions for morality had disappeared, or at least lost validity, and that pure individualism in thought and conduct — tempered at best only by some judicious regard to consequences — was the proper outcome. Others, prevented by what they regarded as the low moral standards of customary morality from coming to its defense, were also shocked by the demoralization attendant upon ethical individualism, and set to work to discover a universal and unassailable basis for a higher type of ideal morality. In this conflict, ethical theory was born.

The Græco-Roman Period (6th century B.C. to 5th century A.D.) — The controversy originated in a discussion as to whether morality exists by convention (νόμῳ), by arbitrary enactment (θέσει), or in reality, that is (in the terminology of the time), "by nature" (φύσει) or in the nature of things. Some of the Sophists taught that morality was a creature of the efforts of the rulers of a community, being a device on their part to keep others in subjection for the better indulgence of their own desires — much as many of the "free-thinkers" of the 18th century (in many respects the modern congeners of the Sophists) taught that religion was an invention of state-craft and priest-craft. Others taught that it was a product of social agreement or institution. Some of the nobler Sophists (like Protagoras, see the Platonic dialogue of the same name) interpreted this as praise of the state of civilization and culture as against the raw, crude state of nature, while others taught that it was merely a conventional means to personal satisfaction, and hence had no binding force when short-cuts to happiness were available. In the meantime the actual moral discipline of the Greek city-state was much relaxed, partly because of the interminable dissensions of party strife, and partly because the religious beliefs which were the foundation of civic life were fast becoming incredible. Socrates (about 470 B.C.–399 B.C.) was apparently the first to undertake a positive and constructive analysis of moral ideas. He made the following contributions: (1) All things have to be considered with reference to their end, which indeed constitutes their real "nature"; the end of each thing is its good. Man must therefore have his own end, or good; this is real and inherent, not conventional nor the product of law. (2) To know is to grasp the essential, real being of a thing — its "nature," or end; "know thyself" is the essence of morality; it means that man must base his activity upon comprehension of the true end of his own being. All evil is really involuntary, based on ignorance or misconception of man's true good. To be ignorant of the good is the one disgrace. If a man does not know it — and Socrates professed that he did not — he can at least devote himself seriously to inquiring, to the effort to learn. If not wise (a sophist) he can at least be a lover of wisdom (a philosopher). And until he attains knowledge, the individual will be loyal to the responsibilities of his own civic life.

The two conceptions of the good as somehow the fulfilment of man's true nature or reality, and as attainable only under conditions of rational insight are the bases of all later Greek thought. Opinions differed to what man's end is, and as to the character of true knowledge of it. The extreme division was between the Cynic school, the forerunner of the Stoics, founded by Antisthenes (about 444 B.C.–30? B.C.), and the Cyrenaic (the precursor of Epicureanism, founded by Aristippus (about 435 B.C.–360 B.C.). The former taught that virtue, manifested in temperance or self-control, is the one and only good, pleasure as an end being evil, and that it is known by pure reason. The latter taught that pleasure, known only in feeling (the sensation of a gentle and continuous change) is the good. The wise man of Socrates is he who knows this moderate and enduring pleasure and is not captured by sudden and violent passion. Both schools take a somewhat antagonistic attitude toward the state; the Cynic emphasizing the superiority of the sage to government and authority, well illustrated in the anecdotes of Diogenes and Alexander the Great; the Cyrenaic holding that the pleasures of friendship and social companionship of the congenial are superior to those of participation in public life. These schools thus set two of the fundamental problems of subsequent ethical theory, namely, the nature of the good, and the nature of knowledge of it; and supplied the framework of later schools of thought. Those who hold that pleasure is the good are termed Hedonists (Gr. ἡδονή, pleasure); those who held to its residence in the virtuous will Perfectionists, or (with certain qualifications added) Rigorists. Those who hold that it is known through reason are Intuitionalists, the other school, Sensationalists or Empiricists.

Plato (q.v.) (about 427 B.C.–347 B.C.) attempted a synthesis of the conceptions of the two schools just referred to, with a constructive program of social, political and educational reform, and with a reinterpretation of earlier philosophic theories of the universe and of knowledge. His most characteristic doctrines are (1) the generalization of the Socratic conception of the good as constituting the true essence or nature of man. Under the influence of philosophic concepts derived from a variety of sources, Plato conceived man as essentially a microcosm; as the universe in miniature. He is composed of a certain arrangement of the elements of reality itself; hence he can be truly known only as the real nature of the universal reality which constitutes him is known; his good is ultimately one with the final cause or good of the universe. Thus Plato goes even farther than Socrates in asserting that morality is by nature — it is by the nature not only of man but of absolute reality itself, which is thus given an ethical or spiritual interpretation. Thus he grounded ethics on general philosophic conceptions and has been the model for all since who have distinctly conceived ethics to be a branch of philosophy. Moreover, since he regards the ultimate good of the universe as one with God and as the animating purpose in the creation of physical nature, he brings ethics into connection with religion, and with man's relations to the world about him. (2) Plato regarded the state in its true or ideal form as the best embodiment or expression of the essential nature of individual man; as indeed more truly man than any one individual. In its true organization, it reflects or images the constitution of the ultimate good. Thus Plato brings ethics back into connection with politics as the theory of ideal social organization. Practically, he delineates this state in outline (especially in his Republic, and, with greater attention to feasible detail in his Laws), and proposes in view of this ideal a specific reform of the existing order, instead of disregard of it as with Cynic and Cyrenaic. (3) He sets forth a scheme of the good as realizable in human nature, which endeavors to combine the one-sided extremes of mere pleasure and mere virtue. He conceives the good to be the fulfilment of all capacities, faculties or functions of human nature, the fulfilment of each power being accompanied with its own appropriate pleasure, and all being ordered and bound together in a harmonious whole by a law of measure or proportion which assigns to each its proper place; at the head, the pleasure of pure knowledge; at the bottom, the appetites; between, the pleasures of the nobler senses (sight and hearing), and of the higher impulses — ambition, honor, etc. The right functioning of each is virtue; its product is pleasure. The system of pleasures according to virtue is the good. Moreover, he specifies four cardinal virtues which result — wisdom, the knowledge of the good or organized whole; justice, the law of proportion or measure; courage, the assertion of the higher tendencies against the pleasures and pains arising from the contemplation or imagination of the lower; temperance, the law of subordination in accordance with which each lower function is restrained from usurping the place of the higher. Plato's system of ethics remains the standard of ethical theories of the "self-realization" type.

Aristotle (q.v.) (384 B.C.–322 B.C.) gave the philosophic consideration of Plato a more scientific and empirical turn — a contrast, however, which is often exaggerated. He protested against the identification by Plato of human end or good with that of the universe, and consequently attached less importance to knowledge in the form of philosophic insight, and more to practical insight or wisdom. But, in the main assuming the Platonic basis, he carried into detail the analysis of human faculties or functions involved in conduct, giving a careful analysis of desire, pleasure and pain, of the various modes of knowledge, of voluntary action and making a remarkable analysis of the various forms of virtue and vice actually current. In a word he emphasized in detail psychological and social aspects, merely sketched by Plato. On the social side, it had become obvious that the comprehensive scheme of reform entertained by Plato was impossible; and here, also Aristotle is free to undertake a more empirical description and analysis of various forms of government and organization in their moral bases and bearings. When in the 12th and 13th centuries A.D. the works of Aristotle were again made known to the European world, first through translations from the Arabic and then from the Greek, Aristotle's ethics became embodied in the official philosophy of the Roman Catholic Church, especially in the writings of Saint Thomas Aquinas (1225–74), and found literary expression in the Divine Comedy of Dante. His ethical writings have more profoundly affected common speech and thought than those of any other writer, and to a large extent have become a part of the moral common-sense of civilized humanity.

The details of later ethical philosophy in Greece and Rome form an interesting part of the history of ethics, but, with one exception, supply no new idea of sufficient importance to need mention here. The exception is the Stoic conception of virtue as "living in accordance with nature," and the conception of the "law with nature" which grew out of this. This idea, under the form of *jus naturale*, was taken up into Roman jurisprudence, and became the ideal of a common moral law which underlies all differences of positive municipal law, and which, accordingly, forms an ethical standard by which positive law can be tried, and its diversities reduced to a common denominator. It reappeared in the Middle Ages in the form of the natural law (as distinct from revealed or supernatural law), written on the "fleshly tablets of the heart," and was thus indirectly influential in forming the still current notion of *conscience* as a moral legislative force. It came out in continental ethical thought of the 17th and 18th centuries in the conception of moral law as something analogous to a system of mathematical axioms, definitions and demonstrations, discoverable by reason, and forming the framework of both individual and political ethics.

Patristic Mediæval Period (5th to 15th centuries A.D.) — The second period of ethical history is characterized by the subordination of ethics, as a branch of philosophy, to theology. The distinctive features contributed in this period to subsequent ethics are the emphasis laid upon ideas of law, authority, obligation or duty, and merit or demerit, namely, the good as religious salvation involving a knowledge and love of God as supreme perfection, possible only in the next world; and evil as sin, guilt also needing supernatural expiation. Because of the emphasis upon law and authority, moral ideas are largely assimilated to forensic and juridical conceptions. Most significant, however, for ethical theory is the transfer of theoretical interest from the conception of the good, the central idea of ancient ethics, to that of obligation. Not the natural end of man, but the duty of absolute submission of will to transcendent moral authority was the keynote. And even when ethics was freed from subservience to theology, it still remained easier for the modern mind to conceive of morality in terms of the nature and authority of duty than as the process of realizing the good. On the more concrete, empirical side, the great contribution of mediæval theory was in depicting the moral drama, the struggle of good and evil, as it goes on in the individual soul. The fact that this was fraught with significance for an endless future life made it a subject of anxious and minute attention; and here, too, even when the moral region was later marked off more or less definitely from the religious, modern thought owes its consciousness of the subtle perplexities, temptations and shades of moral effort and issue to mediæval rather than to ancient ethics.

Early Modern Period (The Reformation to the French Revolution). — The complexity and variety of moral theory and inquiry since the 15th century, as well as its relative nearness, make it difficult to secure the perspective necessary to its proper characterization. It is all more or less connected, however, with the struggle toward greater individual freedom, and with the problem of maintaining a stable associated and institutional life, on the basis of recognition of individuality — the democratic movement. In its earliest period, modern ethics was largely characterized by reaction against scholasticism; it was an effort to secure a basis for ethics free from subordination to theology and to mediæval philosophy, and the schoolmen's versions of Aristotle. Moreover so much of energy was expended in the practical effort to get freedom of thought, of political action, of religious creed, of commercial life, that moral theory turned largely upon detailed questions arising out of the practical struggle. This accounts to a considerable extent for the scattered, fragmentary condition of modern ethics as compared with the systematic character of either Greek or mediæval thought. Moreover, the very gaining of intellectual freedom of inquiry opened up countless fields of interest. Ethical problems sprang into existence at every turn; every new movement in industry, in politics, national and international, and in art, brought with it a new ethical problem. Social life was itself undergoing such rapid change and in such tentative, uncertain ways, that each of these problems had to be attacked independently. The result is a critical controversial and individualistic, rather than a constructive and systematized ethics — with the advantage, however, of remarkable richness in detail.

Continental ethics followed the prevailing philosophic method of rationalism; the attempt to build up a theory of conduct, individual and social, on the basis of pure reason, independent of revelation of ecclesiastic authority, or positive institutions. While the method was *a priori* in name, as matter of fact it drew largely upon the inheritance of generalized Roman law, attempting to harmonize and purify it in accordance with ideals of unity and comprehensiveness which were supposed to represent the demands of reason. Grotius (1583–1645) was the founder of this movement, and, in his *De Jure Belli et Pacis*, used the idea of law which is founded upon man's rational nature, which in turn is inherently social, to place international relations of comity, commerce and war upon a more humane and enlightened basis. His German successors, Puffendorf (1632–94), Leibnitz (1646–1716), Thomasius (1655–1728), Wolff (1679–1754), carried on with greater critical acumen and more adequate philosophic instruments, the same work, and finally developed a complete system of rights and duties (called *Naturrecht* after *Jus Naturale*) applicable to all spheres of private, domestic, civil, political and international life — a *code* of morals, positive in effect, but supposed all to be drawn deductively from rational first principles. Upon the whole, the influence of German ethical rationalism was conservative; the result in fundamentals was the justification of the existing social order, purged of inconsistencies and reformed of abuses in detail. French rationalism took a different turn. It attempted a synthesis of the more basal notions of the newly arisen physical science with psychological ideas borrowed from Locke and his English successors. It was rationalistic not so much in attempting to deduce an ethical system from the conceptions of reason, as in subjecting the existing order of belief and institutions to unsparing criticism as anti-scientific. In its extreme forms it seemed to demand an abrogation of existing institutions, the erection of the same *tabula rasa* in social matters, that Descartes had postulated in intellectual, and a creation *de novo*, by sheer voluntary action, of a new social order, aiming at universal happiness. Reason gives an ideal of society in which all men shall be free and equal, and in which economic want and misery shall be abolished, and a widely diffused intelligence and wealth shall be instituted. Pessimistic to the extreme as regards the existing order, it was equally optimistic as to the possibilities of social organization, culminating in the conception of the infinitely progressive perfectibility of human nature; thus Helvetius, 1715–71 (De l'esprit, 1758; De l'Homme published 1773); Diderot (1713–84); Condillac (1715–80); D'Holbach (1723–89), especially 'Système Social' (1773); Condorcet (1743–94). While German ethics had emphasized the conception of natural law which is social in nature, French thought culminated in a deification of natural rights which are individual in their import and location. Certain characteristic features of not only the French Revolution but of the thought of American publicists in the latter half of the 18th century are directly traceable to this influence.

English ethical theory received its impetus from Hobbes (1588–1679). He begins with an analysis of the make-up of the individual, and resolves the latter into a bundle of egotistic impulses, all aiming at unrestricted satisfaction. He denies the existence of any inherent social tendency, or of anything "rational" in the individual save as deliberation may be involved in the individual's efforts after satisfaction. The social counterpart of this unlimited individualism is chaos, anarchy, conflict — the war of all against all. Hence the individual's quest for happiness is self-contradictory. It is possible of fruition only within the state of absolute power which prescribes to each individual the proper sphere of the exercise of his powers. The state is thus the author and sanction of all moral distinctions and obligations. The authority of this state with respect to individuals is absolute; since the source of moral law, it cannot be subject to anything beyond itself. There are thus three strains in Hobbes' teaching. The psychological, which teaches pure egotism and hedonism; the ethical, which makes the state the source of moral values and relations; the political, which makes its authority unlimited. Each strain evoked profound and instant reaction. John Locke (1632–1704) taught that the individual has a natural right to a life of personal security, possession of property and social activity, subject only to limits of the similar rights of others, and that the state comes into existence to protect and secure these rights by settling cases of dispute or aggression, and hence is null and void when it goes beyond this province and encroaches upon individual rights. A succession of writers, notably Staftesbury (1671–1713); Hutcheson (1694–1747); Butler (1692–1752)); Adam Smith (1723–90), undertook a re-analysis of human nature, and endeavored to justify the presence of disinterested benevolent impulses, of tendencies to regard the welfare of others. Cudworth (1617–88); More (1614–87); Cumberland (1632–

1718); Clarke (1675–1729); Price (1723–91) took up the question of the origin of moral distinctions, and tried to show that they were based not in the state but in immutable laws of reason, or upon a science as abstract and certain as mathematics; or else were made known in intuition, etc. But during these inquiries, new problems came to light, and led to a rearrangement of forces. These problems were (1) the relation of happiness — the expression of the self-seeking tendencies of man — to virtue, the expression of his benevolent tendencies; (2) the nature of the test or standard of right and wrong; (3) the nature of moral knowledge. The first problem led in Butler to the attempt to introduce "conscience" as a third and balancing authoritative factor in human nature; and in Smith and Hume (1711–76) to a peculiarly rich and significant theory of sympathy as a central principle through which distinctively moral sentiments are generated and whose exercise is intimately bound up with individual happiness. The second and third problems taken together lead to the conflict of utilitarianism and intuitionalism, the former holding that conduciveness to the maximum of possible happiness is the standard of right, the basis of obligation, and the source of all moral rules; this conduciveness to be determined by actual experience; the latter holding that there are moral values, which are inherently and absolutely such, without reference to consequences. Each school has a theological and a non-theological variety. Among theological utilitarians are prominent: Gay (1686–1761), and Paley (1743–1805); among the non-theological Jeremy Bentham (1748–1842) outranks all the others. Without adding much that is fundamentally new to the theoretical analysis, he makes an analysis of happiness in connection with a discussion of the various impulses (or motives as he termed them) of human nature the basis of a thorough-going scheme of judicial and penal reform. Through him utilitarianism became the most potent instrument of the first half of the 19th century of social reform; conduciveness to general and equally distributed happiness being the test by which all customs, traditions and institutions were tried — and by which most of them in their existent forms were condemned.

Recent Modern. (From the French Revolution.) — The last 20 years of the 18th century signalize a turning point in the history of thought. Bentham's and Kant's chief works are dated in this period. The French Revolution, carrying into effect the naturalistic rationalism and its optimistic faith in the possibilities of the individual, compelled a reconsideration of the intellectual premises from which it set forth. The problem of 19th century ethics was to get back from the individual to the social whole which includes him and within which he functions; but to do this in a way which should take due account of the deepened significance given to individual initiative and freedom — without, that is, a return to pure institutionalism, or to arbitrary external authority. The following schools or main tendencies are easily distinguishable:

(*a*) *English Liberalism.*— In Bentham, utilitarianism, as we have seen, became a program of social reform. The attempt to stretch an individualistic hedonism which taught that the end of desire is always the agent's own pleasure into a theory which taught that the individual should always judge his motives and acts from the standpoint of their bearing upon the happiness of all beings, brought out all the weaknesses of the theory. James Mill (q.v.) (1773–1836) strove valiantly to overcome these weaknesses by a systematic use of the principle of association, in virtue of which individual states become indissolubly connected, through punishment or commerce, with the welfare of others — the theory of "enlightened selfishness," for which Hartley (1705–57) had previously provided the psychological machinery. His son, John Stuart Mill (1806–73) while extending the same idea, introduced into utilitarianism two innovations, which were seized upon by his intuitional opponents as virtual abandonments of the entire hedonistic position. These were that quality of pleasure is more important than quantity and that the individual is naturally social and so instinctively judges his own welfare from the standpoint of society, instead of vice versa. J. S. Mill also severely criticised the other utilitarians for their neglect of the ideal elements in education, and for neglect of the culture element in historical development. Without abandoning the individualistic basis he was much influenced by schools (*b*) and (*c*) below. From (*b*) came the influence of Coleridge (1772–1834); Maurice (1805–72), and Sterling (1806–43). Bain (1818–1903) belongs to the same empirical and utilitarian school. Sidgwick (1838–1900) in his 'Methods of Ethics' attempted a fusion of the utilitarian standard with an intuitional basis and method.

(*b*) German rationalism culminated in Kant (1724–1804), who reduced the function of moral reason in man to a single principle; the consciousness of the moral law as the sole and sufficing principle of action. Since the claims of this principle are opposed by those of self-love — the desire for personal happiness — the presence of moral reason in us takes the form of a "categorical imperative," or the demand that duty alone, without any influence from inclination, desire or affection, be the motive of conduct. Upon the consciousness of duty are built the ideas of freedom, God and immortality — that is, by moral action is opened to us a sphere of reasonable faith in transcendental realities which are shut to scientific and philosophic cognition. Kant brought rationalism to a turn much as Bentham had affected empiricism. Subsequent German thought attempted to overcome the formalism of Kant's bare reason, making itself known only in a consciousness of obligation. Hegel (1770–1831) attempted a synthesis of the Kantian idealism with the ideas of Schiller, of Spinoza (especially through the medium of Goethe), and of the rising historical school founded by Savigny. He endeavored to show that the social order is itself an objective embodiment of will and reason, and that the regions of civil law, of family life, social and commercial intercourse and above all the state, constitute an ethical world (as real as the physical) from which the individual must take his cue. He anticipated in many particulars from the standpoint of a different method and terminology, doctrines of recent anthropology and social psychology. German moral influence has been felt in English thought chiefly through Coleridge, Carlyle (who was mainly affected by

Kant's successor, Fichte, 1762–1814), and more recently, T. H. Green (1836–82). The New England Transcendentalists were also affected by this school of thought, Ralph Waldo Emerson (q.v.) (1803–82) giving a highly original version of it, blending it with factors of his own personality and with ideas drawn from Puritanism.

(*c*) In France, the reaction from the individualism of the Revolution was most marked. At the head of the reaction stands Comte (1798–1857), who attempted to build up a theory of ethics upon an organized social basis, similar in many respects to that of Hegel, but relying upon a systematization of sciences rather than upon philosophy, for method, his system accordingly being termed positivism. Comte sought to show how such an ethical-social science could replace metaphysics and theology, the latter in the form of a religion of humanity. He influenced G. H. Lewes and the latter's wife, George Eliot, and also John Stuart Mill.

(*d*) In the latter half of the 19th century the theory of evolution has been dominant in ethical as well as in other forms of philosophic and scientific thought. Herbert Spencer's application is the best known to English readers. It is, however, generally recognized that his fundamental ethical conceptions were worked out before he became an evolutionist, and that the attachments between his ethics and the theory of evolution are of a somewhat external character. Indeed, it is now clear that the further development of the science of ethics waits upon the more thorough clearing up of the evolutionary ideas themselves, and upon more complete application to biology, psychology and sociology (including anthropology and certain phases of the history of man) in order to supply the auxiliary sciences necessary for ethical science. Through the conception of evolution it is probable that ethics, will be emancipated from the survival of the idea that it is an art whose business is to lay down rules. The practical aspect of the theory of ethics will necessarily remain (since it is theory of practice or conduct), but it will take the form of providing *methods* for analyzing and resolving concrete individual and social situations, rather than of furnishing injunctions and precepts. The coincidence of the evolutionary tendency with the growth of democracy will relieve ethics in its philosophic aspects from its dependence upon fixed values, ideals, standards and laws, and constitute ethics more and more a working method for the self-regulation of the individual and of society.

Every period of ethical theory has been associated, as we have seen, with some corresponding epoch of human development, having its own characteristic problem. Upon the whole, however, ethics has not as yet adequately outgrown the conditions of its origin, and, the supposed necessity they imposed of finding something as fixed and unchanging as custom. Consequently, philosophic inquiry has been devoted to finding *the* good, *the* law of duty etc.; that is, something unchanging, all inclusive. Even the empirical school, in its emphasis upon pleasure, has tried to find something free from conditions of development, something fixed in the sense of being everywhere and at all times the same single unchanging standard and end. Even Spencer distinguishes present ethical codes as merely relative, and anticipates a period in which evolution will reach its goal — a period in which an unchanging set of rules shall be uniformly binding. But as ethical writers become more habituated to evolutionary ideas, they will cease setting up ideals of a Utopian millennium, with only one end and law; and will devote themselves to studying the conditions and effects of the changing situations in which men actually live.

JOHN DEWEY,
Professor of Philosophy, Columbia University.

ETHIOPIA (Gr. αἴθω, to burn, and ὄψ, countenance), the biblical CUSH, in ancient geography, the name originally given by the Greeks to the southern parts of the known world. It is divided in the poems of Homer into eastern and western Ethiopia, and this distinction is repeated by Herodotus, and by the later Greek and Roman geographers. Homer gives the southern limit of Ethiopia as the northern boundary of the Southern Sea. Some ancient writers give the boundaries of the three Ethiopian kingdoms, Meroë, Aksum and Napata. Eastern Ethiopia appears to have included southern India, whose inhabitants were called Ethiopians from their color. There were also other Asiatic Ethiopians, an equestrian race, of a darker color than their neighbors, who wore crests made of the hides and manes of horses, and are supposed to have been a Mongolian tribe which had wandered into the steppes of Koordistan. The name Ethiopia was more usually and definitely applied to the country south of Libya and Egypt, between the Red Sea on the east and the desert of Sahara on the west, and embracing the modern regions of Nubia, Sennaar, Kordofan and Abyssinia. In a still narrower sense, the designation was restricted to the province or kingdom of Meroë, which was also called the civilized Ethiopia. African Ethiopia, which is called in the Bible the land of Cush, embraced, according to Pliny, 45 distinct kingdoms; yet as neither the Greeks nor Romans ever penetrated beyond Napata, in lat. 19° N., we are indebted for most accounts of it to Greek imagination. Meroë, between the Nile and the Astaboras, formed the most powerful kingdom, and had a theocratic constitution. The other principal divisions were the Blemmyes, whose aspect was hideous; the Troglodytæ, who lived in caverns; the Macrobii, or long-lived men; the Ichthyophagi, or fish eaters; and the Creophagi, Chelonophagi, Elephantophagi, Struthophagi, and Ophiophagi, respectively the eaters of flesh, tortoises, elephants, ostriches and serpents. Fable placed also in this region the race of pygmies. Some parts of Ethiopia were named from their productions; as the land of cinnamon, and of myrrh, and the Jews and Phœnicians went thither to obtain aromatics and ivory. The Ethiopian kings seem to have been chosen from among the priests, and the order of succession gave the crown to the nephew of the king, the son of his sister; and in default of an heir, an election was made. The people practised circumcision, and embalmed their dead in a manner similar to that of the Egyptians. They were of an intrepid, impetuous and violent character, and yet are represented as loving and practising justice. Homer makes Jupiter visit them, and sit at their feasts. There were many Ethiopian queens named Candace, one of whom became subject to the Emperor Augustus. Under the Romans the population of Ethiopia became almost wholly Arabian, and so continued after the introduction of Christianity in the 4th century. When the followers of Mohammed overran the entire region some centuries later, the Arabic element gained complete predominance in it. During the Middle Ages the Christians and clergy of Abyssinia were designated as the Ethiopian Church. See MEROË.

Language and Literature.— Of the different dialects spoken in modern Abyssinia, the Amharic and the Tigré are the most remarkable. The former of these shows little affinity with the ancient language of the country, the Geez, or the Ethiopic properly so called, which since the beginning of the 14th century, when a dynastic change made the Amharic the language of the court, has ceased to be the vernacular, and is used only by people of education and learning, in religious and civil documents. This ancient language, which has its name from the inhabitants calling it *lesana geez*, that is, language of science, as it is also called language of books, is of Semitic origin, resembling in roots, structure and grammatical forms, the ancient South Arabian dialect of the Himyarites, which since Mohammed has disappeared from the peninsula. This favors the hypothesis of some historians, who suppose the Ethiopians to have been a colony from Arabia. The alphabet also of the Geez greatly resembles that of the Himyarites, as found in their remaining inscriptions. It consists of 26 consonants and 7 vowels, which are small marks inseparably connected with the former, thus forming a peculiar syllabic mode of writing, analogous to the Devanagari and some other Indian alphabets. Few of these letters show a resemblance to the Phœnician alphabet, while 24 of them may be traced in the Arabic. There are no diacritical marks; the single words are separated by two dots; the accent is difficult; the mode of writing is from left to right, the reverse having been the practice before the introduction of Christianity into Abyssinia. In roots, and forms of expression and construction, the Geez is poorer than the Arabic. According to Gesenius, one-third of all the roots can be traced distinctly in the Arabic, and many other words may be presumed to be of the same origin, while the roots of others can be found in the Hebrew, Syriac, or Chaldaic, some being native African, a few of Greek, scarcely any of Coptic derivation. The Geez has 10 conjugations, 8 of which answer to those of the Arabic, the 5th and the 6th being peculiar. A double infinitive is used substantively, this mood having both an absolute and constructive form. There is no participle. The dual is unknown both in verbs and nouns; the difference of masculine and feminine is observed throughout in the second and third persons. The relation of the genitive is expressed by an inflection, causing some changes in the terminations, or through the relative pronoun; the dative by prepositions; the comparative and superlative degrees by particles. The plural is formed by affixed syllables, *ān* in masculine, *āt* in feminine nouns, on the principle common to the Hebrew, Arabic and Aramaic, or by changes in the radical letters, after the manner of the so-called broken plural in Arabic. In the formation of nouns the Geez most resembles the Hebrew, but it has superfluous final vowels, modified in certain cases, in which it is analogous to the Arabic in its nunnation. Besides a few fragments in inscriptions, there are no remnants of the ancient Ethiopian literature of a period preceding the introduction of Christianity under Constantine the Great, but of works composed since that time about 200 are known to European scholars. The Old Testament, translated from the Septuagint by unknown Christian writers in the 4th century, is extant in manuscripts in Europe, but only a part of it has been printed. The Psalms were published in Ethiopic and Latin by Ludolf (Frankfort 1701), and in Ethiopic alone (London 1815). The version of the New Testament appeared at Rome in 1548, and in the London polyglot Bible. Of versions of apocryphal books, in which the Ethiopic is particularly rich, several have been published, as the 'Book of Enoch,' translated by Richard Laurence into English (2d edition, London 1833), and by Hoffmann into German (Jena 1838), in *Vatis*, translated by Laurence into Latin, and published in both languages (Oxford 1819). Geez in 1840 (London), and *Ascensio Isaiæ*. The 'Didascalia, or Apostolical Constitution of the Abyssinian Church,' was published in Ethiopic and English by Platt (London 1834). The *Synaxar* contains lives of saints, martyrologies and the hymns of the Ethiopian Church, in rude rhythmical form, every three or five lines often ending in the same consonant, which forms a kind of rhyme. The profane literature of the Ethiopian language is comparatively poor, consisting chiefly of chronicles, which appear to be of considerable interest, but have not yet been generally accessible. Of these the most remarkable are the 'Keber za Nageste,' containing the traditional and legendary history of the once mighty kingdom of Aksum, a copy of which was brought to Europe by Bruce, and a translation of it appended to his travels; and the 'Tarek Nagushti,' or chronicle of kings. In Europe the Ethiopian language was almost unknown until the time of Job Ludolf, who, being assisted by an excellent native scholar, Abbas Gregorius, made himself master of it, and published an admirable dictionary and grammar (2d improved and enlarged edition, Frankfort 1702). Manuscripts written in the Ethiopian language are in possession of Abyssinian monks and in libraries in Europe. Their knowledge of music may be inferred from their musical notation which has been published. After a long interval the interest in this language and literature has been revived by the works of Platt, Laurence, Gesenius, Hupfeld, Hoffmann, Rödiger, Ewald and others, as well as by the contributions of Isenberg, Blumberg, and D'Abbadie.

ETHIOPIAN REGION. See Zoögeography.

ETHIOPIANISM, a movement among the native races of South Africa, having for object negro domination in Africa, thus contemplating the ousting of the whites. It has in the past masqueraded as a sort of religious teaching and took its start in the early 90's of the last century when two black ministers receded from the Wesleyan Church and founded the Church of Ethiopia for blacks exclusively. One of these ministers, Dwane, came to America and had his church recognized by the African Methodist Episcopal Church. Later he sought a union with the Anglican Church at Cape Town and was partially successful through the temporizing and weak-kneed policy of the Anglican archbishop. Various troubles, religious and political, have been traced to the movement; of the latter we may cite the Herero uprising of 1904, and the Zulu insurrection two years later. Little has been heard of the movement within the last decade.

ETHIOPIC. See Ethiopia, *Language and Literature;* Ethiopic Writing.

ETHIOPIC WRITING. See Ethiopia.

ETHIOPS MINERAL, a name formerly given by chemists to the black sulphide of mercury, prepared by rubbing mercury and sulphur together, either hot or cold. *Æthiops martis,* or ethiops of iron, was the black oxide got by exposing iron-filings and water to the air. Vegetable ethiops is the plant bladder-wrack, heated until it becomes black, a remedy for scrofula.

ETHMOID BONE, The (so called from *ēthmos,* "a sieve"), is one of the eight bones which collectively form the cranial box. It is of a somewhat cubical form, and enters into the formation of the cranium, the orbits, and the nasal fossæ. Its upper surface is perforated by a number of small openings (whence its name). See Nose.

ETHNIC PSYCHOLOGY. See Psychology, Ethnic.

ETHNOGRAPHY, a branch of ethnology, the vast science which treats of mankind as a whole, their origin and their development in language, art, religion and political ideas, from barbarism into civilization. The German scientists class ethnology as a science standing midway between natural history and philosophy. As natural history, in the ordinary sense of the term, is a classification and description of the lower animals, ethnology may fairly be considered as a classification of the various families of the human race, based on the observation of their physical characters, and geographical distribution. From the earliest records and monuments of mankind we find traces of various types of humanity. The statues and paintings of ancient Egypt represent several racial types including the negro, the Berber and the Asiatic. In the first book of Moses, mankind are divided according to their descent from one of the three sons of Noah, Shem's progeny occupying Western Asia, while to the posterity of Ham and Japhet fell North Africa and southern Europe, respectively. Some recognition of the superficial physical differences observable in variously distributed races may also be found in Greek and Roman writers. In the Middle Ages little progress was made in ethnography. The discovery of America, with its revelation of new human types, seems to have given the first genuine stimulus to this study, and the word ethnography was first used in a book published at Nuremberg in 1791, and entitled 'An Ethnographical Picture Gallery.' In his great work, 'Systema Naturæ,' Linnæus classes mankind (*Homo sapiens*) together with the apes under the order of *Primates,* and divided them into four groups, as American, European, Asiatic and African. Buffon in his 'Variétés dans l'espèce humaine' distinguishes the races according to their geographical distribution, though he makes some reference to physical variations. Blumenbach was the first to classify the races of men according to the shape of their skull. The Caucasian, whose skull was symmetrical, he set as the normal type, midway between the Mongolian with the square skull, and the negro with his prognathous skull, while the American was ranged between the Mongolian and the Caucasian, and the Malayan between the Caucasian and the negro. In each of these types he distinguished and recognized as important the character of the hair, the setting of the eyes, and the form of the mouth.

The modern science of ethnography dates from the year 1829 when Milne-Edwards wrote to Thierry, with the result that the Société Ethnologique was founded. The founding of an ethnographic museum was suggested by Jomard in 1843, and built some years later in Paris. Since that time the study has been thoroughly systematized all over the world. While of all ethnographical classifications the most obvious is the enumeration of the white, yellow, red and black-skinned races, as together making up mankind, this is clearly insufficient, as it would be likely to confound widely different types. Many attempts at a more scientific classification have been made. Oscar Pechsel recognized seven races of men: (1) the Australian; (2) the Papuan, including the Melanesian, the Negrito, etc.; (3) the Mongolian, including the Polynesian, the Malay, the Eskimo, and the American Indian; (4) the Dravidian (southern India and Ceylon); (5) the Hottentot and Bushman; (6) the negro; (7) the Mediterranean races, or Caucasian, which include the Hamitic, Semitic, and Indo-European.

It will be seen that these divisions are based upon other considerations than those of physical character, for it is merely because of their geographical proximity that the Hamitic, which includes the inhabitants of North Africa, can be placed in one category with the Caucasian. Among the most recent systems of ethnographical classification is that of Haeckel who has divided the human family into races in accordance with the variations of a single physical character, that namely of the hair. According to his authority there are two main species and four sub-species of hair found among mankind, who may be broadly separated into the woolly-haired (Ulotriches), and the straight-haired (Lissotriches). The woolly-haired consist (1) of the crested-haired (Lophocomi) subdivision, represented by the Hottentot, and the Papuan; and (2) of the fleecy-haired (Eriocomi) which includes the negro and the Kaffir. The straight-haired are subdivided into the streaming-haired, and the curly-haired. To the former belong the Australian, the Arctic dwellers, the American Indian, Malay, and Mongolian; to the latter the Dravidian, the Mediterranean races and the Nubian. See Ethnology and consult works subjoined thereto.

ETHNOLOGY, that branch of the science of anthropology which treats of the races of mankind and seeks to explain their origin and development.

Anthropology is the science which treats of man in relation to himself, to other men and to all nature. It is subdivided into several branches, each of which treats of some special phase of man's natural history. There is a difference in the meaning given by students to the names employed to designate the divisions of the study of man. Ethnology, ethnography, and anthropology have been to some extent interchangeable terms. Each of these branches of knowledge has a special meaning given it in different countries. However, there is becoming a more general acceptance of a definite meaning for these topics. The comprehensive term anthropology is recognized in its general sense to include all others (Keane, Tylor, Mason). The meaning herein given to Ethnology is widely recognized (Keene, Brinton). The use of the term anthropology, to designate societies for the study of man and for sections in national scientific bodies on both sides of the Atlantic, indicates a general tendency to accept the proper meaning of the word.

Ethnology differs from ethnography, which deals chiefly with the collection of facts regarding the families, tribes and races of mankind, in seeking to explain the significance of the information obtained. Ethnography (from ἔθνος a people, γράφειν to write) is a writing about, a description of, peoples. Ethnology (from ἔθνος, a people, λογος a discourse), attempts to interpret the facts gathered, to explain the causes for the conditions and the relationships of different peoples. Ethnography and ethnology occupy a relation to each other somewhat akin to that of geography and geology. One deals chiefly with existing facts, the other attempts to interpret the history which brought them forth.

Broca says ethnography studies peoples, ethnology races. The following seems a convenient scheme for grouping the branches of anthropology. Substantially it is as follows: Archæology, Biology, Psychology, Ethnology, Ethnography, Philology, Technology, Sociology and Religion (Mason).

The unity of the race is now generally accepted. From the researches of the physiologist, the anatomist, the philologist and the psychologist we obtain the same testimony as to the specific unity of our race. The place of origin or centre of dispersal is not fixed. From the studies of eminent specialists, it would seem that the land about the shores of the Mediterranean, or the region farther eastward toward India, may claim to be the home of primitive man. About the Mediterranean they settled down like frogs about a pond (Plato).

Classification.— For classification, mankind is divided into groups. On account of their distribution, these are sometimes named for geographical divisions. They are also distinguished as families, clans, tribes, nations, peoples and races. In the naming of the latter, family relationships form a prominent factor. It is with both of these lines of classification and the distribution of those discussed under them that ethnology has to do. In these efforts at classification, different schemes have been tried. It is generally accepted that there are two groups of elements of characterization, which are sometimes called criteria. These are physical elements and psychical elements.

The principal physical elements are the bones, the shape of the skull, the facial angle, the color of the skin, color, shape and texture of the hair. Of these, color, probably because the most conspicuous feature, was the first to be considered and formed the basis of all the early classifications. The craniological school founded by the elder Retzius (1796–1860), made the shape of the head the basis of classification, and introduced exact methods into this branch of the subject. This was based on the relative length and breadth of the skull, and accordingly mankind was divided into long-skulled and short, broad-skulled races. Later developments in craniology introduced a third class, representing a mean between the other two. Craniology alone cannot be depended upon to supply sufficient or trustworthy materials for the proper classification of mankind. Nevertheless it has thrown much light upon the subject. Of late years the color, shape and texture of the hair have steadily risen in the estimation of naturalists as a racial test. The hair is now regarded as the most constant of all the physical features and has been made the foundation of their groupings by some of the most eminent anthropologists.

The other physical ethnical elements are of little value separately, but are often useful aids in combination with others. Such are stature; the shape, color and position of the eye; the size and form of the brain; the shape of the nose and mouth; the superciliary and zygomatic arches, and all such other elements as collectively constitute the broad, flat features of the lower, the oval and regular faces of the higher races.

The psychical elements are less conspicuous, and have but recently been taken into account in classification. It has been said that "Love and hunger rule the world." The former relates to the perpetuation of kind, the latter to self-preservation. Around these two may be grouped the other factors of this class. The following are the principal psychical elements:

(1) Preservative instinct, food, clothing, shelter; (2) Perpetuating instinct; (3) Language; (4) Religion; (5) Government (6) The Arts.

Food, clothing and shelter are the imperative needs of the human species at all ages and under all conditions. Among the prominent topics considered under the sexual impulse are the position of woman, the marriage relation and the line of descent. Language is the chief of the psychical elements. Some perhaps, with Horatio Hale, would make it the sole test of race. The power of religion, both as a constructive and dispersive force, is the repeated testimony of history. The organization and administration of government, whether in its primitive form or in the more enlightened stage, is of deepest interest. The arts of life find their origin in the rude homes of early man, and have steadily been influential in all human progress. For these have lives been lost, tribes been destroyed, nations been formed, battles been won. They have been the motive power in every effort, the impulse behind every forward movement of mankind from the earliest days to now.

Race Classification. There have been so many changes in this world of ours and so many mixtures of ancestral strains that it is impossible to determine certainly to which race certain peoples belong. After successive efforts by able students to classify mankind upon this or that character or group of characters, the tendency now seems to be to return to the earlier classification. To recur to the three greater subdivisions — white, black and yellow; or, Caucasian, Negro, Mongolian.

With all the data gathered and the characters used in succeeding classifications, the original color plan in a general way is as good as we know. Popularly, too, this seems to have struck the fancy. Without thought we speak of a person as white, black or red, as he is a Caucasian, Negro or an American Indian.

Dall divides man into three groups: white, black and yellow. Flower and Lydekker also

Tarantsha-Mongol (after *Prschewalskij*).—16. Kalkas-Mongol woman (after *Prschewalskij*).—B. 17. Chinaman (after portrait, Museum of Ethnology, Berlin).—18. Yakut-woman from the Cheta (after *Middendorf*).—C. 19. North Am. Indian (after photo).—20. South Am. Indian (after *Rohde*). ESKIMO: 21. Koriak woman (from "Peoples of Russia").—22. Eskimo from Greenland (after photograph, *Hagenbeck*).

assign all representatives of mankind to three primary divisions. The status of the American aborigines is left unsettled. Keane gives to these a place among the races, making four. Linnæus in his day adopted four primary divisions. He, however, recognized man as a distinct genus, *homo*, having four species: *Homo-sp æthiopicus, Homo sp mongolicus, Homo sp americanus, Homo sp caucasicus*. Gerland divides mankind into six races, separating the Dravidians from the other groups. To-day man is considered a single species, having several varieties or races. Blumenbach gives five groups, classified according to the color of the skin. Professor Huxley also designated five groups along somewhat similar lines. Morton used the skull as a basis of classification; Haeckel and Broca the hair; and Hale language.

To one who carefully goes over the different schemes of classifying man, it is apparent that none is wholly satisfactory. Each in some direction overlaps some other. It is by taking all these race criteria so far as they are of value that the most reliable conclusions may be drawn as to the proper classification of mankind. No one set of standards will properly answer. That classification will be most satisfactory which obtains the most help from all the elements. All that we can aim to do is to group under some general and loose fitting subdivisions those members of the species which display the greatest number of similarities. (Brinton). Perhaps it will be as satisfactory to follow the plan of Linnæus and classify the races of men according to geographical areas. Under such a plan we speak of the European race, which in ancient times was confined to Europe and adjacent parts of Asia and Africa; the African race, whose natural home is Africa; the Asiatic race, which is chiefly confined to Asia; the American race, composed of those occupying the western continent before its occupation by Europeans; and, the Oceanic or Australian race, comprising the tribes of Polynesia, Australia and the many groups of islands sometimes included in Oceanica. We can use Blumenbach's scheme of dividing them according to the color of the skin. Under it, they are grouped as follows:

1, Caucasian, or white; 2, Ethiopian, or black; 3, Mongolian, or yellow; 4, American, or red; 5, Malay, or brown. Dr. D. G. Brinton enumerated five races of mankind. Their chief characteristics may be summed up substantially as follows: I. The European Race — Traits — Color white, hair wavy, nose narrow, jaws straight, skull variable, languages inflectional, religions ideal. II. The African, or Negro Race — Traits — Color black, hair woolly, nose flat, jaws protruding, skull long, language agglutinative, religions material. III. The Asiatic, or Mongolian Race — Traits — Color yellowish or brownish, hair straight, nose flat or medium, jaws straight, skull broad and high, languages isolating or agglutinative, religions material. IV. The American Race — Traits — Color coppery, hair straight, nose narrow, jaws straight, skull variable, language incorporating, religions ideal. V. The Oceanic Race — Traits — Color dark, hair lank or wavy, languages agglutinative.

Classified in this manner, the human species presents the subdivision shown in the preceding «scheme.»

The European Race.— Of the South Mediterranean branch of the European race there are given two divisions, the Hamitic and the Semitic. The former is divided into three groups, the Libyan, Egyptian and East African. The Libyan group extends over Northern Africa from the Atlantic Ocean to the Nile. Some of these tribes are very dark and have been termed «Black Caucasians.» Neverthless, except for color, they are fine representatives of the white race. The Egyptian group is represented by the ancient Egyptians and their descendants, the modern Fellah of the Nile valley and the Copts. These two groups of this branch of the European race have been potent factors in the world's history. The development of the earliest seats of culture, the organization of government, and the establishment of high degrees of civilization have been the work of their representatives. On the contrary the East African group is represented by a number of tribes who are chiefly nomadic and occupy the territory south of the Egyptian group and extending from the Nile to the Indian Ocean. They include the Gallis, Somalis and Agaas.

The Semitic stocks are made up of three groups — the Arabian, Abyssinian and Chaldæan. The most prominent of the first group are the Arabians; the existing tribes best known are the Ishmaelites and Bedouin. They have occupied at different times parts of the Arabian peninsula and now practically cover it all.

The Abyssinian group is supposed to have originated in the region last mentioned and to have been dispersed over Abyssinia and adjacent parts of Africa. They have become mixed with adjoining tribes and a corrupt form of Christianity exists among them. The Abyssinians, Tigre and Amhara are prominent nations. The former is best known.

The third group of Semitic peoples has been called the Chaldæan. This includes the Syrians, Israelites, Samaritans, Babylonians and Jews. They also originated in Arabia and spread out into other lands. The Jew has become world-wide in his dispersal. From these peoples great nations were developed and from them two great religious leaders, Jesus Christ and Mohammed, have sprung.

The North Mediterranean branch is divided into three divisions. They are the Euskaric, Aryac and Caucasic stocks. The only surviving remnant of the Euskaric stock is the Basques of Spain. That they formerly were more widely distributed is generally believed. Their relationship with other peoples is not satisfactorily determined. The most extended and most important of these race stocks is the Aryac. The origin of the Aryans has been a fruitful theme of discussion in recent years. While there is still a difference of opinion on this subject, the majority of writers have accepted the theory of their European origin. The Aryac or Indo-Germanic stock is divided by Brinton into eight groups: Celtic, Italic, Illyric, Hellenic, Lettic, Teutonic, Slavonic and Indo-Iranic groups.

The Lettic or Lithuanian peoples, while comparatively inconspicuous, are in some respects the most interesting of their fellows. They are thought by some students to be the remnant of the original stock and that which most resembles it. They are located along the Baltic Sea in Prussia and Russia.

The Indo-Iranic group is of special interest because it has the farthest eastern range and for the reason that it is nearest the region which those who believe in the Asiatic origin of the race think was its primitive home. The term Iranic is derived from the plateau of Iran, which has been thought by some to be the area of dispersal of the race. The group divides into two divisions, the Iranic, whose old representatives were the Bactrians and Persians. To-day it includes the modern Persians, the Parsees, generally known as fire-worshippers, and the tribes of Beluchistan, Afghanistan and neighboring regions. The Indic branch comprises the peoples occupying India. The most prominent of these are the Hindus, Rajpoots and Djats. The typical Brahmins probably are the best representatives of the stock.

The Teutonic group includes the Germans, English, Norwegians, Swedes and Danes, and their ancestors, the Goths, Vandals, Angles, Saxons, Norsemen. These independent, aggressive, progressive races have been conspicuous in the history of the past and the activities of the present. They have spread throughout the world as missionaries of business, education or religion. They are the forces which operate in all progressive government, and are destined to sway the world.

East of these is the Slavonic group. It is represented to-day by the Russians, Poles, Czechs, Bulgarians, and other tribes of the Danube region. Of their ancestors known in history are the Scythians and Massagetæ. The Slavonic tribes to the east, in one direction, came in contact with the Indo-Iranians and, in another, with some of the branches of the Mongolians. Within comparatively recent times some of them have made remarkable progress in civilization.

The Hellenic group comprised the ancient Greeks and their relatives. They occupied at an early date the peninsulas of Asia Minor, Greece, the southern part of Italy and contiguous territory. The progress of Greek culture is familiar. Greek language, literature and art form the basis of education everywhere. Their dominion was one of the world's greatest confederacies. Overthrown by the Romans and subsequently by the Mohammedans, they were for generations hidden from the view of the progressive world. The Illyric stock is situated near the Greeks in Turkey. It is represented by the Albanians. The Italic stock covered most of the Italian Peninsula. The Umbrians, Etruscans, Oscans and Latins were the principal older representatives. They developed the Roman Empire, and in the organization and conduct of government and the framing of laws they achieved a front place in the history of the world.

The Celtic group, originally spread over western Europe, has largely disappeared. Certain parts of the British Isles and the north of France contain the surviving members. These are the Irish, Welsh, Scotch, Manx and the people of Brittany.

The Caucasic stock is represented by four groups: Lesghic, Circassic, Kistic and Georgic. They occupy the Caucasus Mountain region.

The African or Negro Race.— The African race occupies Africa south of the Sahara Desert and of the Nile Valley. It is classified in three groups: the Negrillos, Negroes and Negroids. Under Negrillos (little Negroes) are grouped the Akkas and other pygmies of the interior region and the small-sized Bushmen and Hottentots farther south. The characters of some of these tribes are faithfully preserved in figures upon the Egyptian monuments. The most striking of these physical features is the peculiar growth and development about the pelvic region. The clicks of the Hottentot and Bushman languages find no counterpart in any other tongue. The Negroes are confined chiefly to western and central Africa, ranging east into Nubia. They comprise four subdivisions: the Nilotic, Sudanese, Senegambian and Guinean. The first is confined to the upper Nile Valley. The Sudanese group is represented by tribes in Sudan and westward. The western coast south of the Senegal River is the territory of the Senegambians. Farther south toward the Niger River are the tribes of the Guinea group. This region was the chief source of the slave trade. The descendants of the Guinea negroes found throughout the United States are living witnesses of the slavery which existed there but a generation ago.

The Negroids approach the Negroes, but are in some ways quite different from them. Their color is brown rather than black; their hair is «kinky» but not woolly; the nose is straight and not short and flat. They are of two groups — the Nubian and Bantu. The former are found in Nubia and the upper Nile Valley. The latter occupies practically all of southern Africa except the region of the Hottentots and Bushmen. Among the better known tribes are the Kaffirs, Bechuanas and Zulus. The African race occupies a low stage in culture. It has developed in the restricted area south of the Sahara basin. Probably it reached its typical development in the Niger Valley.

The Asiatic or Mongolian Race.— The Asian, or Mongolian race, is made up of two divisions — the Sinitic and Sibiric. The Sinitic branch includes the Chinese, Tibetans and the inhabitants of Anam, Siam, Burma and Cochin China. The Chinese have occupied their territory from quite early times. They have developed a peculiar civilization and in some particulars reached quite a high stage of culture. While there is considerable difference of opinion whether the arts of ancient China developed there or were acquired from the Aryans to the westward, it seems probable that in a great measure at least they were indigenous.

The Sibiric branch of this race is largely located north of the mountains of central Asia, ranging with the Arctic Circle from the Pacific to the Atlantic Ocean. The six groups are the Tungusic, reaching from northern China toward the Arctic Ocean and to Kamchatka. The Mongolic occupying the vast highlands west of Manchuria, Genghis-Khan and later Tamerlane established two of the wide extended Mongol empires. The Tartaric, another highland group, has spread from Turkestan in several directions. The Turk is the most conspicuous representative, though much mixed with other races. The Finnic is a group of Mongols occupying northern Europe. It is represented there by the Finns and Lapps, and farther south by the Magyars. From there it extends east to the Volga River. The rude tribes fringing the Arctic Ocean in eastern Siberia and reaching to the Pacific are grouped under the name Arctic. The Chukchis and Kamchatkans are of their number. The Japanese and Koreans constitute the Japanese group. The Japanese are the most progressive and advanced of the Asiatic race.

The Oceanic Race.— The Oceanic race may be divided into three stocks — Negritic, Malayic and Australic. It occupies Australia, the islands of the South Pacific and Indian oceans and the adjacent shores of Asia. In their migrations, whether along the shores or over the seas, they have so intermingled that their relationships are puzzling. The Negritic stock is represented by the Negritos, including such small peoples as the Mincopies of the Andaman Islands, the Papuans of New Guinea and other islands, and the Melanesians. The Malayic stock is the most conspicuous and energetic of the ocean peoples. Its representatives are found extending almost two-thirds around the world, reaching from Easter Island to Madagascar. The most typical Malays are found in Malacca, Sumatra and Java, while others less marked extend from the Celebes to the Philippines. The Malays farther to the eastward are often called Polynesians. From their traditions it has been possible to obtain a fairly good idea of their successive migrations and of the comparative time of the settlement of the different island groups. They extend from New Guinea to New Zealand, Easter and the Sandwich Islands. The Australic stock includes the different tribes of Australia, the extinct Tasmanians, and, according to some authorities, the primitive peoples of the peninsula of Hindustan. The Australians are very low in culture, nomadic, lacking government and wear little or no clothing. «The life of these savages proves to be of undeveloped type, alike in arts and institutions, so much so, that the distinction of being the lowest of normal tribes may be claimed for them.»—(E. B. Tylor).

The American Race.— The American race includes those peoples occupying the western continent at the time of its discovery by white men. For the purpose of study they may be divided into seven groups: Arctic, North Atlantic, North Pacific, Mexican, Inter-Isthmian, South Atlantic, South Pacific.

The Arctic groups include the Eskimo and Aleutian peoples. They occupy the shores of the oceans in Arctic America and extend from Labrador to Greenland. In the North Atlantic group are some Indians of wide range. The Athabascans extend from the valleys of the Yukon and lower Mackenzie to Arizona; while farther to the southward, reaching into Mexico, the warlike Apaches are of this group. The Algonkins ranged from Newfoundland to the Rocky Mountains and from the Churchill River Valley and Hudson Bay southward throughout the Ohio and Mississippi valleys to the Tennessee River. These included most of the Indians encountered by the early settlers. Their names are more or less familiar to us from history. The intelligent Iroquois, the formidable Dakotas (Sioux), the southern Indians, some of whom built mounds within historic times, and the tribes of the interior plains also belong to this division. The North Pacific group includes a number of tribes west of the Rocky Mountains, many of which are small and represent distinct linguistic stocks. Several of these tribes have the head artificially deformed. These include the Flatheads and Nez Percés (Pierced Noses). The Cliff-dwellers and Pueblo tribes of the arid regions of the southwestern United States are placed here. The Mexican group is notable because of the state of civilization attained by the Aztecs, its best-known tribe. The organization developed, government established, education acquired, buildings constructed and arts pursued were unequaled by any tribe of the American race. The Mayas were the most important tribe of the Inter-Isthmian group. They were builders of note, elaborate decorators of stone and mural artists. The South Atlantic group occupied the Atlantic coast of South America. They were chiefly wandering tribes without settled habitations. The Quichuas of Peru are the best-known tribe of the South Pacific group. They attained higher civilization than any other South American tribe. They developed agriculture, domesticated animals, constructed large buildings of stone, were expert workers in metals and devised a method of record keeping by means of strings and knots called quippus. See ANTHROPOLOGY; ETHNOLOGY; MAN, CHRISTIAN ANTHROPOLOGY; MAN, PREHISTORIC RACES OF; EMBRYOLOGY, HUMAN.

Zoologist and Anthropologist, Indianapolis.

ETHNOLOGY, Bureau of American. See SMITHSONIAN INSTITUTION.

ETHOLOGY. See BIONOMICS.

ETHYL, the organic radical C_2H_5, which occurs in many carbon compounds, but which is not known to exist in the free state. Its most important compounds are ethyl hydrate, or ethyl alcohol (see ALCOHOL) and ethyl oxide, popularly known as ether (q.v.); but the iodide, C_2H_5I, which is formed by acting upon ethyl alcohol with iodine in the presence of phosphorus, is also of much importance in synthetic chemistry.

ETHYL NITRATE. See NITROUS ETHER.

ETHYLAMINE, an amine (q.v.) in which one or more of the hydrogen atoms of ammonia, NH_3, is replaced by the radical ethyl, C_2H_5. Three compounds of this sort are possible, and all have been actually prepared. When only one of the hydrogen atoms of the ammonia has been replaced, the resulting compound, $NH_2.C_2H_5$, is known as mono-ethylamine, or ethyl monamine; and it is this substance which is understood when the word ethylamine is used without qualification. $NH(C_2H_5)_2$ is known as diethylamine, and $N.(C_2H_5)_3$ is called triethylamine. All three are formed when absolute alcohol is heated with zinc chloride, in closed tubes, to 500° F.; and they may then be separated by the crystallization of their picrates. Ethylamine (that is, the mono-amine) may also be prepared by boiling cyanic ether with an aqueous solution of caustic potash, absorbing the liberated gas by passing it through hydrochloric acid, and finally drying the ethylamine hydrochloride that is so formed, and distilling it with quicklime. All three of the ethylamines are alkaline, all smell strongly of ammonia and all combine with acids to form salts. The mono-amine is a colorless, caustic, inflammable liquid, burning with a yellow flame, having a specific gravity of 0.70, boiling at 68° F., and not solidifying at 220° below zero, F. Diethylamine (which may be prepared by heating the mono-amine with ethyl bromide is also volatile, colorless and inflammable, with a specific gravity of 0.72, and boils at 133° F., under ordinary atmospheric pressure. Triethylamine is an oily liquid, alkaline, and similar to the other two in general character. It has a specific gravity of 0.73, boils at 194° F., and its critical temperature (according to Pawlewski) is 513° F. (See CRITICAL POINT). Triethylamine is but slightly soluble in water; diethylamine dissolves in water freely; mono-ethylamine mixes with water with a considerable rise in temperature, and the probable formation of a hydrate, though it is entirely expelled again, upon boiling.

ETHYLENE, a gaseous hydrocarbon having the formula C_2H_4, and constituting the first member of the olefine series. It is formed in the dry distillation of numerous organic bodies, and constitutes 4 to 5 per cent of ordinary coal gas. It is most conveniently prepared for laboratory purposes by mixing 1 part of alcohol with 4 parts of sulphuric acid, adding enough sand to form a paste, and heating the mass over a flame. The sand takes no part in the chemistry of the process, but merely serves to regulate the action. The sulphuric acid, owing to its affinity for water, removes the elements of water from the alcohol, and thereby liberates the ethylene, $C_2H_5.OH = H_2O + C_2H_4$. Ethylene is a colorless gas, which burns with a bright flame, a five-foot burner, using the pure gas, yielding a light of 68 candle-power. It may be condensed to a transparent liquid which boils, under ordinary atmospheric pressure, at 153° F. below zero, and freezes at 272° F. below zero. Ethylene is an unsaturated compound, and combines directly with hydrogen when mixed with that gas and led over platinum black; the product of the combination being ethane, C_2H_6. Mixed with three times its own volume of oxygen, and fired by a spark, ethylene explodes with great violence. When it is mixed with chlorine in the dark, combination takes place according to the formula $C_2H_4 + 2Cl = C_2H_4Cl_2$, the new substance being an oily fluid, known as ethylene dichloride, or "Dutch liquid." It is on account of this reaction that ethylene was formerly called «olefiant» (or «oil-forming») gas. It will be observed that the foregoing reaction is an additive one. In diffuse daylight chlorine attacks the dichloride of ethylene, with the formation of more highly chlorinated substitution products, of which the highest is C_2Cl_6.

ETHYLENE DICHLORIDE. See DUTCH LIQUID.

ETIENNE, Charles Guillaume, shärl gē yōm ā-tē-ĕn, French dramatist: b. Chamouilly, 6 Jan. 1778; d. Paris, 13 March 1845. Under the First Empire he was censor, editor-in-chief of the *Journal of the Empire*, and a member of the Academy. He took part in Napoleon's campaigns in Italy, Germany, Poland and Austria. At the Restoration he was expelled from the Academy, and thereafter as editor of the *Constitutional* was a power on the side of the opposition. His comedies give proof of brilliant fancy, elegant style, and great constructive skill; 'The Two Sons-in-Law' is the best comedy of the Imperial Era, and not unworthy of Molière. He composed many farces, vaudevilles, operettas and spectacular pieces, which had unbounded success; and his operas, 'Cinderella' and 'Joconde,' were the delight of Paris. He wrote a 'History of the French Theatre.'

ETIENNE DU MONT, ā-tē-ĕn dü môn (Fr. «Saint Stephen of the Mount»), a fine church of mediæval Paris. It was founded in 1220; its completion and restoration were begun in 1517, and the building reached its present perfection in 1626. The shrine of Saint Genevieve, heroine and patron saint of Paris is its principal point of antiquarian interest, but it is also the burial-place of Pascal and Racine.

ETIOLATION, ē'tĭ-ō-lā'shŏn, the alteration in the color and the structure of plants due to the absence of light during growth. The most noticeable changes are paleness and elongation of the stems. The elongation is due to the extension of the cells, and the paleness to the non-development, arrested development or destruction of the chlorophyll or green coloring matter of the plant. Other phenomena are imperfect development of leaves, altered method of branching and various modifications of tissues, especially in the imperfect development of the cell walls, which do not attain normal thickness. Agriculturally, etiolation is either a fault to be shunned or a useful process. In the first case it is often responsible for the «lodging» of wheat and other grain-crops sown too thickly, the bases of the stems being shaded so much that the cells fail to develop normal strength, and when the heads form the wind easily beats down the plants. The sprouting of potatoes, turnips, etc., is also undesirable. But etiolation is utilized in the blanching of various plants, such as asparagus and sea-kale, and especially salads such as celery, endive and chicory. The process involves the exclusion of light by means of earth banked around the stems, by boards, paper, etc., or by tying the outer leaves loosely over the inner ones as with endive or with cauliflower. Rhubarb is often grown in darkness. In general, tenderness and modifications in flavor are the chief ends sought in the process.

ETIOLIN, in botany, a name given by the older authors to the carotin of etiolated plant structures. See CAROTIN.

ETIQUETTE, Madame, the nickname of the Duchesse de Noailles, mistress of ceremonies at the French court in the time of Marie Antoinette, because of her rigid adherence to the formalities or prescriptions for the various ceremonies at court.

ETIQUETTE, ĕt'ĭ kĕt, a collective term for the established ceremonies and usages of society. Among courts the Byzantine and Spanish courts, and the French court under Louis XIV and Louis XV, were noted for the strictness of their etiquette. Social etiquette consists in so many minute observances that a tolerable familiarity with it can be acquired only by a considerable intercourse with polite society. Quickness of sympathy and a certain fineness of observation are more needed for proficiency in this sphere than mere power of intellect. The term is derived from the French word *etiquette*, originally a slip of paper affixed to a packet to indicate its contents. This term has come to mean the various decorums to be observed in the ordinary intercourse of life, and especially the comportment on state occasions perhaps from the custom formerly of distributing tickets or slips of paper to each person containing the rules to be observed by him or her at the ceremony. The word is also used by the members of certain professions to designate the rules to be observed by the members, e.g., «legal etiquette,» etc. In the latter sense, however, it has been supplanted by the word «ethics.»

ETIVE, ĕt'ĭv, **Loch**, an inlet from the Firth of Lorne, in north of Argyllshire, west coast of Scotland. The river Awe, the outlet of Loch Awe, and the river Etive flow into it. At Connel Ferry, about three miles from the sea, it is barely 200 yards wide, and is crossed by a ridge of sunken rocks. The depth here at low water is six feet; the inflowing tide, which rises 14 feet, rushes with tremendous force through the narrow channel, breaking into raging foam which may sometimes be heard miles away. Dunstaffnage, a 13th century castle, once a royal fortress, is near its mouth.

ETLAR, Carit, pseudonym of KARL BROSBÖLL, Danish realistic novelist: b. Fridericia, 7 April 1816; d. 1900. His first story was 'The Smuggler's Son' (1839); of his later writings, the historical tale of 'The Queen's Captain of the Guard' and the realistic story 'The People in Need' (1878) are the most popular; his verse also has merit. An edition of his collected works was published in 1859–68, with an additional collection in 1873–79; a new addition appeared in 1888.

ETNA, or ÆTNA, a volcano in the eastern part of the province of Catania, on the island of Sicily, and the largest active volcano in Europe and the highest mountain in Italy. Directly north is the valley of Alcantara, on the west and south, the valley of Simeto, and on the east, the Ionian Sea. From the waters on the east, which are in depth from 5,000 to 6,000 feet, Etna rises cone-like to a height of about 10,875 feet; but on the south and west it seems formed of superimposed mountains, the terminal being surrounded by a number of cones, all of volcanic origin, about nine of which are of considerable size. The circumference at the base is about 90 miles. Around the mountain and at the lower slope are a number of villages, cultivated fields, groves of olive-, orange-, fig- and date-trees; and a little higher up is a belt of forest with oak, birch, beech and coniferæ. Above 7,000 feet vegetation is scanty, the cone is almost bare; rocky precipices, lava beds, masses of ashes and scoriæ are visible at its summit except where covered by snow. A deep depression, Val de Bove, on the eastern side, was once the principal crater; and frequently lava has issued out of the sides of the mountain, thus forming small cones and craters, about 200 of which are now distinctly marked. The summit is usually altered with every eruption. From the summit may be seen the whole of the island of Sicily, the Lipari Islands, Malta and Calabria.

The eruptions of Etna have been numerous and many of them destructive; more than 80 have been recorded, 11 of which occurred before the Christian Era. That of 1169 A.D. overwhelmed Catania and buried 15,000 persons in the ruins. In 1669 the lava spread over the country for 40 days, and 10,000 persons are estimated to have perished. In 1693 there was an earthquake during the eruption, when over 60,000 lives were lost. One eruption was in 1755, the year of the Lisbon earthquake. Among more recent eruptions are those of 1852, 1865, 1874, 1879, 1886, 1892, 1909 and 1911. An eruption is ordinarily preceded by premonitory symptoms of longer or shorter duration. In Greek mythology there are found frequent allusions to Etna, especially in the legends of Enceladus and Hiphæstus. Consult Dana, 'Characteristics of Volcanoes'; Kneeland, 'Volcanoes.'

ETNA, Pa., borough in Allegheny County, on the Allegheny River, the Baltimore and Ohio and a branch of the Pennsylvania railroads. It is really a suburb of Pittsburgh, with only the Allegheny River between. The chief industries are in connection with the iron and steel products for which this part of the State is famous. It has rolling mills, furnaces, steel mills, galvanized-pipe works and other manufactures. The waterworks and electric-light plant are owned by the borough. Pop. 6,341.

ETON, England, village and parish, in the county of Buckingham, on the Thames, 21 miles west-southwest of London. It consists principally of one narrow street which has of late years been much improved. An iron bridge across the Thames connects Eton with Windsor, from which it is separated only by the river. Eton derives its celebrity from its college. Pop. 3,192.

ETON COLLEGE, the most famous of English public schools, was founded by Henry VI in 1440, under the name of «The College of the Blessed Virgin Mary Beside Windsor.» The present collegiate edifice was begun in 1441 and the whole of the original structure was completed about 1523. Important additions were made in 1846, and also in 1889. This school was intended originally for the benefit of the sons of worthy but poor parents, and also for the support of 25 poor infirm men; and was to be maintained out of the incomes from the royal demesne lands. Now the students admitted are the sons of the gentry and nobility, and so numerous are the applicants that it is usual to enter the names at birth. The scholarships are open to all British subjects; but candidates must be 12 years or over and not more than 14 years, and must pass an examination. A certain number of the students, not under 17 years, are elected each year to scholarships at King's College, Cambridge. The number of pupils on the foundation is limited to 70, but the number outside, called oppidans, who board and lodge in the houses of the masters is about 1,000. The course of instruction is mainly classical, but modern languages, mathematics and the natural sciences are given now a due share of attention. The college roll includes the most famous names in more recent English history in nearly every department of service, and especially among statesmen and administrators. Consult Cust, 'Eton College'; Lyte, 'History of Eton College' (1440–1898).

ETOROFU, ā'tō-rō-foo, or **ITURUP,** ē-too-roop', (1) an island; (2) a strait; in the most northerly part of Japan. The island belongs to the Kurile group. Area, 1,500 square miles.

ETOSA LAKE. See Kunene.

ETOURDI, L', a comedy of Molière, which was first produced at Lyons in the year 1653. See Molière.

ETOWAH MOUND. See Mound Builders and Mounds.

ETRETAT, France, a fashionable summer resort on the English Channel, 17 miles east of Havre, in the department of Seine-Inferieure. It contains a casino, bathhouses, a fine strand and many summer residences. It is famed for its gatherings of litterateurs and artists. Pop. (commune) 1,973.

ETRURIA, ē-troo'rĭ-a (Greek *Tyrrhenia*), the name anciently given to that part of Italy which corresponded with the greater part of modern Tuscany and part of Umbria, and was bounded by the Mediterranean, the Apennines, the river Magra and the Tiber. The name Tuscia, for the country, came into use in later times, while Tusci, as well as Etrusci, was used by the Romans as the appellation of the people from an early period. The oldest inhabitants of the country belonged, according to the accounts of the ancients, to the Umbrian stock and were dispossessed by the Tyrrhenians or Tyrsenians, a people who came by sea and who were generally believed to be Lydians. These again were in early times subjected by another race who called themselves Rasena and who finally became incorporated with the Tyrrhenians proper, the whole nation then being called Tuscans or Etruscans. These Rasena, by ancient writers usually confounded with the Tyrrhenians, entered Italy at a very early period from the north and gradually took possession of the whole country from the Alps, Ticino and lower Adige on the south.

To what race the Etruscans belonged is unknown and our ignorance is equally great with regard to their language, remains of which still exist in numerous inscriptions mostly on tombs. It appears to have been quite distinct from the languages of the rest of Italy, but attempts to connect it with the Greek, Celtic, Germanic or Semitic languages have had little or no success. The characters used are essentially the ancient Greek and were either introduced from Magna Græcia or possibly from Corinth. Etruria was very early a confederation under the rulers of the 12 principal cities, each of which formed a republic by itself. The chiefs of these republics were styled *lucumones*, who were also the priests and generals and held their meetings in the temple of Voltumna, where they deliberated together on the general affairs of the country. In all the cities there appears to have been an aristocracy, toward which the mass of the common people stood in the relation of clients, though there would no doubt be a body of entirely free men resembling the plebeians at Rome. The religion of the Etruscans offers a subject of great difficulty, but it is at least certain that it had many points in common with the religious systems of the Sabines and Latins, while in some respects it shows evidences of an Eastern origin. Among the deities may be mentioned Tina or Tinia, corresponding to Juno; Latin Jupiter; Cupra, corresponding to Juno; Menerfa (Minerva); Sethlans (Vulcan); Turms (Mercury); and Aplu or Apulu (Apollo).

What may be called the Etruscan Era commenced about 1044 B.C. They became the dominant race in northern and central Italy and Rome itself fell under their rule and was ruled by Etruscan kings. In the maritime wars they were in alliance with Carthage against Greece. The zenith of their power was in the 6th century B.C., when with the Greeks and the Phœnicians they shared the maritime supremacy of the Mediterranean. Their naval power was shattered in 474 B.C. by Hiero I of Syracuse and after this their decline was rapid. The Gauls swarmed over the Alps in 396 B.C.; in 351 the southern Etruscans made submission to the Romans; and the process of conquest was completed by the subjugation of the northern Etruscans in 282 B.C. After this they became merged in their conquerors, on whom they exercised a considerable influence in religious, social and political life.

The chief occupations of the Etruscans were agriculture and commerce, both maritime and overland. Grain, wine, timber, cattle and wool seem to have been the principal articles of trade. The staple food of the common people was pulse, but the upper classes were notorious for extravagance in their diet as well as in dress and in furniture. Their knowledge of the arts and sciences is said to have been derived mainly from Greece and in a less degree from Egypt. The iron mines and copper mines in the interior of Etruria were worked at a very remote period and the metallurgical skill shown by the Etruscans was obviously connected with their proficiency in the art of working in bronze, silver, gold, etc. Of Etruscan architecture our knowledge is limited; but their cities were laid out on a quadrangular plan and strongly fortified. The so-called Tuscan order seems to be little else than a modification of the Doric. Of their temples there exist no traces; the theatres have been more fortunate, that at Fiesole showing how much in this form of construction they owed to the Greeks. The sepulchres, which were always subterranean, but frequently having superstructures of an architectural character surmounting them, present many varieties of construction.

For articles in terra-cotta the Etruscans were especially celebrated. These were not restricted to small objects, but embraced statues and figures of large size, with which the exteriors and interiors of their temples were adorned. Closely related to this branch of art was the Etruscan pottery, in the manufacture of which they excelled; but the only extant productions of this class that can be said to be genuine are the red ware of Arretium and the black ware of Clusium ornamented with figures in relief, many of them of a grotesque and strongly-marked Oriental character. On the other hand, numbers of the painted vases popularly known as Etruscan vases are undoubtedly productions of Greek workmen, the subjects, the style and the inscriptions being all Greek. The skill of the Etruscans in works of bronze is attested by many ancient writers, and also by numerous extant specimens. The style of art characteristic of these works is stiff and archaic, having some resemblance to the early Greek, though some of the existing specimens exhibit more freedom of design and great beauty of execution. The bronze candelabra, of which many examples have been preserved, were eagerly sought after both in Greece and Rome. Another branch of art which seems to have been peculiar to this people was that of the engraved bronze mirrors, a considerable number of which has been discovered, some quite recently. These mirrors were polished on one side, and have on the other an engraved design, taken in most cases from Greek legend or mythology. Consult Dennis, 'The Cities and Cemeteries of Etruria' (1892); Seymour, 'Up Hill and Down Dale in Ancient Etruria' (1910).

ETRURIA, Kingdom of, the name given to the province of Tuscany, in Italy, when, in 1801, Napoleon formed of it a kingdom, and made Florence the capital. In 1808 he incorporated it with the French Empire, and in 1809 his sister, Elise Bacciocchi, was made Grand Duchess of Tuscany. When Napoleon became an exile in 1814, Tuscany reverted to Austria, and Frederick III became king.

ETRUSCAN. See Etruria.

ETRUSCAN VASES, a class of beautiful ancient painted vases made in Etruria, but not strictly speaking a product of Etruscan art, since they were really the productions of a ripe age of Greek art, the workmanship, subjects, style and inscriptions being all Greek. They are elegant in form and enriched with bands of beautiful foliage and other ornaments, figures and similar subjects of a highly artistic character. One class has black figures and ornaments on a red ground — the natural color of the clay; another has the figures left of the natural color and the ground painted black. The former class belong to a date about 600 B.C., the latter date about a century later, and extend over a period of about 350 years, when the manufacture seems to have ceased. The subjects represented on these vases frequently relate to heroic personages of the Greek mythology, but many scenes of an ordinary and even of a domestic character are depicted. The figures are usually in profile.

ETSCH. See Adige.

ETTINGHAUSEN, Konstantin, Baron von, Austrian geologist and botanist: b. Vienna, 1826; d. 1897. He was educated in his native city and became professor of botany and of medical natural history at the Joseph Academy in 1854. He removed to Gratz in 1871 and seven years later was engaged by the British Museum to arrange the collection of fossil plants there. His works include 'Physiotypia Plantarum Austriacarum' (2 vols., 1856–73); 'Physiographis der Medizinalpfanzen' (1862); 'Beitrage zur Erforschung der Phylogenie der Pflanzenarten' (7 vols., 1877–80).

ETTLINGEN, ĕt'lĭng-ĕn, Germany, town in the Free State of Baden, on the Alb, five miles south of Karlsruhe. It is an ancient place, containing some Roman remains; is entered by three gates, and has an old castle with gardens, town-house, hospital, normal and other schools, manufactures of machinery, linen and cotton goods, starch, leather and paper. Near the town the Archduke Charles of Austria here suffered defeat at the hands of Moreau, 9 and 10 July 1796. Pop. 9,407.

ETTMÜLLER, Ernst Moritz Ludwig, lood'vĭg ĕt'mül-lĕr, German philologist and historian: b. Gersdorf, Saxony, 5 Oct. 1802; d. Zürich, 15 April 1877. He was graduated at Leipzig; lectured at Jena on the German poets of the Middle Ages; in 1833 went to the Gymnasium at Zürich and in 1863 he became professor of German literature in the University of Zürich. He made extensive researches in German mediæval literature and was author of 'German Dynasty Founders' (1844); and other epic poems, besides the 'Anglo-Saxon Lexicon' (1852). He also translated 'Beowulf' into German.

ETTOR, Joseph J., American industrial agitator: b. 1886. He came into prominence during the labor troubles at Paterson, N. J., Brooklyn, N. Y., and elsewhere, but attained his greatest attention in conducting the textile workers during the strike at Lawrence, Mass., in 1912. For his methods in this affair he was sentenced to nine months' imprisonment, having been held responsible for the death of a woman shot in a riot there on 29 Jan. 1912. After his release he was again prominent in the waiters' strike in New York in 1913 and the barbers' strike in the same city in 1914. He is prominently identified with the Industrial Workers of the World, of the executive council of which he became a member.

ETTRICK, ĕt'rĭk, a district of Scotland, in Selkirk, through which the Ettrick water runs. It is now a sheep pasture, denuded of wood, but in ancient times it formed part of Ettrick Forest, which included the whole country as well as parts of Peebles and Edinburghshire. The «Ettrick Shepherd,» James Hogg, was a native of this district. Consult Craig-Brown, 'History of Selkirkshire' (Edinburgh 1886).

ETTRICK SHEPHERD, The. See Hogg, James.

ET TU BRUTE («and thou also, Brutus»), the words supposed to have been uttered by Julius Cæsar at the moment he was stabbed by Brutus. There is, however, no ancient authority for attributing this utterance to Cæsar, and it is probable that the popular impression is due to the use of these words by Shakespeare in his play, 'Julius Cæsar.' Other dramatists of the same period also used the phrase.

ETTWEIN, ĕt'vīn, **John,** American Moravian bishop: b. Trendenstadt, Würtemberg, 29 June 1721; d. Bethlehem, Pa., 2 Jan. 1802. He came to America in 1754 and for nearly 50 years worked among the Moravians as evangelist, pastor and bishop. He traveled thousands of miles, oftentimes on foot, preaching in 11 of the 13 colonies and in what is now the State of

Ohio, «in cities, in villages, in homesteads, from pulpits, in the open air, in courthouses and barns to many and very different classes of men,» as he himself wrote. Among the Indians, too, he worked with great success. In 1776–77 he rendered noble services to the sick and wounded of the American army in the general hospital at Bethlehem, Pa. Elected bishop in 1784, he presided over his Church for nearly 17 years, displaying the soundest judgment in matters of polity and a fine personal heroism in critical circumstances. In 1787 he founded the Society for Propagating the Gospel Among the Heathen, which still exists, richly endowed, and is the bulwark of the extensive Moravian mission work. He became proficient in the language of the Delaware Indians, prepared a dictionary and phrasebook of it, and in 1788 compiled an account of the language with a vocabulary, which has since been published by the Pennsylvania Historical Society. Old age compelled his retirement from active service in 1801.

ETTY, William, English painter: b. York, 10 March 1787; d. there, 13 Nov. 1849. He worked long without much recognition, but at length in 1820 won public notice by his 'Coral Finders.' In 1828 he was elected an academician. Among his works, which were greatly admired, are a series of three pictures (1827–31) illustrating the 'Deliverance of Bethulia by Judith'; 'Benaiah one of David's Mighty Men'; 'Women Interceding for the Vanquished.' All these are very large pictures, and are now in the National Gallery of Scotland. Others of note are 'The Judgment of Paris'; 'The Rape of Proserpine'; 'Youth at the Prow and Pleasure at the Helm.' In coloring and the representation of the nude he displayed high ability.

ETUDE, at first a term to designate a musical composition written for the purpose of developing some particular point, as arpeggio, etc., has come to mean a study for a concert performance with many technical difficulties. Some of the latter by famous masters are of special beauty and elegance, of which we may mention here the famed études of Chopin, Liszt and Schumann, which rank among the finest compositions for the piano. For the violin the compositions of Fiorillo, Kreutzer and Paganini are justly famous.

ETYMOLOGICUM GUDIANUM. See Etymologicum Magnum.

ETYMOLOGICUM MAGNUM (Gr. «the great etymological glossary, or dictionary»), the sole lexicon of size surviving from the Byzantine age of Greek learning. It is evidently a compilation from other works of the same class, and bears no author's name. The book may be attributed to the 10th century. It consists of a number of quotations from the works of ancient grammarians, arranged alphabetically. It may have received its name from its first critical editor, Sylburg, or from its printer, Calliergus. The book is of high philological value, although many of the derivations of words contained in it are fanciful and utterly unscientific. Consult Cohn, 'Griechische Lexicographie' (in 'Griechische Grammatick' of Burgmann-Thumb, Munich 1913); Gaisford, 'Etymologicum Magnum' (Oxford 1848); Reitzenstein, 'Geschichte der griechischen Etymologika' (Leipzig 1897); Sturz, 'Etymologicum Gudianum' (Leipzig 1816–20).

ETYMOLOGY, that branch of philology which deals with the investigation of the origin or derivation and of the original signification of words. It forms a subsidiary part of the science of comparative philology, and, though it has occupied the attention of the learned and the curious in every age, it is only within the 19th century that its study has been pursued on really scientific principles. Ignorance, or what is still more dangerous, half-knowledge, has often suggested false etymologies and many more have sprung from that excess of confident and self-sufficient ingenuity which will not take plain words like *beef-eater* and *welsh-rabbit* for what they are. Folk-etymology, properly so called, has played an important rôle in the development of languages. The words that the people have known from infancy are for them things, but it is quite different from the new terms they meet. These arrest their curiosity, and, as they believe that every word has its signification, they seek for this, guided by resemblances of sound with words already known, and consequently reach conclusions often hopelessly distorted by false analogies. We see the same illogical process in the Old Testament interpretation of personal names, applied conveniently after the fact; in the Homeric explanation of the names of gods and men; in the quaint etymologies so common in the mediæval writers and in such moderns as Thomas Fuller; in the vagaries of Celtic topographers; and even in the pages of some modern dictionaries it is possible to find such a statement as that the English word *news* is derived from a certain conjunction of the points of the compass, north, east, west and south. These whimsical etymologies were laughed at by Dean Swift, whose *ostler* = *oat-stealer,* was a stroke of genius, but have not yet disappeared; and, indeed, the modern ideas of method in etymology are hardly at all beyond the point attained by the grammarians of Alexandria and by Varro among the Romans. It was the birth of philology and the study of the languages of the East that made a scientific etymology possible. It no longer sought the relation of the words of a single language exclusively within itself, but extended its view to the whole group of cognate tongues, or, wider still, to a whole family and became a new science under the name of Comparative Grammar. Grimm's Law was the first finger-post that pointed out the path; among his greatest successors are Curtius and Fick. The Teutonic revival in England in the 19th century commenced the history of English upon an historical method, from which has grown a really scientific English etymology, as seen in the dictionaries of Professor Skeat and Dr. Murray. No more useful chart of warning could be given than the former's canons for etymology: «Before attempting an etymology, ascertain the earliest form and use of the word and observe chronology. If the word be of native origin, we should next trace its history in cognate languages. If the word be borrowed, we must observe geography and the history of events, remembering that borrowings are due to actual contact.» See Curtius, 'Grundzüge der Griechischen Etymologie' (1879); Fick, 'Vergleichendes Wörterbuch der Indo-germanischen Sprachen' (1874–76); Palmer, 'Folk-Etymology' (1882); Skeat, 'The Science of Etymology' (1912); also see Language, Science of, and authorities quoted thereunder.

ETZEL. See Attila.

EU, ė (Lat. *Auga*), France, town in the department of Seine-Inférieure, two miles above the mouth of the Bresle, 17 miles northeast of Dieppe. It was in the castle belonging to this place that William the Conqueror married Maud of Flanders. The town was burned to the ground in 1475, by order of Louis XI, to prevent it from falling into the hands of the English. It has several small manufacturing establishments. Pop. of commune 5,651.

EUA, ā-oo'ä, or **EOA,** a small island belonging to the Friendly Islands, owned by Great Britain. It is about 10½ miles long by three wide. The climate of all the islands of the Tonga group, to which the Friendly Islands belong, is but slightly higher than that of the Samoan Islands, just north. Pop. about 400.

EUANTHIUS, Roman grammarian: d. Constantinople, 358 A.D. He wrote a commentary on Terence which was extensively used by Donatus in his own commentary of that author. His treatise 'De Fabula' was also incorporated by Donatus. Consult Wessner, 'Æli Donati ... Commentum Terenti' (Vol. I, Leipzig 1902).

EUBŒA, ū-bē'a, formerly called Negropont, a Greek island, the second largest island of the Ægean Sea. It is 90 miles long, 30 in greatest breadth, reduced at one point to four miles. It is separated from the mainland of Greece by the narrow channels of Egripo and Talanta, and is connected with the Bœotian shore by a bridge. There are several mountain peaks, one over 7,000 feet. The island is well wooded and remarkably fertile. Wine is a staple product and cotton, wool, pitch and turpentine are exported. The chief towns are Chalcis and Karysto. The island was anciently divided among seven independent cities, the most important of which were Chalcis and Eretria. Successively held by the Athenians, the Persians, the Romans and the Venetians, it was taken by the Turks in 1470, and in 1830 was delivered from their control. With some small islands it forms a modern nomarchy, with a population of 116,903.

EUBULIDES (ū-bū'lidēz) **OF MILETUS,** Greek philosopher: the best known of the disciples of Euclid of Megara, flourished about the middle of the 4th century B.C. His life was a struggle against Aristotle, in which by a captious logic he sought to prevail against good sense. A partisan of the Megaric principle, that there is nothing real but what is always one, simple and identical, he immediately found an adversary in the founder of the great contemporary school which made experience the condition of science. He attacked the peripatetic doctrine, like Zeno of Elea, by striving to show that there is none of our experimental notions which does not give place to insolvable difficulties. He wrote a number of comedies and a work on Diogenes the Cynic. See Megarian School of Philosophy.

EUBULIUS. See Cyrillus and Methodius.

EUBULUS, ū-bū'lŭs, Greek comic writer: fl. at Athens about 375 B.C. His subjects were chiefly mythological and many of his plays contained parodies of the tragic poets, especially Euripides. He is credited with having written over 100 plays, of which only some fragments and 50 titles have survived. Consult Koch, 'Comicorum Atticorum Fragmenta' (Leipzig 1884); Meinke, 'Fragmenta Comicorum Græcorum' (Berlin 1839–57).

EUCAINE. See Cocaine.

EUCALYPTOCRINUS, a genus of fossil Crinoidea found in the Silurian beds of the Niagara group in America and in England and Scotland. Its special peculiarity is that its 20 arms rest in vertical compartments divided by 10 partitions attached to the tegmen and supported by the interbrachials.

EUCALYPTUS, ū-ka-lĭp'tŭs, a genus of trees and a few shrubs of the family *Myrtaceæ.* The species, of which there are about 300, are characterized by simple symmetrical leaves, whose edges usually turn toward the sun; generally white, bell-shaped flowers, sometimes solitary, but commonly in terminal or axillary umbels near the ends of the twigs; calyx-lobes joined to form a lid, which falls off when the flower opens (from this feature the genus is named); numerous stamens; and many-seeded, angular fruit-capsules. With the exception of about half a dozen species which are natives of the East Indies and the Malay Peninsula, the members of the genus are indigenous to Australasia, where they are among the most common forest trees. The various species are highly valued for planting in parks and along avenues; for the gum-resin which oozes from their trunks; for the volatile oil contained in their leaves; for the tannin obtained from their bark; and for the fibre of their inner bark. They have been widely distributed by man in warm climates, particularly in the British possessions. Above all they are valued for their timber, which is extensively used for wharf, ship, bridge and house building, telegraph poles, railroad ties, implements, furniture, etc. To obtain it the trees are frequently ring-barked about the beginning of the warm season so as to exhaust the sap as much as possible. After standing until the end of the dry season they are felled. Some of the species are among the largest living trees of the world. Specimens exceeding 450 feet in height and with a girth of 50 feet are occasionally reported.

Few species are hardy, but many are cultivated for ornament where they can be given shelter from cold winds, or where, like other tender ornamental plants, they can be removed to a house during the winter. In California a majority of the species thrive in the open air and are valued for their striking habits of growth, their foliage, etc. They are readily propagated from seeds sown in light, sandy soil. The seedlings should be transplanted when about four inches tall and again at rather frequent intervals, to ensure the formation of fibrous roots near the surface, thus to secure them a good start when transplanted to final quarters. Transplanting should always be done in cool, moist, cloudy weather. When once established they demand no further attention than ordinary pruning and training.

Among the best-known species are the following: *Eucalyptus globulus,* the blue-gum, which often exceeds 300 feet in height, has bluish or grayish smooth bark, except at the base. It is noted for its rapid growth, the unpleasantly flavored nectar of its blossoms, which is very attractive to bees, and its ability to withstand long periods of drought. It is the most frequently planted species in California, where it is also becoming naturalized by means of its seeds. It is also planted to some extent in Florida and other Gulf States, and is said to survive a temperature as low as 20° F. It is one of the most valuable of timber trees and is one of the chief sources of oil of eucalyptus. A somewhat hardier species (*E. viminalis*), popularly known as manna gum, attains about the same size, but has either dark-colored persistent bark or light-colored deciduous bark. In California, where it also is spreading like the former, it has withstood lower temperatures and made phenomenal growths, in some instances exceeding 70 feet in height and 3 feet in girth in 12 years. It is valuable for its nectar, of which bees are very fond, but its timber is less valuable than that of the preceding species, being less strong. It is frequently used for fencing, shingles and other purposes where strain is not expected. Perhaps the most valued is *E. marginata,* the jarrah tree or wood, which often attains heights exceeding 70 feet without the development of any limbs, and at that height often has a girth of 15 feet. It is not hardy. Its wood is especially valued for wharf and ship building, since it is not attacked by the teredo or shipworm. It is also highly esteemed for underground work, such as ties and telegraph poles, and, being easily worked and polished, is popular for house finishing and furniture. The largest species is probably *E. amygdalina,* the peppermint-tree, which is also noted for its abundant yield of oil. Its timber is not strong, but is largely used for staves, shingles, building, etc. *E. robusta,* the swamp-mahogany gum, is perhaps the species most frequently planted in swampy places. Its timber is remarkably durable and is used, like that of *E. marginata,* but is somewhat less esteemed. It is one of the finest of avenue trees, and one of the best for bees because of its abundant nectar and profuse bloom.

In medicine, oil of eucalyptus is used for its antiseptic and stimulating properties. It is very widely used in affections of the nose, mouth and bronchi, and in diseases of the bladder and urethra. It makes a very agreeable and efficient drug to add to antiseptic mouth-washes and is useful internally as an intestinal anti-fermentative. Trees of eucalyptus have been planted, especially in low marshy places, with a belief in their beneficial effects against malaria. It is frequently asserted that they have a direct action on malaria. By the aid they furnish in converting marshes into dry land they also help to prevent the development of mosquitoes, some forms of which are known to be the chief agents in the spread of malarial disease. (See MALARIA; VOLATILE OILS). Consult Bailey, 'Cyclopedia of American Horticulture' (1914); Mueller, 'Eucalyptographia'; Bentham, 'Flora Australiensis' (Vol. III); Pepper, 'Eucalyptus in Algeria and Tunisia, from an Hygienic and Climatological Point of View' (Proceedings of the American Philosophical Society, Vol. XXXV, pp. 39–56); Cooper, 'Forest Culture and Eucalyptus Trees.'

EUCHARIS, ū'ka-rĭs, (1) a genus of plants of the natural order *Amaryllidaceæ,* the species which, mostly natives of Colombia, are perennial herbs with perennial bulb-like rootstocks, broadly ovate leaves and very showy white flowers in umbels upon long, strong scapes. They are very popular hot-house plants because of their beauty and the prolificacy of their long-lasting flowers. They are easily grown in course fibrous soil which will permit of abundant watering without danger of stagnation. Partial shade and rather high temperature are also needed. The best-known species is probably *E. grandiflora,* which is popularly known as star-of-Bethlehem and Amazon lily. The flowers of this species are borne upon a scape often exceeding 18 inches in height and bearing two to four star-like and very fragrant flowers, often four inches in diameter. (2) a genus of mollusks; also known as Glaucus; (3) the typical genus of Chalcidians, subfamily Eucharinæ.

EUCHARIST, ū'kä-rĭst, in the Roman Catholic Church, the sacrament of the body and blood of Jesus Christ, and also the Christian covenant sacrifice. Regarding the Eucharist as a sacrament, the Roman Catholic Church teaches that it is the true body and blood of Jesus Christ under the «species» or appearances or physical properties of bread and wine. The institution of this sacrament by Christ is recorded in the three synoptic gospels and in Saint Paul's first letter to the Corinthians. The name given to the sacrament comes from the expression in the original Greek text of Luke xxii, 19, ευχαριστησας (eucharistesas), «having given thanks.» The words of institution, as given by the same evangelist, are: «This is my body which is given for you. . . . This is the chalice, the new testament in my blood, which shall be shed for you.» The perpetuation of this sacrament is commanded in the words, «This do for a commemoration of me.» (1 Cor. xi, 24). A year before the institution of the sacrament Jesus Christ in a discourse at Capernaum, spoke of his flesh being «meat indeed» and his blood «drink indeed»; and it is important to note the circumstances in which he employed those extraordinary expressions. He had already said: «I am the bread of life,» at which the Jews murmured. Thereupon Jesus, instead of modifying the expression which offended them, re-enforced it, saying: «The bread which I will give is my flesh for the life of the world.» At this the Jews again murmured, but Christ does but emphasize the doctrine in the words already quoted. And not only the Jews were scandalized by these speeches: many of Jesus' disciples even would no longer listen to him; they «went back and walked no more with him.» Would the apostles also desert him? and he elicited from them a profession of implicit faith in his words, however «hard» his sayings might be.

And that attitude of the apostles is the attitude of the Roman Catholic Church. Those words of her Founder and the many other announcements he made touching this sacramental mystery, the Roman Catholic Church from apostolic times has received in their plain literal interpretation — the interpretation put upon

Forest Cover for Parks, Los Angeles, California

Avenue Shade Trees, near Santa Monica, California them by all who heard them, Jews, disciples, apostles, and by Jesus Christ himself: the Roman Catholic Church teaches that in the Eucharist is contained «truly, really and substantially» the body and blood of Jesus Christ, together with his soul and divinity. Here nothing is added to, nothing taken away from, the words of Christ, and nothing explained away in those «words of eternal life.» And when in the 11th century the Church's reading of those words as denoting a «true, real and substantial» change of the bread and wine into Christ's body and blood was challenged by Berengarius, who, more «spiritually-minded» than the apostles of Jesus Christ, would fain see in Christ's words only a figurative, symbolical presence of his body and blood in the sacrament, the Roman Catholic Church adopted the fittest possible word to express the change wrought in the bread and wine — the word Transubstantiation: in the Eucharist the substance of bread and wine remain no longer underlying the outward appearances, «species» of bread and wine: what underlies them now is the body and blood of Christ. Such is the teaching of the Roman Catholic Church with regard to the real presence of Jesus Christ in the Eucharist.

But the Eucharist is not only a sacrament: it is also the perpetual New Covenant sacrifice, believed to have been foretold by the prophet Malachi, as rendered in the Vulgate, which differs slightly from the authorized Anglican version: «From the rising of the sun even to the going down thereof, my name is great among the Gentiles, and in every place there is sacrifice, and there is offered to my name a clean oblation» (Mal. i, 10–11). And the Roman Catholic Church teaches concerning the Eucharistic sacrifice or the Mass that «it is one and the same sacrifice with that of the cross: the victim is one and the same, Jesus Christ, who offered himself, once only, a bloody sacrifice on the altar of the cross. The bloody and unbloody victim is still one and the same, and the offering upon the cross is daily renewed in the Eucharistic sacrifice, in obedience to the command of our Lord, 'Do this in remembrance of Me.'» —*Catech. Conc. Trid., cap. de Eucharistiæ Sacr.*

EUCHLORINE, a name given by Sir Humphry Davy (q.v.) to the yellow gas obtained by acting upon potassium chlorate with hydrochloric acid. Davy believed it to be a new oxide of chlorine; but it is now known to be a mixture of chlorine and chlorine peroxide, ClO_2. It has powerful bleaching and disinfecting properties, but it is frightfully explosive, and should never be prepared nor handled save by an expert chemist, provided with proper safeguards, and with a full previous knowledge of its properties.

EUCHOLOGION, ū-kō-lō'jĭ-ŏn, the liturgical and ritual book of the Greek Church, corresponding to the Missal, which is the Pontifical and Ritual of the Latin Church. The Uniate Greek Church, or Church of the Greek Rite in communion with the See of Rome, has a separate Euchologion. The Euchologion contains the liturgies, the order of daily services with prayers and litanies, and finally a collection of sacraments and sacramentals, with various rules, canons and blessings. The first printed edition was published in 1526 at Venice and since then the successive official Greek editions have been printed there. There are, however, other editions published both in Athens and Constantinople. There is also an abstract, called 'Small Euchologion.' There is no English translation, but M. Rajewsky has translated it into German under the title 'Euchologion der Orthodox-Katholischen Kirche, etc.' (Vienna 1861–62).

EUCHRE, ū'kėr, a game of cards, regarding the origin of which nothing definite is known. For a long time it was the most generally played parlor game after whist in the United States. The pack of cards consists of 32, but sometimes only 24 are used, being an ordinary «deck,» minus the deuce, trey, four, five and six spots of each suit. The game is usually played by two, three or four persons, the most interesting party being four, two playing on each side as partners. When choice of partners and first dealer has been decided five cards are dealt, usually two at once, then three, or the contrary. Having dealt five cards to each player, the dealer turns up the next card for trumps, leaving it, face upward, on top of the balance of the pack. The cards rank in value as follows: The best euchre card is the knave of trumps; the second best is the knave of the suit of the same color as the trump. The former card is called the «right bower,» the latter the «left bower.» After the right and left bowers the cards rank as at whist, the knaves of the color not turned as trumps falling into their regular place as at whist. The object of the game is to take tricks. The score is five points, unless otherwise agreed. In two-handed euchre the following rules apply: The non-dealer may «pass,» or «order up» the trump. Should he pass, then the dealer may take up the trump and discard. In that case the dealer must make three tricks or be «euchred,» which counts two points for the adversary, but if he makes the three tricks (or four), he counts one point. Should he make all five tricks, it is termed «a march,» and counts him two on the score. The non-dealer has the first lead, after which he who takes the trick leads. Suit must be followed if possible; otherwise any card may be played. Should the non-dealer «order up» the trump he must make three tricks or be «euchred,» which counts two for his opponent, if he win three tricks (or four), having ordered up the trump, he scores one point. Should he make «a march,» he scores two. If both players pass (the dealer turning down the trump), and then both decline to make a trump, there must be a new deal. Either party naming a new suit for trump must make the three tricks or be «euchred.» In four-handed euchre the same counts are made and the same rules practised as in the two-handed game, together with the following: The opportunity to «pass,» «order up,» «assist,» or «play alone» goes around in rotation, beginning with the player on the left of the dealer. «To assist» is for the partner of the dealer to say «I assist,» which has the same effect as ordering up the trump, and is subject to the penalty of two points to the adversary, should three tricks not be secured by the party «assisting» and his partner. Either partner ordering up a trump or making a trump may «play alone,» that is, play his hand singly against the other two, his partner not playing his hand that round at all. «Progressive euchre» is played by a number of participants at separate tables, the successful players moving up in a regular order. A prize is generally awarded to the two winners. There are also a number of other varieties: Railroad, French, Call-Ace or Australian Euchre, and Napoleon. Consult Cady, A. H., 'Euchre' (in 'Spalding's Home Library,' Vol. I, No. 6, New York 1895); Foster, R. F., 'Call-Ace Euchre' (London 1904); id., 'Foster's Complete Hoyle, etc.' (New York 1914); Jessel, F., 'A Bibliography of Works in English on Playing Cards and Gaming' (London 1905); Seaver, C. M., 'The Standard Guide to Progressive Euchre' (Boston 1885).

EUCKEN, Rudolf Christoph, German philosopher: b. Aurich, East Frisia, 5 Jan. 1846. His father died while he was a child, but he enjoyed the loving care of his mother, a woman of marked intelligence and warm sympathies. His early education was received in his native town and he came under the influence of the theologian and philosopher, William Reuter, who was one of his teachers. It is generally believed that Reuter stimulated his interest in religion. He studied at Göttingen where he entered the philosophical classes of Hermann Lotze. It was characteristic of the man that, while he admired Lotze's acuteness, he was not attracted by it. Thus early his anti-intellectualism displayed itself. Eucken took his doctor's degree at Göttingen, not in philosophy, but in classical philology and ancient history. After his graduation, he spent five years as a gymnasium teacher. In 1871 he was called to the University of Basel, and in 1874 he received a call to succeed Kuno Fischer as professor of philosophy at Jena. Here he settled permanently, refusing invitations to other places. During the quiet years passed as a teacher at Jena, he worked out his own philosophy of history and life. In 1908 he received the Nobel prize for literature. His international fame dates from this period. In 1911 he visited England and received a cordial reception, and the next year he came to the United States to deliver a course of lectures at Harvard.

Eucken's early philosophical work was along historical lines. In fact, his first publications deal with Aristotle. Gradually, his thinking became more original and constructive and moved in the direction of a philosophy of religion. His philosophy can best be described technically as a spiritual activism founded on a NeoKantian theory of knowledge. He makes constant use of history to show the growth of life-systems which soar beyond anything for which the physical world can account. This inner spiritual life of man is real and tremendously significant. While it is conditioned by physical processes, it is not reducible to them. Spiritual values are achievements which must be actively appropriated by those who come after. Mere acceptance is not enough. We have already referred to his anti-intellectualism. This does not consist of a distrust of reason but of a feeling that concepts are not sufficient. There must be experiencing as well as knowing. Philosophy must aim at a profound penetration of life in the light of eternal values.

There can be no doubt that Eucken has struck an important note. His attack upon mere traditionalism, for instance, is valuable. So is his stress upon personal idealism. But the technical thinker is likely to criticize his neglect of theory of knowledge and his disregard of the mind-body problem. These lacunæ need filling in, as even his most ardent disciples admit. Yet, when all is said, Eucken must be accorded a high place among modern thinkers. He has helped to free religion from its mythological setting and to bring into relief its ethical content. He has been a very prolific writer. The following are his chief works: 'Die Methode der Aristotelischen Forschung' (1872); 'Die Grundbegriffe der Gegenwart' (1878; this was published in its third edition under the title 'Geistige Strömungen der Gegenwart'); 'Geschichte der philosophischen Terminologie' (1879); 'Die Einheit des Geisteslebens' (1888); 'Die Lebensanschauungen der grossen Denker' (1890; English title 'The Problem of Human Life'); 'Der Kampf urn einen geistigen Lebensinhalt' (1896); 'Der Wahrheitsgehalt der Religion' (1901; English title 'The Truth of Religion'); 'Hauptprobleme der Religionsphilosophie der Gegenwart' (1907; English title 'Christianity and the New Idealism'); 'Sinn und Wert des Lebens' (1908; English title 'The Meaning and Value of Life'); 'Religion and Life' (1911); 'Can We Still be Christians' (1914). The two best expositions of Eucken's philosophy in English are Boyce Gibson's 'Rudolf Eucken's Philosophy of Life' (New York 1907), and W. Tudor Jones's 'An Interpretation of Rudolf Eucken's Philosophy.' Consult, also, Höffding's discussion in 'Modern Philosophers,' Meyrick Booth's 'Eucken: his Philosophy and Influence,' and O. Siebert's 'R. Euckens Welt und Lebensanschauung.'

Roy Wood Sellars,
Professor of Philosophy, University of Michigan.

EUCLASE, ū'klās, a very rare gem mineral, a basic silicate of beryllium and aluminum, $HBe\,Al\,SiO_5$. It occurs in Brazil, Siberia, and Austria, in brilliant, transparent, colorless to pale-green or blue crystals of monoclinic forms, with perfect cleavage and has a hardness of 7.5. Its specific gravity is 3.1. There is a fairly extensive, scientific literature, a bibliography of which as well as all available scientific details regarding Euclase may be found in Dana, E. S., ed., 'The System of mineralogy of James D. Dana' (6th ed., New York 1914).

EUCLID OF ALEXANDRIA, Greek mathematician: fl. about 300 B.C., taught geometry at Alexandria in the reign of Ptolemy I (323–285 B.C.), and extended the boundaries of mathematical science. The severity and accuracy of his method have never been surpassed. There is very little known regarding his life, Proclus (412–485 A.D.) forming the chief source for our information. His chief work, *ταςτοῖχεια*, is known as 'Elements' and has formed for many generations the principal introduction to the study of geometry. It consists of 13 books, though some editions contain two additional books, which, however, are almost without doubt not the work of Euclid. There also have been preserved six other works: 'Data,' 'Introduction to Harmony,' 'Section of the Scale,' 'Phænomena,' 'Optics' and Catoptrics.' Concerning some of these, however, it is doubtful whether Euclid was the author or not. Even more doubtful is the authorship of some fragments sometimes ascribed to him. From quotations, etc., it has been well established that he wrote four other works of which, however, nothing is in existence now: three books on 'Porism,' two books on 'Curves,' four books on 'Conic Sections' and one book on 'Fallacies.' The 'Elements' have come to us indirectly through the Arabs who made a number of translations of which, however, only one, made in the 13th century, has been printed (Rome 1594). It is claimed that the first retranslation into Greek from Arabic was made by Adelard of Bath in the 12th century. On this there was based the first printed Greek edition edited with comments by Campanus of Novara (Venice 1482), which, however, is not very reliable. The first translation into Latin, made by B. Zamberti, was published in Venice (1505). The first reliable Greek text was printed in Basel (1533) and edited by S. Grynaeus. Other editions were brought out by D. Gregory (Greek and Latin, Oxford 1703); F. Peyrard (3 vols., Paris 1814–18); E. F. August (two parts, Berlin 1826–29); T. L. Heath (3 vols., Cambridge 1908). His complete works have been edited by M. Curtze (Leipzig 1899) and by J. L. Heiberg and H. Menge (Leipzig 1883–96). There have also been many translations into almost all the modern languages. The first English translation was made by H. Billingsley (London 1570); the first French by D. Henrion (Paris 1615); the first German by J. Scheybl (Augsburg 1555). There are also a large number of commentaries, almost every new editor for many years feeling it his duty to attempt a new and original, and, therefore, in many cases useless commentary. Consult Anon., 'The Elements of Euclid' (in *Dublin Review*, Vol. XI, p. 330, London 1841); Dodgson, C. L., 'Euclid and His Modern Rivals' (London 1879); Heiberg, J. L., 'Litteraturgeschichtliche Studien über Euklid' (Leipzig 1882); Hultsch, F., 'Eukleides' (in Pauly-Wissowa, 'Real-Encyclopädie der classischen Altertumswissenschaft,' Vol. VI, Stuttgart 1907); Riccardi, P., 'Saggio di una Bibliografia Euclidea' (four parts, Bologna 1887–90); Smith, T., 'Euclid: His Life and System' (New York 1902).

EUCLID OF MEGARA, Greek philosopher, the founder of the Megaric school of philosophy: b. about 450 B.C.; d. about 380 B.C. He was a pupil of Socrates, after whose death, 399 B.C., he retired to Megara (most probably his native city) and set up a school of philosophy, in which he blended the doctrines of the Eleatic school with those of his master. He adopted the Eleatic notion of one universal unchangeable existence, and upon this he engrafted the ethical views of Socrates. From its subtlety and disputativeness, the school of Euclid was sometimes called the Dialectic or Eristic. He wrote six dialogues of which only one small fragment has been saved.

EUDÆMONISM, the doctrine that happiness (Gr. *eudaimonia*) is the chief good. Happiness, according to Aristotle, is the activity of soul in accordance with virtue, virtue being the mean between excess and defect as determined by reason. As pleasure and life are inseparably joined together, the one is therefore essential to the other, and the former is a necessary part of all human activity. See Ethics; Energism.

EUDEMUS OF RHODES, Greek philosopher and the disciple of Aristotle. He wrote many works, most of which were in defense of the philosophy of his master; of these the most celebrated is the 'Eudemian Ethics,' published as a part of the writings of Aristotle. He wrote also a history of mathematics and astronomy, now lost, but of which a commentary remains to us in a work on Euclid by Proclus and in the works of other writers we have fragments. All these fragments were published by Mullach in 'Fragmenta Philosophorum Græcorum' (Vol. III, 1881). Consult Gow, History of Greek Mathematics' (Cambridge 1884).

EUDES. See Odo.

EUDES, Duke of Aquitania: d. 735 A.D. He ruled that portion of France from the Loire to the Pyrenees and in 721 inflicted a serious defeat on the Arabs, who had besieged Toulouse. Ten years later Charles Martel began his incursions into Aquitania and the Arabs took advantage of this state of affairs to again invade France; Eudes joined forces with Charles to repel the invader and the allied armies won the battle of Tours in 732. Consult Vic and Vaissette, 'Histoire generale de Languedoc' (16 vols., Toulouse 1872–1904).

EUDES, Jean, the venerable French clergyman and founder of the Catholic congregation known from his name as the Eudists: b. Ri, 14 Nov. 1601; d. Caen, 19 Aug. 1680. He was educated at the Jesuit College of Caen and in 1623 entered the Congregation of the Oratory at Paris and rose to be superior of the Oratory at Caen in 1639. In 1643 he founded the Congregation of the Mission Priests of Jesus and Mary for the training of priests in missionary work. This society came to be known by the name of their founder, took no vows, and were under the jurisdiction of the ordinary, and were at liberty to leave the congregation at any time they pleased. They received papal approval in 1674 and were regarded with jealousy by the Oratorians, especially after the latter became affected with Jansenism which the Eudists reprobated. The congregation spread rapidly throughout France but suffered in the debacle of the Revolution. In 1826 it was reorganized and has since spread to Canada. Eudes also founded a society for the rescue of fallen women which still exists. Pope Leo XIII bestowed on Eudes in 1903 the title of "Author of the liturgical worship of the Sacred Heart of Jesus and the Immaculate Heart of Mary." In 1908 the canonical process for his beatification was instituted in Rome. Consult Montzey, 'Le Père Eudes et ses instituts' (Paris 1869).

EUDIALYTE, ū-dī'a-līt, rhombohedral red mineral of vitreous lustre, translucent or nearly so; its hardness, 5.5; specific gravity, 2.90 to 3.01. It consists principally of silicates of iron, zirconia and lime. There are two varieties, eudialyte proper, of which the double refraction is positive, and eucolite, in which it is negative. It is found in North Greenland, Norway and Arkansas.

EUDIOMETER, an instrument employed in the analysis of gaseous mixtures. It was originally designed for ascertaining the quantity of oxygen contained in any given bulk of elastic fluid. The first instrument of this kind was constructed by Joseph Priestley. In one form of eudiometer two platinum wires are inserted near the top of a graduated glass tube open at the bottom. An electric spark is introduced by these wires. The process involves the explosion and combustion of one of the constituents to be determined. The operation may be conducted in a trough of mercury or over water. See GASOMETRIC ANALYSIS.

EUDISTS, ū'dists, a congregation or society of secular priests founded in the 17th century by a priest named Eudes for the purpose of conducting ecclesiastical seminaries and giving "missions" in parish churches, for the revival of religious zeal and the conversion of sinners. The members of the society take no religious vows, but they live in common and are voluntarily subject to the orders of their superior. They do not wear any habit to distinguish them from the rest of the secular clergy. Their first house was established at Caen in Normandy 1643; the membership at that time consisted of Eudes and eight other priests. In his time Eudes conducted 110 missions in various places in the kingdom. The institute never spread to other countries. Eight or more Eudists were among the priests who were butchered in the wholesale slaughter of priests, monks and bishops at the Carmes, Paris, September 1792. The society was broken up during the French Revolution, many of the members seeking refuge in England. In 1826 the apostolate was revived and resumed with ardor and great success.

EUDO DE STELLA. See EON.

EUDOCIA, ū-dō'shĭ-a, Roman empress: b. Athens, about 393; d. Jerusalem, about 460. She was a daughter of Leontius the philosophical sophist. After the death of her father, who left nearly all his property to his two sons, she went to Constantinople for the purpose of complaining of this injustice to the emperor, Theodosius II. There she embraced the Christian religion, was baptized as Eudocia and became empress 421 A.D., through the efforts of Pulcheria, sister of Theodosius (421). Pulcheria in reality ruled the royal household and Eudocia appears to have bowed to her will in everything. Finally, however, they quarreled over religious matters and Pulcheria was banished from court; but she succeeded in again securing her influence there and Eudocia was afterward divorced or retired from Constantinople and spent the remainder of her life in Jerusalem, engaged in acts of devotion. She is said to have written some Greek poems and also a life of Christ. Consult Diehl, 'Figures byzantines' (Paris 1906); Gregorovius, 'Athenais' (Leipzig 1892); Ludwig, 'Eudociæ Agustæ Carminum Reliquiæ' (Königsberg 1893); any good history of the period.

EUDOXIA, ū-dŏk'sĭ-a, Byzantine empress: wife of Arcadius, emperor of the West: d. 404. She was the daughter of Banto a Frankish general of Theodosius. Eutropius the eunuch, intriguing against Rufinus, chief minister of Arcadius, induced the emperor to take her to wife, instead of marrying the daughter of Rufinus, as the latter had designed. Eutropius soon after this union caused Rufinus to be put to death and succeeded him. Eudoxia, if we may believe John Chrysostom, was an infamous creature, although at one time winning his admiration and profuse acknowledgments by an open profession of religious earnestness. She was a woman of strong passions and resolute will, and when Eutropius insulted her by saying that as he had raised her so he could debase her, she appealed to the weak Arcadius who at once degraded Eutropius from all his honors and ordered his statue in the market place of Constantinople to be destroyed. Chrysostom so vehemently inveighed against the court life of Eudoxia that she caused him to be banished in 403, but popular clamor, added to the panic caused by an earthquake, induced her to recall him. But her enmity caused his second exile in 404. She survived this persecuted prelate only two years, and if she were too impatient under the almost Aristophanic invective of a bishop who was more a monk than a courtier, she was probably sincere in her anxiety to rescue the feeble Arcadius from the dominion of a minister like Eutropius, and the best act she ever did in her life was to bring this monster of profligacy and corruption to the end of his career.

EUDOXIA, Roman empress, who was the daughter of Theodosius II: b. Constantinople, 422; d. about 463. She was married to her cousin Valentinian III, emperor of the West, after whose death, by the hands of emissaries of the senator Maximus, she was constrained to espouse the latter. Maximus subsequently had the folly to reveal to her the part which he had taken in the murder of Valentinian, and when the time for vengeance seemed to her to have come she invited to Italy Genseric, king of the Vandals, at whose approach Maximus was murdered. Genseric delivered Rome to pillage and bore away with him to Africa Eudoxia and her two daughters.

EUDOXIA FEODOROVNA, tsarina of Russia: b. 1669; d. 1731. At 19 she became the wife of Peter the Great, but her adherence to the Conservative party caused her husband to look on her with little favor and in 1698 for refusing to consent to a divorce she was imprisoned in a convent at Susdal. In 1718 she was brought to Moscow for trial on a charge of adultery and forced to confess her guilt. Thereafter she was confined in the monastery of Staraya Lodoga, but on the accession of her grandson, Peter II, in 1728, she was set at liberty and returned to Moscow, where she died.

EUDOXIANS, ū'dŏk'sĭ-anz, followers of Eudoxius, who from 356 A.D. was bishop of Antioch, in Syria, and from 360 to his death in 370 bishop and patriarch of Constantinople. He was successively an Arian, a Semi-Arian and an Aetian. Respecting the Trinity, he believed the will of the Son to be differently affected from that of the Father.

EUDOXUS (ū-dŏk'sus) **OF CNIDOS**, Greek astronomer, lived about 370 B.C., was the scholar and friend of Plato. All his works are lost, but the poem of Aratus on astronomy makes us acquainted with the extent of his astronomical knowledge. Eudoxus seems to have been the first to introduce an astronomical globe into Greece and this may account for the great reputation which he acquired and long continued to enjoy. He is said to have discovered that the solar year is six hours longer than 365 days and to have invented a sun dial. He was considerable of a philosopher too, in his day; and he held that the *summum bonum* of all things is pleasure, which is the aim of everyone. Consult Letronne, 'Sive les écrets et les travaux d'Eudoxe de Cnide' (1841).

EUFAULA, ū-fa'la, Ala., city in Barbour County, on the Chattahoochee River, and on the Central of Georgia Railroad; 80 miles southeast of Montgomery. It is at the head of steamboat navigation on the river; is the trade centre of a large manufacturing and agricultural district, and carries on an extensive cotton-shipping trade, exporting over 30,000 bales annually. It has manufactures of cotton-goods, cottonseed oil, buggies and fertilizers. It has gas and electric lights, waterworks plant erected by the city in 1897 at a cost of $60,000, public parks, Union Female College, public high school and three national banks. Pop. 4,939.

EUGANEAN (ū-gā'nē-an) **HILLS**, a range of well-wooded hills, lying southwest of Padua, in northern Italy, between the river Bacchiglione, the canals of Battaglia and Este and the river Bisatto, deriving their name from an ancient Italian people called Euganei. They owe their origin to eruptions of trachyte during the Jurassic Period. The highest point, Monte Venda, reaches about 1,980 feet. On their slopes stand several villas with interesting histories, among them Petrarch's house at Arquà in which the Italian poet died in 1374. His tomb is on the market square of Este at the southern end of the Hills and near this town is the villa, I Cappuccini, lent by Byron to Shelley, who there finished the first part of 'Prometheus Unbound' and also wrote 'Lines Written Among the Euganean Hills' (1818). There are also a number of monasteries dating back to the early Middle Ages, some of them in ruins. Valuable building stone, quarries and mineral springs abound. Consult Reyer, E., 'Die Euganeen. Bau und Geschichte eines Vulkans' (Vienna 1877); Symonds, J. A., 'Among the Euganean Hills' (in *Fortnightly Review*, Vol. LIV, p. 107, London 1890).

EUGANEI. See EUGANEAN HILLS.

EUGEN, Frederich Karl, DUKE OF WURTTEMBERG, Russian general: b. Oels, Germany, 1788; d. 1857. His aunt was the wife of Tsar Paul of Russia and while still in his early years he was made major-general. In 1806–07 he took part in the military operations in Prussia and in 1810 in Turkey. He won distinction at Borodino, Krasnoi, Lutzen, Kulm, Leipzig and other battles, commanded the Seventh Russian Army Corps in the war with Turkey in 1828 and retired from the service after the peace of Adrianople. He now gave his attention to study and composed an opera 'Die Geisterbraut,' produced at Breslau in 1830. His works include 'Erinnerungen aus dem Feldzuge des Jahres 1812 in Russland' (1846) and 'Memoiren' (1862).

EUGEN ONIEGIN, an opera in three acts by Peter Ilich Tschaikowsky (libretto adapted from Poushkin), first performance by the students of the Conservatory at Moscow in March, 1879. The reception was cool, but gradually the work crept into popular favor. In spite of the strong dramatic character of Tschaikowsky's music, he never developed any marked talent for the theatre and from the dramatic standpoint 'Eugen Oniegin' shows many weaknesses. Beside the works of the younger Russian school of which Monssorgsky is the leader, it seems to lack the virility that has come to be associated with modern Russian music. The influence of sunny Italy is felt rather than that of the Northern steppes. But the music breathes the composer's joy in creation and is pervaded by a romantic melancholy and elegiac sentiment that makes its emotional appeal very strong. The letter scene is the most popular bit in the opera. Rosa Newmarch, who has made a special study of Russian opera, likens 'Eugen Oniegin' to "the embodiment of some captivating, wayward, female spirit, which subjugates all emotional natures, against their reason, if not against their will."

LEWIS M. ISAACS.

EUGÈNE, ē-zhän, **Prince** (François Eugène de Savoie-Carignan), Austrian general: b. Paris, 18 Oct. 1663; d. Vienna, 21 April 1736. Among all the generals and statesmen of Austria, none has rendered more numerous and important services than Eugène. He was great alike in the field and the cabinet. He petitioned Louis XIV for a company of dragoons, but was refused on account of the opposition of Louvois, Minister of War, who hated the family of Eugène. Indignant at this repulse and at the banishment of his mother, a niece of Cardinal Mazarin, Eugène, in 1683, entered the Austrian service. The distinction he earned at the siege of Vienna in 1683, at that of Belgrade in 1688, at that of Mayence in 1689 and elsewhere, procured for him rapid promotion. War having broken out between France and Austria, he prevailed upon the Duke of Savoy to enter into an alliance with the emperor, and in 1690 received the command of the imperial forces sent to Piedmont to act in conjunction with the troops of the Duke of Savoy. He defeated the Turks at the battle of Zenta (11 Sept. 1697) and obtained on that occasion the applause of Europe. The loss of the Turks at Zenta obliged them to accede to the Peace of Carlowitz, 1699, which was the first symptom of their decline. On the outbreak of the War of the Spanish Succession he was given the command in Italy and defeated the French on several occasions, but inadequate forces led to his defeat at Luzzara, 15 Aug. 1702. In 1703 he received the command of the army in Germany, and his efficient co-operation with Marlborough frustrated the plans of France and her allies. In the battle of Höchstädt (Blenheim), 13 Aug. 1704, the two heroes gained a decisive victory over the French and Bavarian army, commanded by the Prince of Bavaria and Marshal Tallard, the latter of whom was made prisoner. In 1705 Eugène returned to Italy, where he hastened to the relief of Turin, stormed the French lines, forced them to raise the siege and in one month drove them out of Italy. In 1707 he entered France and laid siege to Toulon; but the immense superiority of the enemy obliged him to retire into Italy. During the following years he fought on the Rhine, took Lille and, in conjunction with Marlborough, defeated the French at Oudenarde (1708) and Malplaquet (1709). After the recall of Marlborough and the defection of England and Holland from the alliance against France, his farther progress was in a great measure checked. The Peace of Rastadt, the consequence of the Treaty of Utrecht, was concluded between Eugène and Villars in 1714. In the war with Turkey, in 1716, Eugène defeated two superior armies at Peterwardein and Temesvar, and, in 1717, took Belgrade, after having gained a decisive victory over a third army that came to its relief. The Treaty of Passarovitz (concluded in 1718) was the result of this success. His fame is still celebrated in popular song, «Prinz Eugen der edle Ritter.» He was also distinguished as a discriminating patron of art and literature. Consult Malleson, 'Prince Eugène of Savoy (1888).

EUGENE, ū-jēn', Ore., city and county-seat of Lane County; on the Willamette River, the Southern Pacific, Oregon Electric and other railroads; 123 miles south of Portland and 50 miles from the Pacific Ocean. The University of Oregon was established here in 1876 and now has about 1,000 students. The city is also the seat of the Eugene Bible University and contains a Carnegie library. It is the commercial centre of a fertile agricultural region. Lumbering and gold and silver mining are carried on in the vicinity. The manufactures are chiefly flour, lumber, brick, tiling, fruit drying and packing, a flax factory and some articles for home consumption. The United States census of manufactures for 1914 showed within the city limits 37 industrial establishments of factory grade, employing 322 persons; 238 being wage-earners receiving annually a total of $167,000 in wages. The capital invested aggregated $651,000, and the year's output was valued at $810,000: of this, $403,000 was the value added by manufacture. The city was settled in 1854, and was incorporated in 1864. The government is administered by a mayor, chosen for two years, and a city council. The waterworks and electric-light plant are the property of the city. Pop. 12,000.

EUGENE ARAM, a novel by Edward Bulwer-Lytton (q.v.) written in 1831 and published in 3 vols., 1832. It was founded on the career of an English scholar, Eugene Aram: b. 1704; executed for the murder of one Clark in 1759. The character of the murderer and the circumstances of his life made the case one of the most interesting, from a psychological point of view, in thè criminal annals of England. Aram was a scholar of unusual ability, who, selftaught, had acquired a considerable knowledge of languages, and was even credited with certain original discoveries in the domain of philology. Of a mild and refined disposition, his act of murder seemed a complete contradiction of all his habits and ideals of life. 'Eugene Aram' is an unusually successful study in fiction of a complex psychological case. At the time of its publication, it caused a great stir in England, many attacks being made upon it on the ground of its false morality. To the present generation its romance is of more interest perhaps than its psychology. Some years after the novel was first published, the author changed his opinion concerning the guilt of Aram and as a result also changed the story beginning with the edition of 1851. The English poet, Thomas Hood, wrote a poem on the same theme entitled 'The Dream of Eugene Aram' (London 1831). It has also been dramatized, first by Bulwer-Lytton, who, however, never finished the play but published it in its unfinished form in *The New Monthly Magazine and Literary Journal* (Vol. XXXVIII, p. 401, London 1833), and later attached it to the novel itself. Other dramatic versions were published by Moncrieff, W. T., 'Eugene Aram, or Saint Robert's Cave' (in 'French's Acting Edition of Plays,' Vol. CIII, London and New York, n. d.); Williams, E. W. H., 'Eugene Aram. A Play in Five Acts' (New Orleans 1874), and Wills, W. G., 'Eugene Aram' which was produced in 1873 by Henry Irving. For the history and life of Eugene Aram consult Scatcherd, N., 'Memoirs of Eugene Aram' (London 1838).

EUGÈNE DE BEAUHARNAIS, ē-zhän dé bō-är-nä. See Beauharnais, Eugène de.

EUGENI ONYEGIN. Pushkin's poem 'Eugeni Onyegin' is the prototype of the Russian novels dealing with unsuccessful heroes. Here the hero Onyegin represents a member of cultured society in the 20's who took Childe Harold for their example. Indeed, the first canto arose directly under the influence of Byron's 'Don Juan' and 'Childe Harold,' but in the further development Pushkin described, not an individual blasé, but a class type of helpless, frivolous upper society, and, to a certain extent, gave his poem the nature of a social satire, as which it was recognized by contemporary critics. But, although Pushkin in the beginning of his poem pursued Onyegin with banter and irony, he looked more objectively at the hero as he proceeded, and even pitied him, when his relation to Lenski and Tatyana became tragic. Onyegin began by joining in his friends' orgies, but soon commenced to pine, and at last tried to busy himself with affairs. He wanted to act as a benefactor to his peasants, but was not understood by them. After killing Lenski in a duel, he started on a journey, but even his wandering could not cure his blasé spirit. He insulted simple-minded, faithful Tatyana with his cold counsels, and fell in love with her only when he found her married to another man.

The enormous popularity of this poem is evidenced by the fact that up to 1885 it was reprinted in whole or in part 27 times, while for the same period there are recorded 55 critical essays dealing with the subject and 33 translations. English translations are by D. Minaieff, (Saint Petersburg 1868); by Mrs. J. Buchan Telfer (née Mouravieff, London 1880); by Spalding (London 1881). It was dramatized in 1846, and in this form was kept in the repertoire until 1852. It gained its greatest popularity through Chaykovski's opera, written in 1872.

Leo Wiener.

EUGENICS (from Greek εὐγενής well-born). According to Francis Galton, the great English scientist who, in 1883, first used the term «eugenics,» this branch of learning «is the science which deals with all influences that improve the inborn qualities of a race.» Within the scope of such influences Galton included all forces that tend to produce an increase in the number of such individuals as possess desirable hereditary qualities and a decrease in the number of those whose transmissible traits are undesirable. As applied to the human race Galton admitted that differences of opinion exist as to what hereditary traits are desirable and what are not. A warrior may approve pugnacity, a statesman, tolerance. An hereditary trait expressing itself in one of these qualities might easily prove unfavorable for the development of the other. Who, then, is to decide what qualities are really favorable? Galton met this difficulty by pointing out the fact that few persons would fail to consider desirable such fundamental qualities as health, energy and ability. In a lecture before the Sociological Society of London in 1904 he reviewed some of the results that in his opinion would follow if the British nation through the practice of eugenics were to raise its average quality to that of its better half. «The general tone of domestic, social and political life would be less foolish, less frivolous, less excitable and politically more provident than now. Its demagogues who 'Played to the gallery' would play to a more sensible gallery than at present. We should be better fitted to fulfil our vast imperial opportunities. Lastly men of an order of ability which is now very rare would become more frequent because the level out of which they rose would itself have risen.» It is evident, from the foregoing, that knowledge of the laws of heredity is requisite if eugenics is to be scientific in fact as well as in aim. Such knowledge must necessarily include ability to tell not only what traits are transmissible by physiological processes but also the extent to which they are heritable. If these laws be given as known factors, the eugenist then becomes interested in discussing how they may be utilized. He wishes to know who are the bearers of the desirable hereditary traits and how they may be led to contribute a relatively large proportion of offspring to the succeeding generation. Likewise he wishes to know who are the bearers of undesirable hereditary traits and how their contributions may be minimized. Still further, having ascertained these facts he wishes by propagandist methods to spread abroad whatever knowledge exists within the field and by practical measures to better the breed of man.

The idea that, like the animals, the breed of man may be improved by a conscious selective process is by no means modern. It appears even in early Chinese literature. Plato's suggestions on this subject in the 'Republic' are too well known to dwell upon. Some of the Roman classical writers even give explicit rules of procedure. The modern eugenics movement, however, dates from the publication in 1865 of two articles on «Hereditary Talent and Character» by Francis Galton in *Macmillan's Magazine* for that year. So far as its scientific foundation is concerned, the origin of eugenics may be considered identical with the beginnings of biology. For this no specific date can be assigned because the history of biology — as most excellently outlined by Prof. H. F. Osborne in 'From the Greeks to Darwin' — may be traced from a very early period. Nevertheless it was Darwin's 'Origin of Species' that in 1859 inaugurated the distinctly modern period of biological investigation. The rapid and widespread acceptance of Darwin's contention that the most fundamental characteristics of all living organisms are subject to change naturally prepared the public mind for a practical program for bettering those characteristics. Therefore when in 1869 under the title of 'Hereditary Genius,' Galton presented extensive biographical studies in support of the contention that great ability is hereditary his ideas received widespread attention. An increasing literature on this and other phases of the problem soon popularized the subject. Eminent English writers, such as Wallace, Greg and even Darwin himself took part in the movement. In 1873 the appearance of Alphonse de Candolle's 'Histoire des sciences et des savants' marked the beginning of the interest of continental investigators. In the same year appeared Ribot's 'L'Hérédité psychologique.' Later, Georg Hansen's 'Die drei Bevölkerungstufen,' Ammon's studies of an anthropological character and Lepouge's 'Les sélections sociales' raised the question whether the assumed Aryan race was not suffering from a «reversed selection» caused by the attraction of the best stock to cities and a failure to reproduce therein. The subject matter of de Candolle's work was closely related to that of Galton's. The conclusions reached in the former's book, however, did not fully support Galton's belief that specialized ability is hereditary. Galton immediately replied to it in an effective manner and shortly after brought out his classic 'English Men of Science: their Nature and Nurture.' In this he set forth additional carefully compiled data indicating the supremacy of nature over nurture. Shortly after these hopeful beginnings popular interest in the field now known as eugenics waned in England and for more than two decades little attention was paid to the scientific side of the subject. It is true that during this period Galton produced two important works 'Inquiries into Human Faculty and its Development' and 'Natural Inheritance,' the first in 1883 and the second in 1889, but they aroused comparatively little general notice. Even Galton himself «laid the subject wholly to one side for many years.»

In America, however, various contributions to the problem of race betterment appeared from time to time. Among these Mr. Robert L. Dugdale's 'The Jukes' (1877) was easily the most important. This was a thoroughly scientific and intensive study of a degenerate family. In it the characteristics of over 500 descendants of the head of the family were carefully recorded and a number of important «tentative» inductions were drawn. Among these were: pauperism preponderates in the consanguineous lines; crime preponderates in the illegitimate lines; illegitimate criminal lines show collateral branches which are honest and industrious. A popular impression has quite generally prevailed in America that this study of the Jukes constitutes a demonstration of «hereditary criminality,» «hereditary pauperism,» etc. This impression is unwarranted. As Professor Giddings has pointed out its author never made such a claim for it. «Mr. Dugdale,» he says, «undoubtedly believed in the hereditary transmission of character tendencies as of physical traits and here and there he points out what seem to him to be evidences of heredity in this sense in the 'Jukes' blood. But he is ever careful to say 'seemingly' or 'apparently' or otherwise to warn the reader that the conclusion is tentative. Far from believing that heredity is fatal, Mr. Dugdale was profoundly convinced that 'environment' can be relied upon to modify and ultimately to eradicate even such deep-rooted and wide-spreading growths of vice and crime as the 'Jukes' group exemplified.» Another study of similar nature by McCulloch was published somewhat later under the title the 'Tribe of Ishmael.' In 1883 Dr. Alexander Graham Bell's 'Memoir upon the Foundation of a Deaf Variety of the Human Race' appeared, and shortly after under the imprint of the Volta Bureau, endowed by Dr. Bell himself, there followed Dr. Fay's 'Marriages of the Deaf in America.' Somewhat later under the stimulus of Dr. Amos Warner's chapter on «Charity as a Factor in Human Selection» in his 'American Charities,' various studies on this topic were published in the annual volumes of the proceedings of the National Conference of Charities and Correction. These publications naturally appealed to a rather limited number of specialists. Popular interest in the specific eugenic problem of social improvement through better breeding was waning to some extent in America just as it was in England.

The beginning of the 20th century, however, witnessed a very marked reawakening. By that time Darwin's doctrine of selection had thoroughly established itself and the public was accustomed to think of biological laws as something more than mere hypotheses. By that time, also, the Italian school of criminologists including Lombroso, Garofalo and Ferri had aroused lively discussion of the question as to how far there was a true hereditary criminal type. In England much alarm had been occasioned by the military reverses in South Africa. Moreover at about the same period Charles Booth's thorough investigations had been revealing the wide extent of poverty and degradation in London. The discussion of Max Nordau's 'Degeneration' (1893) which had aroused widespread fears of progressive deterioration had not yet wholly died away and Benjamin Kidd's 'Social Evolution' (1894) which had emphasized the relation of religion and biology to social progress was still the subject of lively comment in pulpit and press. In view of this situation it is not strange that Karl Pearson, the foremost eugenist of England, after Galton, created almost a sensation when in November 1900 he delivered his now famous Newcastle lecture on 'National Life from the Standpoint of Science.' In this lecture he reviewed what he regarded as sources of weakness in the British population and emphasized the necessity of being ever ready to meet the competition of other peoples. «If the nation,» he said, «is to maintain its position in this struggle it must be fully provided with trained brains in every department of national activity. . . . Are we certain we have a reserve of brain-power ready to be trained? We have to remember that man is subject to the universal law of inheritance and that a dearth of capacity may arise if we recruit our society from the inferior and not the better stock.» Again he exclaimed, «Our legislators get wonderfully excited over laws relating to horses and cattle; they devote money and time to breeding purposes and realize the strength of the law of inheritance when they endow national studs and give prizes to encourage the maintenance of good stock or when again they work for the establishment of selected herds. But which of them has considered domestic legislation from the national history standpoint? What statesman has remembered that in the character of the national fertility of to-day is written the strength or weakness of the nation to-morrow?» Primarily through the efforts of Professor Pearson, this lecture was followed a little later by the founding of the journal known as *Biometrika*. This journal became the particular organ of those eugenists who attacked the problem from the mathematical and statistical point of view. The impetus given to the movement by the various investigations published in this journal, however, was greatly strengthened by developments following another striking event — also purely scientific in its nature — which had occurred unexpectedly in 1900. This was the rediscovery by several independent workers of the so-called Mendelian laws of heredity. These laws had been announced by Gregor Mendel as early as 1868 but had received practically no attention. After their rediscovery, however, biologists all over the world began systematic experiments to ascertain the extent to which the so-called «laws» applied. Hitherto such «laws» of heredity as had been formulated always expressed a relationship between the average amount of a given trait in an entire group of ancestors and the average amount of the same trait in the entire group of their descendants. For example, the Galtonian «law of ancestral heredity» was, that two parents contribute together, on the average, one-half of the total heritage of the offspring; the four grandparents, one-quarter; the eight great grandparents, one-eighth. This, even if true, tells nothing about the probability of a given individual inheriting any given characteristic from any particular ancestor. The Mendelian laws, however, formulated relationships between specific traits of a single pair of ancestors and the corresponding traits in their descendants. For example, it happens that eye color in man appear to «mendelize.» Thus to take a single specific instance it is held, with a high degree of probability, that if both parents have blue or gray eyes they cannot have children with black or brown eyes. The laws also express other equally definite but more complex relationships of a highly significant character. How many of the important heritable characteristics of man follow the Mendelian laws is not yet known. The problem is one susceptible of accurate investigation, however, and rapid strides are now being made in solving it. Some notion of the importance of the results likely to follow as further facts are collected may be gained by consideration of a single one out of many discoveries — namely, the operation of one phase of the law in the case of feeble-mindedness. This trait is said to behave like the blue color of eyes: that is, almost without exception, if both parents are feeble-minded none of the children will be normal. Dr. Henry H. Goddard, one of the foremost experts on feeble-mindedness in this country, found this to be true in the case of all but six of 482 children whose parents were all feeble-minded.

The importance for eugenics of the discovery of the Mendelian laws and of the farther investigation of the extent of their validity is evident. In the case of feeble-mindedness alone, the facts stated above, taken together with other known relationships of similar definiteness, constitute ample justification for active efforts to prevent propagation by the feeble-minded. This is not the place to present extended discussion of the technical phases of the biological side of the eugenic problem. Attention may properly be directed, however, to some of the hopes and anticipations, cherished by contemporary eugenists, that will indicate the possibilities of improvement if, in fact, the biological basis of the claims becomes fully established. Dr. Charles Davenport, director of the department of experimental evolution of the Carnegie Institution at Cold Spring Harbor, Long Island, is, at the present time, one of the most enthusiastic believers in what the future holds in store for eugenics. In describing the plans for the work of the committee on eugenics of the American Breeders' Association he outlined a number of interesting plans for future advance. According to Dr. Davenport one sub-committee of that organization is charged with the study of the feeble-minded. «This committee,» he says, «has most important interests since the number of feeble-minded in the United States alone is probably not less than 150,000 of which 15,000 are in institutions.» Other contemplated types of work for the eugenic committee included study of the protoplasmic basis of eye defects; deafness, predisposition toward lung and throat trouble and toward diseases of the excretory and circulatory organs. Still other forms of investigation which Dr. Davenport hoped could be undertaken were studies of criminality and pauperism, the effects of consanguineous marriages and of «such mongrelization as is proceeding on a vast scale in this country.» He was particularly anxious that the extant records of institutions be studied. The amount of such data is enormous. «They lie hidden in records of our numerous charity organizations, our 42 institutions for the feeble-minded, our 115 schools and homes for the deaf and blind, our 350 hospitals for the insane, our 1,200 refuge homes, our 1,300 prisons, our 1,500 hospitals and our 2,500 almshouses. Our great insurance companies and our college gymnasiums have tens of thousands of records of the characters of human blood lines.» By study of these records it will be possible «to learn whence come our 300,000 insane and feeble-minded, our 160,000 blind or deaf, the 2,000,000 that are annually cared for by our hospitals and homes, our 80,000 prisoners and the thousands of criminals that are not in prison and our 100,000 paupers in almshouses and out. This three or four per cent of our population is a fearful drag on our civilization. . . . A *new* plague that rendered four per cent of our population, chiefly at the most productive age, not only incompetent but a burden costing $100,000,000 yearly to support would instantly attract universal attention and millions would be forthcoming for its study as they have been for the study of cancer. But we have become so used to crime, disease and degeneracy that we take them as necessary evils. That they were, in the world's ignorance is granted. That they must remain so, is denied. . . . Vastly more effective than ten million dollars to 'Charity' would be ten millions to eugenics. He who by such a gift should redeem mankind from vice, imbecility and suffering would be the world's wisest philanthropist.» A considerable part of the actual investigations outlined by Professor Davenport has been undertaken under his own direction at Cold Spring Harbor and the results have been published from time to time in the bulletins of Eugenics Record Office.

The phases of eugenics emphasized by Professor Davenport in the foregoing account are chiefly negative. They have to do with efforts to eliminate the unfit. Positive eugenics deals with a wholly different field, namely, the effort to increase the productivity of the best stocks. There is no doubt whatever that the birth rate among the more highly educated classes throughout the civilized world tends to be much lower than that of the more ignorant classes. It is true that a corresponding state of affairs exists in the matter of death rates. In spite of this, however, the actual effective contribution of the better educated to the next generation is at a much lower rate than that of the ignorant.

Not only is it true that college graduates as a group are scarcely reproducing themselves but the same is true of the foremost men of science. The completed family of the contemporary scientific man in the United States and Canada according to a very careful investigation by Professor Cattell is about two; the surviving family about one and eight-tenths. Twenty-two per cent of the families are childless; only one family in 75 is larger than six. As a rule the native-born inhabitants of Massachusetts rank fairly high as regards education. During the 25 years from 1887 to 1911 the deaths among this class exceeded births in families where the parents were native born by 269,918. The eugenic importance of these declines in birth rates among educated persons depends entirely upon the question whether, as a matter of fact, the better educated are, on the average, possessed of better hereditary charactistics than other classes. Biologically considered the training that a man receives cannot be held to increase in any way the probability of his having children of higher talent than if he had not had any training whatsoever. It may well be, however, that, on the average, those who possess better hereditary traits have succeeded in obtaining a good education more frequently than have persons less well endowed by nature. On the other hand it may well be that, on the average, educated and successful persons have merely been more fortunate than others. The question as to whether or not success is an evidence of hereditary superiority has been long debated but is yet far from solution. Galton believed that if the eminent men of any period had been changelings when babies a very fair proportion of those who survived and retained their health up to 50 years of age would, notwithstanding their altered circumstances, have equally risen to eminence. If a man is gifted with vast intellectual ability, eagerness to work and power of working, Galton could not comprehend how such a man could be repressed. If this belief proves to correspond with fact, it is easy to see that the more successful members of society, including the better educated, must be the carriers of hereditary traits higher than the average. A low birth rate in such classes would be correspondingly serious from the eugenic point of view. It is, however, very doubtful if the argument can legitimately be pushed as far as Galton carried it. Prof. Lester F. Ward was never weary of contending that natural ability is distributed fairly evenly throughout the various classes in society. Naturally he did not contend that all individuals are equally endowed at birth — such a contention would have been absurd. He did hold, however, that in all probability the percentage of individuals highly endowed by nature with desirable hereditary qualities in all nations and in all social classes does not materially differ. If the question here presented could be scientifically solved it would carry with it the solution of the vexed question as to whether some races are by nature superior to others. Galton was consistent in holding that the ancient Greeks were much more highly endowed with desirable hereditary qualities than are modern Europeans, and that the African negro of to-day ranks about as far below the present European as the ancient Greeks ranked above. The anthropologist Boas on the other hand agrees with the «egalitarian» view held by Ward.

Because of the differences of opinion held concerning many of the biological questions involved it is evident that no careful thinker is likely to give unqualified approval to the more extreme practical measures advocated by radical eugenists. It is probably in part at least for this reason that advocates of the «sterilization of the unfit» have not as yet succeeded very fully in having their ideas carried over into legislation. It is true that 12 commonwealths of the United States have enacted sterilization laws, but only two appear to have attempted any enforcement and only a few operations have actually been performed. On the other hand the increasing adoption of the idea that custodial care is necessary for the feeble-minded reflects the increasing willingness of public authorities to carry out measures advocated by those more moderate eugenists who base their practical plans upon established biological facts.

Possibly the most hopeful fact in the field of eugenics at the present time is the growing interest in the subject itself and the increasing number of trained investigators who are at work upon the various phases of the problems which lie within the field. One has only to glance over the reviews of books and articles on eugenic topics commented on or listed in the *Eugenics Review* to be convinced of the tremendous popular literature that is accumulating. On the other hand one needs but to scan a few of the numerous strictly scientific journals in the field of biology to realize what a vast amount of accurate research is going on within the general field of heredity. To be convinced that much valuable work in the specialized investigation of strictly eugenic problems is being done one need but turn to publications embodying from time to time the results reached at the biometric and eugenic laboratories in England and, in America, the bulletin of the Eugenics Record Office. The work of this American office according to its own prospectus is: (1) To serve eugenical interests in the capacity of repository and clearing house. (2) To build up an analytical index of the traits of American families. (3) To train field workers to gather data of eugenical import. (4) To maintain a field force actually engaged in gathering such data. (5) To co-operate with other institutions and with persons concerned with eugenical study. (6) To investigate the manner of inheritance of specific human traits. (7) To advise concerning the eugenical fitness of proposed marriages. (8) To publish results of researches. To such persons as will undertake to fill them out it furnishes free in duplicate (one copy to be retained by the applicant) the following blank schedules: (1) Record of Family Traits; (2) Index to Germ-plasm — a Parallel Family Record of Prospective Marriage Mates; (3) Musical Talent; (4) Mathematical Talent; (5) Tuberculosis; (6) Special Trait Chart; (7) Hare-lip and Cleft-palate.

The foregoing is sufficient evidence that the modern eugenic movement is very much alive. To what extent it will suffer from the present war is difficult to predict. Undoubtedly it will lose the services of many brilliant minds that, had peace continued, would have made notable contributions to the subject. It will thus, with

EUGENIE

all the other sciences, feel the «disgenic» effect of war. On the other hand the various psychological investigations now being attempted on a very large scale with army men as subjects may throw such light on various phases of the eugenic problem that the science will advance even more rapidly than it has in the past. Furthermore the war may itself produce such potent demonstrations of various contentions now merely debated that the net result for the science, if not for the race, will be advantageous. Consult BIOLOGY; HEREDITY; MENTAL TESTS; STERILIZATION.

ALVAN A. TENNEY,
Assistant Professor of Sociology, Columbia University.

EUGÉNIE, ê-zhä-nē (EUGÉNIE MARIE DE MONTIJO), ex-empress of the French: b. Granada, Spain, 5 May 1826; d. Madrid, Spain, 12 July 1920. Her father, the Count de Montijo, was of a noble Spanish family; her mother was of Scotch extraction, maiden name Kirkpatrick. On 29 Jan. 1853 she became the wife of Napoleon III and empress of the French. On 16 March 1856, a son was born of the marriage. When the war broke out with Germany she was appointed regent (27 July 1870) during the absence of the emperor, but on 4 September the revolution forced her to flee from France. She went to England, where she was joined by the prince imperial and afterward by the emperor. Camden House, Chiselhurst, became the residence of the imperial exiles. On 9 Jan. 1873, the emperor died, and six years later the prince imperial was slain while with the English army in the Zulu war. In 1881 the empress transferred her residence to Farnborough in Hampshire. She published 'Some Recollections from My Life' (1885).

EUGÉNIE GRANDET, ê-zhä-nē grôn-dā. In the scenes of the 'Comédie Humaine' that present aspects of provincial life the first place by universal assent belongs to 'Eugénie Grandet' (1833). Its heroine is Balzac's finest female character, radiant in the generosity of her love; its story is probably the most terrible study of the corroding influence of avarice in any literature. Its astonishing power of gradually developing description, exhibited in the account of Old Grandet's house, its strong-room, store-closet, stairway, gives a presiding personality to inanimate objects in which each detail marks the inevitable next step in the inexorable progress of the miser's vice to monomania. Grandet's assumed stammering hesitancy in bargaining infects the reader with the same impatience that it was designed to produce in his victims in negotiation. «There was in him,» says Balzac, «something of the tiger, something too of the boa-constrictor. He could lie in wait, watch his prey, leap on it,—and then, opening the jaws of his purse, he would swallow a pile of *écus* and settle down tranquilly, like the serpent after his meal, impassive, cold, methodical.»

The story in brief outline is this: Félix Grandet, a cooper of Saumur, has amassed wealth from trade, land speculation and usury, but with such shrewd concealment that his wife and his daughter Eugénie think him as straitened as he is penurious. Partial confidents of his business intrigue for the hand of the unsuspecting heiress, but are made the dupes and tools of Félix to swell his own fortune. Charles Grandet, a Parisian cousin, son of a bankrupt suicide, wins Eugénie's sympathy and a love of which he proves unworthy. Félix contrives to save his brother's name to his own hidden profit. Eugénie remains faithful to the memory of Charles, who prospers in India, while Félix, with unrelaxing vigilance, is ever seizing and devising new ways to add to his hoard. Eugénie had given Charles her little store of gold coins on his departure. Her father sees opportunity to increase it by exchange. His discovery of the gift leads to a terrible scene, accentuating the miser's mania. He confines Eugénie and ignores her; avoids his wife, who falls ill. Should she die he would have to render an account of her estate to his daughter. It becomes policy to keep the ailing wife alive and to cajole Eugénie to a renunciation of the accounting. The mother dies, but Eugénie's renunciation even of the inheritance from her is attained with a truly diabolical ingenuity by playing on the poor girl's emotions. Five years later Félix dies, clutching at the gold on a crucifix. His last words to his daughter, in the very gasp of death: «Be careful. Some day you will have to render an account of all.» Eugénie, now a woman of 30 and heiress to 19,000,000 francs, looks over-sea for Charles. He returns with enough to marry for social position and, ignorant of Eugénie's fortune, writes her a shameful letter, enclosing a check for her loan, «with interest.» He refuses to make final settlement of his father's debts. Eugénie does it. Charles discovers his mistake, too late. Eugénie contracts a marriage of form with the least unworthy of her old suitors, a lawyer, who, thinking to secure her fortune, arranged that each should be the other's heir but was himself first to die.

No novel of Balzac's is better constructed, none has more scenes and descriptions that cling to memory. Grandet's business transactions are told with the keenest psychological insight. The leading characters are among the masterpieces of all fiction; the minor personages, especially the maid-servant, Nanon, are clearly defined. There are many scenes of great power; that of the miser's death is incomparable. Consult translation by Marriage, E., in ‘Everyman's library.’

BENJAMIN W. WELLS,
Author of ‘Modern French Literature.’

EUGENIUS, ū-jā'nĭ-ŭs, the name of four popes. The first, Saint Eugenius, was elected 654; d. 657. EUGENIUS II occupied the Roman See from 824 to 827. His election was contested by a powerful faction in the city who favored Cincinnus (Zinzinnus); and Lothaire, son of Louis le Débonnaire, who shared the empire with his father, came to Rome to quell the disturbance. On this occasion the people and clergy of Rome took the oath of fidelity to the two emperors and promised that thereafter whenever a new pope succeeded he should, before his consecration, take oath in presence of the people and the emperor's representative to honor the emperor as the protector of the Church. The Pope was the first to take this oath; its terms were complied with at the two papal elections next following, for example, of Valentius who filled the see three months and of Gregory IV. EUGENIUS III: b. Pisa; d. Tivoli, 7 June 1153. He was a Cistercian abbot and a close friend of Saint Bernard of Clairvaux and was elected 1145. Before his consecration the populace of Rome, led by Arnold of Brescia, effected a revolution and overturned the papal government; during a reign of a little more than eight years Eugenius was most of the time in exile, living at Viterbo, Siena and other places in Italy and in France. EUGENIUS IV: b. Venice 1383; d. Rome, 23 Feb. 1447. He was a Celestine monk, cardinal and bishop of Siena when he was elected successor to Martin V 1431. On 23 July 1431 was opened the Council of Basel, convoked by his predecessor; but not one bishop was present for the opening, only theologians, abbots and canons. On 12 November the Pope ordered the council to be dissolved and convoked another council to be held in 1433 at Bologna; but the fathers of the council of Basel continued to hold their sessions; throughout his reign the Pope was in conflict with the council. From first to last the council sought primarily and almost exclusively to curb the authority of the Roman See, and in consequence there passed between Rome and Basel a succession of bulls ordering the dissolution of the council, annulling its acts, anathematizing its members; and from the other side decrees of the council declaring that general assembly of the Church to be superior in authority to the Pope, and finally a decree proclaiming Eugenius deposed and setting up as Pope, Amedeo, Duke of Savoy, who assumed the style Felix V. This was the act of the council in its 35th session held 8 July 1439. At the same date there was assembled at Florence, at the call of Eugenius, a council attended by 160 Latin and some 20 Greek bishops, with the Emperor John Palæologus; at this council a reconciliation was effected between the Eastern and Western churches; but it stood only till its terms and conditions became known in the East, when it was repudiated by the Greek Church. The cause of the rival Pope Felix was at this time fatally weakened by the withdrawal by the emperor Sigismund of his support and by his declaring for Eugenius.

EUGIPPIUS, or **EUGYPPIUS**, an Italian monk of the 5th century, born at Carthage. He studied at Rome and later became the pupil of Saint Severin at Fariana and was afterward abbot of Lucullanum, near Naples. In 511 he wrote ‘Vita Sancti Severini,’ but his most important contribution to ecclesiastical history is a collection of excerpts from the works of Saint Augustine, ‘Thesaurus Augustianeus.’ Consult ‘Corpus Scriptorum Ecclesiasticorum Latinorum’ (Vol. IX, Vienna 1885–86).

EUGNATHUS, ūg-nā'thŭs, a fossil fish, a precursor of the mudfish, found in the Liassic rocks of England and also in Bavaria. It possessed an elongated body with ganoid scales, supported internally by vertical ribs, some of which were joined to each other. It had dorsal, pelvic, pectoral, anal and tail fins.

EUGUBINE (ū'gū-bĭn) **TABLES**, the name given to seven bronze tables found in 1444 at the town of Gubbio, the ancient Iguvium or Eugubium, now in the Italian province of Perugia, bearing inscriptions in a language decided to be that of the ancient Umbrians. They were purchased by the town and are kept in its town hall. These tables are the most important monument of the language in which they are written. Four are inscribed in Umbrian characters, two in Latin and the remaining one partly in Umbrian and partly in Latin. The contents of the tables refer to the ritual customs of the ancient Iguvinians. Photographic reproductions of the inscriptions, with French translations, are given in Bréal, M. J. A., ‘Les Tables Eugubines’ (Paris 1875–78). An edition of the Umbrian text with interlinear Latin translation was published by F. W. Newman, ‘The Text of the Iguvine Inscriptions’ (London 1864). Consult Aufrecht, S. T., and Kirchhoff, J. W. H., ‘Die Umbrischen Sprachdenkmäler, etc.’ (2 vols., Berlin 1849–51); Bücheler, F., ‘Umbrica’ (Bonn 1883); Buck, C. D., ‘A Grammar of Oscan and Umbrian’ (Boston 1904); Conway, R. S., ‘The Italic Dialects’ (2 vols., Cambridge 1897); Huschke, G. P. E., ‘Die Iguvinischen Tafeln, etc.’ (Leipzig 1859); Lassen, C., ‘Beiträge zur Deutung der Eugubinischen Tafeln’ (Bonn 1833); Lepsius, K. R., ‘De Tabulis Sugubinis’ (Berlin 1833); id., ‘Inscriptiones Umbricae et Oscae, etc.’ (Leipzig 1841); Planta, R. von, ‘Grammatik der Oskisch-Umbrischen Dialekte’ (2 vols., Strassburg 1892–97).

EUGUVIUM. See GUBBIO.

EUHEMERISM, ū-hē'me rĭzm, or **EUEMERISM.** See MYTHOLOGY.

EUKAIRITE, ū-kā'rīt, a rare mineral of a shining lead-gray color and granular structure, consisting chiefly of selenium, copper and silver $Cu_2Se.Ag_2Se$. Its name is derived from the Greek word meaning *opportune*, and was given to it by Berzelius because found soon after the discovery of selenium. It occurs in Småland, Sweden, and in Chile and the Argentine Republic. Its hardness is 2.5 and its specific gravity 7.5. Consult Dana, E. S., ed. ‘The System of Mineralogy of James D. Dana’ (6th ed., New York 1914).

EULACHON, ū'lă-kŏn, or **CANDLE-FISH.** See CANDLE-FISH.

EULALIA, ū-lā'lĭ-a, Spanish virgin martyr: b. Merida, Estremadura; d. 12 Feb. 303 A.D. There is some doubt whether there was only one or more martyrs of this name. At any rate there are two distinct festivals celebrated in Spain, one at Barcelona on 12 February and one at Merida, 10 December. The legends, hymns and acts about these two saints are very similar in many points. Concerning Saint Eulalia of Merida it is reported that when she was only 12 years old, the great persecution of Diocletian was set on foot, whereupon the young girl left her maternal home and, in the presence of the Roman judge, cast down the idols he had set up. She was martyred by torture. Aurelius Rudentius has written (about 406) a hymn about the martyrdom of Saint Eulalia of Merida, of which there are a number of translations. Her relics are at Oviedo, whereas those of Saint Eulalia of Barcelona are preserved in the Barcelona Cathedral. The latter saint is the patron saint of Barcelona and of sailors. The oldest French poem in existence is also devoted to the description of the life and martyrdom of a virgin Saint Eulalia; but it is a mooted question whether it refers to one of the two Spanish saints or to still another. This manuscript is to be found in the library at Valenciennes. Consult Anon., ‘Annals of Virgin Saints’ (London 1846); Baring-Gould, S., ‘The Lives of the Saints’ (Vols II and XV, Edinburgh 1872); Moretus, H., ‘Les Saintes Eulalies’ (in *Revue des Questions Historiques,*’ Vol. LXXXIX, p. 85, Paris 1911); Ruinart, T., ‘Acta Primorum Martyrum, etc.’ (Amsterdam 1713); Suchier, H., ‘Über Inhalt und Quelle des ältesten Französischen Gedichtes’ (in *Zeitschrift für Romanische Philologie,* Vol. X, p. 24, Halle 1891).

EULALIA, a popular name for certain species of tall perennial ornamental grasses of the genus *Miscanthus* (family *Poaceæ*). They are natives of eastern and southern Asia. The best-known species is probably *M. sinensis,* which has developed several well-marked horticultural varieties characterized by green, mottled or striped foliage and large terminal fan-like panicles of flowers, which, after shedding their deciduous parts, are still attractive because of their persistent silky hairs, which give the panicle a delicate, fluffy appearance for which they are valued as house decorations and for everlasting bouquets. Because of their beauty, their perfect hardiness and the ease with which they can be propagated by means of seeds or division of the roots, these plants are universal favorites, especially for bedding purposes.

EULALIUS, an antipope, elected in opposition to Boniface I in 418. His election is the first instance of the interference of the temporal authorities in a papal election. Eulalius was unable to maintain his authority against Boniface and was forced to leave Rome. Soon afterward he resigned his pretensions and submitted.

EULENBERG, oi'lĕn-bĕrk, **Hermann**, German physican: b. Muhlheim-on-the-Rhine, 1814; d. 1902. He was educated at the universities of Bonn and Berlin. From 1860 to 1870 he was government medical counsellor at Cologne and in the latter year was named counsellor to the Ministry of Education, in which relation he remained until 1887. In Coblenz he founded the *Korrespondenzblatt der deutschen Gesellschaft für Psychiatrie und gerichtliche Medizin* and from 1870 to 1890 was editor of *Vierteljahrsschaft für gerichtliche Medizin und öffentliches Sanitätswesen.* He published ‘Das Medizinalwesen in Preussen’ (1874); ‘Handbuch der Gewerbehygiene’ (1876); ‘Handbuch des öffentlichen Gesundheitswesens’ (1882); ‘Schulgesundheitslehre,’ with Bach (2d ed., 1896).

EULENBERG, Philip, PRINCE: b. Königsberg, Prussia, 1847; d. 16 Sept. 1921. He took part in the wars against Austria and France and later studied law at the universities of Leipzig and Strassburg. From 1888 to 1890 he was Ambassador at Oldenburg, latter at Stuttgart and Munich, and from 1894 to 1902 he served as Prussian Ambassador at Vienna. Ill health compelled his retirement and in 1900 he was raised in rank, being made Fürst in that year and having Hertefeld added to his title. He was also made hereditary member of the house of peers. Maximilian Harden attacked him bitterly in the *Zukunft* in 1907 and Eulenberg's reputation suffered greatly in consequence and his influence was diminished. He wrote ‘Rosenlieder’ (1886; many later editions); ‘Skaldengesange’ (1892); ‘Dichtungen’ (1892); ‘Erich und Erika und andere Erzalungen für Kinder’ (1893); ‘Abenderzalungen, Marchen und Traume’ (1894).

EULENBURG, oi'lĕn-boorg, **Albert**, German physician: b. Berlin, 1840. He received his education at Bonn and Berlin, was made assistant at the University Hospital, Greifswald in 1863 and there published ‘Die hypodermatische Injection der Arzneimittel,’ for which he was awarded a prize by the Hufeland Society, Berlin. He was named professor of therapeutics and director of the Pharmacological Institute at Greifswald in 1874, removed to Berlin in 1882 and began his researches in neuropathology, in which he was soon recognized as the leading authority. His published volumes include ‘Sexuale Neuropathie’ (1895); ‘Lehrbuch der Nervenkrankheiten’ (2d ed., 1878). He edited the ‘Real-Encyklopädie der gesamten Heilkunde’ after 1893, and with Schwabe the *Deutsche medizinische Wochenschrift.*

EULENBURG, Botho, COUNT, German statesman: b. 31 July 1831; d. 1912. In 1867 he was elected to the North German Reichstag as a Conservative; became Minister of the Interior in 1878 and as such formulated the famous Socialist law of October 1878. Differences with Bismarck led to his resignation of this office 1881. In 1892 he succeeded Count Caprivi as president of the Prussian ministry, but owing to controversies between Eulenburg and Caprivi over the bill for an amendment to the criminal code, the emperor dismissed them both in October 1894. In 1899 Eulenburg took his seat in the Herrenhaus, or Prussian House of Lords.

EULENSPIEGEL, oi'lĕn-spe-gel, a typical character associated in Germany with all sorts of frolics and fooling. The type originated in Till or Tyll Eulenspiegel, a German clown who lived probably in the first half of the 14th century, and became celebrated for the wild pranks and escapades that he practised in all parts of Germany, and in some of the neighboring countries. According to popular account he was born at the village of Kneitlingen, near Brunswick, and died at Mölln, near Lübeck about 1350 where his tombstone with the design of an owl and a mirror on it may still be seen. The tricks and frolics currently attributed to Eulenspiegel first appear in a Low Saxon account written in 1483; the earliest edition, in High German, was published at Strassburg in 1515, a reprint of which was published in Halle (1885). A poetic treatment of the same theme was published by Johann Fischart (q.v.) as 'Der Eulenspiegel Reimensweiss' (Frankfort A. M. 1572; reprinted in Kürchner, J., 'Deutsche National-Litteratur,' Vol. XVIII, pt. 2, Stuttgart 1892). The same collection published a reprint of the prose version in Vol. XXV. The work became very popular, and was translated into nearly every European language. In English it first appeared as a miracle-play, with the title 'A Merry Feast of a Man that was called Howleglas' (Eulenspiegel meaning literally «owl-glass»). An edition of Murner's collection was published by J. M. Lappenberg at Leipzig in 1854, and by K. Simrock at Frankfort A. M. in 1864; English translations and editions appeared in 1860 and 1890. In modern times a number of writers have used the same theme. Some of them drawing freely on the old source, but all of them creating more or less original results. Amongst these may be mentioned the work of the Dutch novelist, Charles de Coster, 'Tyll Ulenspiegel' (1867, transl. into German by F. v. Oppelu-Bronikowski, Jena 1911); that of the German poet, Julius Wolff, 'Till Eulenspiegel Redivivus, Ein Schelmenlied' (1875); and finally the musical rendition of the theme in form of a Rondo by Richard Strauss, 'Till Eulenspiegel's Merry Pranks' (1894). Consult, besides any standard 'History of German Literature,' Brie, F. W. D., 'Eulenspiegel in England' (in *Palæstra*, Vol. XXVII, Berlin 1903).

EULER, oi-lĕr, **Leonard**, Swiss mathematician: b. Basel, 4 or 5 April 1707; d. Saint Petersburg, 7 Sept. 1783. He was educated by his father, a minister and mathematician, and then studied at the University of Basel under the famous mathematician, Jacob Bernoulli, where he received the degree of Master in 1723. In his 19th year he gained the *accessit* of the prize offered by the Paris Academy of Sciences for the best treatise on the masting of vessels. He went to Russia in 1727 to become a member of the faculty of the newly founded Academy of Sciences of Saint Petersburg and, in 1733, became its professor of mathematics, where he labored with astonishing industry. He composed more than half of the treatises in this branch of science contained in the 46 quarto volumes published by the Saint Petersburg Academy 1727–83; and at his death left about 200 unpublished dissertations, subsequently printed by the society. In 1741 he accepted an invitation from Frederick the Great to become professor of mathematics in the Berlin Academy, but in 1766 returned to Saint Petersburg. Soon after his arrival he was attacked by a very serious illness from which he finally recovered, but only after he had lost his eyesight. This, however, did not prevent him from continuing his work, employing a secretary and overcoming the difficulties in connection with his elaborate computations chiefly by means of his remarkable memory. He finally submitted to an operation which, at first, was successful; but in some way he suffered a relapse and lost his newly recovered sight again. He first gave the example of those long processes in which the conditions of the problem are first expressed by algebraic symbols, and then pure calculation resolves all the difficulties. He applied the analytic method to mechanics, and enlarged the boundaries of this science. He greatly improved the integral and differential calculus, of which he afterward published a complete course, which surpassed everything then extant on this subject. An extensive optical treatise, 'Sur la Perfection des Verres object. des Lunettes,' in the Mémoires de Berlin (1747), was the result of his inquiries into the means of improving spectacles. The share which he contributed by this work toward the discovery of achromatic telescopes is sufficient to distinguish his name in this department also. He also employed himself in metaphysical and philosophical speculations. He attempted to prove the immateriality of the soul, and to defend revelation against freethinkers. In his well-known 'Lettres à une Princesse d'Allemagne, sur Divers Sujets de Physique et de Philosophie' (3 vols., Saint Petersburg 1768–72), he attacks the Leibnitzian system of monads and pre-established harmony. Among his numerous writings may be mentioned here his 'Theoria Motuum Planetarum et Cometarum' (Berlin 1744); 'Introductio in Analysin Infinitorum' (2 vols., Lausanne 1748), which has always been regarded as his greatest production; 'Institutiones Calculi Differentialis' (Saint Petersburg 1755); 'Institutiones Calculi Integralis' (3 vols., Saint Petersburg 1768–70); 'Introduction to Algebra' (Saint Petersburg 1770); his 'Dioptrica' (3 vols., Saint Petersburg 1767–71); 'Opuscula Analytica' (2 vols., Saint Petersburg 1783–85). His industry was as remarkable as his genius. During his life of 76 years, of which about 60 were devoted to scientific studies, he published a total of 32 separately printed books written in Latin, German and French, and many running to more than one volume; 331 treatises in the publications of the Saint Petersburg Academy, all in Latin; 14 treatises for the Royal Academy at Paris, in French; 128 treatises for the Royal Academy at Berlin, all in French; and 196 miscellaneous treatises in Latin. For a detailed bibliography of his works consult Hagen, J. G., 'Index Operum Leonardi Euleri' (Berlin 1896). For his life, etc., consult Fuss, N., (Éloge de M. Leon. Euler' (Saint Petersburg 1783, Basel 1786); Hoppe, E., 'Die Philosophie L. Eulers' (Gotha 1904); Schulz-Euler, S., 'Leonard Euler' (Frankfurt a. M. 1907); Rudio, F., 'Die Baseler Mathematiker D. Bernoulli und L. Euler' (Basel 1884); id., 'L. Euler' (Basel 1884).

EUMÆUS, a character in Homer's 'Odyssey,' Book XV, who recognizes Odysseus on the latter's return from his long absence and who materially assisted the latter in getting rid of Penelope's suitors. He was a swineherd by occupation.

EUMENES, ū'mē-nēz, Macedonian officer of Alexander the Great: b. Cardia, Thracian Chersonesus, 360; d. 316 B.C. He began his career as secretary to Philip, and after the latter's death occupied a similar post under Alexander, who also placed him in command of the cavalry. After the death of Alexander he was made governor of Cappadocia, Paphlagonia, and the coast along the Euxine as far as Trapezus. In 321 he, with Perdiccas, defeated Antipater, Craterus and Neoptolemus, but in 320 he was himself routed by Antigonus, and forced to retreat to Nora. Here he held out for over a year until his soldiers at last betrayed him into the hands of Antigonus, who had him executed in 316 B.C. Consult the lives by Nepos and Plutarch, also Vezin, 'Eumenes von Kardia: ein Beitrag, zur Geschichte der Diadochenzeit' (Münster 1907).

EUMENES II, king of Pergamum: d. 159 B.C. He was a son of Attalus I and succeeded to the throne in 197 B.C. He was a faithful ally of Rome, and for his services against Antiochus was given the provinces of Lydia, Mysia and Phrygia. He was also an able civil administrator and under him the kingdom was great and powerful, also rich and prosperous, and having Rome for an ally it was practically invincible in the East. Eumenes did much as a patron of art and science. He founded a magnificent library which in its day had no rival other than that of Alexandria.

EUMENIDES, u-mĕn'ī-dēz. See FURIES.

EUMENIUS, Roman educator: b. Augustodunum (Autun), in Gallia Lugdunensis, 260; d. 311 A.D. He became secretary to Constantius Chlorus, whom he accompanied on his campaigns. Constantius commissioned him to restore the famous schools of Augustodunum in 296. We have an address, 'Pro Restaurandis Scholis,' made there by him in 297. For other addresses attributed to Eumenius consult Baehrens, 'Panygerici Latini' (Leipzig 1874) and Teuffel, 'Geschichte der römischen Litteratur' (Vol. III, 6th ed., ib. 1913).

EUMOLPIDÆ. See EUMOLPUS.

EUMOLPUS, a mythical personage of ancient times, celebrated as a poet, warrior, hierophant and legislator, according to the common tradition a Thracian, the son of Poseidon and Chione, the daughter of Boreas. He is said to have been driven from Thrace, but to have afterward returned. The accounts of his subsequent career vary. According to one tradition he was the founder of the Eleusinian mysteries (q.v.), in which he was instructed by Demeter. The sacerdotal family of the Eumolpides at Athens claimed to be descended from this Eumolpus.

EUMYCETES, ū'mī-sē'tēz, the name used to distinguish Ascomycetes and Basidiomycetes from the Phycomycetes. See FUNGI.

EUNAPIUS, Greek philosopher of the 4th century A.D. He was a native of Sardis and throughout his life bitterly opposed Christianity. In 366 he set up a Neoplatonist school at Sardis. He wrote 'Lives of the Philosophers and the Sophists.' This work was edited by Boissonade (Paris 1849). He also wrote a history of his own time of which only fragments have come down to us. These are to be found in Müller, 'Fragmenta Historicorum Græcorum' (5 vols., Paris 1841–73).

EUNICE, a Jewess of Lystra, mentioned in Acts xvi, 1; 2 Tim. i, 5; iii, 15. See TIMOTHY.

EUNOMIANS, the extreme faction of the Arian sect in the 4th century, so called from the name of their leader, Eunomius (q.v.). They asserted the doctrine that Jesus Christ the son of God is of different nature (or substance) from the Father *ἀνόμιος κατα οὐσίαν καί κατα παντα*: unlike in substance and everything): thus his doctrine was that of Unitarianism. The doctrine of the Roman Catholic Church, declared in the Council of Nicæa, was that of *ὁμοουσίος* consubstantiality; that of the Semi-Arians was that the Son is of like or similar substance, *ὁμοιούσιος* and hence they are called homœusians, while the orthodox took the name of homousians (both words usually written homoiousians, homoousians). To give solemn expression to their distinctive tenet the Eunomians changed the baptismal formula, «I baptize thee in the name of the Father,» etc., to this: «I baptize thee in the name of God, the Creator, into the death of Christ.» Consult Newman, J. H., 'Arians of the Fourth Century' (London 1886).

EUNOMIUS, Arian bishop: b. Dacora, Cappadocia; d. there about 395. In the controversy which gave rise to Arianism, Eunomius was an ardent disciple of Arius. So extreme were his views that he and his followers were looked upon as members of a party within the Arian ranks and were called Eunomians (q.v.). He was made bishop of Cyzicus in 360, but was deposed the following year as a result of his extreme views. He lived the life of an exile after this, but finally returned to his birthplace. He wrote a number of works, three of which are still in existence: 'Apologeticus,' 'Defence of the Defence' and 'Confession of Faith.' The first of these is in 'Patres Græci' (J. P. Migne, ed., Vol. XXX, Paris 1857–66) and has been translated into English by Whiston, W., 'The Apologetick of Eunomius' (in 'Primitive Christianity Revived,' Vol. I, London 1711). The fragments of the second have been collected by Rettberg, C. H. G., 'Marcelliana' (pp. 124–147, Göttingen 1794). Consult Klose, 'Geschichte und Lehre des Eunomius' (Kiel 1833).

EUNUCH, ū'nŭk, a castrated male, generally used to take charge of the harem. Eunuchism is of prehistoric origin and prevailed among all Eastern nations and peoples and amongst those of the West which had been subject to Eastern influences. History refutes the general idea that eunuchs are deficient in courage and intelligence. In Persia, India, China, and during the later days of the Roman Empire, they frequently occupied, with great success, important military and civil positions. In modern times eunuchism is practiced extensively only in Moslem countries and even there it is gradually losing ground. Of secondary importance has been its practice for religious reasons, an exaggerated development of asceticism. In the Christian Church it was, perhaps, most prevalent in the 3d century, though never officially countenanced.

EUNUCHUS, ū-nŭk'ŭs, a comedy of Terence and one of the best of his works, written in 161 B.C. Modern imitators are Sedley in 'Bellamira,' and La Fontaine in 'L'Eunuque.'

EUOMPHALUS, a fossil gastropod, having a spiral shell and found in Silurian and Triassic rocks, but most numerous in the Carboniferous Age.

EUORNITHES, ū-ŏr'nĭ-thēz, a grand division of birds, which, according to some authors, includes all living birds except the ostriches and their allies and the penguins; and according to others includes all birds, modern and extinct, except Archæopteryx. In this sense it is equivalent to the preferable term *Neornithes* (q.v.).

EUPALINUS OF MEGARA, Greek architect, who constructed the great aqueduct for Polycrates on the island of Samos. Consult Smith, 'Dictionary of Greek and Roman Antiquities,' sub verbo, "Emissarium" (3d ed., London 1890).

EUPATARIA, or EUPATORIA, Russia, seaport, in the government of Taurida, on the Black Sea, 38 miles northwest of Simferopol. Having long been possessed by the Tartars of the Crimea (who gave it the name of Kosloff or Kesloff), it is more Asiatic than European in its aspect. The salt lake of Sakė is a bathing resort. Formerly in possession of the Turks it was annexed by Russia in 1783. It was here that the allied forces landed at the commencement of the Crimean War (14–18 Sept. 1854). It was unsuccessfully attacked by the Russians 17 Feb. 1855. Pop. 30,432.

EUPATORIUM, a genus of composite plants including many (about 600) species, especially characteristic of America, where several are well known. Among the most prominent are boneset or thoroughwort (*E. perfoliatum*), a native of low grounds, distinguished by the fact that its opposite leaves are joined around the stem; and the Joe-Pye-weed, or gravel-root (*E. purpureum*), whose purplish rosy flowers become conspicuous in late summer in wet meadows, borne on stems often 12 feet high. The hemp-agrimony is a well-known British medicinal herb. The flower-heads in this genus are in corymbs, all the florets tubular. Several of these plants have enjoyed from time immemorial a reputation in folk-medicine as remedies for the breaking up of fevers. Popular tradition has it that eupatorium is good for broken bones, the common name boneset preserving this notion. It has no such action. By reason of a certain amount of volatile and fixed oil which eupatorium contains it makes a fair diaphoretic mixture, and in the form of "boneset tea" it is of service in causing profuse sweating. This may be of service in the treatment of congestions in different parts of the body. See DIAPHORETICS.

EUPATRIDES (Gr. εὐπατρίδαι, *eupatridai*, well-born), the aristocracy, or land-owning class of ancient Athens, distinguished from the *geomiroi*, or peasants, and the *demiourgoi*, or artisans.

EUPEN, oi'pĕn (Fr. *Néaux*), Germany, town in Rhenish Prussia, on the Wenze, near the frontiers of Holland, 10 miles south-southwest of Aix-la-Chapelle. Its manufactures are numerous and varied. Eupen owes its manufacturing prosperity to the French refugees, who settled here while the town formed part of the duchy of Limburg, under Austrian rule. After the Peace of Lunéville, when this duchy was ceded to France, Eupen belonged to the department of Ourthe until the Peace of Paris in 1814, when this town, with other portions of Limburg, was ceded to Prussia. Pop. 14,000.

EUPHEMISM, a figure of speech by which one avoids the use of words directly expressing anything improper, disagreeable or painful by the employment of phrases that suggest in a more delicate manner or under a more cheerful aspect the idea to be conveyed. Thus the Greeks, in speaking of the Erinyes or Furies, came to call them the Eumenides, or well-disposed, gracious goddesses, and sometimes *semnai theai*, "the august goddesses." Nearly all languages have some euphemism for death, or to express the fact that one has died, as when we speak of the "departed." In the Bible we have the phrases "he was gathered to his fathers," "he has fallen asleep," etc.; the Romans, with the same intention, said "he has lived" (*vixit*); the Germans say "he is ascended" (*er ist hinaufgegangen*), or "he has been made immortal" (*er ist verewigt worden*). On the same principle the Irish speak of the fairies as the "good people."

EUPHORBIACEÆ, ū-fôr-bĭ-ā'sẹ-ē (the Spurge family), a family of plants, consisting of more than 4,000 species of herbs, shrubs and trees arranged in about 220 genera, some of which are well known for their ornamental and economic uses. They are, with few exceptions, natives of warm climates, especially of tropical America, and nearly every species has an acrid juice, usually poisonous, but sometimes made bland when heated. Among the members of the family are many species of commercial importance. Thus the juice of some species and the roots of others are used in medicine, for in plants of this kind are found croton oil, castor oil, etc. A few of the Euphorbiaceæ yield fragrant balsamic products; a few, although their juice is poisonous, yield a wholesome starch in considerable abundance (see MANIOC); a few are cultivated and used as pot-herbs, particularly species of *Plukenetia* in the East Indies; a few yield wholesome and agreeable sub-acid fruits, as *Cicca disticha* and *C. racemosa* in the East Indies; the seeds of some are edible, as those of the candle-nut (q.v.), etc.; the oil of the seeds is also in some cases used for food, like other bland oils, but more frequently for burning, as castor oil, candle-nut oil, the oil of *Aleurites cordata* in Japan and Mauritius, and the solid oil of *Sapium sebiferum*, which is used in China for making candles, and in medicinal preparations as a substitute for lard. From *Hevea* is derived the highest grade of rubber produced in South America. Others yield dye-stuffs. The timber of some of the Euphorbiaceæ is valuable — for example, African teak. Of the numerous genera, many are represented in the American flora, the most important being *Croton Ricinus* (castor-oil plants), and *Euphorbia* or spurge proper. This genus numbers about

700 species, most abundant in the warm parts of the north temperate zone, more than 125 of them being found in America. They are all known as "spurge," and some are poisonous. Some one species is found in almost every part of America, those not native having escaped from cultivation. Some of the species are imposing ornamental plants and are much used in landscape gardening and in greenhouses, usually for their curious forms of growth, rather than for their beauty.

Plants of this family, although of widely differing forms of growth and foliage, are characterized by unisexual, monœcious or diœcious flowers, often brilliantly colored and often inconspicuous, in the latter case sometimes subtended by brilliantly colored bracts; the usually three-lobed fruits split elastically when ripe and throw the seeds to greater or less distances.

EUPHORBIUM. See GUMS.

EUPHORBUS, in Greek mythology, one of the bravest of the Trojan heroes, the son of Panthous. He was slain by Menelaus in the Trojan War.

EUPHORION, Greek grammarian and poet: b. Chalcis, Eubœa, 276; d. about 200 B.C. He was educated at Athens and in 220 was appointed librarian to Antiochus the Great. He maintained secret amours with Nicia, wife of Alexander of Eubœa, reference to which frequently appears in the 'Greek Anthology.' He produced several works on history and grammar in prose, and in verse several elegies, epics and epigrams. Fragments of his works appear in Koch, 'Fragmenta Comicorum Græcorum' (Leipzig 1880), and Meinke, 'De Euphorionis Chalcidensis Vita et Scriptis' (Berlin 1823). Consult Christ-Schmid, 'Geschichte der griechischen Litteratur' (Munich 1911) and *Berliner Klassikertexte* (Vol. I, 1907).

EUPHRANOR, Greek sculptor and painter of the 4th century B.C. He lived at Corinth. His most famous statues were an Apollo, a Paris, a Leto, with Apollo and Artemis in her arms. His most celebrated painting was that representing 12 gods in the Stoa Basileios, at Athens. Consult Gardner, E. A., 'A Handbook of Greek Sculpture' (London 1911).

EUPHRASIA, a genus of plants of the figwort family (*Scrophulariaceæ*). It comprises about 110 species, natives of temperate and cold regions of both hemispheres, several of them occurring in North America. They are annual or perennial low-branched herbs, with small, blue, yellow or white flowers, generally known by the name eyebright. The principal American species are *E. artica*, glandular eyebright and *E. americana*, hairy eyebright, the most widely distributed. The common English eyebright, *E. officinalis*, is not known in America. This is a very pretty little plant, the flowers white streaked with purple, and a yellow spot on the lip. It grows so abundantly in some places, as to give the ground an appearance of being covered with snow, during the time of its flowering, from May to September. The whole plant is slightly aromatic. It has been used with success in catarrhal inflammations of the eye, in cough, hoarseness, earache or headache which follow after catarrhs.

EUPHRATES, ū-frā'tēz, a celebrated river in the Arabic Peninsula, having its sources in central Armenia, at no great distance from the shores of the Euxine, and its mouth in the Persian Gulf; length, including windings, 1,716 miles. It is formed by the junction of two large streams, called the Kara-Su and the Mourad-Chai. These two head streams unite near Kaban Maden, about lat. 38° 58′ N.; long. 38° 30′ E.; from which point the river holds in the main a southeasterly course, until it falls into the Persian Gulf. At Korna, about 100 miles from its mouth, it is joined by the Tigris, and the united streams take the name of the Shatt-el-Arab. In point of current the Euphrates is for the most part a sluggish stream, except in the height of the flooded season. The Shatt-el-Arab has a depth of from three to five fathoms and presents banks covered with villages and cultivation. The most important town on the Shatt-el-Arab is Bassora or Basra. The melting of the snow in the mountains along the upper part of the river's course causes the Euphrates to rise. This takes place about the beginning of March and it increases gradually up to the end of May. The river continues high for 30 or 40 days; but afterward there is a daily decrease. From the middle of September to the middle of October the river is at the lowest. The Euphrates is navigable for a long distance from the sea, but there are numerous rapids. Steamers navigate the Shatt-el-Arab. Between the Euphrates and the Tigris lies the celebrated region Mesopotamia.

EUPHROSYNE, ū-frŏs'ĭ-nē (Lat., from Gr. Εὐφροσύνη the personification of joy, from εὔφρων, *euphron*, joyous), in Greek mythology, one of the three Graces (q.v.).

EUPHTHALMINE, ŭf'thăl'mĭn, an artificial alkaloid the hydrochlorate of which is used in solution in the place of atropine and homatropine to dilate the pupil of the eye for examination with the ophthalmoscope. The great advantage it possesses is that the effect passes off within five hours and there is no danger of causing glaucoma, whereas atropine causes dilation for from 24 to 40 hours and homatropine for several days.

EUPHUES (ū'fū-ēz), **OR THE ANATOMY OF WIT, and EUPHUES AND HIS ENGLAND,** a book and its sequel, by John Lyly, published respectively in 1578 and 1580, when the author was a young courtier. They constitute the first and second part of a work which can only loosely be called fiction in the modern sense. Perhaps the word "romance" best expresses its nature. For 50 years the work was fashionable in the polite circles of England; and the word "euphuism" survives in the language to designate the stilted, far-fetched, ornate style of writing introduced and made popular by Lyly. Although Lyly's style had in it too much of the affected to give it long life, he undoubtedly did something toward making the 16th century speech refined, musical and choice. It is this rather than any attraction of story that makes the 'Euphues' interesting to the modern student of literature. See EUPHUISM.

EUPHUISM, ū-fū'ĭzm, an affected style of speech which distinguished the conversation and writings of many of the wits of the court of Queen Elizabeth. The name and the style were derived from 'Euphues, or the Anatomy of Wit' (1579), and the 'Euphues and His England' (about 1581), of John Lyly. It is probable that Lyly got his idea of these books from Ascham who, in his 'Schoolmaster,' published a short time before, had said that Euphues is «he that is apt by goodness of wit, and appliable by readiness of will to learning having all other qualities of the mind and parts of the body that must another day serve learning.» At any rate Lyly adopted the word «Euphues» as the title of his hero, whom he developed in the sense in which Ascham used the Greek word «a man well endowed by nature.» Lyly deliberately, in his writing, appealed to the audience of ladies throughout Britain for whom it was made light, pleasant and couched in high sounding English, which his followers soon styled «the new English.» For over half a century 'Euphues' remained one of the most popular of books and its author was held to be one of the immortals. Among his most noted ardent admirers was Queen Elizabeth herself. These books which became the model of the wits and the gallants of the time, and an acquaintance with which was regarded as a test of courtly breeding, were characterized by smoothness and verbal elegance, but chiefly by fantastic similes and illustrations. Sir Walter Scott draws the portrait of a euphuist in the character of Sir Piercie Shafton, in 'The Monastery.' Consult Arber, 'Euphues' (1869), a complete edition); Bond, 'Complete Works of Lyly' (1902); Laudmann, 'Der Euphuismus' (1881). See EUPHUES.

EUPHYLLOPODA. See BRANCHIOPODA.

EUPION, ū'pi-ŏn, or **EUPIONE,** Reichenbach's name for a fragrant colorless liquid produced in the destructive distillation of various animal and vegetable substances. It is highly volatile and inflammable; it is insoluble in water, but mixes with oils, and acts as a solvent for fats and resins. It is not readily acted on by ordinary chemical reagents.

EUPOLEMUS, Jewish historian, who lived in the 1st or 2d century B.C. He wrote a work with the title, 'Concerning the Kings of Judæa,' fragments of which have come to us through Clement Alexandrinus and Eusebius, Eupolemus claimed that Moses was the inventor of the alphabet and that from him it passed to the Phœnicians and Greeks. For the fragments consult Kuhlmey, 'Eupolemi Fragmenta' (Berlin 1840) and Müller, 'Fragmenta Historicorum Græcorum' (Vol. III, Leipzig 1849). Consult Schürer, 'Geschichte des jüdischen Volkes' (4th ed., Leipzig 1909) and Willrich, 'Juden und Griechen' (Göttingen 1905).

EUPOLIS, Greek poet: b. about 446; d. 411 B.C. In 429 appeared his first play, written when he was about 17. Suidas relates that he wrote altogether 17 pieces and was awarded 10 prizes. Early in his literary career he was on intimate terms with Aristophanes, with whom he collaborated. Later they became enemies and Eupolis was accused of plagiarism. Fragments of his works are found in Meineke, 'Fragmenta Comicorum Græcorum' (Vols. I and II, Berlin 1839–57) and Koch, 'Fragmenta Comicorum Atticorum' (Leipzig 1880). Consult Christ-Schmid, 'Geschichte der griechischen Litteratur' (6th ed., Munich 1911).

EURAQUILO, ū-rāk'wi-lō, the name given by the sailors to the east-northeast wind which wrecked the ship on which Saint Paul was traveling to Rome (Acts xxvii, 13, 14). The Authorized Version adopted the incorrect Euroclydon from a faulty manuscript, probably.

EURASIANS. See ANGLO-INDIANS.

EURE, ėr, France, a department in the northwest forming part of Normandy; area, 2,331 square miles. The chief river which flows through it is the Seine, of which the Eure and the Rille are the most important tributaries. Wheat is the principal crop, and the mining and manufacturing industries are extensive. Capital, Evreux. Pop. 323,651.

EURE, a river of France, which has given its name to two departments — that of the Eure, and that of the Eure-et-Loir. The river rises in the department of the Orne, and flows into the Seine, near Pont-de-l'Arche, after a course of 124 miles, being navigable for about half the distance.

EURE-ET-LOIR, ėr-ā-lwär, France, a department in the northwest, forming part of the old provinces of Orléannais and Normandy; area, 2,293 square miles. The department is essentially agricultural, and has few manufactures. The capital is Chartres. Pop. 272,255.

EUREKA, ū-rē'ka, a Greek word meaning «I have found it»; used as an expression of triumph at a discovery. See ARCHIMEDES.

EUREKA, Cal., city, county-seat of Humboldt County, on Humboldt Bay, the Eel River and the Northwestern Pacific Railroad, 225 miles northwest of San Francisco. It has a fine harbor, which has been improved by the United States government on the jetty plan. The city is situated in the famous redwood region, and has large lumber interests. Sequoia Park, a tract of 40 acres of redwood forest, is near the city. The noteworthy features are the Carnegie library, Federal building, county jail, hospital, city hall and courthouse. An extensive trade is carried on in redwood lumber, shingles, butter, fish, apples and wool, the exports in 1912 amounting to $10,960,000. There are shingle mills, tobacco factories, bottling works, sash and door factories, marble and granite works, a tannery, iron foundry, woolen mill, etc. The United States census of manufactures for 1914 showed within the city limits 57 industrial establishments employing 928 persons; 799 being wage earners receiving annually a total of $605,000 in wages. The capital invested aggregated $2,976,000, and the year's output was valued at $2,480,000; of this, $1,263,000 was the value added by manufacture. The government, under a charter of 1895, is vested in a mayor, elected biennially, and a municipal council. First settled in 1850, Eureka became the county seat and was incorporated in 1856. The city has gas and electric lights, high schools, daily and weekly newspapers, and five banks. Pop. 13,768.

EUREKA, Ill., city and county-seat of Woodford County, on the Atchison, Topeka and Santa Fe and the Toledo, Peoria and Western railroads, 20 miles east of Peoria. Eureka College, under the auspices of the

Christian Church, was established in 1855. The city is a trade centre for the surrounding agricultural community. Eureka was incorporated as a town in 1856. The waterworks are owned by the municipality. Pop. 1,559.

EUREKA, Kan., city, county-seat of Greenwood County, on Fall River, and on the Atchison, Topeka and Santa Fe and the Missouri Pacific railroads, about 58 miles northeast of Wichita. It is the seat of the Southern Kansas Academy, under the auspices of the Congregational Church. There is a Carnegie library. The city is a trade centre for the surrounding rich agricultural region. Eureka has adopted the commission form of government and owns its waterworks. Pop. 2,333.

EUREKA, Nev., town, county-seat of Eureka County, on the Southern Pacific Railroad. It was once a productive mining camp, producing great quantities of lead, gold and silver; and many other valuable minerals. The town has numerous and important smelting and refining works. Because of severe fires, destroying a large portion of the place, the population decreased from 5,000 in 1880 to 708 in 1920.

EUREKA, Utah, city of Juab County, 90 miles southwest of Salt Lake City, on the San Pedro, Los Angeles and Salt Lake, and the Rio Grande Western railroads. It has copper smelting works and quartz mills and a Carnegie library. Copper and silver are mined in the neighborhood. Pop. 3,608.

EUREKA COLLEGE, coeducational institution in Eureka, Ill.; founded in 1855 under the auspices of the Christian Church. The annual reports show an average of: Professors and instructors, 26; students, 275; and volumes in the library, 12,000.

EUREKA SPRINGS, Ark., city and county-seat of Carroll County, on the Jefferson Highway and the Missouri and North Arkansas Railroad, 175 miles northwest of Little Rock. It is a noted health and pleasure resort to which 30,000 visitors come annually. The shipping of water from the springs is the principal industry. It has two banks with combined resources of $550,000, taxable property valued at $1,875,000, public and high schools and is the seat of the Crescent Cottage for Women. The chief public buildings are the city hall, United States post office and the county courthouse. It has also several large hotels catering to tourists. The receipts of the city amount to about $18,000 annually. The commission form of government is in operation. Pop. 2,429.

EURIC, a king of the Visigoths (q.v.).

EURINGER, oi'ring-ėr, **Sebastian,** German Semitic scholar: b. Augsburg, 1865. He was educated at Munich, Heidelberg, Freiburg, Strassburg, Tübingen and at the Ecole Biblique Pratique at Jerusalem. He entered the ministry in 1887 and preached for two years, after which he toured Egypt and Palestine. From 1894 to 1900 he held a pastorate near Augsburg and in the latter year was appointed professor in the Dillingen Lyceum. He has published 'Der Masorahtext des Kohelet' (1890); 'Die Auffassung des Hohenliedes bei den Abessinieren' (1900); 'Die Chronologie der biblischen Urgeschichte' (1909); 'Die Kunstform der althebräischen Poesie' (1912); 'Ein unkanönischer Text in der armenischen Bibel' (1913).

EURIPIDES, son of Mnesarchus, a retail dealer of the Attic village, Phlya: b. 480 B.C. on the island of Salamis, and, according to tradition, on the day of the famous battle; d. 406. His mother's name was Clito, which indicates aristocratic lineage. Under the influence of his father Euripides first paid attention to athletics, then to painting, and finally to philosophy. He learned much from Protagoras, from Prodicus and from Anaxagoras, with whom he holds that nothing which exists perishes. The poet entered upon his real career at 25. His first success was limited, but he became more and more the favorite of the people. The popularity of his plays at the close of his life and throughout late antiquity was extraordinary. Later comedy was based on his methods. The Romans had a strong predilection for him. In modern times the admiration for Euripides was unbounded until Schlegel set up a standard against him. But Schlegel is unfair: a poet must be measured by his aims. Nevertheless, the poet's works failed at first to win the approval of the Athenians. He was unsuccessful until he was 38, and he won only five first prizes in his whole life. He was also personally unpopular, for he was essentially a pessimist. He felt that the evil in life was not counterpoised by good. He loved retirement and sequestration from open haunts and popularity; preferred the contemplative life of the student to the active life of the statesman. He even acquired the reputation of being a morose cynic, vicious in his private life despite his austere exterior. His gloomy visage, rendered doubly so by unhappy domestic relations, was not attractive to the Athenians, who detested an unsociable disposition. So he lived the life of a recluse, on his estate at Salamis, rapt in secret studies. His library was dukedom enough for him. Late in his life he repaired to the court of Archelaus, king of Macedonia. Here he died in 406. The Macedonians built him a magnificent tomb at Pella. The Athenians erected for him a cenotaph in Athens.

Euripides is the most rhetorical of the three tragic poets, because he is most affected by the spirit of the new school. He is the representative of the new Athens, of the new ideas which were crowding out the simpler beliefs of the Æschylean and Sophoclean school. Euripides is nearer ourselves. He marks the transition to the modern world. The antique standard cannot be applied to him. With Alfred de Musset he might have said: «je ne puis m' enfuir hors de l'humanité.» His heart is full of compassion for the poor. None is too lowly for his Alcestis to address, as she bids farewell to the household. Euripides was the first dramatic poet to hold aloof from the world. But the motive was not pure indifference: he spoke to a larger audience. No tragedian treated a greater number of patriotic themes; but he had no affection for the demagogue. The pomp and glory of war had no fascination for him. The suffering of all humanity appeals to his generous heart. In the cosmopolitanism of Socrates, traces of which we find in Euripides, he anticipates Goethe. A poetic associate of the sophists, he was naturally not orthodox. He did not actually deny the existence of the gods — that were dangerous in Athens and in the theatre impossible. Euripides simply puts the question to his audience and so troubles their souls. He shrinks from discussing no question of heaven or earth. Toward the close of his life he is supposed to have drawn nearer to the religion of his fathers, but the only monument of this change is that remarkable play, the 'Bacchæ.' No chronological development in his religious views can be shown. He was a skeptic and a seeker after truth, but not a creative philosopher. No other poet gives us a better conception of what the truth-seeking Athenian knew and read.

Much has been written about the poet's hatred of women. But we have only to read the 'Alcestis,' or 'Iphigenia,' to discover that he can portray the noblest types of womanhood. Euripides knew *le mal que peut faire une femme,* but no man understood better the capabilities of woman's nature. He is the first Greek after Homer that showed any approach to a just conception of what under normal circumstances woman may and should be to society. True, he assailed fiercely a certain type of woman, but this does not prove that the women of his time were especially depraved. Often the condemnation is due to the dramatic situation. He does satirize the women of his time for their gossiping disposition, for their cleverness and for their love of slander with a persistence that leaves no doubt as to his intentions; but, being a pessimist, his mind emphasized the bad rather than the good.

The plays of Euripides are not so subtle in structure as those of Sophocles. He cared more for striking situations than for articulated plots, more for thrilling scenes than for unity and symmetry of the whole. But he made a special study of the recognition as leading to the dénouement. Another innovation of Euripides was the introduction of the prologue. In the very beginning he gives the entire setting of the piece, relates all the circumstances. This mechanical opening has been criticized as flat and jejune. But he worked on a different plan from Sophocles. Like Lessing, he believed that the audience should know more than the characters themselves. He disdained to excite vulgar curiosity. So he conceived the prologue as an integral part of the play. Moreover, he leaves the most important part untold; the audience does not know at the outset how the poet proposes to treat the myth; hence the pleasure of surprise is not entirely lacking. The audience enjoys also the sudden revelations to the individual characters. Furthermore, the Greeks cared more for the quiet contemplation of situations than we do. Nevertheless, this practice of beginning the play with a prologue became a mannerism and was justly ridiculed by Aristophanes. Euripides' plays have also a mechanical ending — when the conflict seems insoluble, the *deus ex machina* interfers expressly to solve difficulties, to cut the cords atwain that seem too intrinse to loose. This is not high antique art; but the flaw-hunters unduly emphasize the defect. Many of the plays also break in two in the middle. This is, indeed, a fault. Nevertheless, the scenes are interesting, sometimes stirring. Often the thoughts expressed are not adapted to the speaker; and the choral odes frequently seem irrelevant. The poet's monodies constitute an undue proportion of the lyrical element.

We have 80 titles of plays, but very few fixed dates. There are 19 extant dramas — 18 tragedies and one satyr drama ('Cyclops'). The 'Rhesus,' regularly printed in the editions of the Euripidean corpus, is certainly not by Euripides. The earliest extant play is the 'Alcestis' (438); the most famous is the 'Medea' (431); but probably the two greatest tragedies are the 'Hippolytus' (428) and the 'Bacchæ' (407). One of the most interesting is the 'Iphigenia in Tauris' (414) and the most charming the 'Ion' (about 416). The other plays with approximate dates are 'Iphigenia in Aulis' (407), 'Orestes' (408), 'Phœnissæ' (410), 'Helen' (412), 'Electra' (413), 'Troades' (415), 'Andromache' (417), 'Heracles' (418), 'Supplices' (420), 'Hecuba' (424), 'Heraclidæ' (430). See ALCESTIS; MEDEA.

JOSEPH E. HARRY,
Author of 'The Greek Tragic Poets.'

EURIPUS, ū-rī'pŭs, in ancient geography, the strait between the island of Eubœa and the mainland, Bœotia in Greece. At Chalcis, the width at the narrowest part was 120 feet. The term Euripus is also sometimes applied to the southeast part of the Eubœan Channel.

EUROCLYDON, ū-rŏk'lĭ-dŏn, a tempestuous wind that frequently blows in the Levant, and which was the occasion of the disastrous shipwreck of the vessel in which Saint Paul sailed, as narrated in Acts xxvii, 14–44. In the form in which the word is found in the revised version it must be taken as made up of the two Greek words, *euros,* the east or rather southeast wind, and *klydōn,* a wave. But the word used for it in the Vulgate is *Euro-aquilo,* a Latin compound signifying a northeast wind; and some of the best MSS. have the reading *Eurakylōn* instead of *Euroclydon,* which is accepted by some scholars as the preferable reading. Whatever may have been the true form of the word, it was applied to a northeast or north-northeast, and not an east or southeast wind, as the course taken by the vessel referred to indicates. Exactly such a wind is described by sailors of the present day as prevalent at certain seasons (especially in early spring) in the Mediterranean. The name by which the wind is now known is *Gregalia.*

EUROPA, ū-rō'pa, in Greek mythology, the daughter of Agenor or of Phœnix, king of the Phœnicians, and a sister of Cadmus. The fable relates that she was abducted by Jupiter, who assumed the form of a bull, and swam with his prize to the island of Crete. Here Europa bore to him Minos, Sarpedon and Rhadamanthlus. Zehus made her miraculous presents, Talos (a bronze man), a dog that always kept track of his prey and a spear that never missed its mark. By his order also she became the wife of Asterius, king of Crete. As Hellotia, Europa was worshipped in Crete in the capacity of the goddess of fertility. She

EUROPA, Rape of. See Titian; Veronese, Paul.

EUROPE, the smallest of the great continents but the most important, distinguished above the others by the character of its population, the superior cultivation of the soil, and the flourishing condition of arts, sciences, industry and commerce.

Topography.— Europe forms a huge peninsula projecting from Asia, and is bounded on the north by the Arctic Ocean on the west by the Atlantic Ocean; on the south by the Mediterranean, the Black Sea and the Caucasus Range; on the east by the Caspian Sea, the Ural River and the Ural Mountains. The most northerly point on the mainland is Cape Nordkyn, in Lapland, in lat. 71° 6′ N.; the most southerly points are Punta da Tarifa, lat. 36° N., and the Strait of Gibraltar, and Cape Matapan, lat. 36° 17′, which terminates Greece. The most westerly point is Cape Roca in Portugal, in long. 9° 28′ W., while Ekaterinburg is in long. 60° 36′ E. From Cape Matapan to North Cape is a direct distance of 2,400 miles, from Cape Saint Vincent to Ekaterinburg, northeast by east, 3,400 miles; area of the continent, about 3,800,000 square miles. Great Britain and Ireland, Iceland, Nova Zembla, Corsica, Sardonia, Sicily, Malta, Crete, the Ionian and the Balearic Islands are the chief islands of Europe. The shores are very much indented, giving Europe an immense length of coast line (estimated at nearly 50,000 miles). The chief seas or arms of the sea are the White Sea on the north; the North Sea, or the German Ocean, on the west, from which branches off the great gulf or inland sea known as the Baltic; the English Channel, between England and France; the Mediterranean, communicating with the Atlantic by the Strait of Gibraltar (at one point only 19 miles wide); the Adriatic and the Ægean seas, branching off from the Mediterranean, and the Black Sea, connected with the Ægean Sea through the Hellespont, Sea of Marmora and Bosporus.

The mountains form several distinct groups or systems of very different geological dates, the loftiest mountain masses being in the south central region. The Scandinavian mountains in the northwest, to which the great northern peninsula owes its form, extend above 900 miles from the Polar Sea to the southern point of Norway. The highest summits are about 8,000 feet. The Alps, the highest mountains in Europe (unless Mount Elbruz in the Caucasus is claimed as European), extend from the Mediterranean first in a northerly and then in an easterly direction, and attain their greatest elevation in Mont Blanc (15,781 feet), Monte Rosa and other summits. Branching off from the Alps, though not geologically connected with them, are the Apennines, which run southeast, through Italy, constituting the central ridge of the peninsula. The highest summit is Monte Corno (9,541 feet). Mount Vesuvius, the celebrated volcano in the south of the peninsula, is quite distinct from the Apennines. By southeastern extensions the Alps are connected with the Balkan and the Despoto-Dagh of the southeastern peninsula of Europe. Among the mountains of southwestern Europe are several massive chains, the loftiest summits being in the Pyrenees, and in the Sierra Nevada in the south of the Iberian Peninsula. The highest point in the former, La Maladetta or Mont Maudit, has an elevation of 11,165 feet; Mulahaven, in the latter, is 11,703 feet, and capped by perpetual snow. West and northwest of the Alps are the Cévennes, Jura and Vosges; north and northeast, the Harz, the Thüringerwald Mountains the Fichtelgebirge, the Erzgebirge and Böhmerwaldgebirge. Farther to the east the Carpathian chain encloses the great plain of Hungary, attaining an elevation of 8,000 or 8,500 feet. The Ural Mountains between Europe and Asia reach the height of 5,540 feet. Besides Vesuvius two other volcanoes are Etna in Sicily, and Hecla in Iceland. A great part of northern and eastern Europe is level. The «great plain» of North Europe occupies part of France, western and northern Belgium, Holland the northern provinces of Germany, and the greater part of Russia. A large portion of this plain, extending through Holland and North Germany, is a low sandy level not infrequently protected from inroads of the sea only by means of strong dykes. The other great plains of Europe are the plain of Lombardy (the most fertile district in Europe) and the plain of Hungary. Part of southern and southeastern Russia consists of steppes.

Rivers and Lakes.— The main European watershed runs in a winding direction from southwest to northeast, at its northeastern extremity being of very slight elevation. From the Alps descend some of the largest of the European rivers, the Rhine, the Rhône and the Po, while the Danube, a still greater stream, rises in the Black Forest north of the Alps. The Volga, which enters the Caspian Sea, an inland sheet without outlet, is the longest of European rivers, having a direct length of nearly 1,700 miles, including windings of 2,400 miles. Into the Mediterranean flow the Ebro, the Rhône and the Po; into the Black Sea, the Danube, Dnieper Dniester and Don (through the Sea of Azov); into the Atlantic, the Guadilquivir, the Guadiana, the Tagus and Loire; into the English Channel, the Seine; into the North Sea, the Rhine, Elbe; into the Baltic, the Oder, the Vistula and the Duna; into the Arctic Ocean, the Dwina. The lakes of Europe may be divided into two groups, the southern and the northern. The former run along both sides of the Alps, and among them, on the north side, are the lakes of Geneva, Neuchâtel, Thun, Lucerne, Zurich and Constance; on the south side, Lago Maggiore, and the lakes of Como, Lugano, Iseo and Garda. The northern lakes extend across Sweden from west to east, and on the east side of the Baltic a number of lakes, stretching in the same direction across Finland on the borders of Russia, mark the continuation of the line of depression. It is in Russia that the largest European lakes are found — Lakes Ladoga and Onega.

Geology.— The geological features of Europe are exceedingly varied. The older formations prevail in the northern part as compared with the southern half and the middle region. North of the latitude of Edinburgh and Moscow there is very little of the surface of more recent origin than the strata of the upper Jura belonging to the Mesozoic Period, and there are vast tracts occupied either by eruptive rocks or one or other of the older sedimentary formations. Denmark and the portions of Germany adjoining belong to the Cretaceous Period, as does also a large part of Russia between the Volga and the basin of the Dnieper. Middle and eastern Germany with Poland and the valley of the Dnieper present on the surface Eocene formations of the Tertiary Period. The remainder of Europe is remarkable for the great diversity of its superficial structure, rocks and deposits belonging to all periods being found within it, and having for the most part no great superficial extent. Europe possesses abundant stores of those minerals which are of most importance to man, such as coal and iron, Great Britain being particularly favored in this respect. Coal and iron are also obtained in France, Belgium and Germany. Gold is found to an unimportant extent, and silver is widely spread in small quantities. The richest silver ores are in Norway, Spain, the Erzgebirge and the Harz Mountains. Spain is also rich in quicksilver. Copper ores are abundant in the Ural Mountains, Thuringia, Cornwall and Spain. Tin ores are found in Cornwall, the Erzgebirge and Brittany.

Climate.— Several circumstances concur to give Europe a climate peculiarly genial, such as its position almost wholly within the temperate zone, and the great extent of its maritime boundaries. Much benefit is also derived from the fact that its shores are exposed to the warm marine currents and warm winds from the southwest, which prevent the formation of ice on most of its northern shores. The eastern portion has a less favorable climate than the western. The extremes of temperature are greater, the summer being hotter and the winter colder, while the lines of equal mean temperature decline south as we go east. The same advantages of mild and genial temperature which western has over eastern Europe, the continent collectively has over the rest of the Old World. The diminution of mean temperature, as well as the intensity of the opposite seasons, increases as we go east. Peking, in lat. 40° N., has as severe a winter as Petrograd in lat. 60°.

Botany.— With respect to the vegetable kingdom Europe may be divided into four zones. The first, or most northern, is that of fir and birch. The birch reaches almost to North Cape; the fir ceases a degree farther south. The cultivation of grain extends farther north than might be supposed. Barley ripens even under the 70th parallel of north latitude; wheat ceases at 64° in Norway to lat. 62° in Sweden. Within this zone the southern limit of which extends from lat. 64° in Norway to lat. 62° Russia, agriculture has little importance, its inhabitants being chiefly occupied with the care of reindeer or cattle, and in fishing. The next zone, which may be called that of the oak and beech, and cereal produce, extends from the limit above mentioned to the 48th parallel. The Alps, though beyond the limit, by reason of their elevation belong to this zone, in the moister parts of which cattle husbandry has been brought to perfection. Next we find the zone of the chestnut and vine, occupying the space between the 48th parallel and the mountain chains of southern Europe. Here the oak still flourishes, but the pine species become rarer. Rye, which characterizes the preceding zone on the continent, gives way to wheat, and in the southern portion of it to maize also. The fourth zone, comprehending the southern peninsula, is that of the olive and evergreen woods. The orange, lemon and olive flourish in the southern portion of it, and rice is cultivated in a few spots in Italy and Spain.

Zoology.— As regards animals the reindeer and polar bears are peculiar to the north. In the forests of Poland and Lithuania the urus, a species of wild ox, is still occasionally met with. Bears and wolves still inhabit the forests and mountains; but, in general, cultivation and population have expelled wild animals. The domesticated animals are nearly the same throughout. The ass and mule lose their size and beauty north of the Pyrenees and Alps. The Mediterranean Sea has many species of fish, but no great fishery; the northern seas, on the other hand, are annually filled with countless shoals of a few species, chiefly the herring, mackerel, cod and salmon.

Inhabitants.— Europe is occupied by several different peoples or races, in many parts now greatly intermingled. The Celts once possessed the west of Europe from the Alps to the British Islands. But the Celtic nationalities were broken by the wave of Roman conquest, and the succeeding invasions of the Germanic tribes completed their political ruin. At the present day the Celtic language is spoken only in the Scotch highlands (Gaelic), in some parts of Ireland (Irish), in Wales (Cymric) and in Brittany (Armorican). Next to the Celtic comes the Teutonic race, comprehending the Germanic and Scandinavian branches. The former includes the Germans, the Dutch and the English. The Scandinavians are divided into Danes, Swedes and Norwegians. To the east, in general, of the Teutonic race, though sometimes mixed with it, come the Slavonians, that is, the Russians, the Poles, the Czechs or Bohemians, the Serbians, Croatians, etc. In the south and southeast of Europe are the Greek and Latin peoples, the latter comprising the Italians, French, Spanish and Portuguese. All these peoples are regarded as belonging to the Indo-European or Aryan stock. To the Mongolian stock belong the Turks, Finns, Lapps and Magyars or Hungarians, all immigrants into Europe in comparatively recent times. The Basques at the western extremity of the Pyrenees are a people whose affinities have not yet been determined. The total population of Europe is about 425,000,000; nine-tenths speak the languages of the Indo-European family, the Teutonic group numbering about 108,000,000, the Slavonic and Latin over 95,000,000 each. The prevailing religion is the Christian, embracing the Roman Catholic Church, the various Protestant bodies and the Greek Church. A part of the inhabitants profess the Jewish, a part the Mohammedan religion.

Political Divisions.— The states of Europe, with their respective areas and populations, are as shown below.

Area and Population.— The following table shows the countries with their government, area and population according to 'The Statesman's Year Book':

EUROPEAN HISTORY. See also History, Ancient; History, Mediæval; History, Modern. See also the articles on the Centuries —First Century; Second Century, etc., and the history of the various nations under their own titles.

EUROPEAN WAR. See War, European,

EUROPHEN, a yellow powder containing 27.6 per cent of iodine. Heat and moisture applied set the iodine free. Europhen is easily soluble in alcohol, ether or chloroform, but is insoluble in water. In action it is similar to iodoform, to which it is often preferred because of its pleasant odor.

EUROPIUM, a chemical element round in small quantities in monazite sand. Its symbol is Eu; atomic weight, 152; it is known in the metallic state.

EUROTAS, ū-rō'tas, or **IRI**, a river of southern Greece (Peloponnesus), at one time called the Iris and Niris in the upper and the Basilipotamo (King's River) in the lower part of its course. It flows in a southerly direction through the valley between the ranges of Taygetus and Parnon, and enters the Gulf of Kolokytha. Amyclæ and Sparta were on the Eurotas.

EUROTIA, a genus of the goosefoot family (*Chenopoliaceæ*), which comprises two or three species, one of which, *E. lanata*, is found in western North America, and is generally known as white sage. It is a many-branched shrub, from one to three feet high, the flowers densely covered with long silky hairs. It is also called winter fat, being used by cattle as a winter forage.

EUROTIUM, ū-rō'shĭ-ŭm, the common mold which appears on bread, preserves, etc., and often called herbarium mold. Aspergillus is the generic name now in most general use.

EURUS, the southeast wind, also in Greek mythology, the son of Astræus and Eos. See Greek Mythology.

EURYALE, ū-rī'a-lē, a genus of the water lily family (*Nymphæaceæ*). It has but one species, *Euryale ferox*, a native of China and southeastern Asia. The plant is covered with spines; the flowers are small, red or purplish, and the leaves very large, sometimes four feet in diameter. The seeds are rich in starch, and in the native countries of the plant are an article of commerce, being roasted and eaten or used in soups. The root is also eaten. The plant is hardy and will grow out of doors in America and reproduce itself as far north as Baltimore.

EURYBIADES, ū'rĭ-bī'a-dēz, admiral of the Spartan fleet and commander of the united Greek fleets against the Persians in 480 B.C. With Themistocles he shares the glory of the battle of Salamis.

EURYCLEA, the nurse of Odysseus, who recognized the latter on his return by a scar disclosed while washing his feet and reported the matter to Penelope.

EURYDICE, ū-rid'ĭ-sē, in Greek mythology, the wife of Orpheus, who died by the bite of a serpent. Her husband, inconsolable for her loss, descended to the lower world, and, by the charms of his lyre, moved the infernal deities to grant him permission to bring her back. This they granted, on condition that he would not look back upon her till he had reached the upper world. Forgetting his promise, he looked and lost her forever. This story has often formed a subject for poets — as for Virgil in the Georgics (book iv), and for Pope in his 'Ode on St. Cecilia's Day.' One of the first modern operas was the 'Eurydice' (Euridice) of Coccini and Peri. It was first produced at Florence in 1600. The name Eurydice was borne by certain Macedonian princesses.

EURYLOCHUS. See CIRCE.

EURYMACHUS, the son of Polybus and a suitor of Penelope. With the other suitors he was killed by Odysseus.

EURYMEDON, Athenian general. He was commander of a fleet at Corcyra in 428 B.C., and three years later, with Sophocles, son of Sostratides, led an expedition against Sicily. On arrival there they made peace with Hermocrates, which the Athenians suspected to have been brought about by bribery. Eurymedon was heavily fined, but in 414 was sent to reinforce the Athenians at Syracuse and lost his life before reaching Sicily.

EURYMONE, ū-rĭm'ō-nē, an infernal deity, who gnawed the dead to the bones and was always grinding her teeth. Also a daughter of Apollo.

EURYNOME, ū-rĭn'ō-mē, in Greek mythology, the daughter of Oceanus and mother of the Graces and of Zeus, and the wife of the Titan Ophion, the ruler of Olympus. In her temple at Phigolia she was represented as half woman and half fish.

EURYPTERUS, ū-rĭp'tē-rŭs, a remarkable fossil arthropod related to the horseshoe crab (*Limulus*), many genera and species of which occur in Palæozoic rocks of western Europe and eastern North America. They include the largest anthropods known, and form the family *Eurypteridæ* and order *Eurypterida* of the subclass *Merostomata* (q.v.). They resembled the modern horseshoe crabs in structure, but had elongated, often scorpion-like bodies, terminating in a hinged, spike-like or flattened tail or telson. The most remarkable feature, however, is the great size they attained, some exceeding six feet long, so that they were well named by Haeckel *Gigantostraca*. The surface was formed by a thin chitinous epidermal skeleton, ornamented by fine scale-like markings, and bearing upon the head-shield two large lateral faceted eyes and a pair of median ocelli. Beneath the cephalo-thorax are six pairs of legs, the foremost preoral, the basal joints of which serve as jaws. The last pair is greatly enlarged, somewhat flattened and terminated by an oval plate, which suggests that these limbs served as paddles in swimming, but they may have been otherwise useful. In *Pterygotus* and some allied genera the preoral limbs are modified into more or less antennæ-like organs terminating in toothed pincers (chelæ), no doubt for seizing prey, etc. The ventral segments are 13, of which the first two bear the genital organs, and the remainder leaf-like structures regarded as respiratory and equivalent to the "bookgills" of *Limulus*. These extraordinary crustaceans are found associated with graptolites, cephalopods and trilobites in the Ordovician; with marine crustacea in the Silurian; with oceanic fishes in the Devonian, and with land and fresh-water plants and animals in the coal measures. Their structure shows that they must have been marine and good swimmers; but toward the end of their race they became gradually adapted to brackish and even fresh water. The latest review of the group is in Eastman's American edition of Zittell's 'Text-book of Palæontology' (1900).

EURYSTHENES (ū-rĭs'thę-nēz) **AND PROCLES**, prō'clēz, the twin sons of Aristodemus, and the progenitors of the two royal lines of Sparta, which consisted of 31 sovereigns.

EURYSTHEUS, ū-rĭs'thūs, the son of Sthenelus, and king of Mycenæ, who, at Juno's instigation, ordered Hercules to perform "the twelve labors." Hyllus, the son of Hercules, afterward killed him.

EURYTHMICS. See DALCROZE, EMILE JACQUES.

EUSDEN, ŭs'dĕn, Laurence, English poet: b. Spofforth, Yorkshire, 6 Sept. 1688; d. Coningsby, Lincolnshire, 27 Sept. 1730. He attracted much attention by his 'Original Poems' (1714); 'Ode for the New Year' (1720), and other poems. His appointment as poet laureate in 1718 was due to a fulsome poem on the marriage of the Duke of Newcastle, in whose gift the office lay, and was the occasion of much ridicule.

EUSEBIUS (ū-sē'bĭ-ŭs) **OF CÆSAREA**, surnamed Pamphili, Church historian: b. probably Cæsarea, Palestine, 264 A.D.; d. there, about 349. He is known as Eusebius Cæsariensis and Eusebius Pamphili, that is, Pamphilus's Eusebius — a style assumed after the martyrdom of his instructor, Saint Pamphilus. He was chosen bishop of Cæsarea 314. He took a prominent part in the Council of Nicæa (325), and was present at the Synods of Antioch (330) and Tyre (335). With the exception of Origen and Jerome he was the most learned of the fathers, and is regarded as the father of ecclesiastical history. His moderation procured him the favor of Constantine, who declared him fitted to be the bishop of the whole world. Though he never subscribed to the views held by Arius and the Arians regarding the Godhead of Christ, he being averse to discussing the nature of the Trinity, was always friendly toward them and thus incurred censure as being at best a semi-Arian. Before the rise of Arianism he wrote a spirited defense of the Christian faith in refutation of a book by one Hierocles, who contended that the noted impostor, Apollonius of Tyana, was superior to Jesus Christ in sanctity and in miraculous powers. Eusebius wrote two treatises which have come down to our time: (1) the 'Preparation,' and (2) the 'Demonstration of the Gospel,' usually designated by their Latin titles, 'Præparatio Evangelica,' 'Demonstratio Evangelica.' The argument of the former is the groundlessness of idolatry, the impostures of the oracles, the monstrous impieties of the heathen mythology and theology; and the author shows that the doctrine of the unity of the Godhead and the truth of his revealed religion is as ancient as the world. In the 'Demonstratio' the argument is that the law and the prophecies of the Jewish scriptures clearly foreshow Jesus Christ and the Gospel. Of his other works extant the chief is his 'History of the Church from the Time of Its Founder to the year 323.' It has the defect that in it no mention is made of the wickedness or dissensions of Christians as not being edifying to the faithful. See Schöne, 'Die Weltchronik des Eusebius in ihrer Bearbeitung durch Hieronymus' (1900).

EUSEBIUS OF EMESA, Greek ecclesiastic: b. Edessa; d. Antioch about 360. He studied under Eusebius of Cæsarea, and at Alexandria and Antioch. Averse to all theological controversies he declined the bishopric of Alexandria vacant by the deposition of Athanasius. He was afterward, however, appointed bishop of Emesa, in Syria, but was twice driven away by his flock, who accused him of sorcery on account of his astronomical studies. The homilies extant under his name are probably spurious.

EUSEBIUS EMMERAN. See DAUMER, GEORG FRIEDRICH.

EUSEBIUS OF NICOMEDIA, Arian bishop: d. Constantinople 342. He was appointed bishop of Beryta (Beirut) in Syria and afterward of Nicomedia. He appeared as the defender of Arius at the Council of Nice and afterward placed himself at the head of the Arian party. He baptized the Emperor Constantine in 337, and became patriarch of Constantinople in 339.

EUSKALDUN, ū'skăl-dŏn. See BASQUES.

EUSKIRCHEN, ois'kĭr-kĕn, Prussia, town and capital of a circle in the Rhine province, 15 miles west of Bonn. It has manufactories of cloth, furniture, leather, machinery, flour, meal, pottery, malt and beer. Pop. 12,413.

EUSPORANGIATES, ū'spō-răn'jĭ-ā'tēz, plants in which the sporangia occur beneath the body surface and not on the surface. The class includes all the seed plants and most of the Pteridophytes.

EUSTACHIAN (ū-stā'kĭan) **TUBE**, in anatomy, a canal leading from the pharynx to the tympanum of the ear; named for the Italian anatomist, Eustachio. See EAR.

EUSTACHIO, ā-oos-tä'kē-ō, Bartolommeo, Italian anatomist: b. San Severino, c. 1500; d. Fossombrone, August 1574. He studied at Rome and became professor of medicine at the Studeo della sapienza there and was also pensioned physician. He later became physician to Cardinal Peretti, who thereafter became Pope Sixtus V. Although Eustachio at first took the part of Galen against Vesalius, he advanced the science of anatomy very considerably and thoroughly understood the importance of comparative and pathological anatomy. He later came to appreciate the work of Vesalius. The eustachian tube to the middle ear and the eustachian valve of the fœtal heart perpetuate his name. He investigated the structure of the kidneys, the teeth, the ossicles of the ear, the azygous vein, the ductus thoracicus, the valve of the vena cava inferior, the oranial nerves, the muscles of the head and neck and the valves of the coronary veins. He published 'De Renibus Liber' (Venice 1563); 'De Dentibus Liber' (Venice 1563); 'Opuscula Anatomica' (Venice 1564); 'Tabulæ Anatomicæ' (Rouen 1714).

EUSTACHIUS, ū-stā'kĭ-ŭs, or **EUSTATHIUS**, Roman martyr of the 2d century. At first named Placidus, after his conversion to Christianity he took the name of Eustachius. It is told that while hunting he beheld Christ between the antlers of a deer. He is regarded as the patron of hunters and suffered martyrdom under the Emperor Hadrian. In the Roman Catholic Church he is commemorated on 20 September.

EUSTATHIUS, semi-Arian bishop of Sebaste: b. about 300; d. 380. He introduced monasticism in Armenia and the celibate Eustathian order named from him were condemned at the Gangra Synod in 340. At Sebaste he founded a hospital for the poor. His doctrinal views brought him into continual conflict with his more orthodox contemporaries, but his intimacy with Constantine enabled him to retain his see. In 358 he was deposed by the Synod of Melitene. Consult Loofs, 'Eustathius von Sebaste' (Halle 1898).

EUSTATHIUS, Byzantine commentator: b. probably at Constantinople, early in the 12th century; d. 1194. He became a member of a monastic order, was made deacon of Holy Wisdom (Hagia Sophia) and in 1175 was made archbishop of Thessalonica. His principal work is the commentary on the 'Iliad' and 'Odyssey,' still a valuable source of information on ancient learning. In 1542 the commentary was first published in Rome; the latest edition is that of Stallbaum (7 vols., Leipzig 1825–30). He also wrote a commentary on Dionysius the Periegete, valuable for the fragments of Stephanus of Byzantium and Arrianus, which it has preserved to us. Consult the edition of Dionysius by Bernhardy (Leipzig 1828). He also wrote a commentary on Pindar of which the introduction only survives. He also left a great number of historical pamphlets, tracts and speeches; these are nearly all found in Migne, 'Patrologia Græca' (Vols. CXXXV, CXXXVI). Consult Krumbacher, 'Byzantinische Litteraturgeschichte' (Munich 1897) and Pauly-Wissowa, 'Real-Encyclopädie der classischen Altertumswissenschaft' (Vol. VI, Stuttgart 1909).

EUSTATIUS, Saint, one of the Leeward Islands. See SAINT EUSTATIUS.

EUSTIS, James Biddle, American diplomatist: b. New Orleans, La., 27 Aug. 1834; d. Newport, R. I., 9 Sept. 1899. He was admitted to the bar in 1856 and practised in New Orleans till the Civil War broke out. He then entered the Confederate army and served as judge-advocate on the staffs of Gens. Magruder and J. E. Johnston till the close of the war. He was elected United States senator in 1876, but not given his seat till late in 1877; and was professor of civil law in the University of Louisiana in 1879–84, when he again served as senator, 1885–91. In March 1893 he was appointed United States Minister to France, and on the expiration of his term, in 1897, resumed practice in New York. He translated into English the 'Institutes of Justinian,' and Guizot's 'History of Civilization.'

EUSTIS, William, American physician and politician: b. Cambridge, Mass., 10 June 1753; d. Boston, 6 Feb. 1825. He served as a surgeon in the American army during the Revolution, and subsequently practised medicine in Boston. He was a member of Congress 1801–05 and 1819–23; was Secretary of War 1809–13; and governor of Massachusetts in 1823–25.

EUTAW, ū'tâ, Ala., town, county-seat of Greene County; on the Alabama Great Southern Railroad, about 95 miles southwest of Birmingham. It was settled in 1838, named in honor of the battle of Eutaw Springs, S. C. (1781), where the American forces commanded by General Greene gained a victory. It is in a rich agricultural region. It has an oil mill, ginneries, a lumber mill and a cotton compress. Pop. (1920) 1,359.

EUTAW SPRINGS, a small tributary of the Santee River in Charleston County, S. C. It is noted for the battle fought on its banks in 1781. See EUTAW SPRINGS, BATTLE OF.

EUTAW SPRINGS, Battle of, 8 Sept. 1781, in the Revolution. Tactically a drawn battle, in results it was an important American victory, winning the object of Greene's campaign, as the British shortly abandoned interior South Carolina, retiring to Charleston. Greene, having captured 96 men, stole on the British, some 2,500, under General Stuart, at Eutaw, 50 miles northwest of Charleston, and attacked suddenly at 4 A.M. He had about 2,000 men, part militia, but with Marion and Pickens for commanders; while the regulars were the famous Marylanders under Howard and Hardman, Virginians under Campbell, North Carolinians under Sumner, and the remnant of the brave Delaware men; with William Washington, R. H. Lee and Pleasant Henderson for cavalry leaders. The British had one line; the right on Eutaw Creek, the left in the air. The Americans had two, besides the reserves; the militia in front, who fought desperately and fired in some cases 17 rounds before giving way. Then the regulars rushed forward and swept the British line off the field; but gaining their camp, stopped to plunder it, and though rallied, could not drive the British from the strong positions they had taken. In assailing a brick house, Greene's guns were captured and he lost many of his best men; and a charge of Colonel Washington's was repulsed and himself taken prisoner. Greene was obliged to retreat; but Stuart decamped in the night. The American loss was 408 regulars killed and wounded, militia probably at least 150; British, 453 killed and wounded, 257 missing.

EUTERPE, ū-ter'pē ("the well-pleasing"), one of the Muses, considered as presiding over lyric poetry. The invention of the flute is ascribed to her. She is usually represented as a virgin crowned with flowers, having a flute in her hand, or with various instruments about her. As her name denotes, she is the inspirer of pleasure. (See MUSES). In botany, *Euterpe* is a genus of palms found in South America and the West Indies, and embracing seven or eight species. Some specimens attain a height of nearly 100 feet. The wood of *E. oleracea* is used for flooring. Its fruit, as also that of *E. edulis*, is edible; and the latter species furnishes assai (q.v.). Euterpe in astronomy is an asteroid (No. 27), discovered by Hind in 1853.

EUTHANASIA, ū-tha-nā'sĭ-a, means, in Greek, being happy or opportune in the time of one's death. The correlative adjective is applied in Greek literature to a man who died for his country, and it has been translated by the Latin historian "felix opportunitate mortis." The term euthanasia has recently been employed by some scientific men in advocating the reasonableness of relieving the sufferings of those afflicted with incurable diseases by administering to them anæsthetics or narcotics in sufficient doses to prove fatal. But religion, law and medical ethics alike condemn all forms of self-destruction.

EUTHERIA, subclass of Mammalia, comprising all mammals except the monotremes. Consult 'Cambridge Natural History' (Vol. X, London 1902) and Gregory, 'The Orders of Mammals' (in Bulletin of the American Museum of Natural History, Vol. XXVII, New York 1910).

EUTHYMIUS, Bulgarian prelate and author of the late 14th century. He was a pupil of the patriarch, Theodosius, lived for a time as a monk at Mount Athos, but afterward withdrew to Tirnovo, the seat of the Bulgarian patriarch. He here directed a large monastic establishment and revised the Slavic liturgical books. In 1375 he was chosen patriarch. He preached against the Bogomiles and other heretical bodies. He wrote much on the lives of the saints, prominent churchmen and various pastoral epistles. His style was clearly Byzantine, as was his thought, syntax, etc. His school of religious literature for a long time held sway in Bulgaria, Russia, Rumania and Serbia.

EUTING, oi'tĭng, Julius, German Oriental scholar: b. Stuttgart, 1839; d. 1912. He was educated at Tübingen, Paris, London and Oxford. He was made librarian-in-chief at the Imperial University and Government Library at Strassburg, of which institution he became director in 1900. In 1909 he retired. He traveled extensively in the Orient and collected a great number of Semitic inscriptions, which he bequeathed to the University of Strassburg. He published 'Sechs Phönikische Inschriften aus Idalion' (1875); 'Beschreibung der Stadt Strassburg und des Münsters' (1881; 15th ed., 1909); 'Nabatäische Inschriften aus Arabien' (1885); 'Sinaitische Inschriften' (1891); 'Tagebuch einer Reise in Inner-Arabien' (1896); 'Mandaischer Diwan' (1904).

EUTROPIUS, Roman historian. He was secretary to Constantine at Constantinople and in 363 fought against the Persians. Little else is known of him beyond the fact that he was still living in 378 A.D. He wrote 'Breviarium ab Urbe Condita,' a compendium of Roman history down to the time of Valens. An enlarged edition was later issued by Paulus Diaconus, and at the time of the Renaissance the work was in three distinct forms — the two named above and a third interpolated copy. The *editio princeps* (Rome 1471) was printed from the text of Paulus. Good modern editions are those of Droysen (Berlin 1879), of Ruehl (Leipzig 1887) and one with English notes by Hazzard (New York 1898). Consult Teuffel, 'Geschichte der römanischen Litteratur' (Vol. III, 6th ed., Leipzig 1913).

EUTYCHES, ū'tĭ-kēz, heresiarch of the Eastern Church, who flourished in the 5th century. He was a priest and archimandrite or prior of a monastery in Constantinople; was the founder of the religious sect called after him Eutychians, but also Monophysites, as believing that in Jesus Christ was but one nature, and that the divine nature. The Council of Ephesus (431) having declared that in Jesus Christ were united the divine and human natures. Eutyches was condemned as a heretic by a synod of bishops held in Constantinople 448, but the next year the "Robber Synod" of Ephesus, controlled by Dioscorus, patriarch of Alexandria, reversed that judgment. In 451 the General Council of Chalcedon annulled the decrees of the Robber Synod, excommunicated Eutyches and formulated the Catholic doctrine regarding the hipostatic union of the divine and human natures in Christ. Eutyches died in exile. His doctrine took fast root in Syria, Armenia, Mesopotamia, Egypt and Ethiopia, and in those countries the Monophysite (now known as Jacobite) churches are strong to this day. See MONOPHYSITES.

EUTYCHIANISM, u-tik'i-an-iz'm, in Christology, the monophysitism peculiar to Eutyches, an archimandrite, or abbot of a monastery, who lived near Constantinople during the 5th century A.D. Monophysitism designates the creed of those who in opposition to the Creed of Chalcedon maintain the single-nature in Christ, or that the human and the divine in Jesus Christ constitutes but one composite nature. In Eutychianism it is held that the divine and human person in Christ is so blended as to constitute *one nature*. Eutyches was seduced by the vehemence of his opposition to Nestorianism into an unorthodox view of the nature of Jesus Christ. Prior to his time the Nicene Fathers had pronounced on the relation of the Father to the Divine Logos but left within the limits of orthodoxy room for a difference as to the relation of the Logos to the human Christ. The Antiochene school dreaded lest the idea of humanity should be entirely merged in that of the Logos. Others, leaning toward the teachings of Alexandria, sought to avoid any contaminations of the Logos by the associations of humanity. These positions on dogma became intermingled with questions of ecclesiastical authority, the conflict of national ideals and the lower strife of personal rivalry.

It is usually alleged that Eutyches was the victim of his own zeal in opposition to Nestorius. Nestorius, a harsh, unpleasant man, intolerant of doctrinal eccentricities, other than his own, made it his peculiar mission to prevent mankind from assigning human attributes to God, and boldly took the consequences of his position.

Now in time Nestorius came into collision with Cyril, a member of the Alexandrian School. To Cyril, it seemed that the doctrine of the Incarnation of the Logos is impugned by any hesitation to assign the attributes of humanity to the divine Christ. And it was this theological principle which was the cause, or at least the pretext, of Cyril's first attack on Nestorius. On the other side, the Antiochene school, well represented in Theodore of Mopsvestia, a learned man and a great commentator, and the teacher whether directly or indirectly of Nestorius,— held to the christology of Theodore. In it the union of the divine and human in the person of Jesus was moral rather than physical or dynamical, and Theodore carefully avoided the deduction that the relation of divine and human was similar in kind, though different in degree, in Christ and in his followers. And the actions of Christ and his qualities as man and particularly his birth, sufferings and death, were not, in the christology of the Antiochene school, to be attributed to God without a qualifying phrase. This was the doctrine which Nestorius carried to its logical and practical conclusion; a position which is summarized in his saying: "I cannot speak of God as being two or three months old!" And yet this is the view which the Alexandrians, with Cyril at their head, and Eutyches among its following, considered as virtually implying *two* Christs, one divine and the other human.

In the Monophysite controversy Eutyches is the main figure. He had opposed Nestorius; now he was himself accused of disseminating errors of an opposite kind from those of his opponent. His accuser, Eusebius of Dorylæum, induced Flavian, the patriarch of Constantinople, to call Eutyches to account. The accusations made, the aged Eutyches was with difficulty brought from the seclusion of his monastery. He was no theologian; and wished to fall back on the decisions of Nicæa and of Ephesus. But the accusers pressed him, and the old man replied that he confessed Christ as being of two natures *before* the union in the Incarnation, of one nature *afterward*, being God Incarnate! On this point he would not recant: it was his peculiar monophysitism. How he appealed to the emperor, to Pope Leo and to the monks of Constantinople; how the decision of the Patriarch Flavian to excommunicate Eutyches was controverted by the Council of Ephesus in 449; and how in Chalcedon, two years later, Eutychianism was condemned a second time, and the received doctrine came into existence; all this is without the limits of this article. In place of the Monophysite doctrine of the one nature, it was established at Chalcedon that Christ was perfect God and perfect man, consubstantial with the Father as to his divinity, and with man as to his humanity, the two natures being united with him, without conversion, without confusion and without division. But if the Council of Chalcedon had succeeded in pronouncing Eutyches a heretic, it did not stamp out the influence of his doctrine. The sect of the Eutychians continued quietly to grow for a century after his death in the churches of Armenia, Ethiopia and of the Copts. And soon after his condemnation, 10 different sects could be counted who shared his teachings among themselves. Thus it came about that his heresy got for itself the name "ten-horned."

Monophysites still exist in Egypt and the East, under the title of Jacobites, a name derived from Jacob Barodæus. From them the orthodox are distinguished by the name of Melchites, or Royalists, which title they have owing to their adherence to the edicts of the Emperor Marcian, in favor of the Council of Chalcedon, and their adoption of the doctrine it laid down. (See MONOPHYSITES). Consult Harnack, 'History of Dogma'; and Ottley, R. L., 'The Doctrine of the Incarnation.'

EUTYCHIANUS, ū-tĭk'ĭ-ā'nŭs, **Saint**, the 27th Pope and bishop of Rome. He reigned from 275 to 283. He is commemorated on 8 December.

EUTYCHIDES, Greek sculptor of the 4th century B.C. He was a native of Megara and a pupil of Lysippus. For the city of Antioch he executed a statue of Fortune, which made him famous. Many copies of it were made throughout the Orient and a small copy now rests in the Vatican Museum. Some authorities hold that the 'Victory of Samothrace' is his work, but of this there is no conclusive proof.

EUXANTHIC (ūk-săn'thĭk) **ACID** ($C_{19}H_{16}O_{10}$), called also **PURREIC ACID**, an acid obtained from purree, or Indian yellow. With the alkalis and earths, it forms soluble yellow compounds.

EUXENITE, ūk'sē-nīt, a rare Norwegian mineral, essentially a niobate and titanate of yttrium, erbium, cerium and auranium. It sometimes contains iron calcium and germanium, while water is always present. It occurs in orthorhombic crystals, but usually it is massive. It has a hardness of 6.5, a specific gravity of 4.7 to 5.0, a brilliant metallic-vitreous lustre, and a brownish-black color, showing a reddish-brown translucence in thin slivers.

EUXINE, ūk'sĭn, the ancient name for the Black Sea.

EVA, Little, a beautiful child, who becomes the friend and consoler of Uncle Tom in Harriet Beecher Stowe's novel 'Uncle Tom's Cabin.' Her early death forms one of the climaxes of that affecting story.

EVACUATION HOSPITALS. See HOSPITALS, MILITARY.

EVADNE, e-văd'nē, in Greek fable, the daughter of Iphis of Argos, who threw herself into the funeral pile of her husband, Cateneus.

EVAGORAS, ę-văg'ō-ras, king of Salamis in Cyprus, flourished about the beginning of the 4th century B.C. His family had been expelled by a Phœnician exile. Evagoras recovered the kingdom in 410 B.C., and endeavored to restore in it the Hellenic customs and civilization. He was friendly with the Athenians, and in return for his services a statue was erected to him at Athens. His increasing power attracted the jealousy of the Persian king, Artaxerxes II, who declared war against him and besieged Evagoras in his capital. He was saved only by the dissensions of his enemies, and was able to conclude in 387 a peace by which the sovereignty of Salamis was nominally at least secured to him. He was assassinated 374 B.C.

EVAGRIUS (ę-văg'rĭ-ŭs) **SCHOLASTICUS**, Syrian Church historian: b. Epiphania, about 536; d. after 594. He wrote the history of the Church in continuation of the ecclesiastical histories of Eusebius, Socrates, Theodoret and Sozomen from 431, the date of the Council of Ephesus, to 594. His surname, Scholasticus, indicates that he was by profession (probably at Antioch) an advocate, for such at that time was a usual meaning of the word: he was legal adviser to Gregory, patriarch of Antioch, who commended him for his fidelity and learning to the emperor, Tiberius Absimarus, and obtained his promotion to a judicial office. In recognition of his eminent integrity as an official of the empire his second marriage was made the occasion of a public festival; which, however, had a disastrous ending, for it was interrupted by a violent earthquake, which caused the loss of thousands of lives.

EVALD, ā'vălt. See EWALD, G. H. A.

EVALD, ā'vald, **Herman Frederik**, Danish novelist: b. 1821; d. 1908. His works deal mostly with history and are of considerable merit. They include 'Valdemar Krone's Youth' (1860); 'The Nordby Family' (1862); 'Johannes Falk' (1865); 'Charles Lyng' (1882); 'The Swedes at Kronborg' (1867); 'Anna Hardenberg' (1880); 'Clara Bille' (1892); 'Leonore Kristine' (1895); 'Klein Kirsten' (1901); 'Bondebruden' (1904).

EVALD, Johannes, Danish lyrical poet: b. Copenhagen, 1743; d. 1781. In 1764 appeared his 'Temple of Fortune,' followed two years later by 'Elegies' on the death of Frederick V. These works brought him fame, which was further established by the biblical drama, 'Adam and Eve,' in 1769. His 'Rolf Krake,' which appeared in 1770, was the first original tragedy in the Danish language. From 1770 to 1780 he wrote tragedies, comedies and farces, including 'The Fishers,' his greatest work, in which appeared the present Danish national anthem. Evald's health had been seriously impaired through overwork and the strain incident to the production of 'The Fishers' hastened the end. His works were edited by Liebenberg (8 vols., Copenhagen 1855). Consult his 'Life and Opinions' (Copenhagen 1792); and the lives by Hammerich (ib. 1882) and Jorgensen (ib. 1888).

EVANDER, in classical legend, the civilizer of Latium, the son, according to one account, of Hermes and an Arcadian nymph. About 60 years before the Trojan War he established himself in Latium and built, at the foot of the Palatine Hill on the banks of the Tiber, a town, to which he gave the name of Pallantium. The Roman legends represent him as teaching the Latins the use of the alphabet and the arts of agriculture and music, softening their fierce manners by the introduction of more humane laws, and introducing among them the worship of the Lycæan Pan, Heracles, Demeter, etc. In the Æneid Virgil brings his hero Æneas into connection with Evander, who gave him a favorable reception, and becomes his ally against the Latins. Divine honors were paid to Evander by the inhabitants of Pallantium in Arcadia.

EVANGELICAL, a word literally signifying "pertaining to the gospel" and used in different senses. In one of its senses it is a term used to qualify certain doctrinal opinions, stress being laid on the total depravity of human nature, need of conversion, justification by faith, free offer of the gospel, the plenary inspiration and exclusive authority of the Bible.

In this sense the word, when applied to a whole church, is in Scotland almost synonymous with orthodox; and in the United States it has much the same significance, in contrast to the words "liberal" and "rationalistic." In England the Evangelical or Low Church party is looked upon as extreme in its views, and is distinguished from the orthodox party, which holds the doctrines above specified in a more modern form. When used in a less general sense something more is implied in the word. It indicates peculiar attachment to sound doctrine and peculiar fervency in advocating it. In another sense the term is applied in Germany to Protestants as distinguished from Roman Catholics, inasmuch as the former recognize no standard of faith except the writings of the evangelists and the other books of the Bible, and more especially to the national Protestant Church, formed in Prussia in 1817, by a union of the Lutheran and Calvinistic churches.

EVANGELICAL ALLIANCE, a voluntary association of members of the different sections of the Christian Church, organized in London 19–23 Aug. 1846. At this meeting was adopted a doctrinal basis, which is, in effect, the recognition by the members of the divine inspiration, authority and sufficiency of the Holy Scriptures; the right of private judgment in their interpretation; the unity of the Godhead and the Trinity of persons therein; the doctrine of human depravity in consequence of the fall; the incarnation, atonement, intercession and mediatorial reign of the Son of God; justification by faith alone; the work of the Holy Spirit in conversion and santification; the immortality of the soul, the resurrection of the body and the final judgment of the world, resulting in the eternal blessedness of the righteous and the eternal punishment of the wicked; the divine institution of the Christian ministry; and the obligation and perpetuation of the ordinances of baptism and the Lord's Supper. The organization thus commenced has since been extended throughout Protestant christendom. Branch alliances have been formed in Great Britain, Germany, France, Switzerland, Sweden, the United States, Australia, and among missionaries in Turkey, India, Brazil and Japan. These national branches are related to each other as members of a confederation having equal rights. The whole alliance appears in active operation only when it meets in general conferences having the character of Protestant ecumenical councils, but claiming only moral and spiritual power. The American branch of the alliance was organized in 1867. Conferences of the entire alliance have been held in 1851, 1855, 1857, 1861, 1867, 1873, 1879, 1885, 1891, 1896, 1907, that of 1873 having met in New York. The American branch held a conference at Chicago in October 1893. The alliance has aided largely in the promotion of religious liberty in Europe and the East. Consult 'Reports' of the conferences; and Arnold, 'History of the Evangelical Alliance' (London 1897).

EVANGELICAL ASSOCIATION, a religious denomination founded in Pennsylvania about the beginning of the 19th century by Jacob Albright, a member of the Methodist Episcopal Church, who was born in Pennsylvania 1759, and from about 1790 traveled among the German population as an evangelist. Albright founded a society of converts in 1800, which so increased in numbers that it was finally organized in 1807 as the Evangelical Association of North America, with Albright as bishop. The theology of the association as defined in its 21 articles closely resembles that of the Methodist Episcopal Church, from which, also, it differs little in government and form of worship. The Church was divided in 1891, when a minority, numbering 40,000, organized the United Evangelical Church. In 1916 the association had 27 annual conferences, including one in Japan, one in Switzerland, and two in Germany; 1,663 preachers, 115,243 communicants, and property valued at about $11,000,000. Besides its German elements it has a relatively large English-speaking membership and publishes English periodicals and English books. It has four bishops, a well-equipped publishing house at Cleveland and another at Stuttgart, Würtemberg; a biblical institute and Northwestern College at Naperville, Ill.; two seminaries; an orphan home at Flat Rock, Ohio; a charitable society; a missionary society, sustaining domestic and foreign missions in Japan and China and assisting the European churches; a Woman's Missionary Society; a Church Extension Society. Hospitals are maintained in various cities in Germany, and in Chicago and in Bismarck, N. Dak. Its periodicals are *The Evangelical Messenger* (weekly); *The Missionary Messenger* (monthly); *Der Christliche Botschafter* (weekly). Consult Plitt, 'Die Albrechtsleute' (Erlangen 1877); Carroll, 'Religious Forces of the United States' (New York 1912); Orwig, 'History of the Evangelical Association' (1858).

EVANGELICAL CHURCH, The United. See UNITED EVANGELICAL CHURCH, THE.

EVANGELICAL CHURCH CONFERENCE, the name of the general meetings of representatives of the Protestant bodies of Germany and Austria. The first general conference met at Berlin in 1846 and was followed by the Eisenach Conference of 1852. Since 1854 these conferences have been held every two years at Eisenach. The object is the promotion of unity among the several evangelical bodies which send representatives to the conference. The official organ, *Allgemeines Kirchenblatt für das evangelische Deutschland*, is issued regularly at Stuttgart. Consult Braun, 'Zur Frage der engern Vereinigung den Deutschen evangelischen Landeskirchen' (Berlin 1902).

EVANGELICAL COUNSELS, in Catholic theology, are distinguished from divine commandments in this, that the commandments are of universal obligation for whoever would be saved, while the Evangelical Counsels point to the readiest and surest means of attaining that end. When a certain ruler put to Jesus Christ the question "What good thing shall I do that I may inherit life?" and received the answer "If thou wilt enter into life, keep the commandments," he was taught the condition of salvation which applies to all mankind. But he wanted to know whether there is not a more excellent way: he had "observed all those things from his youth up"; was there not some other "good thing" for him to do? Then Jesus prescribed to him the perfect way: "Sell all that thou hast and distribute unto the poor" (Matt. xix, 21), giving him one of the Evangelical Counsels, the counsel of voluntary poverty. The celibate life is commended by Saint Paul as more favorable to entire devotion to the service of God than the state of marriage; that Evangelical Counsel is the principal topic of the epistle of 1 Corinthians. Finally, entire obedience is the third of those counsels — renunciation of self-will, cheerful submission to the rule of superiors. Members of the religious orders of the Catholic Church bind themselves by solemn vows to practise the three Evangelical Counsels: poverty, chastity and obedience.

EVANGELICAL UNION, the name of a religious body, also familiarly known as the Morisonians, from the Rev. James Morison, of Kilmarnock, by whom, with three other clergymen, it was founded in Scotland in 1843. The founders were soon joined by a number of ministers and churches of the Congregational Union of Scotland, and extended themselves considerably in Scotland and the north of England. The Morisonians maintain the universality of the atonement, combining with this the doctrine of eternal personal and unconditional election. In point of church government the members of the Evangelical Union are independent, but many congregations have ruling elders. In 1896 nearly all the churches were absorbed by the Congregational Union. The body had in 1899 between 90 and 100 congregations, chiefly in Scotland, and 712 ministers. Consult Ferguson, 'History of the Evangelical Union' (1876); and Adamson, 'Life of Dr. James Morison' (London 1898).

EVANGELINE. 'Evangeline: a Tale of Acadie' is based upon a true story which traveled from Canada to New England by word of mouth, reached Hawthorne, who did not care to use it for a romance, and was by him turned over to Longfellow, who published his poem in 1847. It instantly won the widest public, and has ever since remained among the most popular narrative poems in the English language. Hawthorne's disinclination to use the incident was probably due to the fact that he did not find it deeply tragic: the fate of the innocent lovers who are separated by a purely external force but who remain faithful till death is hardly more than pathetic. The tenderness, however, with which Longfellow handled the pathos of the theme quite conceivably appealed to a larger variety of readers than a stern tragic handling, such as Hawthorne's might have been. In form the poem follows the example set by J. H. Voss's 'Luise' (1795) and the greater 'Hermann und Dorothea' (1798) of Goethe, both of which had attempted to treat modern sentiments and manners with Homeric simplicity. But 'Evangeline' owes nothing essential to its predecessors. The hexameters in which the story is told, while not so close to classical hexameters as those of A. H. Clough's 'Bothie of Tober-na-Vuolich' (1848) or Kingsley's 'Andromeda' (1858), added to English poetry, never before or since hospitable to the measure, a new rhythm. The language of 'Evangeline,' while rarely vivid, is pure, sweet and melodious; its landscapes, though full of charm and color, like its characters, resemble its characters also in belonging less to any particular soil than to the general world of romance. Still, in spite of its lack of raciness and actuality, the poem founded a national legend which has kept alive the memory of an episode that would otherwise have been forgotten; and by something universal in its gracious manner has increased modern literature with a story everywhere read and remembered.

Carl Van Doren.

EVANGELIST (a bringer of good tidings), in the New Testament, a preacher of the gospel, distinguished (Eph. iv, 11) from the apostles, prophets, pastors and teachers. The term came ultimately to refer to only the authors of the four Gospels, but in modern times has been extended to indicate also an unattached preacher whose specific work is the arousing of personal interest in matters of religion.

EVANGELISTARION, a book of selections from the Gospels, used as a service book in the Greek Church. It contains the Gospel lessons for each day in the year. The book which contained the lessons from the Acts and Epistles was called the Praxapostolos. If both were included in a single work, the latter was termed a Euxologia. There are hundreds of manuscripts of these service books in existence, dating from the 6th century onward. Consult Gregory, C. R., 'The Canon and Text of the New Testament' (New York 1907) and Scrivener, 'Introduction to the Textual Criticism of the New Testament' (4th ed., London 1894).

EVANGELISTS, Symbols of the Four. These symbols take their origin from Irenæus, who identified the four living creatures before the throne of God (Rev. iv, 64) with the four Evangelists. For a long time there was little agreement as to the order in which the creatures were assigned to each Evangelist. Later in the Western Church the following order became general: the man represents Saint Matthew; the lion, Saint Mark; the calf, Saint Luke; and the eagle, Saint John. Consult Goldsmith, E. E., 'Sacred Symbols in Art' (New York 1911) and Jenner, Mrs. Henry, 'Christian Symbolism' (Chicago 1910).

EVANS, Alexander William, American botanist: b. Buffalo, N. Y., 17 May 1868. He was graduated at Yale in 1890 and in 1894–95 studied at Munich and Berlin. In 1895 he began his connection with the botanical department of Yale, becoming professor of botany there in 1906. He is an ex-president of the Botanical Society of America. He has made extensive investigations of the bryophtyes of Connecticut and the hepaticæ of Alaska. He is a Fellow of the American Association for the Advancement of Science.

EVANS, Sir Arthur (John), English archæologist: b. Nash Mills, Hertfordshire, 1851. He is a son of Sir John Evans (q.v.). He was educated at Harrow, Oxford, and Göttingen, and was keeper of the Ashmolean Museum, Oxford, from 1884 to 1908. Since 1893 he has superintended archæological researches in Crete, excavating in 1900–08 the prehistoric palace of Knossos. He has published 'Through Bosnia' (1895); 'Illyrian Letters'; 'Antiquarian Researches in Illyricum' (1883–85); 'Cretan Pictographs and Prae-Phœnician Script' (1896); 'Further Discoveries of Cretan and Ægean Script' (1896); 'The Mycenæan Tree and Pillar Cult' (1901), etc. He was knighted in 1911.

EVANS, Augusta Jane. See Wilson, Augusta Jane Evans.

EVANS, Christmas, Welsh Baptist divine: b. Isgaerwen, Cardiganshire, 25 Dec. 1766; d. Swansea, 19 July 1838. He was at first a Presbyterian but joined the Baptists in 1788, and in the following year was ordained a missionary among the Baptists of Carnavonshire. After three or four years there he removed to Anglesey where he lived until 1826. In Anglesey he practically exercised episcopal functions and his removal to Glamorganshire in 1826 was occasioned by his arbitrary conduct. He removed to Cardiff in 1828 and four years later to Carnarvon. He was an able and eloquent preacher and was well known throughout Wales where he did much in behalf of church building. Consult the biography by Hood (London 1881).

EVANS, Edward Payson, American author: b. Remsen, N. Y., 8 Dec. 1831. He graduated at the University of Michigan in 1854, where, after several years of teaching in Mississippi and Wisconsin, he was professor of modern languages and literatures in 1862–67. He has made a special study of Oriental languages; in 1884 became connected with the 'Allgemeine Zeitung,' of Munich in Europe, to which he contributed many articles on the literary, artistic and intellectual life of the United States. He has published 'Summary of the History of German Literature' (1869); 'Progressive German Reader' (1870); 'Animal Symbolism in Ecclesiastical Architecture' (1896); 'Evolutional Ethics and Animal Psychology' (1898); 'Beiträge zur Amerikanischen Litteratur und Kulturgeschichte' (2 vols., 1898–1903); 'The Criminal Prosecution and Capital Punishment of Animals' (1906).

EVANS, Edward Radcliffe Garth Russell, English explorer and naval officer: b. 1881. He was educated at Merchant Taylors' School and entered the navy in 1897, becoming sub-lieutenant in 1900. He served on the *Morning*, the relief ship to the *Discovery* expedition in 1902–04. In 1907 he was awarded the Shadwell Testimonial Prize by the Lords Commissioners of the Admiralty. In October 1909 he joined the British Antarctic Expedition as second in command, and was made commander in 1912. He returned in command of the expedition after the death of Captain Scott. He lectured on the Scott expedition in the United States in 1914, commanded the *Mohawk* in the bombardment of the right wing of the German army on the Belgian coast in 1914. In this year he received the cross of the Legion of Honor, was made C.B. in 1913 and received the D.S.O. in 1917.

EVANS, Elizabeth Edson Gibson, American prose writer: b. Newport, N. H., 8 March 1832; d. 10 Sept. 1911. She was married to Edward Payson Evans (q.v.) 1868. She has published 'The Abuse of Maternity' (1875); 'Laura, an American Girl' (1884); 'A History of Religions' (1892); 'Story of Kaspar Hauser' (1892); 'The Story of Louis XVII of France' (1893); 'Transplanted Manners' (1895); 'Confession' (1895); 'Ferdinand Lasalle and Helen von Dönninger' (1897); 'The Christ Myth' (1901).

EVANS, Evan Heber, Welsh Congregational clergyman: b. near Newcastle, Cardiganshire, 1836; d. Bangor, 1896. He received his education at Swansea Normal College and Brecon Memorial College. In 1862–65 he was pastor of Lebanus Church, Morriston, and from 1865 to 1894 of Salem Church, Carnarvon. In 1886 he served as clergyman of the Welsh Congregational Union and in 1892 of the Congregational Union of England and Wales. In 1894 he was appointed head of the Bangor Congregational College. He edited the Welsh Congregational magazine, *Y Dysgedydd*. Consult the biography by H. Elvet Lewis.

EVANS, Frederick William, American writer: b. Bromyard or Leominster, England, 9 June 1808; d. Mount Lebanon, N. Y., 6 March 1893. He removed to the United States in 1820; joined the United Society of Believers (Shakers) at Mount Lebanon, N. Y., in 1830, and became a recognized leader in that society. The best known of his works are 'Compendium of the Origin, History, and Doctrines of the Shakers' (1859); 'Autobiography of a Shaker' (1869); 'Shaker Communism' (1871); 'The Second Appearing of Christ' (1873).

EVANS, Sir George de Lacy, British general: b. Moig, Ireland, 1787; d. London, 9 Jan. 1870. He entered the army in 1806, took part in the later stages of the Peninsular War and in the beginning of 1814 was sent to America, and at the battle of Bladensburg (24 Aug. 1814) had two horses shot under him. At the head of 200 men he forced the capitol at Washington. He was present at the attack on Baltimore, and was twice wounded before New Orleans in December 1814, and was on that account sent home to England, where he recovered just in time to be able to join Wellington at Quatre-Bras and Waterloo. He served with distinction on the side of the queen regent in the Carlist War of 1835–37. In 1846 he was raised to the rank of major-general. At the outbreak of the Crimean War he was appointed to the command of the second division of the British army, and distinguished himself at the battle of the Alma, the siege of Sebastopol and the battle of Inkerman. He was made a general in 1861. He served as a Liberal member in the House of Commons between 1831–65, but not continuously.

EVANS, George Essex, Australian poet: b. London, 18 June 1863. He went to Australia in 1881 where he eventually became district registrar at Toowoonby, Queensland. He has written extensively for the Australian press. He was editor of the *Antipodean* (1893–97); and he won the 50 guinea prize offered by the government of New South Wales for the best ode on the inauguration of the Commonwealth in 1901. He was founder of the Astral Association for the Advancement of Music, Art, Literature and Science' (1901). Among his published works are 'Madelene Despar and Other Poems' (London 1891); 'Loraine and Other Verses' (Melbourne 1898); 'The Garden of Queensland' (1898); 'The Secret Key and

Other Verses' (Sidney 1906). The greater part of his work, most of which has been contributed to magazines and newspapers, has not been published in book form.

EVANS, Henry Clay, American politician: b. Juniata County, Pa., 18 June 1843; d. Chattanooga, Tenn., 12 Dec. 1921. He served in the 51st Wisconsin Infantry, enlisting 1864, and subsequently settled in Chattanooga, Tenn. He was mayor of Chattanooga for two terms. He sat in Congress in 1889–93. His election as Postmaster-General 1889–93. His election as governor of Tennessee 1894 was disputed and the opposing Democratic candidate was seated. He stood second in the vote for Vice-President at the National Republican Convention 1896, was appointed United States Commissioner of Pensions in 1897, and was consul-general in London from 1902 to 1905. He was subsequently commissioner of education and health of the city of Chattanooga.

EVANS, Hugh Davy, American author: b. Baltimore, Md., 26 April 1792; d. there, 16 July 1868. He studied law, began practice in Baltimore in 1815 and became eminent as a jurist. He was editor of *The True Catholic* 1843–56, and was connected with various other papers. He was a prominent member of the Maryland Colonization Society, and prepared a code of laws for the Maryland colony in Liberia; and in 1862–64 lectured on civil and ecclesiastical law. Among his writings are 'Essays on Pleading' (1827); 'Maryland Common-Law Practice' (1837); 'Theophilus Anglicanus' (1851); 'Essays on the Episcopate of the Protestant Episcopal Church in the United States' (1855); 'Treatise on the Christian Doctrine of Marriage' (1870). Consult memoir by Harrison (1870).

EVANS, John, American geologist: b. Portsmouth, N. H., 14 Feb. 1812; d. Washington, D. C., 13 April 1861. He served on several State and Territorial geological surveys, and discovered remarkable fossil deposits in the Bad Lands of Nebraska. He was afterward commissioned by the United States government to carry on the geological surveys of Washington and Oregon.

EVANS, John, American philanthropist: b. Waynesville, Ohio, 9 March 1814; d. Denver, Colo., 3 July 1897. He was graduated at the medical department of Cincinnati College in 1838; in 1848 became a professor in the Rush Medical College of Chicago, in which city he accumulated a large fortune by investments in real estate. Much of this he gave to philanthropic objects. He established the Northwestern University, and endowed two chairs in it with $50,000 each. In 1862–65 he was governor of the Colorado Territory. Later he established the University of Denver, to the construction of which he gave $200,000 and a large endowment. He gave largely for the erection of the Grace Methodist Episcopal Church in Denver, and aided almost every educational institution and Methodist Episcopal Church in the State.

EVANS, Sir John, English archæologist: b. Britwell Court, Buckinghamshire, 17 Nov. 1823; d. 31 May 1908. His publications include 'The Coins of Ancient Britons'; 'The Ancient Stone Implements, Weapons and Ornaments of Great Britain and Ireland' (1872); 'Ancient Bronze Implements, Weapons and Ornaments of Great Britain and Ireland' (1881). From 1878 till 1896 Sir John was treasurer of the Royal Society, and he presided over the Toronto meeting of the British Association in 1897. He was president of the Geological Society (1874–76), of the Numismatic Society (1874–1908), and of the Society of Antiquaries (1885–92). His great work on stone implements received a prize from the French Academy, and both it and his other work on bronze implements were translated and published in Paris shortly after they appeared in England.

EVANS, John Gwenogvryn, Welsh scholar: b. Ffynon Velved, Carmarthenshire, 1852. He was educated at Pontshan Grammar School, the Presbyterian College, Carmarthen, and Owens College, Oxford. He was editor of the 'Series of Old Welsh Texts,' was inspector of documents in the Welsh language for the Historical Manuscripts Commission from 1894 to 1906. He was nominated governor and member of the council of the University College of Wales, and governor and member of the council of the National Library of Wales by the lord president of the Privy Council. His publications include 'Homeward Bound' (1882); 'Red Book Mabinogion' (1887); 'Facsimile of the Black Book of Carmarthen' (1888); 'The Bruts' (1890); 'The Book of Llandav' (1893); 'Diplomatic Text, with Notes and Introductions, of the Black Book of Carmarthen' (1906); 'Editio Princeps of the White Book Mabinogion, and Romances from the Peniarth MSS.' (1907); 'Facsimile and Text of the Book of Aneirin' (1908); 'Facsimile of the Chirk Codex of the Welsh Laws' (1909); 'Facsimile and Text of the Book of Taliessen, with a revised text and translation into English' (1914).

EVANS, Margaret J. See HUNTINGTON, MARGARET EVANS.

EVANS, Mary Ann, or Marian. See ELIOT, GEORGE.

EVANS, Oliver, American inventor: b. Newport, Del., 1755; d. New York, 25 April 1819. In 1787 Evans invented a machine for making card-teeth. Two years later he entered into business with his brothers, who were millers, and in a short time invented the elevator, the conveyor, the drill, the hopper-boy, and the descender, the application of which two mills worked by water-power effected a revolution in the manufacture of flour. For some years after these improvements were perfected, the inventor found much difficulty in bringing them into use, although in his own mill the economy of time and labor which they effected was very manifest. About 1799 or 1800 he set about the construction of a steam-carriage; but finding that his steam engine differed in form as well as in principle from those in use, it occurred to him that it could be patented and applied to mills more profitably than to carriages; and in this he was completely successful. This was the first steam engine constructed on the high-pressure principle; and to Evans, who had conceived the idea of it in early life, and in 1787 and again in 1794–95 had sent to England drawings and specifications, the merit of the invention belongs, although it has been common to assign it to Vivian and Trevethick, who had had access to Evans' plans. In 1803–04, by order of the board of health of Philadelphia, he constructed the first steam dredging machine used in America, consisting of a flat scow with a small engine to work the machinery for raising the mud. Evans also invented the "Cornish boiler."

EVANS, Robley Dunglison, American naval officer: b. Floyd Court House, Va., 18 Aug. 1846; d. Washington, 3 Jan. 1912. He was appointed to the United States Naval Academy from Utah in 1860, promoted ensign in 1863, and in 1864–65 was on board the *Powhatan* of the North Atlantic blockading squadron. He participated in both attacks on Fort Fisher; in 1868 was commissioned lieutenant-commander, in 1870–71 was on duty at the navy yard, Washington, in 1871–72 at the Naval Academy. Having served in 1873–76 successively on the *Shenandoah* and the *Congress*, of the European station, he was made commander in 1878; in 1891–92 was in command of the *Yorktown* at Valparaiso, Chile, where American sailors were killed by a mob, and in 1893 became captain. He policed the Bering Sea sealing grounds. During the Spanish-American War he was in command of the *Iowa*, and at the naval battle of Santiago he took an important part in the destruction of Cervera's fleet. In 1901 he was commissioned rear-admiral; in 1902 was made commander of the Asiatic fleet with the flag-ship *Kentucky*; was escort to Prince Henry of Prussia, during the latter's visit to the United States; commanded the Atlantic fleet, 1905–07, taking it in 1907, as commander-in-chief, on tour of the world. After rounding Cape Horn, and on reaching San Francisco, ill health forced him to give up the command. He was retired 18 Aug. 1908. He published 'A Sailor's Log' (1901); and 'An Admiral's Log' (1910).

EVANS, Thomas Williams, American dentist: b. Philadelphia, 23 Dec. 1823; d. Paris, 14 Nov. 1896. He studied dentistry and practised in Maryland and later in Lancaster, Pa., and made a specialty of saving teeth by filling. In seeking a substitute for gold foil he mixed rubber and sulphur, which made a black substance instead of a white one. Because of the unfavorable color he laid the substance aside and gave it no more thought till his mixture was used by others for producing commercial gutta-percha, which he declared he had discovered. In 1848 he went by invitation to Paris, as the most skilful American dentist, to attend to the teeth of President Louis Napoleon. During his career in Paris he accumulated a very large fortune. He also won an international reputation as an expert in military sanitation, and was one of the founders of the Red Cross Society. His home was the refuge of the Empress Eugénie from the mob on the night of 4 Sept. 1870. Dressed in his wife's clothes, she was taken by him to the Normandy coast, where he secured her escape to England. He bequeathed all of his fortune, estimated at from $8,000,000 to $12,000,000, excepting $250,000, to establish a museum and institute in Philadelphia.

EVANSTON, Ill., city in Cook County, on the Chicago and Northwestern Railway, 12 miles north of Chicago on Lake Michigan. It has electric surface and elevated railroads to Chicago; Holly system of waterworks, with complete filtration plant, daily newspapers and three banks, deposits over $6,000,000. It is the seat of Northwestern University (M.E.) founded in 1854, largely endowed and of high repute, with a library of 25,000 volumes and a museum. It is the seat also of the Garrett Biblical Institute. The Dearborn Observatory was transferred here from Chicago in 1888. Evanston was the home of Frances Willard (q.v.). It is really a residential suburb of Chicago, and called "City of Churches." The Evanston Commercial Association — over 300 members — has much influence in civic and business affairs. Pop. (1920) 37,234.

EVANSTON, Wyo., city and county-seat of Uinta County, 76 miles east of Ogden, on the Bear River and the Union Pacific Railway. There are valuable coal mines in the vicinity, and the surrounding region is also largely devoted to stock-farming and agriculture. Oil has been discovered in the neighborhood. Among the local industries are a large flouring-mill, ice plant and railway repair shops. The State Asylum for the Insane is situated here. The city contains a public library and owns the waterworks. Pop. (1920) 3,479.

EVANSVILLE, Ind., a city and port of entry of Vanderburg County, of which it is the county-seat, about 185 miles west of Louisville, 192 miles northeast of Cairo, and 180 miles southwest of Indianapolis, on the Ohio River, and the Louisville, E. & St. L., the Louisville & N., the Evansville & T. H. and other railways. It is pleasantly located on a high bank of the river. Evansville is the chief shipping point for southwestern Indiana, and ranks highly among the commercial centres of the State. The neighboring region abounds in coal and the local coal trade is a large one. There is also an important trade in flour, pork, tobacco, grain and timber. There are machine-shops and foundries, plow-works, furniture factories, flouring-mills, and manufactures of cottons and woolens, brick and tile, pottery, terra-cotta and fire-clay products, malt liquors, and saddlery and harness. The United States census of manufactures for 1914 showed within the city limits 297 industrial establishments of factory grade, employing 11,698 persons; 10,333 being wage earners, receiving a total of $5,168,000 annually in wages. The capital invested aggregated $24,666,000, and the year's output was valued at $31,427,000: of this, $13,427,000 was the value added by manufacture.

The prominent buildings include the United States custom-house, the courthouse, the city hall, the Willard Library, the State Hospital for the Insane, Evans Temperance Hall, Citizen's National Bank Building and the United States Marine Hospital. There are also 10 parks. Daily and weekly newspapers are published. Evansville was founded by Gen. R. M. Evans in 1817, became the county-seat of Vanderburg County in 1819, and was incorporated in 1847. The government is administered by a charter of 3 March 1893, with amendments of 11 March 1895. This instrument provides for a mayor, elected for four years, and a common council, one member from each ward for one year and four councilmen at large for two years. The annual expenditure of the municipality is about $700,000, the annual income about $940,000. The municipality owns the waterworks, which are operated at a yearly expense of about $30,000. Pop. (1920) 85,264.

EVANSVILLE, Wis., a village of Rock County, 17 miles northwest of Janesville and 22 miles south by east of Madison, on the Chicago and Northwestern Railway. Among its industries are an extensive wind-mill factory, an iron-foundry and two large tobacco warehouses. Pop. 2,209.

EVAPORATION (Lat. *evaporatio*, from *evaporare*, to emit vapor), the formation of vapor at the free surface of a liquid. In evaporation a portion of the liquid escapes in the gaseous form from the general mass, and, rising into the space, spreads through it according to the laws of diffusion of gases. Supposing the temperature of the space above the liquid to be uniform, the evaporation proceeds (provided there is a sufficient quantity of liquid) until the space is uniformly filled with vapor. A space thus filled with the maximum quantity of vapor corresponding to the temperature of it is said to be saturated. If the dimensions of the space be diminished, a portion of the vapor is forced to condense; if the temperature of the space falls, a portion of the vapor condenses also; while if the temperature of the space is increased, the dimensions remaining unchanged, the space ceases to be saturated, because the quantity of the vapor that corresponds to saturation is greater the higher the temperature. When there is not a sufficient quantity of liquid present to saturate the space completely, the whole of the liquid evaporates and the vapor diffuses uniformly through the space. The space is then said to be non-saturated. Consult the *United States Monthly Weather Review* for March 1914. See Boiling Point; Vapor.

EVARTS, Jeremiah, American editor and missionary secretary: b. Sunderland, Vt., 3 Feb. 1781; d. Charleston, S. C., 10 May 1831. He was graduated at Yale 1802, and settled in New Haven as a lawyer. His life was largely devoted to the interests of missions, he being editor of the *Missionary Herald* for a long term and corresponding secretary of the American Board of Commissions for Foreign Missions 1821–31.

EVARTS, William Maxwell, American lawyer and statesman: b. Boston, Mass., 6 Feb. 1818; d. New York, 28 Feb. 1901. He was graduated from Yale in 1837, studied law in the Harvard Law School and the office of Daniel Lord of New York, in 1841 was admitted to the bar, and in 1849–53 was assistant district attorney in New York. In 1851 he was successful in the conduct of the prosecution of the Cuban filibusters of the *Cleopatra* expedition. He was retained in 1857 and 1860 to argue the Lemmon slave case on behalf of the State of New York against Charles O'Conor, counsel for Virginia. An active and prominent Republican, he made the speech nominating Seward for the Presidency at the Republican National Convention in Chicago in 1860, though subsequently moving to make the nomination of Lincoln unanimous. In 1861 he and Horace Greeley (q.v.) were rival candidates before the State legislature for appointment to the senatorship vacated by Seward, newly made Secretary of State. As a compromise, Ira Harris was finally appointed. Evarts' legal knowledge was frequently employed in the service of the administration. On behalf of the government he conducted numerous important cases. Among such were that before the Supreme Court to establish the right of the United States during the Civil War to deal with the captured ships as maritime prizes (1862), and that maintaining the unconstitutional character of the State laws taxing United States bonds or stock of the national banks without authorization of Congress (1865–66). He was principal counsel for Andrew Johnson (q.v.) in the President's trial for impeachment, and by his lofty judicial argument contributed much to a result which has since been regarded as most fortunate. He then went into Johnson's Cabinet as Attorney-General for the remaining year of the term. In 1872 he was chief counsel for the United States before the Geneva tribunal for settlement of the Alabama claims. As chief counsel for the Republican party before the electoral commission (q.v.) that settled the Hayes-Tilden Presidential dispute, Evarts based his argument on the constitutional idea that sovereign States must conduct their elections and govern themselves without Federal interference, pointing out that the electoral returns from Louisiana revealed the choice of Hayes electors. During Hayes' administration he was Secretary of State. He made, in 1880, a report upon the matter of American control of a trans-isthmian canal, whether at Nicaragua or Panama. His administration of the office was marked by skill in diplomatic questions, the improvement of the consular service and the publication of consular reports on the economic and commercial status of foreign lands. In 1881 he was a delegate to the international monetary conference at Paris, and in 1885 entered the United States Senate, his term expiring 3 March 1891. He was the senior partner in the law firm of Evarts, Choate and Beaman, and was frequently retained in important corporation cases. While in the Senate he made several noteworthy speeches and he also pronounced many distinguished occasional addresses, including the Centennial oration at Philadelphia in 1876.

EVE. See Adam.

EVE, Paul Fitzsimmons, American physician: b. near Augusta, Ga., 1806; d. 1877. He was graduated at Franklin College in 1826 and at the medical college of the University of Pennsylvania in 1828. He then studied for two years in Europe, and in 1831 was surgeon during the Polish Revolution. In 1832–49 he was professor of surgery in Georgia Medical College, and in Louisville 1849, the University of Nashville 1850–68, and the University of Missouri in 1868–77. He was elected president of the American Medical Association in 1857. He published over 600 articles on medical subjects, including 'Remarkable Cases in Surgery' (1857).

EVECTION (Lat. *evectio*, «a turning upward»), the second inequality in the motion of the moon, due to the attraction of the moon by the sun. Owing to the evection the position of the moon may vary 1.20 degrees. It was discovered by Hipparchus nearly 200 years before the Christian era, and more completely determined by Ptolemy.

EVELETH, ĕv'ĕ-lĕth, Minn., city of Saint Louis County, 70 miles northwest of Duluth, on the Duluth and Iron Range, and the Duluth, Missabe and Northern railroads. It has extensive dairying, lumber and iron-mining interests, a public library, etc. The commission form of government was adopted in 1913. The waterworks are the property of the municipality. Pop. 7,205.

EVELINA. When 'Evelina' appeared, in 1778, its originality created a literary sensation. That Fanny Burney, a young woman of 25, in a period of mediocre and frequently indecorous imitations, should have produced a novel keen in observations, seemly in humor and spirited in execution, won admiration everywhere. To-day some of the newness has worn off and the artistry has been partially eclipsed by the genius of later writers. But 'Evelina' will always possess distinction as an early example of the novel of domestic manners as seen through clear and subtle feminine eyes; time cannot rob it of its intrinsic freshness, and, indeed, enriches it with a certain charming quaintness. The story is told in the form of letters, continuing in this respect the tradition of 'Pamela.' But most of the Richardsonian analytical psychology is omitted and the incidents are not as exceptional as those that were necessary to regale an earlier generation. With these modifications, the stress is laid upon the presentation of contemporary English life as it would impress an Evelina. The result is a degree of immaturity and externality as compared with the penetration of Jane Austen; however, the surface of society as it is reflected in the mind of the youthful letter-writer, is portrayed with undeniable vivacity and comic power. The comedy arises chiefly from the juxtaposition of contrasting ridiculous characters. They are simplified and exaggerated almost to the point of caricature, but they possess truth enough to make them human; and the comedy to which they give rise, though verging upon farce, is always amusing and wholesome. Among the varied types moves Evelina, finally successful in winning the recognition of her deceived father and the love of her noble admirer. She is in essence Miss Burney herself; and to the spontaneity and vividness of her reactions to the life about her the novel in the last analysis owes its vitality and charm. Consult Dobson, Austin 'Life of Fanny Burney'; Macaulay, Lord, 'Essays on Madame D'Arblay,' passim; 'The Early Diary of Francis Burney,' passim.

George B. Dutton.

EVELYN, ĕv'ĕ-lĭn, **John,** English writer: b. Wotton, Surrey, 31 Oct. 1620; d. there, 27 Feb. 1706. After completing his course at Oxford he began to study law at the Middle Temple. He made some efforts in favor of the royal cause in 1659, on which account he was much favored by Charles II after his restoration. In 1662 he published 'Sculptura, or the History and Art of Chalcography or Engraving on Copper.' On the foundation of the Royal Society he was nominated one of the first Fellows and at its meetings he read a discourse on forest-trees, which formed the basis of his most celebrated publication, 'Sylva, or a Discourse of Forest-trees' (1664). He continued in favor at court after the Revolution of 1688 and was made treasurer of Greenwich Hospital. He lived for many years at Sayes Court, Deptford, and subsequently succeeded to his brother's estate of Wotton, his life being that of a loyal, worthy, public-spirited country gentleman. Evelyn left a most interesting diary, picturing his life from 1641 to 1706, first published with his correspondence in 1818. A new edition of the 'Diary' was issued in 1827; another, with life, by Wheatley, in 1879; and one by Austin Dobson in 1906.

EVENING GROSBEAK, a large finch (*Hesperiphona vespertina*) or western North America. It is olivaceous, with the crown, wings, tail and feet black; forehead and rump yellow; bill yellowish and a white patch on the wing. It inhabits the forests of northwestern Canada and the Rocky Mountain region, occasionally coming south into the upper Mississippi Valley in winter. This was the limit a few years ago, but since about 1905 the bird has extended its winter migration to eastern Canada, New England and New York, where it annually appears in increasing numbers and is reported to have bred in a few instances. Its nest is a rather rude structure placed in a tree; eggs, greenish, blotted with pale brown. This grosbeak feeds by preference on berries, especially those of the mountain ash, bittersweet and the like; also on buds, seeds, frozen apples, etc. It goes about in small flocks, uttering a variety of calls, and in spring sings in a loud, odd way, more striking than beautiful. Full accounts of the extraordinary winter-spread eastward of this interesting bird may be found in recent files of the ornithological magazines.

EVENING PRIMROSE, the common name of American plants belonging to the various genera of the family *Onagraceæ*, or evening primrose family. They are annual or biennial herbs, the yellow flowers opening either during the night or at evening. There are upwards of 40 species to which the name is applied, nearly all natives of North America, but some of them naturalized in Europe, particularly in England. Evening primroses, especially *Oenothera biennis* and related species, have attracted much interest because of experiments in plant breeding conducted with them.

EVENING or **NIGHT SCHOOLS,** schools in which instruction is given to pupils debarred, generally by reason of being wage-earners, from the advantages of the day schools. Evening schools arose at a time when compulsory education was not as widespread as at present and when more children were consequently growing up without instruction. Beginning with the idea of imparting the more rudimentary branches, such schools have extended their scope until in some cases they form departments of institutions devoted to the study of art, science or technology. In some of its wider aspects their work has become allied to the university extension movement.

Central Europe.— The evening schools in central Europe are largely the outgrowth of Sunday-schools which shortly after the middle of the 18th century began to add elementary secular instruction to religious teaching. The school age limit being less than at present, a review or continuation of school studies seemed of great importance. In Germany, beginning with lessons in arithmetic and the mother tongue, the range of instruction gradually widened. Some states made attendance obligatory at such Sunday-schools in certain cases. At present the term *Fortbildungsschulen* (literally «further developing schools») is applied in Germany and Switzerland to schools intended for pupils who have passed the elementary school age and yet study the elementary branches. These *Fortbildungsschulen* are open only in winter and rarely require more than six hours of attendance in the week. Their object is to give boys a practical turn of mind by instruction fitted to bear upon their future callings. They do not furnish instruction in foreign or dead languages or the higher mathematics. In Switzerland, all the 25 cantons have systems of *Fortbildungsschulen* held on Sundays, holidays and in the evening. The evening schools of France, now numbering many thousands, appear not to date back farther than 1820. The tendency is toward technical training rather than liberal studies, but there are also evening classes or lectures open to those who desire a broader culture.

Great Britain.— In 1806 a benevolent association founded an evening school in Bristol, England, for young persons who were working for a living. In 1811 a school for adults was started in Bala, Wales, and others shortly followed in London and other towns. Such schools were originally supported by private benevolence or local funds, but the government, after a time, saw the wisdom of aiding them by grants. Since 1861 this aid has been greatly increased, but is not intended to supersede local effort. According to regulations issued by the Board of Education of Great Britain for the school year ending 31 July 1903, local funds were expected to meet 25 per cent of expenditure for the evening schools and such expenditure to be approved by the board. The schools must not be conducted for private profit. They are under supervision and examination by the board, are subject to its examinations and must report to it. Schools charging no fees are not generally recognized. Instruction must begin after 4 P. M. or on Saturday after 1 P. M. Students under 12 are not admitted nor those who attend day schools under government inspection (art students being excepted). The courses are as follows: (1) Literary and commercial; (2) art; (3) manual instruction; (4) mathematics and science; (5) home occupations and industries. The last course is largely for girls and includes "home nursing." The boys may take a course in ambulance training, in gardening, etc. Throughout London the evening schools give instruction in gymnastics and swimming and life-saving methods have been taught to some of the pupils. Evening classes have been held in London at various institutions such as University College, King's College, South Kensington Museum, etc. In the so-called provincial colleges evening classes constitute an important part of the work. Special schools give instruction in commercial branches, courses for women, art, technology and advanced science. The Education Department of Great Britain reported 1911–12 for the evening schools of England and Wales 7,749 schools inspected and 222,776 pupils enrolled.

In Scotland the Parliamentary grants for evening schools are administered by the Scotch Education Department, and are used as in England to supplement locally raised funds. The courses of study cover about the same ground. Gaelic is found on the curriculum, and agriculture, horticulture, navigation, military drill and swimming may all be learned.

Evening schools also exist in most of the countries of Europe and republics of Latin America; and in Canada they are specially flourishing.

United States.—The first successful evening schools of the United States began near the middle of the 19th century, although an attempt without permanent results was made in New York in 1834. Boston and other large cities soon followed and evening schools gradually became a recognized part of the common school system. The aims of the pupils in the evening schools being generally very practical and their minds more mature, the methods and subjects of instruction are varied from those of the day schools. Branches relating to commercial and industrial occupations are naturally preferred. Free evening schools for instruction in drawing exist in some cities and drawing is included in the curriculum of some of the regular schools. Evening high schools have become common and in addition to these extensions of the public school system, various important institutions, such as Cooper Union, New York; the Maryland Institute, Baltimore, and the Drexel Institute, Philadelphia, offer evening courses of a highly varied and very valuable character, and of a range resembling that of the day classes. Free lectures also connect such schools with university extension methods.

The evening schools of the Young Men's Christian Association in the United States, in 1914, had 83,771 students, while the Young Women's Christian Association had 65,129. In the business and commercial schools reporting to the United States Bureau of Education in 1912, there were 134,818 students in evening classes. The evening schools connected with the city school system of the United States reported, in 1912, for cities over 10,000 inhabitants, a total of 204 cities, 9,476 teachers. Forty-one of these schools were in Massachusetts and the remainder were scattered over the other States. In 1911 Massachusetts added greatly to the efficiency of the State vocational education by extending its help in a very liberal and broad manner to the night schools. The greatest number of night schools are still to be found in the North Atlantic States and the smallest number in the South Central States and Territories.

EVENING STAR (also called **HESPERUS** and **VESPER**), the name given to any one of the planets seen above the horizon before midnight; especially applied to the planet Venus on account of its brightness. Mars, Jupiter and Saturn are the other chief evening stars.

EVERDINGEN, ev'er-ding-en, **Aldart** or Allart van, Dutch landscape painter: b. Alkmaar, 1621; d. Amsterdam, November 1675. His sea pieces, in which he represents the disturbed elements with great truth to nature, are particularly celebrated. In forest scenes, too, he was a master. He is known also as an able engraver by his plates to 'Reynard the Fox.'

EVEREST, Sɪʀ **George**, English military engineer: b. in Wales, 1790; d. 1866. He was educated at the Royal Military Academy at Woolwich, was commissioned second lieutenant in the Bengal artillery, and took part in a survey of Java and in engineering work on the Ganges. Later he was engaged on a survey of India and in 1830 was appointed surveyor-general of India, from which post he retired in 1843. He was knighted in 1861 and was elected vice-president of the Royal Geographical Society in 1862. Mount Everest was named in his honor. He published 'An Account of the Measurement of Two Sections of the Meridional Arc of India' (1847).

EVEREST, Mount, the highest known mountain in the world, is a peak of the Himalays, in Nepal near the Tibet frontier. It is 29,002 feet high, or about five and one-half miles. It was named in honor of Sir George Everest, an Englishman who for a time was surveyor-general of India. This mountain has been confused with Gaurisankar, whose twin peaks lie 36 miles west of Everest.

EVERETT, Alexander Hill, American diplomatist: b. Boston, Mass., 19 March 1792; d. Canton, China, 29 May 1847. He was graduated from Harvard in 1806, was admitted to the bar, and, after serving as chargé-d'affaires at The Hague, was Minister to Spain in 1825–29. He then became editor of the *North American Review,* and was elected to the State legislature of Massachusetts. In 1840 he was appointed special agent to Cuba, and from 1845 until his death he was a commissioner to China. To the *North American Review* he contributed a large number of essays. While resident in Cuba he was appointed to the presidency of Jefferson College, but ill health compelled his return north. He was at first a member of the National Republican or Whig party, but later supported Jackson. His work on 'Europe, or a General Survey of the Political Situation of the Principal Powers, with Conjectures on their Future Prospects' (1822) was highly esteemed in its time, and was published in French, Spanish and German. In 1827 appeared his somewhat similar book on 'America.' Among his other volumes are 'Critical and Miscellaneous Essays' (1st series, 1845; 2d series, 1847) and 'Poems' (1845). He wrote also biographies of Patrick Henry and Joseph Warren for Sparks' series of 'American Biography.' Other works were 'New Ideas on Population' (1822); and orations on 'The French Revolution'; 'The Battle of New Orleans,' and 'The Battle of Bunker Hill.'

EVERETT, Charles Carroll, American Unitarian clergyman: b. Brunswick, Me., 19 June 1829; d. Cambridge, Mass., 17 Oct. 1900. He was graduated at Bowdoin College, and afterward studied at the University of Berlin. He returned to Bowdoin College, where he was tutor for two years, librarian for five and professor of modern languages 1855–57. He was ordained pastor of the Independent Unitarian Congregational Church in Bangor, Me., 1859, but resigned in 1869 to become professor of theology in Harvard Divinity School, and was dean of the school from 1879 till his death. Among his published works are 'The Science of Thought' (1869); 'Religions Before Christianity' (1883); 'Fichte's Science of Knowledge' (1884); 'The Gospel of Paul' (1893); 'Psychological Elements of Religious Faith' (1902); 'Immortality and Other Essays' (1902); 'Theism and Christian Faith' (1909).

EVERETT, David, American writer: b. Princeton, Mass., 29 March 1770; d. Marietta, Ohio, 21 Dec. 1813. He studied law in Boston, and while there wrote for *Russell's Gazette* and a literary paper called the *Nightingale.* He edited the Boston *Patriot* (1809), and the *Pilot* (1812). His works include 'The Rights and Duties of Nations,' an essay; 'Darenzel,' a tragedy (1800); 'Common Sense in Deshabille, or the Farmer's Monitor.' He wrote the well-known lines beginning —

> You'd scarce expect one of my age
> To speak in public on the stage.

EVERETT, Edward, American statesman and orator, brother of A. H. Everett (q.v.): b. Dorchester, Mass., 11 April 1794; d. Boston, 15 Jan. 1865. He was graduated from Harvard in 1811, pursued studies in divinity, became in 1813 pastor of the Unitarian Church, Brattle street, Boston, and in 1814 published his 'Defence of Christianity' in reply to the 'Grounds of Christianity Examined' of George G. English. In 1814 he was also chosen to occupy the newly established chair of Greek literature. To qualify himself for the post he went to Europe in 1815 for a course of travel and study. He was for two years at the University of Göttingen, and later sojourned in France, England, Italy and Greece. In 1819 he returned to enter on the duties of his professorship. He became also in 1820 the editor of the *North American Review,* and in 1820–24 contributed to it about 50 papers. He was elected to Congress in 1824, and by successive re-elections held his seat until 1834. Throughout this period he was a member of the Committee on Foreign Relations and in the 20th Congress its chairman. He drew either the majority or the minority report of many select committees. In politics he was a National Republican (Whig). He declined a renomination to Congress in 1834. In 1835 he was elected governor of Massachusetts, subsequently was three times re-elected, holding the office for four years, and in 1839 was defeated by a majority of one vote. While in Europe in 1840 he was appointed Minister Plenipotentiary to England. At a time when there were many points of controversy between England and the United States he was successful in the adjustment of numerous important questions. He declined in 1843 an appointment as commissioner to China, and in 1845 was recalled. In 1846–49 he was president of Harvard, and in 1852 he became Secretary of State in Fillmore's Cabinet for the last four months of the latter's administration. During this brief term of office he settled several difficult matters. In a diplomatic note he declined the joint proposition of Great Britain and France that the United States should enter a tripartite convention which should guarantee to Spain exclusive possession of Cuba in perpetuity. Before he left the Department of State he was elected to the Senate. There he vigorously opposed the Kansas-Nebraska bill for the repeal of the Missouri Compromise. He resigned his seat in May 1854. From 1856 to 1859 he pronounced his well-known lecture on Washington in all on 122 occasions, realizing thereby nearly $60,000, which he turned into the treasury of the Mount Vernon Association for the purchase of Mount Vernon by private subscription. He prepared a collective edition of the orations and speeches of Daniel Webster, with an introductory biographical notice; wrote a life of General Stark for Sparks' 'American Biography'; and prepared for the 'Encyclopædia

Britannica,' at the instance of Macaulay, a life of Washington, afterwards separately published (1860). In 1860 he reluctantly became a candidate for the Vice-Presidency on the Constitutional-Union, or, as it was sometimes known, the Bell-Everett ticket — John Bell (q.v.) being the Presidential candidate. The ticket received 39 electoral votes,— those of Kentucky, Tennessee and Virginia. During the Civil War he was a staunch Unionist, but disposed also toward a policy of reconciliation. He delivered the address at the dedication of the national cemetery at Gettysburg, Pa., 19 Nov. 1863, and in the Presidential election of 1864 as an elector-at-large he cast his ballot for Lincoln and Johnson. His last public appearance was at Faneuil Hall, 9 Jan. 1865, where he spoke on behalf of the sufferers at Savannah.

Everett was noteworthy in his versatility,— a preacher and theologian, a Greek scholar, an editor and author, orator, diplomat and statesman. He attracted much attention by his pulpit eloquence. As a Grecian he was thoroughly equipped and gave in his time a considerable stimulus in America to the study of Greek letters, antiquities and history. His literary productions were carefully wrought and marked by his scholarship; but, through interruptions by other activities, they were limited, so far as published, chiefly to his *North American* articles and the above-mentioned 'Defence of Christianity.' He did not complete a treatise on public law — a subject he was eminently fitted to expound,— on which he was for some time at work. His utterances in Congress showed him rather the orator than the debater, and while a member of the lower house he stood apart from much of party contention as it there appeared. He took, however, a prominent part in discussion, and, as indicated above, was a most valuable committee member. While he was a foreign minister the general negotiations regarding the northeastern boundary and Oregon difficulties were transferred from him through the appointment by Great Britain of Ashburton as special ambassador, yet many of the points in dispute were left to Everett's skilful adjustment. As representative, secretary and senator he held to the possibility of saving the Union by compromise on the slavery question, but, the war once begun, he was among the ablest supporters and advisers of the Federal government. It is as an orator that Everett is best known. His addresses were generally written with elaborate care, and were of the Ciceronian type in the knowledge and culture displayed as well as in their finished rhetoric. More fully than any other American orator he combined the resources of learning with the arts of the speaker. He lacked Webster's fire and Phillips' magic, but his manner was always impressive and well-poised. Even in his own time, however, his oratory did not escape criticism for lack of directness and artificiality, and this charge has frequently been made against it. He may be called the pioneer in the American "lyceum," which long had such a reputation. His 'Orations and Speeches on Various Occasions' were collected in four volumes in 1853–68. Consult also Dana, 'An Address upon the Life and Services of Edward Everett' (Cambridge 1865); 'A Memoir of Edward Everett' (Boston 1865); and Whipple's remarks in 'Character and Characteristic Men,' pp. 243–252 (1866).

EVERETT, James, English clergyman: b. Alnwick, Northumberland, 16 May 1784; d. Cumberland, 10 May 1872. In 1807 he began to preach as a Wesleyan Methodist minister. In 1821 he retired until 1834 and was in the book business at Sheffield, later at Manchester. In 1842 his health compelled a second retirement. From 1846 to 1848 he published the notorious 'Fly Sheets' intended to expose the inefficiency in the affairs of the Wesleyan Methodist Connection. This led to his expulsion from the Wesleyan ministry along with his friends William Griffith and S. Dunn. They formed the Wesleyan Reform Union which later united with other liberal Methodists and formed the United Methodist Free Churches. He was president of the Conference of this body. He was a voluminous author and a poet of no mean ability. His most noted book was 'The Village Blacksmith' (1831), which passed through many editions. He was also the biographer of his friend Adam Clark, the great commentator. He assisted John Holland in the preparation of the life of the poet James Montgomery (7 vols., 1854).

EVERETT, Joseph David, English physicist: b. Rushmore, near Ipswich, 11 Sept. 1831; d. 9 Aug. 1904. He was educated at Glasgow University; was professor of mathematics, King's College, Nova Scotia, 1859–64; assistant in mathematics, Glasgow University, 1864–67; and professor of natural philosophy in Queen's College, Belfast, 1867–97. He took a leading part in the selection and naming of dynamical and electrical units, and drafted a report (1873), the adoption of which originated the C.G.S. system now generally employed. His 'Universal Proportion Table,' was the first application of the parallel column arrangement for obtaining a slide-rule with very open scale. His English version of M. Privat-Deschanel's 'Physics' (1870) was so largely rewritten as to be almost an original work. Other of his publications are 'Centimètre-Gramme-Second System of Units' (1875); 'Elementary Text-Book of Physics' (1877); 'Shorthand for General Use' (1877); 'Vibratory Motion and Sound' (1882); 'Batteries of Natural Philosophy' (1887), etc.

EVERETT, William, American educator, youngest son of Edward Everett (q.v.): b. Watertown, Mass., 10 Oct. 1839; d. Quincy, Mass., 15 Feb. 1910. From 1870 to 1877 he was assistant professor of Latin at Harvard. He was master of Adams Academy at Quincy, Mass., 1877–93 and in 1897, and was member of Congress 1893–95. He was the author of 'On the Cam' (1865); 'Changing Base' (1868), 'Double Play' (1870), two books for boys; a poem, 'Hesione, or Europe Unchained' (1869); 'School Sermons' (1881); 'Thine, Not Mine'; and many pamphlets on political, literary and religious subjects.

EVERETT, Mass., city in Middlesex County, three miles north of Boston, on the Boston and Maine Railway and with connection by electric surface lines with Lynn, Salem, Chelsea, Boston and adjacent towns. According to the report of the 13th United States census there were in Everett 62 establishments with a capital of $22,905,000, employing 2,030 wage-earners at wages amounting to $1,979,000 and having a product valued at $8,747,000. The most important manufactories are a chemical plant, structural iron foundries, steel works and gas and coke works, radiators, shoes, coal-tar products, leather, beds, concrete blocks, tools, wagons, boxes, trunks, etc. The United States census of manufactures for 1914 showed within the city limits 85 industrial establishments of factory grade, employing 3,788 persons; 3,226 being wage-earners receiving annually a total of $2,047,000 in wages. The capital invested aggregated $26,409,000 and the year's output was valued at $13,219,000; of this, $6,708,000 was the value added by manufacture. There are two public libraries, the Shute Memorial and the Parlin Memorial, and the Whidden Memorial Hospital is also located here. Everett was settled in 1643 and until 1870 it was a part of Malden. It received its city charter in 1892. Its chief development was in the decade 1890–1900. The government is administered by a mayor, chosen annually, and a municipal council in which members of the lower chamber are elected by wards for one year, those of the upper chamber at large for two years. The more important of the subordinate officials are nominated by the mayor and confirmed by the council; the others are chosen by the council. Pop. (1920) 40,120.

EVERETT, Wash., city, county-seat of Snohomish County, on Puget Sound, on the Northern Pacific, the Great Northern, the Chicago, Milwaukee and Saint Paul railroads, about 55 miles east by north of Tacoma and 30 miles north of Seattle. It has an excellent harbor with water communication with the Pacific and agricultural lands, forests and valuable mines nearby. Such a combination of natural resources is not common. Everett is the entrepôt of the towns and camps in a rich mining belt. Within a district 36 miles long and 20 miles wide, the Monte Cristo, Great Lake, Silver Creek, Troublesome, Sultan, Stillaguamish and North Fork district send ores to the great smelter in Everett and in various ways contribute naturally to the substantial growth of the city. The city trades extensively in lumber, having some of the largest plants in the Northwest. Red-cedar shingles are the most important products. The smelter and refinery plant obtains mineral from all over the Northwest. The city contains railroad shops, flour- and lumber-mills, large shipyards, sash and door factories, saw and shingle mills and one of the two plants in the United States for saving arsenic from smelter fumes. There are several well-built brick buildings, churches, a theatre, graded streets, electric light and motor power, sewers, school houses, newspapers, a Carnegie library, two hospitals and the United States customs and assayer's offices, etc. Its school system is excellent. Everett was settled in 1891, incorporated in 1893. Its growth has been rapid because of its favorable situation as a commercial port, its transportation facilities and its nearness to extensive forests. It has adopted the commission form of government. Pop. (1920) 27,644.

EVERETT-GREEN, Evelyn, English writer: b. London, 17 Nov. 1856. She is the daughter of Mary Wood Everett-Green (q.v.). She was educated at Bedford College, London; studied music at the London Academy; and for two years was a nurse in a London hospital. Since 1883 she has devoted herself entirely to writing. Among her many published works the best known are 'The Last of the Dacres' (1886); 'St. Wynfriths' (1893); 'Dare Lorimer's Heritage' (1892); 'Dominique's Vengeance'; 'Shut In' (1894); 'Over the Sea Wall' (1894); 'Arnold Inglehurst the Preacher' (1895); 'Squib: His Friends' (1896); 'French and English' (1898); 'Odeyne's Marriage' (1899); 'The Heir of Haskett Hall' (1899); 'Monica' (1900); 'After Worcester' (1901); 'For the Faith' (1901); 'Olivia's Experiment' (1901); 'In Fair Granada' (1901); 'Fallen Fortunes' (1902); 'Alwyn Ravendale' (1902); 'Hero of the Highlands' (1903) 'Dufferin's Keep' (1905); 'The Magic Island' (1906); 'Married in Haste' (1907); 'The House of Silence' (1910); 'The Evolution of Sara' (1911); 'Blackladies' (1914); 'The Double House' (1915); 'Confirmed Bachelor' (1915).

EVERETT-GREEN, Mary Anne (Wood), English author: b. Sheffield, 1818; d. London, 1 Nov. 1895. She moved to London in 1841 and for nearly 40 years was employed in the record office as one of the editors of the 'Rolls Series of State Paper Calendars.' The works edited by her include 'Letters of Royal and Illustrious Ladies of Great Britain' (1846); 'Diary of John Rous' (1856); 'Letters of Henrietta Maria' (1857); 'Life of William Whitingham' (1870). Her only original work was the 'Lives of the Princesses of England from the Norman Conquest, (1850–55).

EVERGLADES. The name given to a vast tract of land and water in the southernmost part of Florida, a region, though under the very eyes of the early pioneers and bordered by our own advanced lines of commerce and travel, remained practically undiscovered until the first decade of the 20th century. It is not a marsh, a swamp nor a stagnant pool; neither land nor water. No white man had penetrated it for any great distance, either by boat or on foot, owing to the variance in the depths of the water and the dense tangle of saw-grass, scrub-willow and custard-apple which abounded there. The State of Florida is one immense mountain top of limestone formation, covered with a network of pot-holes, varying in size from a few feet to thousands of acres; it has countless lakes of fresh water, fed by springs and subterranean streams, and among these is Lake Okeechobee, named by the Indians Lake Mayaimi; at the southern end of the lake began the district known as the Everglades. This vast marsh lay in Dade, Lee, Monroe and Palm Beach counties, extending southward from the lake about 110 miles and having a breadth of about 45 miles. Over the rocky bottom of this region lay a layer of muck, formed of alluvial deposit and decayed vegetation, varying in thickness from a few inches to several feet, and in this muck the saw-grass found its origin, took root and sometimes grows to a height of 10 feet. This saw-grass is one of the most peculiar and interesting features of the Everglades. Shooting up rapidly, pale green in color, as it goes through the water, fading in the sunlight to a dull golden tint, its blades are tough as bamboo, its edges sharp and jagged as a saw. Toward the western end of the lake it is interwoven with wild myrtle and formed an almost impassable barrier, running through the entire length of the lake, although there are some passages through it, known familiarly to the Seminole, but which are almost impossible to locate by the explorer.

Scattered along the eastern and western edges of the marsh are numerous islands, some very small, others hundreds of acres in extent, covered with luxuriant growths of live oaks and bays, interspersed with wild cucumber, lemon and orange trees. The papaya, the custard-apple and prickly-ash are of frequent occurrence, and here and there may be seen the cabbage palmetto, the pine and the rubber-tree.

The first white man to enter this mysterious, silent country was a Spaniard, one Escalente de Fontenada, who, after being shipwrecked in the Strait of Florida, was made captive and slave by the great cacique, Calos, but he has left us only a few meagre details of his experiences during his 17 years of captivity. Frequent expeditions of exploration were sent out by the United States government from 1847 to 1900 to penetrate this wilderness if possible, but all failed, each bringing the explorers, after days of hardships and privations, to the conclusion that the Everglades, though fascinating in its wildness, was a region to be avoided; a forest of trees, rank undergrowth and saw-grass, impenetrable and practically valueless; and the lake a mixture of currents which seemed to begin without reason, led nowhere in particular and generally ended in a comparatively still pool, with a labyrinth of passages from which there seemed no direct egress.

Animal life in the Everglades is fairly abundant, deer being found on both eastern and western shores, otter are plentiful, alligators and crocodile quite numerous, while the snake is there in large numbers. The Glades were once the breeding place for the egret, the ibis and the heron, and, while many of them are yet to be found, the plume hunter has made such inroads that all are nearly extinct. Small flies and gnats are found where the foliage is thick, as in all regions.

Probably the most interesting of the denizens of the Everglades are the Seminole Indians, divided into two clans or families, the Muskokis and the Mikasukes, who for hundreds of years have inhabited this section of Florida, defying all attempts to dispossess them, and in 1835, during the Seminole War, killing a large number of troops, under Major Dade, sent against them. The shores of the streams by which the Glades are entered are covered with the cocoa-plum tree, which also grows about the edge of the Glades, producing a blue fruit on the eastern and a white fruit on the western edge. Wherever the land is sufficiently dry, the coontie-plant, really the Florida arrow-root, grows, and from these the Indian gets his sustenance, extracting flour and starch from the roots.

The physical features of the Everglades are beyond description, beauty and charm blending in a strange, sweet sense of mystery. In dry weather, when the water is low, it is possible to drive into the Glades, but the most beautiful and ideal approach is by water, all the rivers of the Glades finding their way to the sea, some by the rocky channels worn by their own age-long floods, and some through miles of wandering curves, their shores lined with forests of mangrove trees.

Looking into these forests, only the dark waters are to be seen. Ascending, the fresh water of the Glades overcomes the brackish tidal water, and the cocoa-plum takes the place of the mangrove. Still farther up the river, the cocoa-plum gives way to the cypress, and pond lilies abound, the whole panorama of shifting green,— the lemon-like foliage of the cocoa-plum, the dark olive of the mangrove, and the lighter green of the cypress, enlivened by the sunlight,— making a scene of unique beauty.

In the perspective, when the water is low, the Glades, with its numerous islands and with the tall golden grass, gleaming in the sunshine, waving over a field of silver, ending with a sky-line of blue, has a charm for the eye, unequaled, perhaps, by any other spot in the world, and gives to the sightseer or explorer that subtle impulse and uncontrollable desire to adventure into this never-ending plain of grass and water, never reaching the goal but always seeking for something that lies just beyond the horizon.

The climate of the Everglades is faultless, showing no extremes of heat or cold, nor is it subject to sudden change. There are two seasons in the year, the rainy and dry, the latter including June and September, although light showers may be expected at any season, and in the autumn the humidity is very high. Malaria is seldom heard of, the pure air giving the best assurance of health, and it is small wonder that the ancient explorers spent years here trying to find the «Fountain of Youth.»

The title to the Everglades is vested in the trustees of the Internal Improvement Fund of Florida, under patents from the Department of the Interior of the United States, by virtue of an act of Congress of 1850, and they promoted efforts to drain the Glades and open it to actual settlers, the cost of reclamation being small compared to the great agricultural value.

A private company set about building a drainage canal from Lake Okeechobee to the New River in 1881, but owing to faulty planning the project failed. A definite plan was finally outlined by the State in 1906 and work was promptly begun. This plan provided for a series of main canals to be dredged from the coast to the lake, with the purpose in view of lowering the level of the lake sufficiently to stop the overflow of its waters into the Everglades, and to lower the water level there by means of these same canals. At the present time five canals of a total length of over 200 miles and of an average depth of 5 feet with a 60-foot width have been completed and have served to reclaim about 1,000,000 acres, although certain acres have not received sufficient protection against overflow during heavy raining season. The success of this work proved that a great part of the remainder — 2,700,000 acres — could in time be reclaimed by the natural incline of the surface, from the flood source to the rivers entering the sea. A contract was let to a dredging company of Baltimore to excavate nine canals aggregating 425 miles. All of these waterways are now under construction, with widths ranging from 50 to 60 feet for the larger, and an average of 25 feet on three smaller ones. The depth of the main canals ranges from five to seven feet, while some average four feet. The excavation is accomplished by huge dredges and ditching machines of the clamshell, dipper and suction types according to the nature of the formation in which they are employed. Floating dynamite plants are employed for rock excavation, and are equipped with steam-driven shovel buckets for removing the rock blown out from the bottom of the cut. The work is proceeding at such a pace that soon about one-third of the entire area will be ready for the farmer and the settler. The Everglades, where drained, are being occupied by settlers from all parts of the country. Every kind of fruit and vegetable raised in the temperate zone can be cultivated at a profit in Florida. Oranges, bananas, pineapples and other varieties may be added to the list. The farms under cultivation in the reclaimed portion prove the truth of this. The new land is being sold in large tracts by the State authorities to be divided into truck and other farms, but the possibility of producing sugar is perhaps the most important. The total cost of the reclamation project under the plan of 1906 has been about $4,500,000 or $1.125 per acre. For acts, reports and official papers relating to the reclamation scheme, and giving much valuable information concerning the region, consult 'The Everglades,' Senate Document No. 89, 62d Congress, 1st Session (Washington 1911); 'Florida Everglades,' Report of the Everglades Engineering Commission, Senate Document No. 379, 63d Congress, 2d Session (ib. 1914); Rhodes and Dumont, 'Guide to Florida' (New York 1912) also Willey, D. A., «Draining the Everglades,» in *Scientific American*, Vol. CIV, No. 2 (21 Jan. 1911); id., «Reclaiming the Everglades,» in *Scientific American*, Vol. CXV, No. 12 (16 Sept. 1916); and Dimock, «The Passing of a Wilderness» in *Scribner's Magazine*, Vol. XLI (March 1907).

EVERGREEN, Ala., town, county-seat of Conecuh County, on the Louisville and Nashville Railroad, about 100 miles northeast of Mobile. An agricultural school and experiment station and the State Baptist Orphan Asylum are located here. Its mineral springs and agreeable climate make it a winter resort. The town is interested chiefly in agriculture, lumbering and market gardening, and contains a veneer mill, box factory and saw mill. The waterworks and electric-light plant are owned by the municipality. Pop. (1920) 2,000.

EVERGREEN ISLE, a poetical name given to Ireland.

EVERGREENS. Those plants which imperceptibly shed their leaves and acquire new foliage, without noticeable change in their aspect, and those which, like certain biennials and alpines, maintain their leaves throughout the winter season so that they may make a quick start in the spring, are called evergreens. In the northern countries cultivated evergreens are roughly divided into two groups popularly called conifers and «broad-leaved» evergreens, the latter including laurels, rhododendrons, hollies, box, etc. The tropical flora is chiefly evergreen, and some trees, like the Magnolia glauca, that shed their foliage in the north, retain it in the south.

This evergreen character, especially where the plants are subjected to extremes of drought and wetness, or of heat and cold, has given rise to many devices for regulating transpiration or the deleterious effects of too much moisture, such as the rolling of leaves, waxy deposits on the leaves, and various curious arrangements of pits, hairs and cells. Wherever the foliage is persistent for several years, as is the case of the holly and of many tropical trees and epiphytes, it is often thick and leathery, being provided with a thickened cuticle, especially where the leaf undergoes drought periodically. Other evergreens like cacti and rock-plants become fleshy or succulent, when living in arid conditions, storing water in their tissues and sometimes retaining it there with mucilaginous juices and salts. Furthermore they are apt to assume a more or less cylindrical shape in both leaf and stem, the foliage often being reduced to mere needles and scales, or being absent entirely. This rodlike, nearly leafless, condition is particularly noticeable in the so-called whip-plants of arid regions, which are reduced to switch branches with scales for leaves, thus greatly reducing the evaporating surface during the heated term. They often occur on the Mediterranean shores where another type of device for controlling exhalation is conspicuous; for there the evergreens are really gray, like the lavender, hoary with their envelopes of hair, just as some alpine plants, notably the edelweiss, are smothered in felted hairs. In the shadowless forests of Australia many trees reduce their evaporating surfaces by presenting only the edges of their leaves to the midday sun.

Coniferous evergreens furnish some of our most valuable forest products in the way of timber, naval stores and tanning materials, and also various food products as nuts and bark, chiefly of value to the aborigine. One or two, as the West Indian yacca and the yew, furnish cabinet woods, but the latter seems to have been used wherever it grows, chiefly for bows. Most of them also are useful for windbreaks, hedges or for ornamental planting, where shelter, concealment or winter-color is desired; various species being adapted for differing soils and climates. Some of them, as the arbor-vitae and yew, stand shearing well, and can be pruned into sundry geometrical forms; holly and box share this distinction, and the custom was formerly carried into grotesque excess in topiary gardening.

Laurel, rhododendrons and other «broad-leaved» evergreens are often valuable in shrubberies not only on account of their winter verdure but because they also have handsome blossoms or fruit; they moreover afford shelter for birds.

Their long life and perpetual verdure have caused many of the evergreen tribe, particularly the fir and mistletoe, to be included among sacred plants; and they have become adopted as symbols of immortality, of resurrection and of perennial remembrance, at funeral services and in graveyards. Several kinds, as the yew, served as «palms» on Palm Sunday. On the other hand, yews and cypresses, especially the latter, serve as emblems of eternal death and are frequently referred to in this connection in classical literature «with every baleful green denoting death.»

Evergreens are favorite plants for decorating during the Christmas holidays; in England a certain order was observed in their disposal, as we find in Herrick's 'Ceremonies for Candlemas Eve':

Down with the rosemary and bays,
Down with the mistletoe;
Instead of holly, now upraise,
The greener box, for show.

Then youthful box which now hath grace
Your houses to renew,
Grown old, surrender must his place
Unto the crisped yew.

Presumably these holiday garlands and decorations of evergreens — rosemary, ivy, laurel, box, holly and mistletoe — were survivals, with the Christmas tree, of pagan ceremonies and tree-worship, more or less incorporated in the rites of the early Christian churches; the mistletoe, however, was so intimately connected with Druidical rites that it was excluded from the Church decorations. There is a large trade in these Christmas greens, both of the foreign and native kinds, the latter including southern smilax, long-eared pine, ground-pine and hemlock.

HELEN INGERSOLL.

EVERHART, Benjamin Matlack, American botanist: b. West Chester, Pa., 24 April 1818; d. 22 Sept. 1904. After a successful business career in his native town and Charleston, S. C., he retired in 1867 and devoted himself to botanical study, becoming a recognized authority on cryptogamic botany. With J. B. Ellis, of New Jersey, he published in 50 parts a notable work entitled 'The Century of North American Fungi,' describing 5,000 species, many of which were discovered by Everhart. With W. A. Kellerman, professor of botany in Ohio State University, he founded and edited 'The Journal of Mycology,' to which he contributed numerous articles on his specialty. Several new fungi discovered by him have been named after him by his fellow-scientists.

EVERLASTING FLOWERS, a name applied to certain plants belonging to the family *Asteraceæ*, from the fact that when dried they suffer little change in their appearance. By the French they are called *immortelles*, and this name has been introduced into our own language as applied to wreaths made of such flowers to be placed beside recent graves as emblems of immortality. The plants to which this name is most commonly applied belong to the genus *Helichrysum*, and are natives of southern Africa and Australia; but it is also given in America to members of allied genera, such as *Antennaria, Gnaphalium, Anaphalis*, etc. The native women of Australia are fond of decorating their hair with the flowers of *Helichrysum elatum* and *Helichrysum bracteatum*. See AMARANTHUS.

EVERLASTING GOSPEL, The. See JOACHIM DE FLORIS.

EVERLASTING MERCY, The. 'The Everlastng Mercy' (1911), by John Masefield, is a poem of some 1,800 lines, telling the old story of a man's degradation and redemption. Life, while ruthlessly bringing every man's sowing to the harvest, is always merciful enough to keep open the way that leadeth out of evil. Masefield prefers the familiar simile of the Christ knocking at the door of one's inner self. It is the story of one Saul Kane (the name is suggestive of two biblical characters and incidents), who at the age of 20 «was tokened to the devil.» The crisis in his depravity is hastened by the fight with Billy Myers, precipitated by a poaching adventure and succeeded by a drunken debauch at «the Lion.» After «three long hours of gin and smokes» with every nerve on edge and mind a-swirl in a tumult of accusing thoughts his reason reeled and a madness that was not wholly from «Hot Hollands punch on top of stout» seized him. Throwing boots and torn clothes and glasses through the window he leaps out and rushes through the street,

A naked madman waving grand
A blazing lamp in either hand

He wakens the sleeping town with a furious ringing of the fire bell. When the firemen rush toward him he flees and they, because of his nakedness and his wild yelling,

I'm fire of hell come up this minute
To burn this town and all that's in it.

think him an escaped lunatic. Having shaken his pursuers he returns to «the Lion» and sleeps. On waking a second spell of madness rushes him to the street. On seeing «old puffing parson,» with exaggerated rudeness he bars his path and pours out a scathing criticism of the established religious and social order, not sparing even the parson:

O, what are you, and what you preach,
And what you do, and what you teach
Is not God's Word, nor honest schism,
But Devil's cant and pauperism.

Masefield is at his best when criticizing the social order, but the sanity of his spirit is well disclosed in the parson's pointed and effective reply. Saul Kane drunk and exaggeratedly boastful in his degradation is not bad all through. Before the fight began he looked at

The five and forty human faces
Inflamed by drink and going to races,
Faces of men who'd never been
Merry or true or live or clean.

It is a man's sympathy rather than a drunkard's that prompts Kane to comfort little Jimmy Jaggard who has lost his mother in the market place. Jimmy's mother hurries to the scene as soon as she is warned that «Saul Kane, the drunken braggard,» is talking to her Jimmy, and in her crude, unlettered and forceful way she pictures Kane to himself and to the assembled crowd with pitiless accuracy, so that he confesses that

This old mother made me see
What harm I done by being me.

And

Summat she was, or looked, or said,
Went home and made me hang my head.
I slunk away into the night
Knowing deep down that she was right.

Put thus to shame before himself and the people he drowns the mortification he felt in deeper drunkenness which spurs him to a more brazen assertion of depravity as exhibited in the insult offered to Miss Bourne, who regularly visited the saloons «To bring the drunkards' souls to grace,» an act which shocked even his companions in drunkenness. This insult recoiled upon him with such force from the clean soul and simple word of Miss Bourne that it caused something to snap inside his brain. The remaining part of the poem describes his wandering «out into darkness, out to night,» merging into the dawn of a new day, the birth of a new self, and the finding of the «everlasting mercy, Christ.» The whole poem grips and holds the reader with the intensity of its realism and speed of action. One forgets that it is verse and feels the touch of flesh and blood.

EVERLASTING PEA, a popular name for plants of the genus *Lathyrus*, of the pea family. In the United States it is applied to the beach pea (*L. maritimus*), because it often blossoms until late in the fall. In Europe the everlasting pea is *L. latifolius*, a cultivated plant like the sweet pea, sometimes cultivated for ornament in North America.

EVERMANN, Barton Warren, American ichthyologist: b. Monroe County, Iowa, 1853. In 1886 he was graduated at Indiana University, after which he spent 10 years as teacher and superintendent of schools in Indiana and California. In 1888 he began his connection with the United States Bureau of Fisheries, was made ichthyologist in 1891 and from 1903 to 1911 was chief of the division of scientific inquiry. Thereafter, until 1914, he had charge of the Alaska Fisheries Service. In 1892 he was also United States fur-seal commissioner and in 1908 was made chairman of the fur-seal board. At various times he lectured at the universities of Cornell, Stanford and Yale. He is the author of several bulletins of the United States Fish Commission and has contributed to the proceedings of several learned societies.

EVERSLEY, 1st Baron (George John Shaw-Lefevre), English statesman: b. 12 June 1832. He received his education at Eton and at Cambridge University. In 1855 on the completion of his studies in law he was called to the bar. He unsuccessfully contested Winchester at the election of 1859, but was successful in 1863, when he was elected member for Reading, which seat he held until 1885, when he was elected from Bradford. In 1856 he became civil lord of the Admiralty and in 1858 was appointed commissioner to negotiate a convention on fisheries with the French government. He carried the vote in the Commons, in 1868 for the arbitration of the claims arising from the *Alabama*. From 1869 to 1871 he was secretary of the Board of Trade and in the latter year was made undersecretary at the Home Office. In 1871–74 he was secretary to the Admiralty; in 1881–83 first commissioner of works and in 1883–84 postmaster general. In 1892–93 he was a member of the Gladstone ministry and in 1894–95 was president of the Local Government Board. While in the Commons he sponsored many important legislative bills, especially dealing with modern social legislation. He was created first baron in 1906. He published 'English and Irish Land Questions'; 'Incidents of Coercion'; 'Peel and O'Connell'; 'Agrarian Tenures'; 'English Commons and Forests'; 'Gladstone and Ireland' (1912); 'The Partitions of Poland' (1915).

EVERY MAN IN HIS HUMOUR, the first comedy of Ben Jonson, which has come down to us. It was produced at the Globe Theatre in 1598, with Shakespeare in the cast and was printed in 1601. David Garrick later revised it and achieved a great success in the principal rôle.

EVERY MAN OUT OF HIS HUMOUR, a satirical comedy by Ben Jonson, first produced in 1599.

EVESHAM, ĕvz'ham or ĕvz'am, England, municipal borough and market town in the county of Worcester, on the Avon, 15 miles southeast of Worcester, beautifully situated in the vale of Evesham. It is an ancient place and was the scene of a battle fought in 1265, which replaced Henry III on the throne. It had a celebrated abbey, of which a fine tower and some other structures still remain. Fruit growing and market gardening are the chief industries. Pop. 8,340.

EVICTION. See EJECTMENT AND EVICTION.

EVIDENCE. «The word evidence considered in relation to law includes all the legal means which tend to prove or disprove any matter of fact the truth of which is submitted to judicial investigation.» (Taylor). Evidence may be either oral or documentary. Oral evidence is the statements made by witnesses during the trial; and documentary evidence consists of the production of papers, on which is writing, marks or characters capable of being read, which are submitted during the course of the trial. Oral evidence must in all cases be direct: if it is of something that was seen, by the person who saw it; if of something heard, by the person who heard it; if of an opinion, by the person who holds that opinion; or if the knowledge was acquired in any other manner, by the person who perceived it in that manner. The general rule is that hearsay evidence is not admissible. Documentary evidence may be either primary or secondary. Primary evidence of a document is where the document itself is produced for the inspection of the court. When a document has been executed in counterparts, each counterpart is primary evidence against the party executing it, and where a document has been made by printing or any other means that will ensure an exact reproduction, each copy is primary evidence of the other copies, but none of them is primary evidence of the original. Secondary evidence of a document would be counterparts of the document as against the party who did not execute them, copies made from the original and compared with it, office copies, official copies and oral evidence of the contents of a document by a person who has seen the original. Before secondary evidence will be received the party offering it must show a legal reason why the original is not produced, such as being lost, destroyed, in possession of the adverse party who refuses to produce it after notice to do so, or when it is a public document, or when it is in a country or place from which it is not permitted to be removed.

Either oral or documentary evidence may be given of any fact in issue or relevant to the issue; and where two facts are so connected, although one fact is and the other fact is not the issue or relevant to the issue, yet evidence of both may be given if that fact will render probable the existence or non-existence of the other fact which is in issue or relevant to the issue.

Admissions are statements made by a party to any proceeding and in reference to that proceeding, and they are admissible against the party making them, but not in his favor. Admissions may also be made by an agent, but to bind the principal they must be made by the agent in his regular course of business or employment. If an admission is made after an agreement has been entered into between the parties not to use it as evidence, it is not admissible, nor is it admissible in evidence made under duress. A confession is a statement made by a person charged with a crime stating or suggesting that he committed that crime. If made voluntarily it is admissible as evidence against him, but if made while the person is under any threat or promise which has been given by a person in authority, it is not admissible. Confessions may be made during the course of the trial, but if the question which produced the confession is an improper one, and after the witness had refused to answer it he had been compelled to do so, it is not a voluntary confession and therefore inadmissible. But if he made no objection to answering the question, it is admissible as a voluntary confession. A witness's opinion is received in evidence when it falls under the head of expert testimony; as, when the question is of some science or art, the opinions of persons specially skilled in that art or science are relevant. Any subject on which special study or experience is necessary to the formation of a correct opinion is a science or art. The most frequent illustrations are medical and handwriting experts. Before the testimony of a person called as an expert is received, he must satisfy the court as to his ability to form a correct opinion on the particular subject on which he is to testify. The general rule is that evidence as to a person's character is not admissible unless it is the fact in issue, except in criminal cases, but if a person introduce evidence to show good character, the other side may produce witnesses to show the contrary. All facts should be proved by the best or highest evidence. If a fact can be proved by a written instrument, the writing should be produced and the party alleging a fact must prove it.

In the United States the rules of evidence are laid down by State enactments which apply in State courts in civil cases, and in Federal courts also, in the absence of Federal enactments. There is no bar to the giving of testimony, either of color or nationality. In criminal trials evidence follows common-law rules, as interpreted by the Federal courts, modified by Federal enactments. Consult Chamberlayne, 'Treatise on Evidence' (4 vols., Albany 1911); Greenleaf, 'Treatise on the Law of Evidence' (16th ed., Boston 1899); Stephen, J. F., 'Digest of the Law of Evidence' (7th ed., London 1907); Thayer, 'Preliminary Treatise on Evidence at Common Law' (Boston 1898); Wigmore, 'System of Evidence in Trials at Common Law' (Boston 1904); Mills, 'Theory and Practice of the Law of Evidence' (London 1907).

EVIDENCES OF CHRISTIANITY, in favor of its divine origin, may be divided broadly into two great classes, namely, external evidences, or the body of historical testimonies to the Christian revelation; and internal evidences, or arguments drawn from the nature of Christianity itself as exhibited in its teachings and effects.

Among the earlier Christian apologists were Justin Martyr, Minucius Felix, Tertullian, Origen, Arnobius and Augustine. Their work was continued by the schoolmen during the Middle Ages. In the 16th and 17th centuries the influences of the Renaissance and the Reformation gave rise to a spirit of inquiry and criticism which developed English deism as represented by Herbert and Hobbes in the 17th century, and Collins and Bolingbroke in the 18th. The general position of English deism was the acceptance of the belief in the existence of God, and the profession of natural religion along with opposition to the mysteries and special claims of Christianity. It was in confutation of this position that the great English works on the evidences of Christianity of Butler, Berkeley and Cudworth were written. In France the new spirit of inquiry was represented by Diderot, D'Holbach, and the encyclopædists, who assailed Christianity mainly on the ground that it was founded on imposture and superstition, and maintained by sacerdotal trickery and hypocrisy. No reply of any great value was produced in the French Church, though in the previous age Pascal in his 'Thoughts' had brought together some of the profoundest considerations yet offered in favor of revealed religion. The 19th century was distinguished by the strongly rationalistic spirit of its criticism. The works of such writers as Strauss, Bauer and Feuerbach, attempting to eliminate the supernatural and the mysterious in the origin of Christianity, were answered by the works of Neander, Ebrard and Ullmann on the other side. The historical method of investigation, represented alike by the Hegelian school and the Positivists in philosophy, and by the Evolutionists in science, is the basis of the chief attacks of the present time against the supernatural character of Christianity, the tendency of all being to hold that, while Christianity is the highest and most perfect development to which the religious spirit has yet attained, it differs simply in degree of development from any other religion. Notable among later apologists of Christianity have been Paley ('Natural Theology'), Chalmers ('Natural Theology'), Mansel, Liddon and others, lecturers of the Bampton Foundation; in Germany, Luthardt, Ewald, Baumstark and others. The evidence of the miraculous is not so much insisted on as it was; life and conduct and the fruits of Christian grace make a stronger appeal to the age. Consult Bruce, 'Apologetics' (London 1902); Burton, 'Our Intellectual Attitude in an Age of Criticism' (Boston 1913); Fisher, 'Grounds of Theistic and Christian Belief' (1883, rev. ed., 1902); and 'Manual of Christian Evidences' (New York 1888); Foster, 'The Finality of the Christian Religion' (Chicago 1906); Garvie, 'Handbook of Christian Apologetics' (New York 1913); Robbins, 'A Christian Apologetic' (London 1902); Rowland, 'The Right to Believe' (Boston 1909); Stearns, 'Evidence of Christian Experience' (New York 1891). See APOLOGETICS; CHRISTIANITY; HIGHER CRITICISM.

EVIL, King's. See SCROFULA.

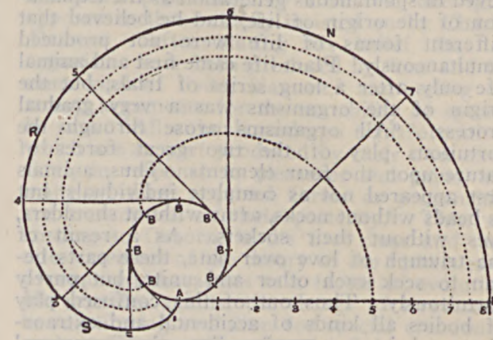
EVIL, Origin of, the subject of extensive theological and philosophical speculation. The difficulty of the question lies mainly in the fact that the existence of evil in the world seems inconsistent with the view that it was created and is maintained by an omnipotent and beneficent creator. The various theories on the subject have all sought to elude this difficulty either by the supposition of some principle of evil equally eternal with that of good, or by regarding evil as having only a relative existence, being a kind of good in an imperfect and immature stage. But the problem remains inscrutable and insoluble.

Perhaps the oldest theory on this subject is that of Parseeism, or the religion of Zoroaster, according to which there were two original antagonistic principles, one good (Ormazd) and the other evil (Ahriman). This is the doctrine that is now very often spoken of as Manichæism. In contradistinction to this dualistic theory with reference to the origin of evil stand the Monistic theories of Brahmanism and Platonism. According to the Brahmanic doctrine of the emanation of all things from one original being (Brahma), this original being was regarded as the sole true existence, and the phenomenal world, with all the evils appearing in it, was held to be mere illusion. Similarly Plato held that the good was the essence of all things, and that the evil and imperfect contained in them had no real existence. The theory enunciated by Leibnitz in his 'Théodicée' ('Vindication of God') resembles that of Plato. In that work he assigns to the evil existing in the world created by God, which he holds to be the best of all possible worlds, a merely relative existence; all that we call evil is, he holds, only evil to us because we do not see it in relation to the rest of the universe, for in relation to the universe it is not evil but good, and accordingly cannot be evil in its own nature. The traditional Christian account of the origin of evil is that given in Genesis. In the theology based thereon, Satan, the personal principle of evil, differs from the Zoroastrian Ahriman only in not being co-ordinate with the personal principle of good. Consult Orchard, 'Modern Theories of Sin' (1911); Rashdall, 'Theories of Good and Evil' (1907); Royce, 'Studies of Good and Evil' (1898).

EVIL EYE. See SUPERSTITION.

EVIL-MERODACH, ē'vĭl-mē-rō'dăk, king of Babylonia and son of Nebuchadnezzar II. He reigned for less than a year in 561–560 B.C., and was put to death by his brother Neriglissar. His name has been found on some contract tablets. According to 2 Kings xxv, 27 he liberated Jehoiachin, king of Judah.

EVOLUTE. The evolute of a curve is the locus of its centres of curvature. The tangents to the evolute will be normals to the curve, if it lies in a plane, and principal normals, if it lies in a three-dimensional space, so that the curve may be traced by the unwinding of a cord stretched along its evolute. A curve is said to be the involute of its evolute. In general, every curve has an infinitude of involutes. Different involutes of the same curve are said to be parallel. The equation of the evolute of the plane curve $y = fcx$ is obtained by eliminating x and y between the equation of the curve and $x_1 = x - y^1\left[\frac{1+(y^1)^2}{y^{11}}\right]$, $y_1 = y + \frac{1+(y^1)^2}{y^{11}}$



Circle, BBB, as Evolute and its Spiral Involute, MNRSA.

In the geometry of surfaces, the so-called surface of centres corresponds to the evolute. This consists of two sheets, corresponding respectively to the centres of maximum and minimum curvature of the various points of the surface with reference to which it is described. See CURVES; SURFACES, THEORY OF.

EVOLUTION. See MAN, CHRISTIAN ANTHROPOLOGY.

EVOLUTION, History of. In traversing the history of natural science as in traversing the history of any phase of human thought and activity, we seek constantly for new things, for the precise time of the discovery of the new fact, the announcement of the new idea, the formulation of the new understanding or philosophy. But nothing comes wholly new into the world; the world and its content are all the result of development and growth. So correspondingly very little comes wholly new into history; and the history of evolution is no exception to the rule. The history of evolution clearly reveals that the evolution idea is the result of a long evolution itself; it is impossible to say just when the idea came first into its more primitive form of being, or just when its principal modifications or accretions occurred, or when its present form was finally determined. In tracing the history of the unfolding of the evolution idea we shall find that the conspicuous achievements in connection with it have not been the discovery of absolute newness, but the recognition and determination and general establishment of the important ideas and conception germs among the host offered.

An eminent American naturalist has defined three stages in connection with the discovery of the laws of science: First, a stage of dim suggestion and pure speculation with little reference to facts; second, a stage of the statement of a working hypothesis to explain certain facts; and, third, the proof or demonstration of the law by facts. These stages can be recognized in the history of evolution. The first corresponds with the period of the Greek philosophers; the second with the post-Greek, pre-Darwinian period, and the third with the Darwinian and post-Darwinian period.

The evolution theory was largely anticipated, at least by suggestion, by the Greeks. They have left writings that can easily be interpreted as more or less clearly outlining the essential conception of organic evolution. Empedocles (493–435 B.C.), for example, who has been called «the father of the evolution idea,» believed in spontaneous generation as the explanation of the origin of life, and he believed that different forms of life were not produced simultaneously. Plant life came first and animal life only after a long series of trials, but the origin of the organisms was a very gradual process. «All organisms arose through the fortuitous play of the two great forces of nature upon the four elements. Thus, animals first appeared not as complete individuals, but as heads without necks, arms without shoulders, eyes without their sockets. As a result of the triumph of love over hate, these parts began to seek each other and unite, but purely fortuitously. Thus out of this confused play of bodies all kinds of accidental and extraordinary beings arose.» But the unnatural products soon became extinct because they were not capable of propagation. After the extinction of these monsters other forms arose which were able to support themselves and multiply. Thus, if one cares to, one may see in the ideas of Empedocles the germ of the theory of the survival of the fittest, or natural selection.

Aristotle (384–322 B.C.), the greatest of the Greek natural philosophers, believed in a complete gradation in nature, a progressive development corresponding with the progressive life of the soul. Nature, he says, proceeds constantly by the aid of gradual transitions from the most imperfect to the most perfect, while the numerous analogies which we find in various parts of the animal scale show that all is governed by the same laws; in other words, nature is a unit as to its causation. Man is the highest point of one long and continuous ascent. Aristotle perceived a marvelous adaptation in the arrangement of the world, and felt compelled to assume intelligent design as the primary cause of things. Nothing, he held, which occurs regularly can be the result of accident. Aristotle rejected the crude conception of Empedocles of the survival of adapted, and the extinction of unadapted, beings. «It is impossible that these adapted parts should arise in this manner [of Empedocles]; for these parts and everything which is produced in nature are either always, or for the most part, adaptively produced; and this is not the case with anything which is produced by fortune or chance even as it does not appear to be fortune or chance that it frequently rains in winter . . . As these things appear to be either by chance or to be for some purpose, and we have shown that they cannot be by chance, then it follows that they must be for some purpose. There is, therefore, a purpose in things which are produced by and exist from nature.»

The Greeks, taken altogether, suggested more or less crudely the idea of the gradual development of organisms, the idea of the elimination of mistakes in production, and therefore the idea of the survival of the fittest, the idea of the adaptation of parts or the fitness of certain structures to certain ends, the idea of intelligent design constantly operating in nature, as also the idea of nature being controlled by the operation of natural causes due in the beginning to the laws of chance. After all, however, in how far are we justified in reading into a happy suggestive phrase or sentence of any Greek speculative thinker a real conception of that idea of the origin and development of organic nature that we hold to-day under the name of Evolution?

Following the Greeks the evolution idea was left in the hands of the theologians, natural philosophers and naturalists of the long period from Augustine (1st century A.D.) to the end of the 17th century, a period chiefly ruled by the Mosaic interpretation of the origin of organic life and its variety. Augustine, himself, large-minded man that he was, gave a liberal and naturalistic interpretation of the Mosaic record, favoring potential rather than special creation and teaching that in nature we should not look for miracles, but laws. But opposed to him were almost all the other churchmen, and their rigid adherence to the Mosaic interpretation controlled almost all thinking about life for many centuries. The great Evolution idea lay practically dead from the time of its foreshadowings by the Greeks until the time of the speculative natural philosophers of the 16th and 17th centuries.

Bacon (1561–1626) pointed out the evidence for variation in animals and the bearing of this upon the production of new species and upon the gradations of life forms. Descartes (1596–1650) advocated a strong mechanistic conception of the physical universe and all life within it. Leibnitz (1646–1716) advocated a doctrine of continuity of life forms, and said that the different classes of animals are so connected by gradatory forms that it was practically impossible either by observation or imagination to determine where any one begins or ends. These ideas of continuity in nature were also reiterated and strengthened by Spinoza, Pascal and Newton. It is interesting to note that all these contributions to the establishment of the evolution idea came from the speculative natural philosophers rather than from the naturalists.

Chief among all the natural philosophers who have attempted to express the early idea of evolution was Kant (1724–1804), but he was staggered by the thought that any human investigation could ever reach an understanding of the laws which have governed the derivation of all organic beings from the lowest up to man. «It is quite certain,» he wrote, «that we cannot become sufficiently acquainted with organized creatures and their hidden potentialities by the aid of purely mechanical natural principles, much less can we explain them; and this is so certain, that we may boldly assert that it is absurd for man even to conceive such an idea, or to hope that a Newton may one day arise even to make the production of a blade of grass comprehensible, according to natural laws ordained by no intention. Such an insight we must absolutely deny to man.»

However, certain naturalists of the 17th and 18th centuries did make their contributions of fact, or alleged fact, to the evolution idea. For example Bonnet (1720–93), who is reputed to be the author of the term «Evolution» in connection with the development of life, is famous for his extraordinary «encasement theory» of embryology, according to which all the future progeny and successive after-generations derived from a female animal existed in miniature in the eggs in her body, with lesser eggs within the miniature young, containing the next generation, and so on *ad infinitum*.

But it is with the great French naturalist Buffon (1707–88) that the real contribution of naturalists to and participation in the development of the evolution idea importantly begins. He has, indeed, been called by Osborn the naturalist founder of the modern applied form of the evolution theory. But with other historians of evolution, he has no such standing. Radl, for example, says that «the best thing about Buffon is his style.» However it may truthfully be said of him that he was the first great naturalist to point out on a broad scale the mutability of species in relation to changes of environment. Very early in his studies of comparative anatomy he found difficulty in the special creation theory. «The pig does not appear to have been formed upon an original special and perfect plan since it is a compound of other animals. It has evidently useless parts, or rather parts of which it cannot make any use, toes, the bones of which are perfectly formed and which nevertheless are of no service to it. Nature is far from subjecting herself to final causes in the formation of her creatures.» Buffon believed in the direct modifying influence of environment. «How many species, being perfected or degenerated by the great changes in land and sea, by the favors or disfavors of nature, by food, by the prolonged influence of climate, *are no longer what they formerly were*.» He also fairly clearly expressed the conception of a struggle for existence, an elimination of the least-perfected species and a contest between the fecundity of certain species and their constant destruction. This is anticipating more or less definitely the prodigality of production ideas of Malthus, and the natural selection doctrine of Darwin. But he was not of the stuff of which martyrs are made. When the authorities of the Church called for an explanation of his views he said: «I declare that I have had no intention of denying the Holy Writ; I declare that I firmly believe all that is written there concerning creation, as well concerning the time as the procedure; and I willingly retract whatever is in my book that in any way is contradictory of the Mosaic relation, as I hold my hypothesis concerning the formation of the earth and other planets as a purely philosophical conception.»

It is interesting to note the fact that another great naturalist, Linnæus, exactly contemporaneous with Buffon, a botanist, and the first great systematist or classifier of organisms, was an absolute believer in the fixity of species. Species were, in his mind, the units of direct creation; each species bore the impression of the thought of the Creator in all its structure and functions. Later in his life Linnæus did give up, in some little measure, this idea of the special Divine creation and absolute fixity of species. «All the species of one genus,» he wrote before his death, «constituted at first a single species, but this subsequently became multiplied by hybrid generations, that is, by intercrossing with other original species.»

Following Buffon, the next two most important names to be mentioned in connection with the history of evolution are those of Erasmus Darwin (1731–1802), and Lamarck (1744–1829). Erasmus Darwin was a poet and naturalist, and the grandfather of Charles Darwin. He was, in his late years at least, a firm evolutionist, with conceptions concerning the factors or causes of evolution strangely like those afterward proclaimed by Lamarck, and quite opposed to those chiefly insisted on by Charles Darwin. After stating his belief that all organisms have been produced by «one and the same kind of living filament,» and setting out strong arguments for the mutability of species, he says: «All animals undergo transformations which are in part produced by their own exertions, in response to pleasures and pains, and many of these acquired forms or propensities are transmitted to their posterity.» This, according to Osborn, is the first clear and definite statement of the theory of the transmission of acquired characters as a factor of evolution. He provides against the charge of irreverence in substituting evolution for special creation by saying: «If we may compare infinities, it would seem to require a greater infinity or power to cause the causes of effects, than to cause the effects themselves: that is to establish the laws of creation rather than to directly create.»

Lamarck may fairly be called the first to set out in detail a full and logical theory of descent with explanations of the causes of this descent. With full justice he is referred to as the most prominent figure in the history of evolution between the Greeks and Charles Darwin. But no one has been more misunderstood nor judged with more partiality by over or under praise. He had as contemporaneous antagonist the great anatomist Cuvier (1769–1832) who gave all the heavy weight of his name and position to the attack on the Lamarckian doctrines in particular and evolution in general. Indeed, Cuvier, though he added enormously to our knowledge of comparative anatomy, almost as enormously hindered the progress and postponed the acceptance of the evolution theory, which actually finds a large part of its proof in the facts of comparative anatomy.

Lamarck's exposition of the evolution theory and particularly of its causes, with the great stress laid upon the principle of the inheritance of acquired characters, and hence the all-important influence and effect of varying environment in the modification of species, has come to be known in evolution literature as «Lamarckism» in contrast with «Darwinism,» or Charles Darwin's contribution with its special emphasis on natural selection as the explanation of the «origin of species.» «Darwinism» is too often popularly used synonymously with evolution, but it should not be so used. «Darwinism» is a convenient inclusive name for Darwin's explanations of evolution; his theories of natural and sexual selection.

Contemporary with Lamarck were Goethe (1749–1832) who contributed somewhat to the evolution theory by his studies and generalizations on the metamorphosis of plants and the vertebrate theory of the skull, and Saint Hilaire (1772–1844) who maintained insistently the truth of the evolution theory, then being obscured by the antagonism of Cuvier, but who denied the inherited influences of habit, holding that the direct modifying action of environment on organisms was the sole cause of species-forming.

But it was Charles Darwin (1809–82) who

was first able to restore and extend enormously the prestige of the evolution conception. This was due first to his tremendous marshaling of facts to support it, and, second, to his contribution of a new, or practically new, causo-mechanical explanation of species change, or, as usually expressed, «origin of species.» It is Darwin's great merit to have wholly re-established the theory of descent and to have offered the first explanation of it that made a really winning appeal to biologists generally. It was also his fortune to bring the evolution conception home to the people. Up to the publication of his 'Origin of Species' (1859) but few persons believed in evolution, and the great mass of the people knew nothing about it.

Part of the general acceptance of Darwin's ideas was due to the polemic ability of various immediate friends and champions of Darwinism among contemporary naturalists. Intimately associated with Darwin and his presentation of the natural selection theory were such men as Huxley, Lyell, Asa Gray, Agassiz and others. Huxley, Lyell and Asa Gray were adherents and defenders of Darwinism, while Agassiz was among the more conspicuous of the antagonists. The actual weight of personal debate and polemic struggle on behalf of Darwin fell largely on Huxley. It could have rested in no better hands. Despite the fact that the time was ripe for Darwin, and despite his extraordinary massing of facts, and his marvelous anticipations and refutations of criticisms, the swift winning of the acceptance of Darwinism was largely due to the championship of Huxley. Haeckel, the great zoologist and bold speculative monist philosopher of Jena, was the principal continental contemporary champion of Darwinism.

A curious incident in the history of the Darwinian evolution exposition and explanation is that of the extraordinary coincidence of the formulation of the natural selection theory by Alfred Russel Wallace at the very same time of its utterance by Darwin. As a matter of fact both men published papers formulating this theory in 1858 in a single number of the *Journal* of the Linnæan Society The name of Wells (1813), Matthews (1831) and Nandin (1852), are often mentioned as those of men who anticipated in some measure, at the various dates indicated, Darwin's utterance of the selection theory, by more or less clear statements of its essence, but none of them carried conviction to the world.

The post-Darwinian history of evolution has chiefly to do with the further development of the Darwinian theories, together with the rise of the so-called «mutations theory» of species origin, associated with the name of De Vries, as an addition to Lamarck's and Darwin's explanations, and the stressing of the significance of the new knowledge of heredity, beginning with the discovery by present-day biologists of the experimental work and conclusions of Mendel, achieved some 30 years prior to their coming to be generally known. But as these later developments are treated in some detail, together with Lamarck's and Darwin's own theories, in an article elsewhere in this work (see EVOLUTION. THEORIES OF), this sketch of the history of evolution may suitably close with the period of Charles Darwin. The present status of the evolution conception is still that so solidly established by Darwin and his contemporaries. As to the explanations, or factors, of evolution, also, Darwin's still hold chief place, especially in the minds of the mass of the generally educated people. Among biologists, however, there is a growing tendency to see in the Darwinian selection theories many difficulties formerly unperceived, and to cast about for other aiding or even possibly replacing theories.

EVOLUTION, Theories of. In any consideration of the «theories of evolution» there must be kept clearly in mind the distinction between conceptions or theories of the origin or transformation of species and of plant and animal descent generally, and theories offering explanations of the causes and controls of this species, origin and descent. The first is the evolution conception proper, and should be what is primarily meant when the term evolution is used alone. We could still believe in evolution, and recognize it as a great scientific fact, even if we had no wholly clear or generally accepted understanding of the causes that bring it about and the influences that control it. In fact, that is not far from being the actual situation to-day.

But in common usage, and in many books, the fact, or theory, of evolution, and the facts and theories of the causes of evolution are not differentiated. In the minds of naturalists, however, the distinction is usually maintained, and it would be of great advantage if it were more widely and popularly made. For the evolution conception itself is no longer a debated question, whereas the particular methods and, above all, the so-called factors, or initiating and guiding causes of evolution, are still open to debate, and, indeed, are continuously and vigorously debated. When one reads of disagreements among biologists concerning the merits of «Darwinism,» it is not a disagreement concerning the fact of evolution, for which the term «Darwinism» is too often synonymously used in popular writing and speaking, but it is a disagreement concerning the value of Charles Darwin's explanation of the causes of evolution, namely, his theories of natural and sexual selection.

However it is hardly possible to consider the general theory of evolution apart from theories of its cause and control, and the subject of this article, which for the sake of brevity, is written simply as «theories of evolution,» is really meant to cover a discussion of theories which explain evolution; how it comes to be, what its methods are, and what are its causal factors.

In earlier days, the days of the Greeks and the later churchmen and natural philosophers of the middle centuries, there were various different theories of evolution, if the incomplete and often fantastic speculations of these times can be called theories. Some of these are outlined in the article EVOLUTION, HISTORY OF. But the real struggle from the beginning of serious thinking about the multitude and variety of plant and animal forms up to the time of the publication of Darwin's 'Origin of Species' (1859) and the few years thereafter, when its heretical doctrine was getting firmly established among scientific and educated men the world over, was between the believers in special creation of all these forms and believers in their origin by evolution.

To-day there is not a biologist of standing who does not accept the theory, or better, fact, of evolution. And the great majority of all people who think about the matter at all also accept this once ultra-heretical and scoffed-at doctrine.

The explanatory theories of evolution are numerous; some of them are not readily distinguishable from one another; they overlap more or less; but a number of fairly well-contrasted different theories can be made out when careful analysis is made of the whole group. Each of these is distinguished by the emphasis which it gives to some one factor and the subordination or even total rejection of other factors particularly stressed in other theories.

These various distinguishable theories can be grouped into several categories, such as those which are essentially vitalistic as compared with those essentially mechanistic in their explanation; or those which envisage species-forming as proceeding by little leaps as contrasted with those which assume perfect gradation and continuity in species. Some of the theories are based on the assumption of individual change in response to the environment and personal habit, and the inheritance of these «acquired characters.» Others reject this possibility *in toto*, or partially, and stress the effect of a selection among strictly germinal inheritable variations based on a rigorous struggle for existence which extinguishes the possessors of disadvantageous variations and preserves the lucky possessors of advantageous ones, thus leaving only these latter to leave progeny, which will naturally inherit the fortunate characteristics of the parents. Some see the germinal variations, which in all modern theories are the basic elements of evolution, produced purely by chance, while others see them as the determined results of the influence of an inner directing force, or of the outer environment.

Only the more important and more strongly contrasted of these theories need be described. For most are but changes rung on a few principal themes. Lamarckism and Neo-Lamarckism as contrasted with Darwinism and Neo-Darwinism; Vitalism as contrasted with the Mechanicalism; and Chance as contrasted with Determinism; these are the chief points that need to be taken into account in differentiating the various explanations of the phenomena of organic evolution.

Despite the suggestiveness of the many Evolution and Evolution-explaining speculations made by various natural philosophers and naturalists before the beginning of the 19th century, it was not until Lamarck, in the very first years of said century, began to express his view of evolution and its causes, that a full and logically constructed evolution theory may be said to have been formulated. The nearest approach to such an earlier formulation was that made in the late years of the 18th century by Erasmus Darwin, grandfather of Charles Darwin. «A rapid run through the later writings of Dr. Darwin,» says Clodd, «shows that there is scarcely a side of the great theory of evolution which has escaped his notice or suggestive comment.» While Grant Allen notes that the theory of natural selection, which was Charles Darwin's great contribution to the evolution conception, was the only cardinal one in the evolutionary system on which Erasmus Darwin did not actually forestall his more famous and greater grandson.

Lamarck and the Lamarckian Theories.— Jean-Baptiste-Pierre-Antoine de Monet, Chevalier de Lamarck, born in 1744 in the village of Bazentin in Picardy (northeast France), was in 1800 professor of invertebrate zoology in the Museum of Natural History in Paris. He had previously been for many years keeper of the herbarium in the Museum. He was, therefore, well grounded in the facts of both botany and zoology, and he had a philosophical mind, which, in the face of the facts of science learned by him, compelled him to turn from the orthodox view of creation by special design and act to the heretical one of evolution. In the opening lecture of his professional course in the year 1800 he outlined his views and his theory of the method and cause of evolution. Later he exposed his theory at length and in full detail in his famous 'Philosophie Zoologique' (1809).

The essential feature in the explanation of descent conceived and uttered by Lamarck is the inheritance of acquired variations. Lamarck was convinced, first, of the certainty that species vary under changed external influences, second, that there is a fundamental unity in the animal kingdom, and, third, that there is a progressive development. The main influences that tend to change species come under the law of use and disuse, for he believed that nature does not effect her changes directly (Buffon's belief) but through the reaction of animals to their environment. Lamarck denied, absolutely, the existence of any perfecting tendency in nature, and regarded evolution as the final necessary effect of surrounding conditions on life.

Thus, instead of suggesting that animals had been created for a certain mode of life, he supposed that their mode of life had itself created them. «In considering the natural order of animals, the very positive gradation which exists in their structure, organization, and in the number as well as the perfection of their faculties, is very far removed from being a new truth, because the Greeks themselves fully perceived it; but they were unable to expose the processes and proofs of this evolution because they lacked the knowledge necessary to establish it. In consideration of this gradation of life, there are only two conclusions which face us as to origin: *The conclusion adopted up to to-day:* Nature (or its Author) in creating animals has foreseen all possible sorts of circumstances in which they would be destined to live, and has given to each species a constant organization, as well as the form, determined and invariable in its parts, which forces each species to live in the places and climates where it is found, and there preserve the habits which we know belong to it. *My personal conclusion:* Nature, in producing successfully all the species of animals, and commencing by the most imperfect or the most simple to conclude its labor in the most perfect, has gradually completed our organization; and of these animals, while spreading generally in all the habitable regions of the globe, each species has received, under the influence of the environment which it has encountered, the habits which we recognize and the modifications in its parts which observation reveals in it."

The following is Lamarck's statement or explanation of the causes of this descent: "First Law: Life by its internal forces tends continually to increase the volume of every body that possesses it, as well as to increase the size of all the parts of the body up to a limit which it brings about. Second Law: The production of a new organ or part results from a new need or want, which continues to be felt, and from the new movement which this need initiates and causes to continue. Third Law: The development of organs and their force or power of action are always in direct relation to the employment of these organs. In every animal which has not passed the term of its development the more frequent and sustained employment of each organ strengthens little by little this organ, develops it, increases it in size, and gives it a power proportioned to the length of its employment; whereas the constant lack of use of the same organ insensibly weakens it, deteriorates it, progressively diminishes its powers and ends by causing it to disappear. Fourth Law: All that has been acquired or altered in the organization of individuals during their life is preserved by generation (heredity), and transmitted to individuals which proceed from those which have undergone these changes."

Neo-Lamarckian Theories.— Lamarck's theory was a simple and well-constructed one, and one which, if based on established fact, would furnish the most satisfying explanation of evolution yet offered. But its great fault is that the basic assumption in the theory is not an established fact; indeed, it seems to be just opposed to the facts. Despite a few plausible cases, about which a great storm of argument has raged — for example, the famous controversy in 1893 and 1894, in the *Contemporary Review*, between Herbert Spencer, champion of Lamarckism, and August Weismann, its most destructive antagonist — most naturalists agree that the known facts of inheritance not only do not support but strongly deny the Lamarckian assumption of the heritability of characters acquired by an individual in its lifetime by reaction to environment, use or disuse of parts, and personal habit.

And yet there have always been, and are today, biologists of the very first class who believe in most of the essentials of the Lamarckian explanation of evolution as opposed to the Darwinian. Their principal reasons for this belief are: First, the radical assumptions as to almost limitless time, rigor of the struggle for existence and actual validity of the minute, fortuitous, germinal variations as determining elements in this struggle, and the necessary extreme variety of these variations, that have to be made in connection with Darwin's selection explanation in order to get such results out of chance as are revealed in the extraordinarily fine and perfect adaptations of plants and animals to their environment.

Second, it has been shown by the experiments of Klebs, Tower and others, that the environment *can* sometimes affect the germ-cells, and that when it does it can actually produce changes in the next generation that are inheritable, although it must be said that these changes are not necessarily adaptive.

Third, it is a fact of familiar observation that the adaptations of species are often almost exactly of the same character as the changes that are produced in individuals by their immediate reaction to environment conditions, and on this the assumption is made that despite our lack of any knowledge of how this individual change is impressed on the germ-cells, and even in face of our greatly advanced understanding of the mechanism of inheritance, almost all of which goes to indicate the independence of the germ-cells from external influences affecting the body-cells, this parallelism must in some way be the result of an inheritance of acquired characters.

For these reasons and others, therefore, there is a school of biologists, who may be called Neo-Lamarckians, which is busy formulating modifications of the old Lamarckian theory to make it fit our more recent knowledge of facts.

Charles Darwin and the Darwinian Theories.— In a paper presented to the Linnæan Society of London in 1858, and far more fully and elaborately in the 'Origin of Species' published in 1859, Charles Darwin, born in 1809, in Shrewsbury, England, and bearing, without any question, the most distinguished name in all the long roll of names associated with the evolution conception, presented an explanatory theory of species-forming and descent which is best known as the Selection Theory.

This Darwinian explanation rests on certain observed facts and certain inductions from these facts. The observed facts are: (1) the increase by multiplication in geometrical ratio of the individuals in every species, whatever the kind of reproduction which may be peculiar to each species; (2) the always apparent slight (to greater) variation in form and function existing among all individuals even though of the same generation or brood; and (3) the transmission, with these inevitable slight variations, by the parent to its offspring of a form and physiology essentially like the parental. The inferred (also partly observed) facts are: (1) a lack of food and room for all these new individuals produced by geometrical multiplication, and consequently a competition (active or passive) among those individuals having any œcologic relations to one another, as, for example, among those occupying the same locality, or needing the same food; (2) the probable success in this competition of those individuals whose slight differences (variations) are of such a nature as to give them an advantage over their confreres, which results in saving their lives, at least until they have produced offspring; and (3) the fact that these "saved" individuals will, by virtue of the already referred to action of heredity, hand down to the offspring their advantageous condition of structure and physiology.

The competition among individuals and kinds (species) of organisms may fairly be called a struggle. This is obvious when it is active, as in actual personal battling for a piece of food or in attempts to capture prey or to escape capture, and less obvious when it is passive, as in the endurance of stress of weather, hunger, thirst and untoward conditions of any kind. The struggle is, or may be, for each individual threefold in nature: (1) an active struggle or competition with other individuals of its own kind, for space in the habitat, sufficient share of the food, and opportunity to produce offspring in the way peculiar and common to its species; (2) an active or passive struggle or competition with the individuals of other species which may need the same space and food as itself, or may need it or its eggs or young for food, and (3) an active (or more usually passive) struggle with the physico-chemical external conditions of the world it lives in, as varying temperature and humidity, storms and floods and natural catastrophes of all sorts.

The resultant of these existing conditions is, according to Darwin and his followers, an inevitable natural selection of individuals and of species. Thousands must die where a few may live to maturity (i.e., to the time of producing young). Which 10, say, of the thousand shall live depends on the slight but sufficient advantage possessed by 10 individuals in the complex struggle for existence due to the fortuitous possession of fortunate congenital differences (variations). The 990 with unfortunate congenital variations are extinguished in the struggle and with them the opportunity for the perpetuation (by transmission to offspring) of their particular variations. The offspring of the 10, of course, will vary in their turn, but will vary around the new and already proved advantageous parental condition: among the thousand, say, offspring of the original saved 10 the same limitations of space and food will again work to the killing off before maturity of 990, leaving the 10 best equipped to reproduce. This repeated and intensive selection leads to a slow but steady and certain modification, through the successive generations, of the form and functions of the species; a modification always toward adaptation, toward fitness, toward a moulding of the body and its behavior to safe conformity with external conditions. The exquisite adaptation of the parts and functions of the animal and plant as we see it every day to our infinite admiration and wonder has all come to exist through the purely mechanical, inevitable weeding out and selecting by nature (by the environmental determining of what may and what may not live) through uncounted generations of unreckonable time.

Associated with this theory of natural selection Darwin also advanced a theory to account for the often marked differences between the sexes of a species, involving the possession by one sex, usually the male, of special outgrowths of the body, bright and heavy plumage, or conspicuous colors and pattern, etc., most of which would seem to be elements of disadvantage rather than advantage in the struggle for life. Darwin's explanation of this, called the theory of sexual selection, was that these characters are of advantage in the rivalry of mating, many of them being apparently of a kind to attract and excite individuals of the opposite sex. Hence they might help their possessors win in the struggle to find mates and consequently to leave progeny. It is a sort of particular and limited kind of natural selection, not involving a determination between life and death, but one between going childless and leaving posterity — which is, after all, the essential determination in natural selection. But the assumed fact of choice in this theory of sexual selection involves various unproved and hardly probable assumptions regarding the esthetic development of birds, butterflies, spiders, etc., and has been strongly attacked both on the basis of actual opposing observation and experiment as well as on the basis of general improbability. On the whole, Darwin's theory of sexual selection has been largely discredited, although it must be said that no very satisfactory substitute explanation has been offered for it. But this discrediting of sexual selection throws a heavier strain on the theory of natural selection, for it was to relieve the latter theory of the difficulty of facing these apparently existing disadvantageous characters of the males of many species of birds and insects that the sexual selection theory was devised.

Nevertheless it is true that Darwin's natural selection explanation of evolution has been, ever since its announcement, more widely and authoritatively accepted as the needed revelation of the causes and methods of species-forming and adaptation than any other explaining theory yet offered.

Neo-Darwinian Theories.— Darwin never claimed for natural selection that it was the only influence capable of modifying species and explaining descent. But some of his followers have practically made that claim. Most notable among these Neo-Darwinians was August Weismann, professor of zoology at Freiburg in Baden, whose strenuous attacks on the conception of the inheritance of acquired characters did so much to discredit the Lamarckian explanation of evolution. Weismann's theories of heredity led him to a belief in the almost absolute isolation in the body, and hence independence from influences affecting it, of the germ-cells, and the consequent belief that the only variations that could be possibly inherited were the minute germinal ones that served Darwin as the basis for the working of natural selection. From this to a belief in the *All-Macht* of natural selection in determining species-change and descent generally was but the natural step.

Alfred Russell Wallace and some other prominent English naturalists ranged themselves with Weismann as Neo-Darwinians. Most American naturalists, however, held aloof from this extremist attitude, while the Germans were divided. In the later years of his life, Weismann withdrew from his original most advanced position, and was inclined to admit the inadequacy of natural selection as an all-sufficient explanation of descent.

Isolation Theories.— One of the most valid criticisms of the natural selection theory has been that it makes it necessary to ascribe a life-and-death determining value to the small germinal variations which are the basis of the selective working of the struggle for existence, and it has always seemed hard in the face of the very trivial character of many of these little differences to admit this value for them. But there is one way in which it seems that these little differences might be heaped up and developed into larger ones in the course of successive generations, and that is by the isolation from the main body of the species of a group of individuals more or less similar in germinal characters. This isolation could be effected by a migration and later geographic segregation of a group. The result would be an enforced inbreeding and an elimination of the swamping effects of unrestricted wider crossing. The result would be a cumulation of the characteristics represented in the group by originally minute germinal variations.

Beginning with Moritz Wagner (1868), energetically supported by Romanes (1897), and now most conspicuously urged by David Starr Jordan, this «isolation theory» has been much in favor with some biologists, especially those who pay especial attention to the relation of geographic distribution of plants and animals to evolution.

Theories of Orthogenesis.—As the character of the original small germinal variations necessarily first determines the possible lines along which species change and descent proceed; and as it is evident from careful study of the actual lines of descent exhibited both by the many living groups of animals and plants and also the many extinct ones (made visible to us by their fossils) that descent has actually proceeded along certain distinct lines and has not been scattered miscellaneously and futilely in all directions, it is plain that the discovery of any cause or form of control which would direct variation in certain more or less definite directions would help very much in solving the great problem of the cause and control of evolution.

From the beginning, therefore, the existence of such means, and its character, have been sought for. Many biologists have believed that the phenomenon of evolution can only be explained by the assumption of such a means. Cope, an American paleontologist — and it may be noted that paleontologists, from their studies of the long succession of life through many millions of years seem especially inclined to this belief — about 1870, attributed to the simplest life-stuff a sort of primitive consciousness which gives it a capacity for adaptation and modification that results in definite orthogenetic evolutionary advance. Naegeli, a great German botanist and natural philosopher, proposed in 1884 a theory of orthogenesis (evolution in fixed lines) by assuming the existence of an inner perfecting principle, inherent in all organisms, which determine the general lines of variation and makes steadily toward evolutionary progress.

Both these theories are essentially vitalistic in character in that they assume an inner mystic something associated with life and characteristic of it that can direct its evolution, which makes it unnecessary and futile to try to find a more mechanical or physico-chemical explanation of this capacity of living matter. More modern exponents of this vitalistic belief are such men as Driesch and Bergson, who may be called Neo-Vitalists.

Eimer, a German zoologist, in 1888 denied the vitalistic, automatic inner perfecting principle of Naegeli, but upheld the assumption of orthogenetic evolution, attributing its cause to the direct influence of extrinsic and environmental conditions. A number of English biologists, as Henslow and Lloyd Morgan, have ranged themselves in the ranks of the believers in orthogenesis, but they have not cared to admit the existence of any peculiar vitalistic factor as its explanation. The present dean of American paleontologists and evolutionists, H. F. Osborn, is also, on the basis of his extensive studies of evolutionary progress among extinct animals, especially the mammals, a believer in orthogenesis, but he is content to attribute its cause to some as yet «unknown factors of Evolution.» It is also true that under the influence of modern discoveries in connection with the mechanism and methods of heredity there is a strong tendency among many modern biologists to lean more and more toward an assumption of an internal cause and control of variation concerning the action of which little can be prophesied and about the character of which little is known.

Theories of Heterogenesis and Mutations.—All of the theories of the causes of evolution so far referred to agree in assuming a progress mostly by small, continuous change, so that species form series of perfect gradations. But there have always been naturalists to deny this assumption and to claim that change comes often by definite leaps, so that even the original differences may be fairly large and fixed from the beginning. Such naturalists have formulated a number of theories of heterogenesis or mutancy. Von Koelliker, a German zoologist, proposed, in 1864, such a theory, but only in most general terms. The American naturalist, Dall, in 1877, expressed his conviction that sudden changes of species-forming character sometimes occur in animals, and Francis Galton, the great English anthropologist and cousin of Charles Darwin, and in most of his beliefs a thorough Darwinian, nevertheless denied that the original germinal variations must necessarily be small, referring to the many known cases of «sports» among animals and plants as examples of original differences appearing as leaps.

In 1899, Korschinsky, a Russian botanist, advocated an explanation of species-forming by heterogenesis as one to be preferred to Darwin's selection theory, which he strongly opposed. However he presented few new facts bearing on the subject and made no particular impression on biologists. In 1901, however, the Amsterdam botanist, Hugo de Vries, published the first volume of a large work called 'The Mutations Theory,' in which he described his observations and experiments, extending over many years, on certain plant species, especially the evening primrose, *Oenothera lamarckiana*, and definitely proposed a theory of the origin of species by mutations, or sudden new fixed changes, the new forms thus formed having no special relation, as regards their origin, to adaptation or the struggle for existence. He backed up his theory with a description of many such new «elementary species» which had arisen suddenly under his eyes from the evening primrose.

De Vriess' theory has had a large attention and a considerable acceptance from naturalists, especially with those already dissatisfied with the Darwinian explanation. However, despite much observation and experimentation by other men, few other «mutations» besides those described by De Vries have been recorded, while as a general explaining theory of evolution the mutations theory leaves much to be desired.

It is especially helpless in the face of the necessity of explaining adaptation, and adaptation is as characteristic of evolution as is species-change.

Influence of the Modern Knowledge of Heredity on Theories of Evolution.— In 1900 three European botanists working independently at problems of inheritance in plants discovered that certain similar work done a third of a century before in the gardens of an Augustinian cloister in Brunn (Austria) by a monk named Gregor Mendel, had been quite overlooked by naturalists and yet was of the utmost importance. This discovery of Mendel's work by the botanists De Vries, Correns and Tschermak, and their independent discoveries, at the same time, of facts confirming Mendel's earlier results, marks the beginning of the modern study of heredity whose positive results already amount to more than had been learned in all time before.

A general summation of these results and consideration of their bearing on the validity of the various theories for the explanation of evolution, lend much weight to the type of theory that assumes the original variations to be the result of influences working from within rather than without. The modern knowledge of heredity also is strongly opposed to any assumption of the inheritance of acquired characters and emphasizes the strictly germinal character of all variations that really count in species-making. As has recently been said by Davenport, a leading American exponent of Mendelism, «a theory of Evolution that assumes internal changes chiefly independent of external conditions, i.e., spontaneously arising . . . seems best to meet the present state of our knowledge» [of heredity]. And he admits that the thorough-going accepters of Mendelism and the new heredity generally are driven to a position as regards the causes and fundamental control of evolution which is essentially like Naegeli's vitalistic theory of evolution from within by virtue of a perfecting or progressive tendency; which is an idea that goes back to Aristotle and includes Huxley and Bergson in its roll of adherents. In other words the most modern theory in explanation of evolution is essentially both anti-Lamarckian and anti-Darwinian, and allies itself with that type of explanation which may be called orthogenetic and vitalistic.

F., 'The Origin and Evolution of Life' (New York 1917); Packard, A. S., 'Lamarck, His Life and His Work' (New York 1901); de Vries, H., 'Species and Varieties' (New York 1905); Weismann, August, 'The Evolution Theory,' (2 vols., London 1904).

VERNON KELLOGG,
Professor of Entomology, Leland Stanford Junior University, California.

EVOLUTION IN MATHEMATICS. See INVOLUTION AND EVOLUTION.

EVOLUTIONS, Military, the movements by which troops change formation, position or order. See TACTICS, MILITARY.

EVONYMUS, ĕv-ŏn'ĭ-mŭs, a genus of the staff-tree family (*Celastraceæ*), comprising about 120 species of shrubs, natives of the north temperate zone. Three species are found in America. The best known are the strawberry bush (*E. americanus*), the burning-bush or wahoo (*E. atropurpureus*), and the spindle-tree (*E. europæus*). (See SPINDLE-TREE). From the bark of the wahoo or burning-bush an extract known in medicine as euonymin is obtained. It is used as a cholagogue, tonic and diuretic, and for its stimulant action on the liver.

EVORA, ā'voo-rä (ancient EBORA), city, Portugal, capital of the province of Alemtejo, 75 miles east by south of Lisbon. It is a very ancient city; Quintus Sertorius took it in 80 B.C., and it was also conquered by the Moors in 715, but recovered from them in 1139. Among the famous Roman antiquities of Evora are the temple of Diana, with fine Corinthian columns; an aqueduct erected by Quintus Sertorius and restored in the 16th century, which still supplies the city with water; and the beautiful tower, surrounded by Ionic columns, at the extremity of the aqueduct, and which, although it has existed since 70 B.C., is in almost perfect preservation. It has an archiepiscopal library, containing, besides some 25,000 volumes, several pictures of great merit. There are iron furnaces and some manufactures of cotton cloth and hats, and a considerable trade in wine. Pop. 17,901.

EVREMOND, āvr-môṅ. See SAINT EVREMOND.

EVREUX, ā-vrê (ancient CIVITAS EBUROVICUM), France, the capital of the department of Eure, on the Iton, 57 miles west by northwest of Paris. It is one of the oldest towns of France and its ruins and existing ancient Norman buildings show its antiquity. The most noted of the buildings are the church of Saint Taurin; the bishop's palace, dating back to 1484; the Tour de l'Horloge, built in the same century. The history of the town has been of the same tumultuous order as that of many other towns in that section of France, having been taken from the Romans by Clovis; the Normans under Rollo pillaged the town in 892; Henry I of England captured it in 1119, laying it in waste by fire; Philip Augustus of France took it in 1194 and in 1199; and during the wars of the 15th century between the French and English it was the scene of many bloody conflicts, being passed from the control of one to the other many times. The principal manufactures are machinery, linen, hosiery, leather, tiles and bricks. Pop. (of the commune) 18,957.

EWALD, ā'väl, **Carl,** Danish novelist: b. Schleswig 1856; d. 1908. He was educated at the University of Copenhagen, to which city his family had removed after his native province had fallen to the Germans in 1864. After spending some years as a forester, he turned to literature in 1887, at first issuing school texts and translations. His principal original works are 'Singleton's Udenlandsrejse' (1894) 'Glaede over Danmark' (1898); 'Sulasmiths Have' (1898); 'Der Kinderkruezzug' (1896); 'Mein Kleiner Junge' (1899); 'Crumlin' (1900). Several of his works have been translated into English.

EWALD, Georg Heinrich August, gā-ōrg hīn'rĭн ow'goost ā'vält, German Orientalist and biblical critic: b. Göttingen, 16 Nov. 1803; d. there, 4 May 1875. As a student he published his first critical work, 'Die Komposition der Genesis.' He became professor of theology at Göttingen in 1831, and in 1835 professor of Oriental languages. As one of the seven professors of Göttingen who signed the protest against the abrogation by King Ernest Augustus of the Hanoverian constitution, he was deposed from his chair and accepted, in 1838, a call to Tübingen as professor of philosophy. In 1841 he was ennobled by the king of Würtemberg and returned in 1848 to Göttingen, and resumed his old position. When Hanover was annexed by Prussia in 1866 he became a zealous defender of the rights of the ex-king and this led to his removal from his university chair, though his salary was continued. He was elected several times a member of the Diet, where he spoke strongly in favor of the restoration of the Hanoverian monarchy. His 'Kritische Grammatik der hebräischen Sprache' (Critical Grammar of the Hebrew Language) (1827), afterward merged in his 'Ausführliches Lehrbuch der hebräischen Sprache,' and continually enlarged (8th ed., 1870), formed an epoch in the study of Hebrew and placed Ewald in the first rank among scholars. 'Das Hohe Lied Salomos' (The Song of Solomon); 'Die poetischen Bucher des Alten Bundes' (The Poetical Books of the Old Testament); 'Die Propheten des Alten Bundes,' containing a translation and interpretation of all the prophets in chronological order; together with his 'Geschichte des Volkes Israel' (History of the People of Israel); and 'Die Alterthümer des Volkes Israel' (The Antiquities of the People of Israel), are his principal works on the Old Testament.

The 'History of Israel' is considered his greatest work, entailed a labor of 30 years and is a work of rare genius stamped with the impress of its author's individuality. Like others of his more important writings, it has been translated into English. On the New Testament he wrote, among other works, 'Uebersetzung und Erklärung aller Bücher des Neuen Testaments' (Translation and Explanation of all the Books of the New Testament). Another important work is 'Die Lehre der Bibel von Gott, oder Theologie des Alten und Neuen Bundes' (the Doctrine of the Bible regarding God, or Theology of the Old and New Testaments). He also wrote philological treatises on various Eastern languages and on subjects connected with them, among which may be mentioned works on the book of Enoch, on Phœnician inscriptions, on Phœnician views regarding the creation of the world, on Arabic Grammar, and 'Linguistic Studies.' From 1849–65 he issued a serial almost entirely written by himself called 'Die Jahrbücher der biblischen Wissenschaft' (Year Books of Biblical Science). Ewald has been called the "second founder of the science of the Hebrew language." Consult Cheyne, 'Founders of Old Testament Criticism' (London 1893).

EWALD, or EVALD, Johannes, yō-hän'nĕs, Danish poet: b. Copenhagen, 18 Nov. 1743; d. there, 17 March 1781. At 15 he ran away and enlisted in the Prussian service. Being compelled to join a regiment of artillery at Magdeburg, instead of being attached to the hussars as he had been promised, he deserted the Prussian standard in the Seven Years' War, and entered the Austrian service. After a few months he again deserted, returned home and began to apply himself seriously to theology. On the death of Frederick V of Denmark he was requested to compose an elegy (1766); and the general admiration with which it was received roused his ambition and he soon became one of the most eminent lyric and tragic poets of his nation. His opera the 'Death of Balder' (1774), the subject of which is taken from the northern mythology and his 'Rolf Krage' (1770), a tragedy taken from the ancient history of Denmark, are works which, notwithstanding many defects, bear the impress of true genius; but by some his lyrical drama 'The Fishers' (1779), in which is included the Danish national hymn, is ranked as the finest of all his works. As a lyric poet he is most popular at the present day, and several of his odes and elegies are among the best that modern times have produced. Consult Jorgensen, 'Johannes Ewald' (1888).

EWART, ū'ärt, **David,** Canadian architect: b. Scotland, 1843. He received his education at the Edinburgh School of Arts, removed to Canada in 1871 and became assistant engineer and architect in the Department of Public Works at Ottawa, rising to the post of chief architect in 1897. He completed the central tower of the Parliament buildings at Ottawa and erected the Canadian buildings at the Chicago World's Fair in 1893 and at the Paris Exposition of 1900. He is a member of the board of assessors of the departmental buildings at Ottawa since 1906 and since 1909 is councillor of the Royal Architectural Institute of Canada.

EWART, James Cossar, British zoologist: b. Penicuik, near Edinburgh, 26 Nov. 1851. He was educated at Edinburgh University, where he graduated M.D., and was appointed demonstrator of anatomy 1874. In '875 he became conservator of the museum, University College, London; in 1878 professor of natural history, Aberdeen University; and in 1882 professor of the same, Edinburgh University, when he was also appointed member of the Scottish Fishery Board. In London he made researches into the bacillus of splenic fever, etc., and at Aberdeen founded the first marine laboratory in Britain, where, with the late Dr. Romanes, he made researches into the locomotor system of the echinoderms, which was the subject of the Croonian lecture of the Royal Society 1881. He conducts the fishery investigations into the fertilization and life history of the herring, whitebait and other food-fishes and directs a large corps of assistants in the work at various stations. He established lectureships in his university in embryology and the philosophy of natural history and organized, for the students, a union. At Penicuik he has conducted the costly experiments, with which his name is widely known, into the development of the horse, and hybridizing of equine species, including the quagga, zebra and island pony, in different ways; and disproved the hoary theory as to the influence of previous impregnation (telegony). Among his publications are 'The Electric Organs of Skate' (1888–89); 'The Cranial Nerves and Lateral Sense Organs of Elasmobranchs' (1889); 'The Development of the Horse' (1894); 'Telegony and Reversion' (1887); 'A Critical Period in the Development of the Horse' (1889); 'Guide to Hybrids' (1900); 'The Multiple Origin of Horses and Ponies' (1904); 'Horse Skulls from the Roman Fort, near Melrose' (1906); 'On a Prejvalsky Hybrid' (1907).

EWART, John Skirving, Canadian lawyer: b. Toronto, 1849. He received his education at Upper Canada College and was admitted to practice in 1871. He practised in Toronto until 1882, when he removed to Winnipeg. He came to Ottawa in 1904 and was now recognized as a leader in his profession. During the contest for separate schools in Manitoba he represented the Catholic side. He became interested in political questions after 1900 and opposed the aims of the imperialists. At The Hague court in 1910 he was chief counsel for Canada. He published reports of cases in the courts of Manitoba from 1883 to 1890 and also 'The Kingdom of Canada and Other Essays' (1908); 'Sir John Macdonald and the Canadian Flag' (1908); 'Canadian Independence' (1911); 'The Kingdom Papers' (1912).

EWART, William, English physician: b. London, 1848. He received his education at the University of Cambridge and also at Paris and Berlin. He became consulting physician to many hospitals and examiner and lecturer to the Royal College of Physicians. He was assistant physician to the Brompton Hospital for Consumption. He became a recognized authority on the diseases of the heart and lungs. His works include 'Pulmonary Cavities' (1882); 'Cardiac Outlines' (1892); 'Heart Studies, Chiefly Clinical' (1894); "Bronchitis," and "Bronchiectasis" (in Allbutt and Rolleston's 'System of Medicine,' London 1909), and a portion of 'Report on Climates and Baths of Great Britain' (issued by the Royal Medical and Chirurgical Society, Vol. II, 1902).

EWBANK, ū'bank, **Thomas,** American scientist: b. England, 11 March 1792; d. New York, 16 Sept. 1870. He came to America about 1819 and engaged in manufacturing metallic tubing (1820–36). He was United States commissioner of patents 1849–52. His publications include 'The World a Workshop' (1855); 'Life in Brazil,' with an appendix on a collection of American antiquities (1857); 'Reminiscences in the Patent Office' (1859); 'Thoughts on Matter and Force' (1858); and 'Inorganic Forces Ordained to Supersede Human Slavery,' an essay.

EWE, a linguistic negro stock, inhabiting the coasts of Dahomey and Togoland. It is probable that they came from Borgu or Gurma only a few centuries back. They are agriculturists and possess a highly developed juridical system. They comprise the Awuna, Ataklu, Agbosimi, Aflao, Geng, Togo, Krikor, Ewemi, Fra, Dahoman, Mahi, Aja, Affakpami and others. Consult Ellis, 'The Ewe-Speaking Peoples of the Slave Coast of West Africa' (London 1890); Stanford 'Africa' (ib. 1895).

EWELL, ū'el, **Arthur Woolsey,** American physicist: b. Bradford, Mass., 1873. He was educated at Yale where he was graduated in 1897, and also studied at the universities of Johns Hopkins and Berlin. From 1897 to 1910 he was instructor in physics and assistant professor at the Worcester Polytechnic Institute, becoming professor in 1910. He is a Fellow of the American Academy of Arts and Sciences and has published 'A Textbook of Physical Chemistry' (1909); 'Physical Measurements' (1910; 2d ed., 1913); 'Artificial Rotatory Polarization' (1911).

EWELL, Benjamin Stoddert, American educator: b. Washington, D. C., 10 June 1810; d. James City, Va., 19 June 1894. He was graduated at West Point 1832, taught mathematics there until 1836, and later served as assistant engineer of the Baltimore and Susquehanna Railroad, becoming professor of mathematics at Hampden-Sidney College 1839, where he remained till 1846. He filled a similar chair at Washington University, Lexington, Va., 1846–48, when he went in the same capacity to William and Mary College, becoming its president 1854, and president emeritus 1888. He was in command of the 32d Regiment, Virginia Volunteers, from 1861–62 and adjutant-general of the Confederate army on the staff of Gen. Joseph E. Johnston, when he was commander of the departments of Tennessee and Mississippi 1862–64.

EWELL, Marshall Davis, American lawyer: b. Oxford, Mich., 18 Aug. 1844. He was graduated at the University of Michigan Law School (1868), and was professor of common law in the Union College of Law, Chicago, from 1877 until the founding of the Kent College of Law, in which he became professor of common law, dean and president. He is well known as a microscopist and handwriting expert, and was elected a Fellow of the Royal Microscopical Society of London (1886), and president of the American Microscopical Society (1893). He has edited 'Blackwell on Tax Titles' (1875); 'Illinois Reports' (Vols. XXXII–XXXVI, inclusive, 1877); 'Washburn's Manual of Criminal Law' (1878); 'Evans on Agency' (1879); 'Lindley on Partnership' (1881); and written 'Leading Cases in Disabilities' (1876); 'Treatise on the Law of Fixtures' (1877); 'Student's Manual of Medical Jurisprudence' (1887; 2d ed., 1909); 'Essentials of Law' (1882; 2d ed., 1915).

EWELL, Richard Stoddert, American soldier: b. Georgetown, D. C., 8 Feb. 1817; d. Springfield, Tenn., 25 Jan. 1872. He was graduated at the United States Military Academy in 1840, and served during the Mexican War with Scott from Vera Cruz to the City of Mexico. At the outbreak of the Civil War he resigned his commission in the National army; joined the Confederates; was actively engaged throughout the war and attained the rank of lieutenant-general. He was at the battles of the first and second Manassas, where he lost a leg, Front Royal, Cross Keys, Port Republic and Cedar Mountain; and was later placed in command of the Second Corps of General Lee's army, upon the death of "Stonewall" Jackson. In this capacity he was in personal command and led the charges of the corps at the capture of Winchester, at Gettysburg, the Wilderness, and Spottsylvania Court House, but was transferred to the Department of Richmond after these engagements, owing to his inability, on account of his wounds, to withstand the hardships of another campaign. He was later captured by Sheridan at Sailor's Creek with his forces (6 April 1865). After the war he retired to private life.

EWER, ū'ẽr, **Ferdinand Cartwright**, American Episcopal clergyman: b. Nantucket, Mass., 22 May 1826; d. Montreal, Canada, 10 Oct. 1883. He was graduated at Harvard 1848. After several years devoted to journalism he entered the Episcopal ministry and became rector of Grace Church, San Francisco, 1858. In 1862 he was chosen rector of Christ Church, New York, but his belief in the doctrine of the Real Presence and his introduction of ceremonies and practices not usual in Episcopal churches caused him to be charged with Romanism and he resigned. The majority of his communicants followed him to the parish of Saint Ignatius, New York, which was organized for him, and of which he continued rector till his death. He was an able controversialist, and wrote ‘Two Eventful Nights, or the Fallacies of Spiritualism Exposed’ (1856); ‘Sermons on the Failure of Protestantism’ (1869); ‘Catholicity in its Relations to Protestantism and Romanism’ (1878); ‘The Operation of the Holy Spirit’ (1880); ‘Grammar of Theology’ (1880).

EWING, ū'ĭng, **Finis**, American clergyman: b. Bedford County, Va., 1773; d. 1841. He received his license to preach in the Cumberland presbytery in 1802 and for many years was a successful revivalist. In 1810, with two others, he formed the presbytery which later became the Cumberland Presbyterian Church. In 1820–36 he held a pastorate at New Lebanon, Mo., and after 1836 at Lexington, Mo. He published ‘Lectures on Important Subjects in Divinity’ (1824). Consult Cossit, ‘Life and Times of Finis Ewing’ (Nashville 1853).

EWING, Hugh Boyle, American soldier: b. Lancaster, Ohio, 31 Oct. 1826; d. there, 30 June 1905. He was educated at the United States Military Academy; in 1849 went to California in charge of an expedition sent out by his father, then Secretary of the Interior, to rescue emigrants from the snow-bound Sierras, whence he returned in 1852; practised law in Saint Louis 1854–56 and in Leavenworth, Kan., 1856–58. He served through the Civil War, becoming a brevet major-general; was United States Minister to The Hague 1866–70, and wrote ‘A Castle in the Air’ (1887); ‘The Black List’ (1893), etc.

EWING, James, American pathologist: b. Pittsburgh, Pa., 1866. In 1888 he was graduated at Amherst College and three years later at the College of Physicians and Surgeons of Columbia University. He also studied at Vienna and after his return was successively tutor, Fellow and instructor at Columbia from 1893 to 1899. In the latter year he was appointed professor of pathology at Cornell. He is an ex-president of the Association for Cancer Research and of the Harvey Society. His publications include ‘Clinical Pathology of Blood’ (2d ed., 1903); and articles in ‘Textbook of Legal Medicine and Toxicology’ (1903).

EWING, Sir (James) Alfred, Scottish physicist and engineer: b. Dundee, 27 March 1855. He was educated at the Dundee high school and the University of Edinburgh. For several years he was engaged in engineering work and was assistant to Lord Kelvin and Prof. Fleeming Jenkin. He was professor of mechanical engineering at the Imperial University of Tokio 1878–83. While in Japan he devoted himself assiduously to the study of earthquakes, devising seismographs to record the earth's vibrations during such disturbances. In 1883 he became professor of engineering at University College, Dundee, and from 1890 to 1903 he was professor of mechanism and applied mechanics in the University of Cambridge. From 1903 to 1906 he was a member of the Explosives Commission and a member of the Ordnance Research Board 1906–08. In 1907 he was made C.B., and K.C.B. in 1911. In 1916 he became principal of the University of Edinburgh. He was awarded the royal medal for researches in magnetism in 1895. He has published many papers on scientific subjects, especially on magnetism and the physics of metals, in ‘Transactions of the Royal Society’ and elsewhere; also ‘Treatise on Earthquake Measurement’ (1883); ‘Magnetic Induction in Iron and Other Metals’ (1891); ‘The Steam Engine and Other Heat Engines’ (1894); ‘The Strength of Materials’ (1899); ‘The Mechanical Production of Cold’ (1908).

EWING, John, American Presbyterian minister and mathematician: b. Nottingham, Md., 22 June 1732; d. Philadelphia, Pa., 8 Sept. 1802. As a youth he exhibited marked ability in mathematics and later took a course of study in Princeton College. Upon graduating in 1755 he was appointed instructor in the college. He then became interested in theology and after finishing his course in divinity was licensed to preach by the presbytery of Newcastle, Del. In 1758 he received his appointment as instructor of the philosophical department in the College of Philadelphia and in 1759 became pastor of the First Presbyterian Church in that city, remaining such until 1773 when he was sent to England to solicit pecuniary aid in the establishment of an academy. In 1775 he returned to his native land, and in 1779, when the College of Philadelphia was changed to the University of Pennsylvania, he was placed in the station of provost, and officiated in that capacity until his death. He was also selected to serve on more than one boundary commission. His ‘Lectures on Natural Philosophy’ (2 vols., 1809), and a collection of sermons were published after his death.

EWING, Juliana Horatia Gatty, English writer for young people: b. Ecclesfield, Yorkshire, 3 Aug. 1841; d. Bath, Somerset, 13 May 1885. She contributed largely to a magazine started by her mother (Mrs. Gatty). On her mother's death the magazine was edited by her and her sister conjointly, and many of her best stories first appeared in it. Of her delightful tales of child-life we may mention ‘Mrs. Overthe-Way's Remembrances’ (1869); ‘The Land of Lost Toys’ (1869); ‘The Brownies’ (1870); ‘A Flat-iron for a Farthing’ (1873); ‘Loblie-by-the-Fire’ (1874); ‘Six to Sixteen’; ‘Jan of the Windmill’ (1876); ‘A Great Emergency’ (1877); ‘We and the World’ (1881); ‘Old Fashioned Fairy Tales’; ‘Brothers of Pity’ (1882); ‘The Doll's Wash’; ‘Three Little Nest Birds’; ‘A Week Spent in a Glass House’; ‘A Sweet Little Dear’; and ‘Blue Red’ (1883); and ‘Jackanapes’ (1884). A biography by her sister, Horatia K. T. Gatty, was published in

1885 under the title ‘Juliana Horatia Ewing and Her Books.’

EWING, Thomas, American statesman: b. near West Liberty, Va., 28 Dec. 1789; d. Lancaster, Ohio, 26 Oct. 1871. He was graduated at the Ohio University in Athens in 1815; admitted to the bar in 1816; and practised law for 15 years. He was a United States senator from Ohio 1831–37 and 1850–51; Secretary of the Treasury under President Harrison in 1841; and Secretary of the Interior under President Taylor in 1849–50. In the United States Supreme Court he ranked among the foremost lawyers of the nation. During the Civil War his judgment in matters of state was frequently sought by President Lincoln. When the capture of Mason and Slidell brought England and the United States to the very point of hostilities, Ewing sent the famous telegram that was really decisive of the whole trouble: «There can be no contraband of war between neutral ports» — and it was his advice that finally prevailed over Everett's opinion, and the envoys were set free.

EX CATHEDRA (Lat. «from out the chair»): a phrase originally applied to decisions given by the Pope in the discharge of his spiritual office as pastor and bishop of all Christians. Hence it is applied to every decision pronounced by any one in the exercise of his proper authority, as a bishop in the spiritual sphere, a judge on the bench, etc.

EX PARTE, ĕks par'tē (Lat. «from a part»), a law Latin term used in reference to an action taken by either party to a suit or other legal proceeding, or on behalf of such party, without notice to the other. Ex parte evidence or hearings are frequently made use of without being regarded as an infringement of the rights of the opponent. In a derived sense the term indicates a lack of accuracy or impartiality in a statement.

EX POST FACTO LAW (eks pōst fāk tō) (Lat. «from what is done afterward»), one made after an offense and taking effect retroactively. The provision in the Constitution of the United States, Art. I, sec. 9, clause 3, that «no . . . ex post facto law shall be passed,» has been interpreted to refer only to crimes, and in that sense the words are commonly used. The following have been decided to come within the scope of the phrase: Every law that makes an action done before its passage, and innocent when done, criminal, and punishes such action; every law that aggravates a crime, or makes it greater than when committed; every law that changes the nature of the punishment, or makes it greater than at the time the act was committed; every law that alters the rules of evidence so as to make it easier to convict the offenders; every law that, while not avowedly relating to crimes, in effect imposes a penalty or the deprivation of a right; every law that deprives persons accused of crime of some lawful protection to which they have become entitled, as a former acquittal. Such laws are therefore contrary to the Constitution. Consult Cooley, ‘General Principles of Constitutional Law in the United States’ (3d ed., 1900).

EXACTIONS (from Lat. *exactio*, act of driving out, forcing out, a forced contribution), a legal term of ecclesiastical jurisprudence, used in the Middle Ages to denote such duties or contributions, demanded by the clergy of their parishioners, as were extraordinary, either because they were new and against custom or because their amount was unduly increased. They were illicit, and it was found necessary repeatedly to denounce their unlawfulness. The power of the clergy over their parishioners or of the bishops over the subordinate clergy was so great that it was easy for them to make the most outrageous exactions. They were denounced at the third Council of Toledo (589).

EXAMINERS, Medical, in some States, as Massachusetts and New York, county officials whose duties are practically those formerly discharged by coroners, whom they have superseded. See CORONER.

EXANTHEMATA, ĕk-săn-thē'ma-ta, a name formerly widely employed to designate the acute infectious diseases that were characterized by an eruption — the eruptive fevers. The most important of these are measles, scarlet fever, chickenpox, smallpox, typhoid fever, and typhus fever (qq.v.). The term is also used in botany for blotches and eruptive excrescences on the surface of leaves.

EXARCH, ĕks'ärk (Gr. *ἔξαρχος*, *exarchos*, leader), a title equivalent to governor (Lat. *rector*), in the terminology of civil government after the seat of empire was transferred to Constantinople. But already in the 4th century it acquired the signification of archbishop, metropolitan or patriarch. In the acts of the first Council of Constantinople (381) the bishops of Alexandria, Antioch and Constantinople are styled exarchs; and the field of jurisdiction of an exarchos is exarchia. In the same period exarchos, exarchia were in use as designations of civil magistrates and their jurisdictions, the terms diocese (*διοικησις*, *diôecesis*) was also used. In ecclesiastical usage exarch came in time to be a title of honor apart from jurisdiction; thus, by the Council of Chalcedon (451) the bishops of Ephesus, Heraclea and Cappadocian Cæsarea, though deprived of their jurisdiction over the metropolitans previously suffragan to them, were permitted to be called by the title exarch.

EXAUVILLIEZ, Philippe Irénée Boistel d', fē-lēp ē-rē-nā bwäs-tĕl dĕks-ō-vē-ē-ā, French author: b. Amiens, 6 Dec. 1786; d. Paris, 30 March 1862. His essay, ‘The Saint Gervais Library’ (1831), gave the first impulse to the establishment of small libraries all over France. He translated Walter Scott's novels, from which he eliminated every passage which could be interpreted as telling against the Roman Catholic religion, and also all love passages as far as possible.

EXCALIBUR, the famous mystic sword of King Arthur (q.v.) which, in accordance with the promise of Merlin, was given him by the Lady of the Lake. At Arthur's death it was hurled by Sir Bedivere into the lake, where it was seized and conveyed from sight by a mysterious hand. Consult Tennyson, ‘Idylls of the King.’

EXCAVATION, the removal of material in engineering operations in order to make space for some structural work. There is a wide variety of such work and the special processes are described under CANALS, DAMS, FOUNDATION, TUNNELS, etc.

EXCAVATOR, a machine for digging, moving and transporting gravel, soil, etc. Excavators are made of two kinds, each adapted for different kinds of work. In making a long cutting, the first to come into operation is operated on rails, and employs a large «scoop» or bucket, with a lever heavy enough to counterbalance the bucket when filled with clay. The scoop is lowered and driven into the bank until full. It is then raised by the suspension chain, and dumped by the chain on the lever. The second class of excavator is employed to make the cutting wider. Its sides are made sloping to an angle of 45 degrees, and on the top of the bank a temporary line of rails is laid a few feet from the edge. The machine is placed on the rails at the end of the cutting; the jib is lowered until the row of buckets it carries can cut into the clay; these scrape up the bank, reaching the top of it full of soil; they next pass over the machine, and are emptied into the wagons beyond it. Excavators were extensively employed in the digging of trenches and construction of breastworks on the Western front during the Great War. Consult McDaniel, ‹Excavating Machinery› (New York 1913).

EXCELL, Edwin Othello, American song writer: b. Uniontown, Stark County, Ohio, 13 Dec. 1851. He received his education in the public schools of the states of Ohio and Pennsylvania, and gave special attention to the study of music. For over 20 years he was associated with the celebrated Georgia evangelist, the Rev. Sam P. Jones, as gospel singer. After 1881 he engaged in the publication of church and Sunday school music books. He composed many gospel songs which have attained wide popularity. He also took a prominent part in the Prohibition movement. He died 10 June 1921.

EXCELLENCY (from Lat. *excellentia*, superiority), a title of honor given to ambassadors, ministers plenipotentiary, governors of British colonies and their wives and the governor of Massachusetts. The President of the United States and the governors of many of the States have the same title by courtesy. Formerly it was limited to soverign princes.

EXCELSIOR (Lat. «higher») (1) the motto of New York State. (2) A well-known poem by H. W. Longfellow, published in 1841, of which the opening words are: «The shades of night were falling fast.» The poem in its musical setting became in America a favorite academic song.

EXCELSIOR, the trade name of a material invented in America and widely used for packing and as stuffing in mattresses and upholstery. It is made from logs of wood which have first been divided into 18 inch blocks. The fibres are separated from the blocks with great rapidity by knife-points, and packed in bales of 250 pounds weight. Not far from 140,000 tons are annually manufactured in the United States, and of this output large quantities are exported.

EXCELSIOR SPRINGS, Mo., city of Clay County, 25 miles northeast of Kansas City, on the Chicago, Milwaukee and Saint Paul, the Wabash and other railroads. Because of its mineral springs it is widely known as a summer resort; it has fine hotels, a Carnegie library, an auditorium, a government building and several pavilions. Its industrial establishments are limited to bottling works and an ice factory. Pop. (1920) 4,165.

EXCEPTION, an objection taken to testimony or any relevant matter in a legal proceeding, also to an adverse ruling of the court upon a point of law. In general, it must be taken within a prescribed period and must be entered on the record. The term is also given to the exclusion of some part of an instrument, or statement. It may mean also the part so excluded. See PLEA AND PLEADING.

EXCESS. In spherical and Riemannian non-Euclidean geometry, the excess of a triangle is the amount by which the sum of its angles exceeds 180°. Thus the spherical excess of a spherical triangle with angles of 70°, 60° and 65° is 15°. Similarly, the excess of a polygon is the amount by which the sum of its angles exceeds the sum of the angles of a plane Euclidean polygon with the same number of sides. The spherical excess of a triangle or polygon, if measured in radian, is equal to the area of the figure divided by the square of the radius of the sphere. In Lobachevskian geometry the defect, or the amount by which the sum of the angles of a polygon falls short of that of a plane Euclidean polygon with the same number of sides, plays a part quite analogous to that of spherical excess. The term excess is also used to indicate the remainder when one number is divided by another. See TRIGONOMETRY.

EXCHANGE, the act of exchanging or giving one thing for another. The term also signifies that which is so given. In commerce it is applied to a place where merchants, brokers, etc., meet to transact business; it is generally contracted into 'Change. The institution of the modern exchange dates from the 16th century. Those institutions originated in the important trading cities of Italy, Germany and the Netherlands, from which last-named country they were introduced into England. The most celebrated are the Royal Exchange of London, the *Bourses* of Paris and Amsterdam, the Börse of Hamburg and the New York Stock Exchange in Wall street. In some exchanges only a special class of business is transacted. Thus there are stock exchanges, corn exchanges, coal exchanges, cotton exchanges, etc. For Bill of Exchange, see BILL.

Course of exchange is the current price of a bill of exchange at any one place as compared with what it is at another. If for $500 at one place exactly $500 at the other must be paid, then the course of exchange between the two places is at par; if more must be paid at the second place, then it is above par at the other; if less, it is below it. *Arbitration of exchange* signifies the operation of converting the currency of any country into that of a second one by means of other currencies intervening between the two. Consult Goschen's standard work, 'The Theory of Foreign Exchange'; and Withers, ‹Money Changing› (1913).

In arithmetic *exchange* is a rule for ascertaining how much of the money of one country is equivalent in value to a given amount of that of another. In law, a mutual grant of equal interests, in consideration the one for the other, is termed *exchange*. In physics the *theory of exchange* is a hypothesis with regard to radiant heat, devised by Prevost of Geneva, and since generally accepted. All bodies radiate heat. If two of different temperatures be placed near each other, each will radiate heat to the other, but the one higher in temperature will receive less than it emits. Finally, both will be of the same temperature, each receiving from the other precisely as much heat as it sends it in return. This scale is called the mobile equilibrium of temperature.

EXCHANGES, Government Regulation of. This regulation in no way differs from that controlling other associations, corporations or banking institutions, exchanges having no different or special relations with governments. They may be held liable for restraint of trade if they fix prices; their transactions may be subject to special taxes, or they may be considered as gambling under some circumstances. See STOCK and STOCKHOLDER.

EXCHEQUER, ěks-chěk'ër, in Great Britain, the department which deals with the moneys received and paid on behalf of the public services of the country. The public revenues are paid into the Bank of England, or the Bank of Ireland, to account of the Exchequer, and these receipts as well as the necessary payments for the public service are under the supervision of an important official called the controller and auditor-general. The public accounts are also audited in his department.

EXCHEQUER, Chancellor of the. See CHANCELLOR.

EXCHEQUER, Court of. See COURT.

EXCHEQUER BILLS, bills of credit issued by authority of the British Parliament as a means of raising money for temporary purposes. They are of various sums and bear daily interest. Generally paid off, or renewed annually they were much in demand and usually quoted at a premium, and were receivable in payment of taxes. These bills pass from hand to hand as money, and form a principal part of the public unfunded debt of Great Britain. Exchequer bonds, which have generally superseded them in recent years, are similar, but they run for a definite number of years at a fixed rate of interest. Exchequer bills somewhat resemble the treasury notes which were adopted as a financial expedient in the United States before the Civil War.

EXCHEQUER TALLIES, seasoned wands of ash, hazel or willow, formerly used for checking accounts in the English Exchequer. Notches cut on the tally indicated by their form the class to which the account belonged.

EXCIPIENT (from Lat. *exipere*, take up, undertake), in pharmacy, an inert or slightly active substance used to give form and consistence to solid preparations, such as pills, or to give palatability and the necessary qualities for administration to any medicine. The various conserves, also honey, treacle, simple syrups, glycerin, white of egg and mucilage of acacia are among the most useful excipients.

EXCISE, an inland duty or impost laid on commodities produced and consumed in the country. The word seems to be derived from a Dutch term of similar meaning, which in turn may be of same origin as *assize*, its present form being influenced by a supposed derivation from Latin *excisus*. It must be differentiated from customs duty, imposed on goods entering a country. In England excise duties were established in 1643. On one article, spirits, the duty was at first only a few pence per proof gallon; in 1915 it was 14s. 9d. In the United States the internal revenue duties are analogous to the British excise. For a more detailed explanation of excise, see CUSTOMS; INTERNAL REVENUE.

EXCISE LAWS IN THE UNITED STATES. The struggle of the English people against excise was not due to any intrinsic iniquity in the tax, but partly to popular dislike of all direct taxes (see CUSTOMS; TARIFF); partly to the inquisitorial methods involved, partly to their use as a means of strengthening the royal power against popular control. At any rate, the colonists inherited this unreasoned dislike, even under totally different conditions; though Connecticut had laid an excise on spirits and all use of foreign articles, and Massachusetts and Pennsylvania on spirits, before the Revolution. But all shrank from giving the national government such power, and several States proposed amendments to the Constitution forbidding the United States ever to lay excises. Hamilton, however, recommended to Congress in 1790 an excise on spirits, upon the most advanced modern grounds — that it would not only produce a revenue without burdening any worthy industry or person, but would check the consumption, to the great advantage of the community. With great opposition the law was passed, imposing a duty of 9 to 25 cents a gallon (according to strength) on all native spirits, and a higher one on imported. In 1792 the tax was lowered somewhat. Later, under Hamilton's advisement, the scope was extended to other articles of luxury, auction sales, stamp duties on instruments of exchange, etc. But it was nullified in some sections by passive resistance; at last in 1794 a furious open defiance began in Pennsylvania (see WHISKY INSURRECTION), which had to be quelled by the regular army. There was no further resistance, but no cessation of the dislike, which was naturally a Democratic tenet, from the power it gave the general government; and when Jefferson became President, on his recommendation Congress abolished the entire system, which was possible from the large increase in customs receipts. The War of 1812, however, necessitated a fresh resort to it; and duties were laid on spirits (license tax), and the same articles Hamilton had chosen — sugar, carriages, auctions and exchanges — with salt added. They were repealed in December 1817, and no further excises were levied till the system of internal revenue taxes (q.v.) was adopted in 1862.

EXCITANT. See STIMULANT.

EXCITO-MOTOR ACTION, the action of nerves distributed to muscular organs the stimulation of which leads to movement. Thus, irritation of a nerve supplying a muscle will lead to contraction of the muscle by excito-motor action, and irritation of certain nerves distributed to blood vessels will lead to contraction of the vessel by acting on its muscular coat. See NERVOUS SYSTEM.

EXCLUSION, Bill of, a bill introduced into the British Parliament (1679) during the reign of Charles II for the purpose of excluding the Duke of York, he being a Roman Catholic, from the throne. See CHARLES II; JAMES II.

EXCOMMUNICATION, an act of ecclesiastical jurisdiction whereby a Christian is separated from the communion of the Church. It is not, however, peculiar to biblical religion, a discipline somewhat analogous being exercised by the ancient Romans. The clearest analogy to the Christian discipline is that furnished by the rabbinical code, whereby offenders were excluded from civil and religious fellowship. Under the Christian dispensation this power was exercised by the Apostle Paul when in his first letter to the Corinthians, ch. v, he writes concerning a man guilty of incest that he «delivers such a one to Satan.» Authority for excommunication is found in the words of Christ reported in Matt. xviii. «If he will not hear the church let him be to thee as the gentile and the publican.» In the Roman Catholic Church there are two degrees of excommunication — major and minor. By the minor an offender is deprived of the use of the sacraments; by the major one he is deprived of all manner of communion or communication with the faithful. In the times when the laws of the Church were enforced in their primitive rigor the excommunicated were denied communication with the faithful not only in sacred things but in the common life; and if a monarch, his subjects were absolved from all allegiance. This is greatly modified now, and persons who have incurred the uttermost ecclesiastical censures suffer only the spiritual penalties attached to their offenses. But though the Church's excommunication has in the present time lost all its civil effects, a brief notice of these effects is necessary for an appreciation of the condition of an *excommunicatus vitandus,* that is, of a person under the major excommunication, who must be avoided by the faithful, under penalty of themselves incurring the minor excommunication.

A person who is under the major excommunication is disqualified for acting as judge or juror, notary, witness in courts of law, advocate, attorney; but he is competent to plead his own cause and to sue others on his own behalf. He cannot be a guardian of a minor, nor curator, nor executor of a last will, nor can he make contracts. He cannot act as a legislator. After death his body is deprived of Christian burial: and if it does get burial in consecrated ground in whatever way, it is to be dug up and cast out. The excommunicate under major excommunication must be shunned by all the faithful: they must not, under pain of excommunication (minor), communicate with him either by word of mouth or by writing; must not greet him, nor have exchange of gifts with him. If an *excommunicatus vitandus* happens to enter a church while the Mass is proceeding, he must forthwith be put out; if that cannot be, then the service must be suspended. Such is the letter of the laws; but long before these stern prescriptions went into desuetude there were notable assuagements of their rigor through the interpretations of moralists. To illustrate this by one example only: The serfs and servants and the children, grandchildren and other relatives (even by affinity only) were permitted to continue their relations of obedience and respect to their head even after he was excommunicated. See BELL, BOOK AND CANDLE.

The Reformers claimed and exercised the same rights in regard to excommunication as did the Roman Church. In England the excommunicated person was subjected to various disabilities; he could not hold a benefice, or practise as a barrister or attorney in the courts; and could not be admitted as a witness. These were removed by Act of Parliament in England in 1813, and in Ireland in the following year. In the Presbyterian churches of Scotland the lesser excommunication involved deprivation of «sealing ordinances»; the greater excommunication is now unheard of, and since the Revolution of 1688 has carried no civil consequences with it.

EXCRETION. See FÆCES; SWEAT; URINE.

EXCRETORY SYSTEM, Comparative Anatomy of the. See ANATOMY.

EXCURSION, The. 'The Excursion' (1814), Wordsworth's longest poem, was originally designed as the second part of a still vaster work, 'The Recluse,' in which the poet intended to embody in monumental fashion his ripest reflections on man and nature. Of this enterprise 'The Prelude,' which was to have constituted an introduction, 'The Excursion,' in nine books, and one other fragment were completed. Less interesting, on the whole, than 'The Prelude' and the best of the shorter poems, 'The Excursion' is yet a rich and noble work of genius, not to be neglected by those who would master Wordsworth's philosophy or appreciate the full compass of his powers. The poem consists of a series of dialogues, of which the protagonist is The Wanderer, a venerable friend of the poet's, who from long and loving contact with nature and a deeply sympathetic knowledge of human life, has reached the heights of optimism and philosophic calm. Meeting the poet at a ruined hut on a common he tells in the first book the pathetic story of Margaret, its last inhabitant. They then pass to the secluded abode of The Solitary, a person in whom Wordsworth has embodied the disillusionment and despondency characteristic of the age, a reflection of what Wordsworth himself might have become after the French Revolution had not the malady been checked by a timely return to the tranquillizing influences of his early years. (See PRELUDE, THE). The conversation of The Wanderer and the subsequent discourses of a good Pastor, visited by the party in his parish, are directed toward a correction of The Solitary's despondency. Standing amid the graves of a country churchyard, The Pastor tells the simple but affecting stories of the lives of those who lie buried there. In Books VIII and IX The Wanderer discourses of society and government, deploring the industrial exploitation of the poor, advocating a system of universal education and exalting morality as the true basis of national greatness and the highest fruit of freedom. Despite some tediousness inseparable from the didactic character of the theme, the poem is a moving record of a mature and sobered idealism, firmly held in the face of all the influences which work against it — an impressive memorial of the strength and comfort which Wordsworth found

> In the primal sympathy
> Which having been must ever be;
> In the soothing thoughts which spring
> Out of human suffering;
> In the faith that looks through death,
> In years that bring the philosophic mind.

For reference, see article on 'THE PRELUDE.'

JAMES H. HANFORD.

EXE, a river of England, rising in Somersetshire and flowing southeast to the Devonshire border, thence south through Devon and debouching into the Channel at Exmouth. Its length is about 54 miles. Tiverton and Exeter are situated on the banks of the Exe.

EXECUTION, in law, the carrying into effect of the final judgment, decree or order of the court. Execution is effected by a writ or order directed to the proper officer and commanding him to do a certain thing. In civil law it is the means of obtaining that which the court ordered to be done by one of the parties. Execution may be had for either plaintiff or defendant. When taken out by the plaintiff it depends on the cause of action as to what is to be recovered under the writ; generally it is for the debt and costs or for the goods, damages and costs. When taken out by the defendant it may be for goods, damages and costs, and in some cases it may be only for costs.

As soon as final judgment has been entered, the party entitled to it may take out his writ of execution, and he is entitled to this writ until the other party has taken some step which is a *supersedeas,* such as an appeal or writ of error. The writ issues from the court which last passed on the judgment on which the writ of execution is taken out. Execution may be against personal property, taking and selling it, or it may be against real estate, either holding it until the judgment is paid or selling it, or in some cases by the seizure of the person of the defendant and holding him until the judgment is satisfied or until he is declared insolvent. If the property is sold the fund derived from the sale is applied to paying the judgment and costs, and the surplus, if any, is returned to the former owner of the goods. At common law, however, real property was not subject to execution except for a debt due the State or the king. By statute of 5 George II, c. 5, real estate in the colonies became subject to sale under execution the same as personal property. A writ of execution, although issued at the instance of the party in whose favor the judgment is, must be directed to the sheriff, who must carry out the direction of the writ. If he fails to do so he must answer in damages to the injured party.

Originally, at common law, when the execution was against personal property, such as goods and chattels, the writ of *fieri facias* was used, but to-day this writ may be used against land also. When the personal property consisted of choses in action it was reached by a writ of attachment. If the execution was against real estate a writ of *scire facias* was used (now usually *elegit* or *fieri facias*), and it was sold under a writ of *venditioni exponas.* In some cases, when the judgment was confined to a particular piece of real estate, the writ of *levari facias* was issued first and it was sold under a writ of *venditioni exponas.* In modern usage, if the execution is against the person of the defendant a writ of *capias ad satisfaciendum* may be issued in some jurisdictions, under which the defendant is arrested and his person held until the judgment is satisfied or until the defendant is declared insolvent. Sometimes the defendant is released if security is given that the defendant will abide by the order of the court. Nearly all these writs and other old forms are obsolete or modified in use except *fieri facias* and, to a less extent, *elegit* and *capias ad satisfaciendum.* See ATTACHMENT; FIERI FACIAS; SCIRE FACIAS.

A general judgment binds all property owned by the person against whom the judgment is recovered at the time the judgment is entered, and it also attaches to all property he acquires up to the time the judgment is satisfied, and if the debtor sells any real estate before the judgment is satisfied, the property is not released from the lien of the judgment. When property is sold under an execution the purchaser buys only the title of the debtor, and all equities under which he held it still attach to the property.

In criminal law execution is the carrying into effect of the judgment of the court in relation to the person convicted. It consists in putting the convict to death according to his sentence. See CAPITAL PUNISHMENT.

EXECUTION, Military, in drill regulations, the command following the preparatory command and causing the execution of the latter. Legally, a military execution is the putting in effect the sentence of a military court. See MILITARY LAW.

EXECUTIONER, the official who carries into effect a sentence of death or inflicts capital punishment in pursuance of a legal warrant. In England it is the province of the sheriff to execute the extreme sentence of the law, but in practice the disagreeable duty is performed in his presence by an officer retained for this purpose. In Scotland the duty devolves upon the civic magistracy, but the strict letter of the law is avoided as in England by the attendance of a magistrate to witness the proceedings. Several executioners have become famous from their names being dragged into literature; such as Richard Brandon, the supposed headsman of Charles I; Jack Ketch, commemorated by Dryden (Epilogue to the Duke of Guise), whose name was long vulgarly given to all who succeeded him (in London) in this odious office. In America, the title and duties of the public executioner differ in the various States. In some States the sheriff of the county becomes the executioner, but in New York State the warden of the penitentiary is technically the executioner. The duties are usually performed by one of his subordinates. In the army the provost-marshal is the military executioner. See CAPITAL PUNISHMENT; ELECTROCUTION; GUILLOTINE; HANGING.

EXECUTIVE, in the United States, properly, though in the narrow and restricted sense, the entire official body charged with the execution of the laws, but popularly the chief officer, as President (of the United States), governor (of a State), mayor (of a city), etc.

Executive Power.—The executive functions in the modern state are much more diversified and important than the usual definition of the word «executive» would indicate, since, besides enforcing the laws enacted by the legislative department of government, the executive, in the larger sense, must formulate and carry out constructive policies, direct the public life of the state, act as its representative in its relations with foreign states, render many highly-important decisions and exercise wide discretion and judgment. Hence the executive power covers a range of official activities wider and more significant than the mere fulfilment of the commands of the legislature. The organization of the legislative and executive branches of government necessarily must differ because the former is the body which deliberates upon the needs of the state and enacts the legislation required to meet such demands, while the latter's primary, though not its sole, function is to execute with the utmost promptness, energy and efficiency the will of the state as formulated by the legislative body. To attain such results a single executive is most desirable, since the division of executive power between several co-equal authorities would create confusion in times of stress, would enable the responsibility for action easily to be shifted from one shoulder to another, and would result in a lack of unity and efficiency in government so essential to its success. In ancient Athens executive power was divided between generals and archons; in Rome between two consuls, and in Sparta for many years between two kings, while in France between 1795 and 1800 a directory (q.v.) of five persons was in office and later three consuls held the executive power. The general executive of the American colonies was the king; their individual executives, the governors, appointed by the Crown or (in Rhode Island and Connecticut, and for a few years in Massachusetts) chosen by the people. These were succeeded *de facto* by the committees or councils of safety; then by officials usually called governor, sometimes president, and sometimes not by single persons, but by executive councils, as in Switzerland. (See also COLONIAL GOVERNMENTS, PROPRIETARY). The general government had no executive till the adoption of the Constitution (q.v.). The Continental Congress (q.v.) had only such functions as the State legislatures allowed it, which were to debate and ask for supplies and make recommendations; and the Articles of Confederation provided for no executive. (See UNITED STATES — THE ARTICLES OF CONFEDERATION). At the present time executive power is organized on the single person plan in all countries save Switzerland which has an executive council of seven members.

In general executive power may be said to include the execution of the laws and treaties; the conduct of foreign relations either with or without the aid or consent of the legislature or one of its branches; the command and disposition of the military and naval forces; the power to approve or disapprove acts of the legislature, to recommend subjects and measures for its consideration, and in some countries to summon, open and prorogue its sessions; the power of appointing and dismissing the more important administrative officials; and the right to pardon those who have offended against the laws, save in impeachment cases. The executive branch of the government in nearly all states, in a greater or lesser degree, is empowered to issue ordinances, regulations or decrees establishing rules for the conduct of governmental officials and affairs, to interpret statutes for the guidance of officials and to supplement laws respecting numerous matters that have been left to the discretion of the executive. In England such executive legislation is accomplished by the «statutory rules and orders» issued by the departments of state, especially the home office and the local government board. In France the legislature enacts laws on broad, general principles and allows the executive to insert the details by means of ordinances. The undefined and now greatly restricted «royal prerogative» of the executive in monarchical states has no statutory authority and may be considered the remnant of the king's common-law powers. See the articles or paragraphs on «Government» under the titles of the various nations.

RELATIONS OF THE NATIONAL EXECUTIVE AND CONGRESS.

Separation of Powers.— When the Constitution was framed the belief prevailed that the executive, legislative and executive departments of government should be separate and independent, but nevertheless this separation was subject to some modifications in the Constitution as adopted and has been considerably changed by the practices which have developed since. The Senate was allowed to wield a certain amount of executive power in that it was entrusted with the confirming of appointments; Congress was given a considerable degree of control over the administration through its right to establish, regulate and maintain the various departments; and the President could participate in legislation through his right to address or send messages to Congress and through his power of veto. In recent years the contest for domination between the executive and legislative branches has resulted in a struggle in which each has endeavored to strengthen its own position at the other's expense.

Patronage.— Under Article II, § II, ¶ 2 of the Constitution the President has power, «by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers, as they think proper, in the President alone, in the courts of law, or in the heads of departments.» Though the fathers of the Constitution probably intended that the Senate should refuse to confirm Presidential nominations because of unfitness only, the Senate has not hesitated to use its power in this respect for partisan purposes, chiefly to coerce the President. Under this senatorial power has arisen the practice known as «Senatorial courtesy» (q.v.), the extent and importance to which this practice may attain depending largely on the President's character and forcefulness. The Constitution makes no provision respecting removals from office, but in 1867, at the time of the dispute between President Johnson and Secretary Stanton, Congress passed the Tenure-of-Office Act (q.v.), providing that persons appointed with the consent of the Senate should hold office until their successors were appointed in like manner; in other words, the incumbent could be removed only with the consent of the Senate. The doubtful legality of the act caused material alterations in 1869 and its final repeal in 1887. (See also DE FACTO GOVERNMENT). Impeachments are rarely used, though all branches of the government have had occasion to employ this cumbersome procedure (President Johnson, Judges Pickering, Chase, Humphreys, Peck, Swayne and Archibald; Senator Blount; Secretary Belknap) and in the nine cases only three convictions have resulted (Pickering, Humphreys and Archibald), while Blount and Belknap were out of office when their cases came up for consideration. Save by the method of impeachment Congress cannot remove objectionable officials, though it may investigate and discredit them and thus compel their resignation or dismissal. See APPOINTMENTS; UNITED STATES — THE NEW DEMOCRACY AND THE SPOILS SYSTEM; UNITED STATES — IMPEACHMENTS.

Treaty-Making.— The legislature is seldom allowed to participate in the negotiations of treaties, but to exclude errors and to prevent the possibility of abuse by an unwise, ambitious or unscrupulous executive, the legislature, or one branch thereof, usually possesses power of ratification before treaties negotiated by the executive may become the law of the land; hence the treaty-making power is neither purely executive nor legislative in character. The Senate practically controls the power of making treaties through the constitutional provision, as previously stated, that two-thirds of the Senators must approve the treaty; as a result of the encroachment of the legislature on the executive the Senate now to a certain degree participates in the negotiations through its committee on foreign relations. The House has often endeavored to exert some influence over the course of negotiations but the President is not obliged to heed the advice of the House, its concurrence being necessary only when legislation is required to render treaties effective. Sometimes, to circumvent the certain defeat of a treaty in the Senate, the President has entered into an «executive agreement» with the country involved, under which, by independent action, the chief provisions of the proposed treaty were carried out. See TREATIES.

Departmental Affairs.— The President's power and influence over the executive departments vary and in many respects are subject to Congressional limitation. He is the head of the National administration, is obliged to enforce the faithful execution of all laws, and under Article II, § II, ¶ 1 of the Constitution «may require the opinion, in writing, of the principal officer in each of the executive departments, upon any subject relating to the duties of their respective offices»; yet the departments, being organized by Congress, are subject to the will of Congress under statutory regulation, which situation somewhat curbs Presidential power over departmental heads and their subordinates. From a strictly legal standpoint, the President does not possess full authority in respect to the control and direction of administrative affairs but he can establish himself as the chief executive and administrative officer of the government and can make his will effective by removing an officer who refuses to comply with his wishes and appoint one who will do so — as was the case when President Jackson compelled the removal of government funds from the United States Bank. However potent this power may be, it could not be said to constitute the President's chief means of control over administrative affairs since his authority has been strengthened constantly by an ever-broadening construction of the constitutional provisions requiring him to execute the laws. His power to issue and enforce executive orders pertaining to administrative affairs has been sustained by numerous opinions and the courts seldom interfere to upset firmly established precedents. When clothing the President with executive power the framers of the Constitution primarily intended that, besides enforcing the laws, he should perform acts of a political nature, such as conducting foreign affairs, which are not subject to judicial review. Hence Congress seldom hampers the President in his conduct of foreign affairs through the State Department, and the extent of his personal supervision of such affairs depends largely upon the personality (and of course the capabilities) of the Secretary of State. But in respect to vesting authority for the administration of affairs (other than political), the intent of the framers was not clearly indicated in the Constitution, since one or more of the secretaries is required to report annually direct to Congress instead of to the President; furthermore, when it deems necessary or wise, Congress may provide for the management of certain services by joint committees of the two Houses, and may authorize subordinate officials to perform certain acts without the consent, approval or intervention of their superiors or the President. (Among the administrative services outside the jurisdiction of the executive departments are the Interstate Commerce Commission, the Civil Service Commission, the Government Printing Office, the Commission of Fine Arts, the Smithsonian Institution, etc.). Congress maintains a close control and regulation over the Treasury Department and the administration of the financial needs of all departments. Although each secretary annually submits an estimate of his department's needs, Congress not only disregards the secretary's recommendations but, if in the mood, appropriates vast sums which are not only not requested, but which are deemed by the secretaries and the President to be unnecessary and wasteful. Such oftentimes are appropriations for rivers and harbors and public buildings, popularly known as the «pork barrel.» See BUDGET SYSTEM, AMERICAN.

The executive endeavors to cultivate harmonious relations with Congress by complying with requests for opinions and advice, information, documents, etc., partly because the success of the administration's legislative program depends upon such harmony and partly because Congress controls the purse of the nation. This has resulted in bringing the executive and legislature together by devious and extra-legal methods, but in one instance an opposite development has occurred. In our early history Cabinet members sometimes appeared in person before Congress to give information or to outline and advocate or oppose policies and this was not unconstitutional. Department heads cannot be members of either House though they are not excluded from the sessions, but the early practice was discontinued and seems unlikely to be revived, though this course was advocated by a Senate committee in 1881 and by President Taft in a message 19 Dec. 1912. See UNITED STATES — THE PRESIDENT'S OFFICE; UNITED STATES — THE CABINET OF THE; UNITED STATES — BEGINNINGS OF EXECUTIVE DEPARTMENTS OF THE; CABINET AND CABINET GOVERNMENT; CONGRESS; FEDERAL GOVERNMENT; CONSTITUTIONAL GOVERNMENT; and the various departments by name.

Presidential Influence over Legislation.— Under Article I, § VII, ¶ 2 of the Constitution the President may veto an act of Congress and such act cannot become law unless repassed by a two-thirds vote of both Houses. (See VETO; ACTS OF CONGRESS; BILLS, COURSE OF). This fact is important not because of the frequency of Presidential vetoes, but because it enables the President to dominate Congress in a large measure; by a threat to wield this weapon he may prevent the passage of bad laws and compel the elimination of objectionable features from otherwise good ones. Article II, § III provides that the President «shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient.» No method of communicating with Congress is suggested or prescribed and both the written message and the speech in person have been employed. Congress is not compelled to act upon the President's recommendations and seldom does complete the suggested legislative program, but as the legislation advocated by the President presumably coincides with the policy of the party by which he has been elected, as the majority of the members of Congress usually have the same political affiliations, and as the outcome of future elections is much influenced by the character of the legislation and the manner of its execution, the President's recommendations rarely are refused serious consideration and generally are enacted into law. Moreover Congress can ill afford to ignore public opinion and if the President be a capable party leader and can arouse public interest sufficiently to constitute a public demand he is quite sure to obtain the desired results. In recent years the President's influence has depended largely upon his ability to control his party whether through force or persuasion.

RELATIONS OF THE NATIONAL EXECUTIVE AND THE JUDICIARY.

Conflicts often arise in the relations of the executive and judiciary, due chiefly to the adoption of the doctrine of separation of powers and the fact that unconstitutional actions and laws are referred to the courts for determination. This conflict of relations is most noted as regards the State executives and the Federal courts. Amendment XI of the Constitution provides that «the judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State.» Nevertheless the courts have decided that this amendment does not apply to an injunction or mandamus suit brought against a State officer under a Federal statute or constitutional provision (*Ex parte* Young, 209 U. S. 123). On the other hand suits against Federal officers in the State courts have been rare and never successful (see, for instance, Ableman *vs.* Booth, 21 Howard 506; Tarble's Case, 13 Wallace 397). Conversely, in 1793 Congress passed an act prohibiting Federal courts to issue writs of injunction in order to stay proceedings in State courts, save in matters of bankruptcy ('Rev. Stat.' 720). Broadly speaking, the executive is not subject to judicial control in cases of discretion nor in any political matter, save that any executive order which is unconstitutional is null and void, even though it be issued by the President himself; and any officer or other person executing such unconstitutional order is liable in damages (Little *vs.* Barreme, 2 Cranch 170). In the case of Marbury *vs.* Madison (consult also Cranch 137) Chief Justice Marshall enunciated the doctrine that although the court could not interfere with the prerogatives of the executive it could and would command a head of a department to perform a duty not dependent on executive discretion; but the question of such executive coercion has not been extended to the President. Furthermore, so far as the President and Secretary of War are concerned, the court has decided that purely political actions by an executive are not subject to judicial review or injunction (4 Wall. 475; 6 Wall. 50). But while unauthorized and unconstitutional executive orders are null and void and private parties have the right to sue for damages those executing such orders, the mere allegation of unconstitutionality is not sufficient ground for the courts to enjoin the enforcement of a statute by the executive. In Wilson *vs.* Shaw (204 U. S. 24) Justice Brewer expressed the opinion, since Congress had ratified the executive action, that the courts «have no supervising control over the political branch of the government in its action within the limits of the Constitution.» Indirectly through the appointing power the executive has considerable influence over the judiciary. See UNITED STATES — JUDICIARY OF THE; SUPREME COURT; COURT.

POWERS AND INFLUENCES OF THE STATE EXECUTIVE.

Organization of the State Executive.— Unlike the National Government, where the chief responsibility is concentrated in the hands of a single individual, the executive power and responsibility in the States are divided between the chief executive and a number of other State officers, virtually his colleagues, over whom he has little or no control, and who, save in rare instances, are elected by the people, to whom alone they are responsible. Sometimes the chief executive may belong to one political party and his subordinates or part of them to another, which renders difficult any co-operation among departments or between departments and the chief executive. Under early State constitutional provisions these State officers were either appointed by the governor or chosen by the legislature and thus the governor had a certain measure of control over the conduct of State business; but in late years these officers have been elected by the people, as a result of which the governor no longer can be compared with the President as the head of the administration which has been placed in power, having no general authority to direct, remove or discipline such elective officers; his only power of supervision is the right to examine the administration of the respective offices and in some cases to remove the incumbents if found guilty of malfeasance, corruption or gross negligence. In a few States (New York for instance) the treasurer, if found to have violated his duty, may be suspended from office but not removed by the governor. As a rule the governor may remove his own appointees for good cause, but the person removed must be informed of the reasons and be afforded ample opportunity to refute the charges. In Massachusetts and a few other States the governor at first appointed all judges, sheriffs, court clerks, registers of probate and the attorney-general, but in most States all these officials (and in Massachusetts all save the judges) are elected by the people. In Maine a few of the department heads are appointed by the legislature, and in New Hampshire a few are elected on joint ballot of the general court. In Delaware and Texas the secretary of state is appointed by the governor, while in Maryland the secretary of state, state librarian and commission of law office, in New Jersey the secretary of state and the attorney-general, and in Pennsylvania the secretary of state, the attorney-general and the superintendent of public instruction are appointed by the respective governors with the advice and consent of the Senate. In New Jersey the treasurer and in Tennessee the secretary of state are appointed by the general assemblies, but in the latter State the attorney-general is appointed by the judges. Governors still possess the pardoning power (in most States without restriction), but in a few New England States the pardon is incomplete without the concurrence of the executive council. The governor is commander-in-chief of the State military forces and may appoint his military staff, but as a rule the other militia officers are elected by the votes of the military organizations.

Relation to Legislation.— Like the President, the governor is authorized to convene the legislature in other than its regular sessions, and again like the President he presents for the consideration of that body his views respecting matters of public policy and importance and his recommendations of legislation to be enacted for the good of the State. As is the case with Congress the legislature is not obliged to heed his advice and often does not, but in many cases governors have made direct and effective appeals to the people to arouse public sentiment in favor of their plans. All the States save North Carolina empower their governors to veto legislative enactments with the exception of constitutional amendments, but when returning such rejected measures they must state their reasons for objection. Unless overruled by a two-thirds vote of both branches of the legislature the veto is absolute, but if repassed by the necessary vote the enactment becomes law without the governor's signature; all other acts approved by him bear his signature.

Administrative Powers.— From the foregoing the governor's powers may be surmised as lying not so much in his constitutional rights or privileges as in the moral atmosphere and prestige of his office, since he represents the highest dignity of the State. On all public occasions he is the first citizen of the State, the representative of its political, civil and military authority. As the official head of the State he sends and receives communications in its name; issues proclamations to its people; and owing to a variety of powers, including the bestowal of considerable patronage, his prominence in the public eye and his relation to the legislature, he has an influence in shaping legislation far exceeding a strict interpretation of his constitutional prerogatives. He is the official and natural exponent of the State in National affairs and in its relations to the Federal Government, for which reason he issues writs for the holding of elections to fill vacancies in Congress and even under Amendment XVII to the National Constitution may make temporary appointments of senators in case of vacancies until the people fill such vacancies by elections; he transmits ratifications of constitutional amendments and other acts of the State legislature which relate to National matters.

Tendencies and Proposed Reforms.— The evils of the subdivision of executive power have not only been recognized but in many States the tendency is to remedy such defects by strengthening the governor's control over the administration through a wider appointing power; by reducing the number of co-ordinate elective officials; by relieving him of the confirmation of his appointment, by the State senate; by recognizing his unrestricted removal power; by authorizing him to make special inquiries into the several executive departments and during the legislative recess to suspend officers who have violated the law; by empowering him to require from department heads written statements pertaining to anything connected with their respective duties; in some cases by allowing him, at stated intervals, to examine the accounts of officials such as the treasurer and auditor; and in some States by requiring the principal State officers to render to the governor periodic reports covering the activities of their departments, although such reports, even if convincing as to the official's incompetency, neglect of duty or violation of the law, in no way augment the governor's power of supervision over the administration because of his greatly restricted power of removal. Although responsible for the faithful execution of the laws, the governor is often powerless, without the co-operation of the department heads, to carry out the constitutional injunction owing to the manner in which the executive power is divided; as an example, he cannot compel the attorney-general unwillingly to start a suit against an individual or a corporation chiefly because he has neither the power of direction or removal, and this same weakness characterizes his relations with other State officers. The enforcement of responsibility is impossible owing to the multiplication of departments exercising administrative powers, and this is particularly noticeable in States which have boards and commissions the members of which are often elected by the people, though even if they are appointed by the governor he has little power of control or supervision over the administration of affairs entrusted to them. New York, Pennsylvania and Massachusetts each have nearly 100 such boards and commissions, but a movement is going forward to consolidate most of these boards into one board of control or board of affairs. The creation of the office of «state business manager,» to organize and manage State business affairs under the governor's direction, has also been proposed. One governor has even recommended a system of State rule by commission, similar to the commission system of city government (q.v.). Another proposal is to authorize the governor to appoint the principal State officers, who, collectively, shall constitute a cabinet or council, and to give the governor a large power of initiating legislation. In this way the State executive would resemble the President and his Cabinet; thus the power and responsibility would be centralized, and unity, co-ordination and efficiency could be introduced into the administration of State affairs.

POWERS AND INFLUENCE OF THE MUNICIPAL EXECUTIVE.

Growth of the Mayor's Powers.— In the government of the borough during colonial times the executive and legislative functions were not separate. The council was the sole governing body and the presiding officer was called mayor. He was merely a member of the council, possessed no powers other than those of a presiding officer, could not veto enactments of the council and could make no appointments to office, though in a few boroughs he did have some minor responsibilities, such as regulating taverns, supervising markets, holding coroners' inquests and hearing petty contestations at law. After the Revolution and with the advent of the Federal Government, the mayor's powers were increased gradually but materially, owing to the influence of the separation of powers which was put in vogue in the National and State governments. For the first time in the history of American cities, Baltimore in 1796 empowered the mayor to veto resolutions of the city council, though vetoed measures might be repassed by a three-fourths vote; the mayor's powers of appointment to city offices were also much enlarged. In 1822 Boston authorized the mayor to appoint whom he chose, subject to aldermanic approbation. But not until the middle of the 19th century did the municipal executive make much headway. The government of cities by council had developed inefficiency, waste, extravagance and considerable corruption, whereupon the State governments intervened, transferring various functions from the councils to State-appointed and controlled boards, as, for example, in 1860 the Baltimore police department was placed under the control of a State board; in 1866 the Chicago police suffered the same intervention; and in 1865 the New York legislature assumed control of police, fire protection, public health and licensing in New York city. Subsequently the legislatures restored a large measure of local control, but instead of reinstating the city council in power, they placed control in separate executive boards, the members of which were appointed by the mayor or elected by the people. Hence the power of appointment substantially increased the powers of the mayor's office and in time even the confirmation of the mayor's appointees by the aldermen was eliminated from city charters, as was the case in Brooklyn in 1882. Many other cities followed Brooklyn's lead and though a large number still retain the practice, it is gradually being abandoned. It should be remembered, however, that in no two cities of the United States are the mayor's powers alike, and in describing the position and powers of the American mayor even the most important statements must be made with large reservations; in New York and Boston the authority of the municipal councils is insignificant when compared with the powers of the mayors, whereas in Philadelphia and Chicago the reverse is true, the councils still maintaining a strong grip on local governmental affiairs.

The Mayor's Influence upon Legislation. — Theoretically the mayor's office is administrative and has no legislative power but often the mayor exerts a strong influence upon local legislation. In some cities, like Chicago, he presides over the sessions of the city council but in most cities he not only is deprived of this privilege but may communicate with that body only through a written message. Like the President and the State governor, the mayor may and often does suggest new legislation for the consideration of the council and to a certain degree the deference shown to his suggestions depends upon his personal character and political influence. Like the President, however, the mayor has an effective weapon in the veto power (but not the privilege of the «pocket veto»), since under most city charters he must pass upon every ordinance or resolution of the council, and in many cases mayors have used this privilege without scruple to enforce aldermanic submission. A prescribed majority must be obtained to override the mayor's veto whether the council consists of one or of two chambers, but though the usual practice is a two-thirds vote, the requirement is more rigid in some cities, being three-fifths in Philadelphia, three-fourths in Baltimore and seven-ninths in San Francisco.

The Mayor's Appointing Power.— In most cities the people elect a few heads of the city departments; in other cities some officers are appointed by the council; and in isolated cases important city officials may be appointed by the State executive or by the higher State courts. But in the majority of cities the mayor appoints the departmental heads, subject to the approval of the council or board of aldermen; sometimes, as in New York city, Denver and San Francisco, these appointments need not be confirmed by any municipal or State authority, but in a few cases, as in Boston, such appointments, to be effective, must be approved by a State civil service commission. Recently the system of council confirmation has been viewed with disfavor and the latest city charters omit the confirmation feature. See APPOINTMENTS, FEDERAL, STATE AND LOCAL.

Miscellaneous Functions.—As regards municipal finance, the mayor's powers have been largely increased; the preparation of the city budget, which formerly was under the supervision of the council, has been transferred to the city executive owing, in a large measure, to the inordinate amount of logrolling in which the councilmen indulge. In some cities, like New York, the preparation of the budget and the determining of the tax rate are supervised by the board of estimate and apportionment and in other cities, like Boston, the mayor has direct charge of the work, but in all cases the city executive is deprived of the power of making appropriations, this being vested in the council, which, under certain restrictions, may also increase or reduce the various items. (See BUDGET SYSTEM, AMERICAN). Some charters empower the mayor to obtain reports from city officials at stated intervals, to inspect accounts and to conduct investigations; and some require the mayor's approval to validate contracts. In a few cities, when necessary, the militia may be called out by the mayor and in some cities persons convicted and fined in municipal courts may be pardoned by the mayor and he may also remit their fines. See CITIES, AMERICAN, GOVERNMENT OF; MUNICIPAL GOVERNMENT; CABINET AND CABINET GOVERNMENT; COMMISSION FORM OF GOVERNMENT; CITY MANAGER PLAN OF GOVERNMENT.

IRVING E. RINES.

EXECUTIVE AND JUDICIARY, those branches of government which, respectively, are entrusted with the execution of the laws, and that judge or determine the application of the laws to particular cases, their constitutionality, etc. See COURT; EXECUTIVE; STATE.

EXECUTIVE OFFICER, in the navy of the United States the officer of the line next in rank to the captain. His appointment is usually direct from the Navy Department, but in some cases a senior officer is detailed as executive officer by the captain. On the larger vessels this officer is generally of the rank of commander, but in the smaller vessels is of lower rank. He is the aide and executive of the captain in all matters and is responsible for all drills and routine work. He has charge of the enlisted force and keeps their records. In battle the executive officer has general supervision of the battery and of everything in regard to the safety of the ship except navigation. While on board he has general supervision of the organization, discipline, exercise, etc., of the crew.

EXECUTIVE POWER, narrowly defined, is that power which enforces law. In its larger aspect it involves the exercise of wide discretion and judgment, the rendering of important decisions, and the formulation and carrying out of constructive policies. The executive directs the public life of the state, and in all relations with foreign states is its representative. The principal function of the executive is to administer and enforce the will of the state as formulated by the legislature. The executive should be characterized by prompt decision, singleness of purpose and energetic action, objects which are only obtained by vesting the executive power in the hands of a single person. See EXECUTIVE; GOVERNMENT; GOVERNOR; STATE; PRESIDENT.

EXECUTIVE REFORM. See EXECUTIVE; STATE.

EXECUTOR (Lat. «performer»). An executor is one to whom another man commits his last will and testament for execution of that last will and testament (2 Black. Comm. 503). A person to whom a testator by his will commits the *execution* or putting in force of that instrument and its codicils. The following is a brief summary of an executor's duties:

(1) He must bury the deceased in a manner suitable to the estate left behind. But no unreasonable expenses will be allowed, nor any unnecessary expenses if there is risk of the estate's proving insolvent. (2) Within a convenient time after the testator's death, he should collect the goods of the deceased, if he can do so peaceably; if resisted he must apply to the courts for relief. (3) He must prove the will, and take out administration papers. (4) Ordinarily, he must make an inventory of personal property, and in some States of real estate also. (5) He must next collect the goods and chattels, and have the claims inventoried, with reasonable diligence. And he is liable for a loss by the insolvency of a debtor, if it results from his gross delay. (6) He must give notice of his appointment in the statutory form and should advertise for debts and credits. (7) The personal effects he must deal with as the will directs, and the surplus must be turned into money and divided as if there was no will. An administrator must at once collect, appraise and sell the whole. The safest method of sale is a public auction. (8) He must keep the money of the estate safely, but not mixed with his own, or he may be charged interest on it. (9) He must be at all times ready to actually file an account within the year generally prescribed by statute. (10) He must pay the debts and legacies in the order required by law. Funeral expenses are preferred debts. See ESTATE.

EXECUTORY DEVISE, a bequest by testament of a future interest of real or personal property, which is such that it may not be described as a residuary estate. It must take effect within a life or lives in being and 21 years after. See DEVISE; FUTURE ESTATE.

EXEDRA, a seat built out from a portico in Greek and Roman buildings. Such seats were usually simi-circular in form and sometimes were provided with a roof. Famous examples of exedras built out of doors were those in the Street of Tombs, Pompeii. The Sieges-Allée, Berlin, contains modern examples of this kind.

EXEGESIS, Biblical. The word «exegesis» is from the Greek ἐξήγησις, primarily *a leading out,* and coming to mean, *an interpretation, an explanation, a making clear.* The verb ἐξηγέομαι occurs six times in the New Testament, always in the sense of revealing a fact or of making clear a truth, Luke xxiv, 35; John i, 18; Acts x, 8; Acts xv, 12, 14; Acts xxi, 19. In John i, 18, we read, «No man hath seen God at any time; the only-begotten Son, who is in the bosom of the Father, that one became his exegete» (ἐκεῖνος ἐξηγήσατο). That is to say, Jesus *revealed* the inmost character of God. He *made manifest* what otherwise would have remained hidden. He *interpreted God's* being. He *made clear* the Divine providence and plan. His person and his whole teaching and life were an exegesis of the invisible and previously incomprehensible Godhead. What Jesus did for God's being and providence, the exegete endeavors to do for the Bible. He searches for its inmost meaning, explains what is obscure, leads out to the light what is less manifest, makes clear all its implications and sets its complete import before the mind's eye. The task of Biblical exegesis, therefore, is to clear up all difficulties and to make plain the meaning of the Bible text. It might seem a comparatively easy thing to do this; but centuries of endeavor have shown that while all the essentials of the revelation in the Bible are reasonably clear there are problems connected with all of the Bible books which tax the utmost powers of the greatest minds to master them. Then at least four temptations beset the interpreters of Bible truth. One of these is apparent in those exegetes who

> "Each dark passage shun
> And hold their farthing candle to the sun."

What is clear in itself needs no further explanation. The office of the exegete becomes a necessity only when the meaning seems obscure. Another danger in exegesis is that of bringing a meaning *to* the text instead of drawing the meaning *from* it. The text is forced into agreement with previous prejudice or opinion. This is nearly always fatal to the truth. As an old monk said, «Whosoever seeketh an interpretation in this book shall get an answer from God; whosoever bringeth an interpretation to this book shall get an answer from the devil.» Jerome put the same truth more mildly when he said, «He is the best teacher who does not bring his doctrine into the Scripture but out of the Scripture.» Sometimes the obvious meaning of the text is unpalatable to the exegete, for doctrinal or other reasons, and then he is tempted to explain the meaning away. This is rankest treason to his calling. He is expected to be loyal to the truth and nothing but the truth. If he betray the truth in behalf of a political party or a church organization or a doctrinal system he is no longer worthy of his office or name. A fourth temptation is that of adding to that which is written, improving upon the text by the addition of unwarrantable inferences and subjective fancies and unjustifiable subtleties of every sort. It represents the presumption of the apostle Peter at Cæsarea Philippi, who thought he knew better than his Lord what ought to be said and done. These are four fundamental faults of all exegesis; a failure to explain the meaning that is obscure, a distorting of the meaning that seems obvious, an utter perversion of the plain truth, and a supplanting of the truth with merely human verbiage or wisdom. Wilful miscarriage, maiming, murder and the substitution of a changeling for the true child are crimes in the realm of interpretation, as well as under the civil law. The science of exegesis has sought from the first to free itself from these faults. If it has not wholly succeeded as yet, that is simply to acknowledge that like all other science its development has been entrusted to fallible men. We may trace various schools of exegesis through the history of the Church, and in all of them some one or other of these fundamental faults is likely to be manifest.

The first important school of exegesis was founded at Alexandria, and it flourished from 150 to 400 A.D. Its most distinguished representatives were Clement, Origen, Athanasius, Basil and the two Gregories. Of these the peerless prince was Origen, the greatest scholar and saint the Christian Church has produced since apostolic times. A great injustice has been done both him and the Alexandrian school by associating their names almost exclusively with the allegorical interpretation of the Scriptures, in which they sometimes indulged, as though this method were their only method or were peculiar to them alone. Neither of these things were true. The allegorical interpretation was much older than the Alexandrian school and has persisted in dragging out its pernicious existence to this day. It was prevalent and predominant in the Rabbinical schools of exegesis before the Christian era began. The Talmudists finally found a watch-word for their mystical exegesis in Pardes, or Paradise. The four letters of this word in the Hebrew, P R D S, were made to indicate the four words, Peshat or explanation, Remes or hint, Darush or homily, and Sod or mystery; and these in turn represented the fourfold interpretation of which every passage in Scripture was capable. Rabbi Ishmael declared that by means of these any Scripture could be expounded in 49 ways and the expositor could break every text into fragments even as a rock is broken by a hammer (Sanhedrin, 34). The apostle Paul carried at least one example of allegorical treatment into our New Testament, probably suggested by his Jewish training in the school of Gamaliel, Gal. iv, 22–31. This method was introduced into Alexandria by Aristobulus and pseudo-Aristeas, and it became authoritative as a method of exegesis under Philo, the foremost writer among the Alexandrian Jews contemporary with the Christ. Philo found the method ready made to his hand, not only by the Jewish rabbis, but also by the Greek philosophers who had allegorized Homer and Hesiod and the ancient Greek myths into conformity with their more advanced ethics and faith. The Alexandrian Church fathers thus found the allegorical interpretation in vogue among their heathen and Jewish neighbors and forbears. They believed it had a Scriptural sanction. They accepted it without question. Their genius and wide influence gave it a standing in the Christian Church for centuries; but the Alexandrian school never had a monopoly of its use. It is unfair, therefore, to hold them responsible, either for the origination or for the promulgation of this method of Scriptural interpretation. Origen did teach that there was a threefold sense in Scripture, corresponding to the body, soul and spirit in man — a literal and a moral and a mystical sense. But Jerome also made it a rule that the Scripture should be interpreted in three ways, historically, tropologically and spiritually; and he related this threefold division to the doctrine of the Trinity. And Augustine formulated one principle of his exegesis in these words, «Whatever there is in the word of God that cannot, when taken literally, be referred either to purity of life or soundness of doctrine, you may set down as figurative» ('De Doctr. Christ. III, ch. 10, sect. 14). He wrote to Honoratus, «All that Scripture, therefore, which is called the Old Testament, is handed down fourfold to them who desire to know it, according to history, according to ætiology, according to analogy, according to allegory» ('De util. credendi,' 5). This fourfold division was adopted by many of the church fathers and found its final formulation in the famous couplet of Nicholas of Lyra.

> Littera gesta docet, quid credas Allegoria,
> Moralis quid agas, quo tendas Anagogia

A good example of this fourfold sense was the Scriptural use of the word, Jerusalem. Literally it was a city; allegorically, the church; morally, the individual believer; anagogically, the heavenly state.

This much may be said for the Alexandrian school in connection with the allegorical interpretation of the Scripture. (1) It did not originate this method. (2) It never exercised any monopoly in its use. (3) It found what seemed to be a sufficient sanction in the typology and allegory of the Apocalypse, the Pauline epistles, and the epistle to the Hebrews. (4) No other method of interpretation would have availed them, in their stage of Biblical knowledge and in their environment, for the defense of many portions of the Old Testament. Their adequate apology for yielding to the fourth temptation mentioned above is to be found in the necessities of their case. (5) Their use of this method grew out of their very piety and spirituality. These simply joined forces with their poetical imagination and philosophical insight in the endeavor to save the Scripture from contemporary disrepute. (6) They never used the allegorical method dogmatically and they avoided most of the excesses of the later day. «They are always intelligent and reasonable. They evaporated the letter; they did not stereotype the spirit» (Bigg, 'Christian Platonists of Alexandria,' pp. 149–150). Making all allowance for fault at this point, the fact remains that «Origen was the greatest Biblical critic and exegete of the ancient church» (Terry, 'Biblical Hermeneutics,' p. 639). His one object was to find and set forth the edifying truth in the Scripture. He said, «The passages that are true in their historical meaning are much more numerous than those which are interspersed with a purely spiritual signification.» Having adduced many passages in which a literal meaning seems impossible, he concludes, «Therefore the exact reader must, in obedience to the Savior's injunction to search the Scriptures, carefully ascertain in how far the literal meaning is true, and in how far impossible; and so far as he can, trace out, by means of similar statements, the meaning everywhere scattered through Scripture of that which cannot be understood in a literal signification» ('De Principiis,' IV, 1; 19). This is seen at once to be, as Davidson said, «not so absurd or injurious as many represent» ('Sacred Hermeneutics,' p. 68). Bishop Lightfoot is fully justified in saying of Origen, «A very considerable part of what is valuable in subsequent commentaries, whether ancient or modern, is due to him. A deep thinker, an accurate grammarian, a most laborious worker, and a most earnest Christian, he not only laid the foundation, but to a very great extent built up the fabric of Biblical interpretation» ('Commentary on Galatians,' p. 227). Farrar declares, «His knowledge of the Bible and his contributions to its interpretation were absolutely unrivaled» ('History of Interpretation,' p. 188). Fairweather adds, «Properly speaking, Origen was the first exegete. Everything done in this direction previously had been merely preparatory to a scientific interpretation of Scripture. . . . One of the great merits of Origen is that he never shirks a difficulty. . . . Nothing could exceed his passion for verbal and grammatical accuracy, or his linguistic and critical insight, while his knowledge of the ancient theology is unique» (‘Origen,’ p. 120). Harnack calls Origen «the father of ecclesiastical science in the widest sense of the word,» and says that he «was an exegete who believed in the Holy Scriptures and indeed, at bottom, he viewed all theology as a methodical exegesis of Holy Writ» (‘History of Dogma,’ II, pp. 332, 335). In Origen, therefore, we find the founder of scientific exegesis and the great master in this field. His faults were those of his age; his excellences have been an abiding blessing to the Church. Our age is coming to agree with Gregory Thaumaturgus in his Panegyric, when he says of Origen as an exegete, «That greatest gift that man has received from God, and that noblest of all endowments, he has had bestowed upon him from heaven, that he should be an interpreter of the oracles of God to men, and that he might understand the words of God, even as if God spake them to him, and that he might recount them to men in such wise as that they may hear them with intelligence. . . . He explained whatsoever was dark and enigmatical, . . . and set it in the light, as being himself a skilled and most discerning hearer of God. . . . He alone of all men with whom I have myself been acquainted, or of whom I have heard by the report of others, has so deeply studied the oracles of God, as to be able at once to receive their meaning into his own mind, and to convey it to others. For that leader of all men, who inspires God's dear prophets, and suggests all their prophecies and their mystic and heavenly words, has honored this man as He would a friend, and has constituted him an expositor of these same oracles; the things of which He only gave a hint by others He made matters of full instruction by this man's instrumentality; and in things which He, who is worthy of all trust, either enjoined in regal fashion, or simply enunciated, He imparted to this man the gift of investigating and unfolding and explaining them; so that, if there chanced to be anyone of obtuse and incredulous mind, or one again thirsting for instruction, he might learn from this man, and in some manner be constrained to understand» (Argument, XV). It is the picture of the perfect pattern of the union of scientific investigation and spiritual insight which makes the model exegete. The transcendent genius of Origen lifted him above his age at many points, and the 20th century is beginning to see that his conception of revealed truth is far superior to that of most of his successors in the history of the Church.

It has been customary to denounce Origen and the Alexandrian school for their indulgence in allegory and to contrast with them most favorably the next great school of exegetes at Antioch. The most distinguished names here were those of Lucian, Diodorus, Theodore, Theodoret, and Chrysostom. We are told that these men were literalists rather than allegorists. They held rigidly to the historical and grammatical sense and it is but natural that the historical and grammatical critics of the 19th century should applaud their opposition to the allegorical flights of the Alexandrians. However, it is well for us to remember that this school has its dangers and faults as well as the Alexandrian. Its literalism resulted in a rationalism which was like a dry rot in the Church. Historically, it led directly to Arianism, which threatened to cut the tap-root of the Christian faith; and against this the orthodox exegesis of Athanasius the Alexandrian, proved to be the only safeguard of the Church at the last. Its tendency was to narrowness, rather than to richness. What it gained in straitness, it lost in breadth. However, among all the Greek fathers, Chrysostom will rank next to Origen in uniting the best characteristics of both schools. «Through a rich inward experience he lived into an understanding of the Holy Scriptures; and a prudent method of interpretation, on logical and grammatical principles, kept him in the right track in deriving the spirit from the letter of the sacred volume» (Neander, ‘History of the Christian Religion and Church,’ II, p. 693). Origen and Chrysostom had no worthy successors in the next millennium of church history. Jerome has been called the Origen of the Western Church but he was too hasty in composition, too much influenced by his personal prejudice, and too vacillating and uncertain in his own opinions to deserve this name as an exegete. His services in other directions were invaluable. He was the greatest scholar in the West as Origen had been the greatest scholar in the East; but he lacked the depth of character, the consistency of principle, and the consequent spiritual intuition of that greatest master in the early Church.

Augustine has exerted a wider influence upon the Christian Church than any other of the church fathers. He was the chief authority through the whole of the mediæval age. Martin Luther was an Augustinian monk at the time of his conversion; and he and Melanchthon and Calvin and Bucer all built upon the foundations which Augustine had laid down. The works of the great Latin father have been read and reverenced by Protestant and Roman Catholic alike; and it is only in our day that serious question has arisen as to his right to continued supremacy. In the present reaction from the theology of the Latin fathers to the older and purer theology of the Greek fathers, it is in the field of scholarly exegesis that the inferiority of Augustine becomes most apparent. He was not even equal to Jerome in scholarship. He knew no Hebrew. He was very deficient in his knowledge of the Greek. He preferred a translation to the original text. He was continually making mistakes as to the meaning of words. He had all the defects of his predecessors, without their excuse for them. The Alexandrians had been driven into the use of allegory to harmonize the Gospel teaching with the truth of Greek philosophy and to command the hearing and respect of their Jewish contemporaries. But Augustine was an allegorist of the allegorists when no necessity was laid upon him and when allegory had degenerated into mere imaginative ingenuities. Augustine had genius and a genuine Christian experience and consequently flashes of illuminative interpretation are found in his books, but these cannot compensate for the lack of the critical faculty and a sound basis of linguistic scholarship in exegesis. «Spiritual insight though a far diviner gift than the critical faculty, will not supply its place. In this faculty Augustine was wanting, and owing to this defect, as a continuous expositor he is disappointing» (Lightfoot, ‘Commentary on Galatians,’ p. 233). His total influence has been an immeasurable bane to Christendom. He was chiefly responsible for subordinating exegesis to ecclesiastical authority. He said, «For my part, I should not believe the gospel except as moved by the authority of the Catholic Church» (‘Ep. c. Manich.,’ ch. 5. sect. 6). He declared, «Now Scripture asserts nothing but the Catholic faith» (‘De Doctr. Christ.’ III, ch. 10, sect. 15), and he bent his exegesis to make good that declaration. He fastened upon the Christian Church the dogmas which have been the chief hindrances to its progress for 1,400 years; «the exaggerated doctrine of total human depravity,» the guilt of innocent infancy, arbitrary election involving a practical denial of the freedom of the human will, atonement by quantitative equivalence in suffering, the subtle systematization of divine counsels and schemes, the imperious necessity of sacerdotalism and sacramentarianism, intolerance of opinion contrary to churchly authority, even when based upon an earnest and intelligent study of the revealed Word. Following his lead the Church has floundered for centuries through sloughs of despond and has almost forgotten the broader horizon and the fresher air of the high table-lands of the earlier theology. Among the Greek fathers no one of these questions which have afflicted our Latinized Christianity found an atmosphere congenial enough in which to thrive. We owe much to Augustine but it is hard for us to believe that his good influence can begin to equal his evil influence upon the Christian Church. His is the last great name among the church fathers. For a thousand years little or no progress was made in the interpretation of the Scriptures.

The Schoolmen contented themselves for the most part with copying and compiling the work of their predecessors in this field. It became a proverb among them, Si Augustinus adest sufficit ipse tibe. One of them stated plainly that no interpretation of Scripture must be accepted which ran counter to the authority of the Church, «however much such a sense may be in conformity with the literal meaning. Indeed that ought not to be called the literal sense which is repugnant to ecclesiastical authority» (Paulus of Burgos, ‘Prol. in Additiones’). Even Gerson declares, «The literal sense must be judged according as the Church has determined» (Propp. de sens., lit. 3). With no independence of thought and with no fresh scholarship the schoolmen added no new principle of exegesis in a thousand years of commentary writing. They were expending their energies upon subtle and futile speculations. They composed great folios which aimed at nothing original and arrived nowhere in particular. They labored hard in a treadmill. They were weakest in exegesis. Only two or three of them knew any Hebrew, and most of them knew very little if any Greek. They were unoriginal, uncourageous, uncertain, uninformed. They had a wrong notion of the Church and a wrong conception of inspiration, and it naturally followed that they had a wrong method of exegesis. They had their merits too, but not as exegetes.

With the Protestant Reformation we come to a new era in Scriptural exegesis. Coleridge said of the Reformers, «The least of them was not inferior to Augustine and worth a brigade of Cyprians, Firmilians, and the like» (‘Remains,’ III, p. 276). Calvin sweepingly asserts, «Modesty will not allow me to speak of ourselves as fact would justify; and yet I will most truly declare that we have thrown more light upon the Scriptures than all the doctors who have appeared under the Papacy since its commencement. This praise even they themselves dare not deny us» (‘Antid. in Conc. Trid.,’ Sess. IV). The Bible seemed like a fresh discovery to the Church of that day. For the first time it became the property of the common people; and the printing press made it possible for it to become a common possession. It had been locked up in the Latin tongue and was supposed to be the peculiar property of the priests. Translations now made it accessible to all and the Protestant preachers constantly appealed to its authority in their opposition to the usurpations and the abuses of the hierarchy. That necessitated a renewed study of the sacred text on both sides. It soon became impossible for a man to be a doctor of divinity for eight years, as Carolstadt confessed that he had been, before he had read his New Testament. The Protestants delighted to circulate such stories as that of Sixtus of Amana concerning Albert, archbishop of Mayence, who read a few pages in the New Testament and then put it down, saying, «I know not what book this is, I only see that all things contained in it are hostile to us» (‘Antibarb. Bibl.’ II, 7). The churchmen and schoolmen had always based their doctrinal systems upon the Bible, but the stereotyped interpretation of the Scriptures had come to claim the authority of the Scriptures themselves. John Nathin said to Martin Luther in the convent at Erfurt, «Brother Martin, let the Bible alone; read the old teachers; they give you the whole marrow of the Bible; reading the Bible simply breeds unrest» (Lindsay, ‘History of the Reformation in Germany.’ p. 200). Heresbach the friend of Erasmus, heard it said that the study of the original Greek was the prolific source of all heresies, while the study of Hebrew turned men into Jews at once. (D'Aubigné, I, ch. 3). It was deemed dangerous for the layman to attempt to understand the Scripture for himself; it was his duty to accept the interpretation of the book by the Church. It was at this point that the protest was made; and all the Reformers insisted that the Bible ought to be open to every man and that the Spirit of God would help every man to a safe and sufficient understanding of its contents. Luther came to take the position that no external authority could decide what was Scripture or what was the meaning of Scripture. He said, «How can we know what is God's Word and what is true or false? . . . Who decides me there? No man, but only the truth which is so perfectly certain that nobody can deny it» (Dods, ‘The Bible, Its Origin and Nature,’ pp. 38–40). Calvin said, «Scripture is self-authenticated, carrying with it its own evidence. . . . It obtains the credit which it deserves with us by the testimony of the Spirit» (‘Institutio.’ I, 7; 5). Over against this position may be put the words of Lacordaire, «What kind of a religion is that which saves men by aid of a book? God has given the book, but He has not guaranteed your private interpretation of it. . . If there be a true religion on earth, it must be of the most serene and unmistakable authority» (cf. Lindsay op. cit., p. 457). That authority is not, according to Lacordaire, found in private judgment but in the infallible decree of Pope or Councils. Such was the issue drawn by the Reformation, both parties claiming the authority of the Scriptures, the one as interpreted by the Church for all, and the other as interpreted by the Spirit to each man. It was equally incumbent upon all concerned to show that their interpretation was a true one. This battle over the Book led to such searching of the Scriptures as had not been seen in the Church in any period of its history.

The way was opened for an intelligent discussion of the Scripture text largely by the labors of Erasmus of Rotterdam. His edition of the Greek Testament became the standard text among the reformers. His translations, annotations and paraphrases entitle him to high rank as an exegete. He was independent in judgment, characterized by good sense, and a philologist without a peer. His aim was to make the meaning of the Word perfectly clear to all. He said, «I do not see why the unlearned are to be kept away, especially from the evangelical writings, which were proclaimed alike to learned and unlearned, equally to Greeks and Scythians, as much for slaves as for the free, at the same time to men and to women, not less to peasants than to kings» ('Praef. in Paraph. in Matt.'). Erasmus still clung to the mystical or allegorical interpretation of certain Scriptures and thought that the Holy Spirit had intended that some words should carry multiple meanings. It was Martin Luther who broke finally and conclusively with this ancient error. He deserves highest honor as an exegete as well as a reformer by the enunciation of this principle, «Each passage has one clear, definite and true sense of its own. All others are but doubtful and uncertain opinions.» He added, «The literal sense of Scripture alone is the whole essence of faith and of Christian theology. . . . Allegories are empty speculations. . . . An interpreter must as much as possible avoid allegory that he may not wander into idle dreams. . . . To allegorize is to juggle with Scripture. . . . If we wish to handle Scripture aright, our one effort will be to attain *unum, simplicem, germanum, et certum sensum literalem*» ('Commentary on Genesis'). Unlike Jerome and so many others who had recognized these truths before him, he is true to these principles in his own exegesis. He published 'Notes' on many portions of the Scripture, and a complete 'Commentary on Galatians.' His exegetical works were published in a score or more volumes in both Latin and German, and were of paramount influence in introducing better methods of exegesis in the Reformed Churches. Melanchthon, Bucer, Zwingli, Beza and many others did notable work in exegeses in the Reformation period; but their books are for the most part unread to-day. The greatest exegete among the reformers was John Calvin. He wrote complete commentaries on nearly the whole of the Bible. The single exception in the New Testament was the book of the Apocalypse; and Judges, Ruth, Kings, Esther, Ezra, Nehemiah, Proverbs, Ecclesiastes, and Song of Solomon were the only books left untouched in the Old Testament. His commentary on the Psalms was justly celebrated for its religious insight; and in the Pauline epistles and the book of Acts he is at his best in the New Testament. He wrote to his friend Grynæus in 1539, «We were both of this mind, that the principal point of an interpreter did consist in a plain briefness. . . . We wished that there might be some one who gave his diligence not to trouble those who are desirous of learning with long commentaries» ('Praef. in Rom.'). This suggests one chief excellence of Calvin's exegetical work. It is clear and concise and not loaded down with references to a host of other authorities. Calvin has the learning necessary for his task, but he makes no needless display of it. He uses it simply to present plainly the meaning of the text. He was honest and independent in his comment, intelligent in his method and comparatively free from the worst faults of all his predecessors in this line. He never agreed with Luther as to the adequacy of the private judgment; and yet he was a persecutor of those who did not agree with his own views. The prejudices of his peculiar theology appear throughout his commentaries, and the repudiation of his conception of the decree as the central idea of Christianity has gone far to detract from his use and usefulness in the America of the 20th century. However he is still worth consulting for his good sense in most things and his good style in all.

It seemed a necessity of the age that all Christians should be dogmatists, and Protestant dogmatism soon became as deadly an influence in the field of exegesis as Roman Catholic tradition had ever been. The successors of the great Reformers were like the schoolmen who succeeded the great Fathers of the early Church. They were subservient to authority and fettered by dogma; and in the 17th and 18th centuries very few exegetes appeared whose works are read to-day. The scholarship of the elder Lightfoot is valued. The practical comments of Robert Leighton on First Peter are still enjoyed. John Owen's Exercitations on the Epistle to the Hebrews is a monument of erudition and pious reflection; but, like Caryl on Job, it is too voluminous to hold attention in this modern age. Robert Hall said of Owen, «He always takes for granted what he ought to prove, while he is always proving what he ought to take for granted; and after a long digression, he concludes very properly with, This is not our concernment; and returns to enter upon something still farther from the point.» Adam Clarke added, «To me he is one of the most unsatisfactory of writers. His sense and meaning he drowns in a world of words. He cannot condense his meaning, and never comes to the point, but by the most intolerable circumlocution» (Etheridge, 'Life of Adam Clarke,' pp. 317-318). He may stand as probably the last example the world will ever see of such intolerable prolixity. Arminius and Grotius introduced the reaction from Calvinistic and Lutheran and Augustinian exegesis, which has been gathering force ever since and which has about come to its triumph in America. Coccius and Vitringa in their opposition to scholasticism and dogmatical bias furnished a series of commentaries with many excellent qualities, but reverting too far in the direction of the mystical or allegorical interpretation. Bengel's Gnomon is a model of brevity and learning in exegesis. Philip Schaff calls it «a marvel of *multum in parvo*.» Henry, Scott and Adam Clarke wrote devotional commentaries which are still in use. Ernesti has been regarded as the founder of a new exegetical school, attempting to hold the *via media* between the allegorists and the dogmatists. His exegesis was predominantly grammatical. Semler, pietist and rationalist, introduced the historic method of exegesis, and prepared the way for the unparalleled exegetical activity of the 19th century. The most dominant influence in the 19th century in the whole field of theology was that of Schleiermacher. He was the founder of what has been called the psychological school of exegesis. He was both rationalistic and supernaturalistic in his interpretation of the Scriptures. He appealed to opposing classes and did much to bring all Germany back to a central emphasis upon the person and teaching and influence of Christ. In Germany and, through Coleridge and Maurice, in England and America his spirit and methods have been fruitful of much good in Biblical study. «Church history offers no parallel to him since the days of Origen» (Farrar, 'History of Free Thought,' p. 244). He was the «Plato and Origen of Germany in the 19th Century» (Philip Schaff). He based his religion upon faith and feeling, and he made the Christian consciousness and personal experience the guiding lights of his Scriptural interpretation. He claimed a Divine compulsion in his teaching and spoke and wrote with prophetic fervor and authority. He said, «Divinely swayed by an irresistible necessity within me, I feel myself compelled to speak. . . . Nor is it done from any caprice or accident. Rather. . . . it is a divine call» ('Reden über die Religion,' I). His personal magnetism and pronounced genius, his eloquence and earnestness, the genuineness of his Christian experience, the remarkable breadth of his vision and thought, and the intensity of his spiritual zeal gave him a most extraordinary influence upon his own and succeeding generations. He vindicated the right of Christian experience to an equal hearing with the results of any purely scientific research. His spirit pervades the Christian world to-day and will maintain its permanent place in Christian thought. De Wette was the greatest exegete among the disciples of Schleiermacher. His work represents prodigious learning and «perfect loyalty in the search for truth» (Godet). He expresses himself clearly, but does not always come to a desirably definite conclusion. Credner occupied practically the same standpoint.

The year 1835 marked a new era in all scientific Bible study (Pfleiderer, 'Development of Theology,' p. 209). In that year Strauss published his 'Life of Jesus,' Baur, his work on the 'Pastoral Epistles,' and Vatke, his 'History of the Religion of the Old Testament.' Each of these books may be regarded as epoch-making.

Eichhorn has reduced the rationalistic treatment of the Scriptures to a scientific system. Strauss was the first to put this rationalism into concrete and popular form. Baur was the founder of the Tübingen or Tendency school, which probably represented in Germany the greatest theological movement of the century. Baur endeavored to bring all his exegesis to the bar of historical investigation. He examined all traditional exegesis critically and subjected the New Testament books to a more thorough-going analysis than they had ever known. He emphasized the theological standpoint of each writer, and he thought he detected an irreconcilable antagonism between the Pauline and the Petrine wings of the Christian Church. He stimulated Bible study to an astonishing degree. His personal power was manifest in the remarkable group of disciples he gathered about him. Among these we may mention Zeller, Schwegler, Hilgenfeld, Holsten, Pfleiderer and Volkmar. The entire movement inaugurated by Baur has been characterized by comprehensive and accurate scholarship, the value of which has been somewhat impaired by the critical presuppositions upon which it was based. Strauss came over into this school in the second edition of his 'Life of Jesus.' Ritschl began his career in it, but later swung clear of it and became the founder of a distinct school of thought, to which Harnack, Jülicher, Kaftan, Hermann and Von Soden adhere.

Ritschl claimed to repudiate all metaphysical presuppositions and to found his system on the religious consciousness alone. He believed that the primitive faith sprang from the person and word of Jesus, with no philosophical alloy in the beginning. He held that experience limits the domain of knowledge. The Scriptures are sufficient in themselves to reveal the spiritual and moral worth of the kingdom of God, whose end is realized in love. Dogmatics and ethics unite in the higher synthesis of the revelation of the New Testament. Frank was the most determined opponent of Ritschlianism in Germany. He pointed out the lack of a true and deep conception of sin in this system of thought, and its consequently inadequate notion of atonement and conversion; and he claimed that, instead of rejecting metaphysics, the whole system was based on a highly developed but false and contradictory metaphysics of its own.

Vatke in 1835 outlined the revolution which has since taken place in the conception of Old Testament history. His book, however, was overloaded with philosophical terminology and met with no general appreciation and soon seemed to be forgotten. Reuss lectured along the same lines at Strassburg, and two of his pupils, Graf and Wellhausen, published the new hypothesis of the development of Old Testament ritual and literature. It was Vatke's theory brought to life again, and it has exercised increasing influence upon the exegesis of all the Old Testament books for the last half century. The prophets have come into new prominence as a result of this study. They are recognized as the founders of the Hebrew religion. The Law in its present form was of later growth in the Jewish Church. The Pentateuch has been resolved into a number of documents. Deuteronomy is believed to belong to the times of Josiah. Isaiah and other prophetic books are shown to be of multiple authorship. The Psalms come last in the Hebrew sacred literature. Stade, Budde, Smend, Schultz and others have represented this school of thought.

Germany has been the great battle-ground of the Higher Criticism through the last century; and the exegetes have enrolled themselves among the critical and the traditional, the more radical and the more conservative camps. Neander the champion of spirituality, Hengstenberg the bulwark of orthodoxy, Delitzsch the pre-eminent scholar, did valiant service for what they deemed the traditional truth. Just before his death Delitzsch seemed disposed to go over into the critical ranks. Dillmann and Gunkel have adopted the newer views. The indispensable commentary in the New Testament field has been that of H. A. W. Meyer. Characterized by grammatical rigor and literary freedom, and brought up to date by frequent revisions, it has maintained itself as a standard authority for two generations. The principal contributor to the later editions has been Bernard Weiss, the present prince of all laborers in the exegetical field. Having completed more than 50 years of University service he stands to-day without a peer in his record of worthy achievement as a textual critic and commentator. He is incomparable for minute and searching investigation, exactness and solidity of scholarship. His associates in the Meyer Commentary series have been Wendt, Heinrici, Sieffert, Schmidt, Düsterdieck and Beyschlag. Lipsius, Weizsäcker, Schmiedel and Holtzmann have represented the more advanced school of commentators. Bleek did most admirable work in the earlier part of the century and Luthardt and Hofmann have been conservative leaders in the latter days.

Among the Dutch theologians the dominant tendency in the last century has been toward extreme radicalism. Scholten and Kuenen have represented advance thought in the Old Testament field, while Loman, Pierson, Naber, Völter and Van Manen have been generally considered hypercritical in the discussion of New Testament questions. Steck has represented the latter school in Switzerland; while Godet has nobly upheld the traditions of orthodoxy in this land. Godet combines a French felicity of style with a German thoroughness of scholarship and adds to these a genuine spiritual fervor which makes his commentaries on Luke, John and Romans veritable masterpieces of exegesis. It may well be doubted if the century has produced more luminous and interesting contributions to this field.

France has furnished the brilliant and versatile and radical Renan, and the more profound and philosophical De Pressense; and it is making its influence felt to-day through the writings of the new Symbolo-Fideistic school, Stapfer, Sabatier and Ménégoz being the chief theological representatives. This school emphatically repudiates the infallibility of Pope or Church and just as emphatically renounces the infallibility of Scripture or the Christ recorded in Scripture. It believes that philosophy can never deduce any religious truth from its premises, and so repudiates rationalism as a foundation for faith. It believes in a Divine revelation through the immanent Spirit of God. It identifies prayer and religion. All expression of religious impression must be through images or symbols. "All religious formulas are symbolic formulas; and Dogmatic itself is a great system of symbols" (Ménégoz). The essence of the gospel is to be distinguished from what is merely contingent. Jesus is the perfect manifestation of God in man. Salvation is by faith and faith consists in repentance and heart-surrender to God. The advocates of this school confidently claim that the future belongs to them.

In Great Britain the century has furnished some masterly exegetical work. Cambridge University has easily taken the honors in this field. Dean Alford in his 'Commentary on the Greek Testament' introduced the best results of German exegesis to English readers. Bishop Ellicott gave splendid examples of painstaking investigation of the Scriptural text. The great trio of later Cambridge scholars, Lightfoot, Westcott and Hort, have reached the high-water mark of English scholarship in their field. Bishop Lightfoot's commentaries upon the Pauline Epistles have been standard authorities ever since their publication. Westcott did equally fine work upon the writings of John and the Epistle to the Hebrews. Hort was generally reputed to be the greatest scholar of the three, but his extreme modesty and his realizing sense of the yet unattained perfection possible in his work kept him from the publication of any but fragmentary treatises. His influence lives among his students and associates. Mayor on James and Second Peter and Jude, and Swete on Mark and the Apocalypse are worthy companions of the other Cambridge University commentaries. Professor Davidson of Edinburgh was the leading Hebrew scholar of Great Britain in the century, and his pupils, W. Robertson Smith and George Adam Smith and others, have done yeoman service in revolutionizing and revitalizing the exegesis of the Old Testament. Sanday, Driver, Plummer, Beet, Findlay, Bruce and Dods have done excellent interpretative work. The 'International Critical Commentary' and the 'Expositor's Greek Testament,' bid fair to continue the best traditions in English exegesis.

America has had a share in the exegetical labor of the century. Moses Stuart, J. A. Alexander, Hackett, Hodge, Shedd, Harper, Mitchell, Moore, Toy, Vincent and others have produced exegetical studies of acknowledged merit. Albert Barnes, Henry Cowles, J. A. Broadus and D. D. Whedon have published series of helpful and devotional commentaries. Ezra Abbott, Edward Robinson, McGiffert, Mathews, Burton, Briggs, Bacon, Gilbert, Stevens, Allen and Smyth have done first-class service in special fields.

The Roman Catholic Church began the century with two most worthy representatives of Biblical learning. Hug ably combated the rationalistic tendencies of his day and defended the traditional views of the origin of the New Testament writings. Herbst performed the same service for the Old Testament. During the greater part of the century, however, free inquiry has been more or less stifled by the authority of "the usual exegesis of Scripture." Scientific research has been systematically discouraged and any tendency toward a new or modified interpretation of the Scriptural text and any originality of conclusions, such as may not be guaranteed by the authority of the Fathers and the Councils of the Church, have been frowned upon by those in the places of power. A better condition of affairs seems to be on the point of realization now. A growing body of students within the pale of the Church have felt the influence of the great onward movements in the Protestant world and are beginning to demand the privilege of free inquiry and the use of modern methods in exegesis. They point to the critical work in the writings of Origen and Jerome and Eusebius and other Christian scholars and saints as proof that scientific research is no novelty in the Catholic Church, and they claim the right to follow in the footsteps of these illustrious critics of antiquity. A measure of freedom would seem to be already granted them since Pope Pius X wrote to Bishop Le Camus, "We should not approve the attitude of those who in no way dare to depart from the usual exegesis of Scripture, even when, faith not being at stake, the real advancement of learning requires such departure. You follow a wise middle course, and by your example show that there is nothing to be feared for the sacred books from the true progress of the art of criticism, nay that a beneficial light may be derived from it, provided its use be coupled with a wise and prudent discernment" (Dated 11 Jan. 1906). What this "wise and prudent discernment" may be is probably best illustrated in the decisions of the Biblical Commission appointed by Leo XIII, in its report upon the Pentateuch, published in the *Revue Biblique* and dated 27 June 1906. The report is presented in the form of questions and answers in catechism style. They may be summarized as follows: May one assert that Moses was not the author of the Pentateuch, but that it was made up largely of later elements? No. Must Moses then have written the whole of the Pentateuch with his own hand, or dictated it to secretaries? No. May Moses have committed the editing of it in whole or in part to secretaries and have permitted the publication of it under his name? Yes. May he have used sources, documents or oral traditions, borrowing sometimes the words, sometimes the sense? Yes. May the Pentateuch have undergone modifications, "additions made after Moses' death by an inspired author, glosses and parenthetical explanations, ancient words and phrases turned into more modern language, false readings to be attributed to errors of copyists, which criticism may examine and weigh according to its principles? Yes, the Church reserving judgment." The rights of the newer criticism to a hearing and standing in the Church are clearly allowed in this report, while the Church reserves the right to judge to what extent the findings of the critics may be compatible with its authority and peace.

Historical criticism has now come to the fore. The allegorical interpretation is discredited, it is to be hoped, finally and permanently. A vaster knowledge is at the service of the exegete than has been possible in any preceding age. The battles of the giants would seem to have ended for the time at least, and much of the smoke of conflict has cleared away. What ought the 20th century exegesis to be? It ought to be capable of the production of both popular and critical work. It ought to meet the demand for edification on the part of the most humble and unlearned; and at the same time it ought to be proficient in the most exhaustive scholarship. It has at its disposal the accumulated wealth of material collected in the preceding centuries; and it may profit by the defects as well as the excellences of the masters who have gone before. Biblical knowledge was never more profound or more prevalent than now. The original text has been determined within approximate accuracy. The Bible has been freed from multiplied errors of manuscript transcription and restored to something like its original form and revelation. The original languages are better understood. The study of ancient inscriptions and fragments of newly discovered papyri have thrown a flood of light upon many new points. Modern travel and exploration and excavation in the Orient have taught us many things concerning the manners and customs of the ancient times. The marvelous advance made in the last century along the lines of scientific investigation and metaphysical research and literary criticism has had its beneficial influence upon the interpretation of the Bible. The exegete of to-day has an unprecedented equipment, and his task is comparatively clear. To-day, "the great body of evangelical expositors are united on the fundamental principles of interpretation. They agree that a proper commentary on the Bible or on any part of it should clearly set forth the true meaning of the words and the train of thought intended by the sacred writer; and it should point out the grammatico-historical sense of every passage, giving careful attention to the context, scope, and plan" (Terry, 'Biblical Hermeneutics,' p. 738). The great exegetical works of the present are characterized by directness, accuracy, learning, independence of research, a careful consideration of the context and all the light that historical and literary criticism can throw upon the theme. There is a better conception of the nature of inspiration and more freedom in the exercise of the critical faculties of the commentator. Rationalism has come to its rights, together with a recognition of the due restraint laid upon the student of a divine revelation. Having escaped from the tradition of an absolutely inerrant text and a form of revelation infallibly fixed for all time, the exegete of to-day is freer to turn from the letter that killeth to the spirit that maketh alive. The tendency of the times seems to be away from the dominance of the Latin and the Reformation theology to the purer exegesis of the primitive faith. With the broader spirit of the Greek fathers and the better critical apparatus of the present day the promise of work in this field was never brighter than now.

W., 'Geschichte der Schrifterklärung' (5 vols., 1802–08); Ernesti, 'Institutio Interpretis Novi Testamenti' (5th ed., 1809); Marsh, 'Lectures on the Criticism and Interpretation of the Bible' (1842); Lücke, 'Grundriss der neutestamentlichen Hermeneutik' (1817); Schleiermacher, 'Hermeneutik und Kritik' (1838); Klausen, 'Hermeneutik. German translation from Danish' (1841); Immer, 'Hermeneutik des neuen Testaments' (1873); English translation (3d ed., 1890); Doedes, 'Manual of Hermeneutics' (translated from the Dutch, 1867); Davidson, Samuel, 'Sacred Hermeneutics' (1843); Fairbairn, 'Hermeneutical Manual' (1858); Cellérier, 'Manuel D' Herméneutique Biblique' (1852); Elliott and Harsha, 'Biblical Hermeneutics' (chiefly a translation of the foregoing, 1881); Lange, 'Grundriss der Biblischen Hermeneutik' (1878); Hofmann, 'Biblischen Hermeneutik' (1880); Farrar, 'History

of Interpretation' (1886); Terry, 'Biblical Hermeneutics' (3d ed., 1890), probably the best book on the subject in English.

D. A. Hayes,
Professor of New Testament Exegesis, Garrett Biblical Institute, Evanston, Ill.

EXELMANS, ĕks-ĕl-mŏng, **Remy Joseph Isidore**, Comte, French soldier, Marshal of France: b. Bar-le-duc, 13 Nov. 1775; d. 22 July 1852. He entered the army in 1791, when only 16 years of age, and by 1799 had reached the rank of captain. He subsequently served with great distinction under Macdonald and Championnet in the campaign of Naples, and in 1801 was appointed to the staff of Murat as aide-de-camp. He was arrested in 1808 while serving with Murat in Spain, and sent to England, but after three years of confinement there effected his escape and in 1812 joined Napoleon in his Russian campaign. For brilliant conduct during this campaign he was appointed general of division by Napoleon but upon the emperor's fall was banished from France owing to his Napoleonic inclinations. He was, however, permitted to return in 1819 and seems to have been highly esteemed under every successive government. He was restored to the Chamber of Peers in 1831 by Louis Philippe and Louis Napoleon appointed him grand chancellor of the Legion of Honor, and on 11 March 1851 created him Maréchal de France. He was subsequently thrown from his horse which resulted in his death.

EXEMPLARY NOVELS. Second only in importance to 'Don Quixote' among the fictions of Cervantes are his tales, published in 1613 as 'Novelas Exemplares,' or 'Exemplary Novels.' Although the preface spoke of 13 stories, but 12 were first included, the 13th having evidently been withdrawn at the last moment. This was not printed until 1814, when Agustin Garcia Arrieta found it in manuscript among other matters of entertainment prepared from 1606 to 1610 for the delectation of an archbishop of Seville. Published at first in expurgated form, 'La Tia fingida,' or 'The Pretended Aunt,' it was soon presented in full, and now forms part of all modern editions of the 'Novelas Exemplares.'

The 13 stories were written at various times, one as early as 1605, since it is referred to in the first part of 'Don Quixote.' Cervantes, who had spent six years in Italy, sought to compete with Boccaccio in tale-telling, although expressly distinguishing his productions from the novelle of the 'Decameron' as being moral and instructive. Unlike his contemporaries, Cervantes drew less upon Italian sources than upon his own invention. He endeavored to reflect life as he had seen it and to avoid the sensationalism of Bandello and Cinthio. Such sensationalism appears only in 'La Fuerza de la sangre,' where, however, he carefully reconciles the ravished heroine to her lover. The exotic adventures so common in early fiction are reduced in this collection. Although an unreal London is shown in 'La Española Inglesa,' the heroine is a Spanish girl carried off by the English in their sack of Cadiz; and, although the island of Cyprus is the scene in 'El Amante liberal,' the story contains recollections of Cervantes' own experience among the Mohammedans of Algiers. If the setting of 'La Señora Cornelia' is Italian, that of most of the tales is native, and in the best it is strongly localized. This is the case, above all, with 'Rinconete y Cortadillo,' a humorous picture of roguery among the professional thieves of Seville, organized in a band astutely governed. Inn life is smartly shown in 'La ilustre Fregona,' and life among the gullible students of Salamanca in 'La Tia fingida.' Humor and satire unite in 'El Casamiento engañoso,' with its account of the marriage of two knaves, each thinking to deceive the other, and, more admirably still, in 'El Coloquio de los perros,' with its dialogue between two dogs of Valladolid, one of them a canine Sancho Panza, who describes to the other his griefs in the service of various masters. Cervantes' imagination finds freest play in 'El Licenciado Vidriera,' whose hero suffers from the delusion that he is made of glass, and in 'La Gitanilla,' with its gypsy heroine who proves to be well born, after a noble youth for love of her has turned Bohemian. This story in particular has exerted wide influence, Preciosa's adventures being copied by Hugo in France and Longfellow in America, and dramatized by Montalván and Antonio de Solís in Spain, by Moeller and Wolff in Germany, and by Middleton and Rowley in England. Middleton, also, drew upon 'La Fuerza de la sangre,' as did Florian in his 'Léocadie,' and Fletcher in four plays borrowed from four tales of Cervantes — in 'Love's Pilgrimage' from 'Las dos doncellas' (used also by Rotrou), in 'The Fair Maid of the Inn' from 'La ilustre Fregona,' in 'The Chances' from 'La Señora Cornelia,' and in 'Rule a Wife and Have a Wife' from 'El Casamiento engañoso.' The last-named tale was dramatized, also, in England by Tobin; in Germany by Schröder; and in Denmark by Holberg. The 'Novelas Exemplares' were early translated into French, Italian, English and German. They are most fully discussed in the Spanish volume of Luis Orellana y Rincón, entitled 'Ensayo Critico sobre las Novelas Exemplares' (1890).

Frank W. Chandler.

EXEMPTION, the right to be excused from rendering certain services, or retain property free from claims or taxation. Exemptions are established by positive law. For example, the laws designating certain classes of persons not liable to military service nor to jury duty. Such also are the laws exempting church and school properties from taxation. Exemption from debt claims is also granted in many cases; in distress for rent cases, the necessary household furniture, the tools of a workman, domestic animals and a limited supply of food are exempted from seizure under execution. For the various State exemptions it is necessary to consult the codes of the State in question. Consult Hubbell, 'Legal Directory for Lawyers and Business Men' (New York, annually).

EXEQUATUR, the document issued by the executive department of a government regarding the consul of another state after it has been formally notified of his appointment by the latter. The effect of the exequatur is to grant all the privileges, immunities and advantages to a consular officer in the country to which he has been appointed, with authority to discharge all the functions of his office and to constitute him the legitimate representative of his state in the locality mentioned in the document. The following is the form of exequatur issued to principal consular officers of foreign countries by the government of the United States:

President of the United States of America

To all whom it may concern:

Satisfactory evidence having been exhibited to me that ....has been appointed.................. of............at..............., I do hereby recognize him as such, and declare him free to exercise and enjoy such functions, powers, and privileges as are allowed to......... by the Law of Nations (or " the.........of the most favored Nations in the United States ").

In testimony whereof, I have caused these letters to be made Patent, and the Seal of the United States to be hereunto affixed.

Given under my hand, at the City of Washington, the ......day of............, A.D. 19...., and of the independence of the United States of America the...........

President's signature.

Seal

By the President

....

Secretary of State.

To subordinate consular officers an almost identical form is issued by the Secretary of State. When a state of war supervenes or even when diplomatic relations are broken between two states it is usual to cancel all exequaturs of consular officers of the country with which war has been declared or diplomatic relations broken. Consult Moore, John Basset, 'Digest of International Law' (1906); Stowell, E. C., 'Consular Cases and Opinions' (1909).

EXERCISE, Physical. The upbuilding of the muscular system of the body is of prime importance in preserving the health or the curing of disease, and whether by passive motion or volitional activity is now recognized as necessary to keep the various functions of the body in normal condition. Artificially devised methods have been brought into use, but regular daily out-of-doors exercise is preferable. Instruction in gymnastics is now given in many educational institutions and public schools, well-appointed gymnasiums being maintained for that purpose. In these gymnasiums outdoor sports are often practised, but the chief courses of exercise consist of a systematic use of dumb-bells, wands, Indian clubs, horizontal and parallel bars, chest-weights, swinging rings and other specialties. In many gymnasiums there are running tracks, baseball cages, swimming tanks, bowling alleys, etc. The chief outside sports are tennis, golfing, bicycling, baseball, football, rowing, walking, running, skating, swimming and the various forms of track athletics. See Gymnasium; Hygiene; Physical Training; Educational Athletics, etc.

EXERCISES, Spiritual. See Spiritual Exercises.

EXETER, or Exon, Domesday. See Doomsday Book.

EXETER, England, city, seaport and county, parliamentary and municipal borough, in the county of Devon on the left bank of the Exe, 10 miles northwest from its outlet in the English Channel, on the Great Western and London and Southwestern railways and 171 miles by rail southwest of London. Though still presenting many indications of antiquity, the city can now boast of as handsome squares, terraces, streets and houses, all of modern erection, as any other in the kingdom. The principal object of interest is the cathedral, a noble edifice founded in 1112. It is cruciform, 408 feet in length, and consists of a nave, with two side aisles, two short transepts formed out of two heavy Norman towers, each 130 feet in height; a choir of the same width as the nave and 128 feet in length; 10 chapels or oratories and a chapter-house. The west front, erected in the 14th century, is richly decorated, presenting one of the most picturesque façades of any building in Europe. The interior, restored by Sir Gilbert Scott in 1877, is magnificent. Its perfect symmetry and the grand unbroken line of vaulting are remarkable features. The episcopal throne dates from 1320. The Great Peter Bell weighs 12,500 pounds. The chapter-house contains a valuable library of manuscripts and early books. Other architectural antiquities are the remains of the castle of Rougemont, portions of the ancient city walls of Athelstan, Norman work in some of the churches and the noble guild-hall, tastefully restored. Among several fine modern churches Saint Michael's may be mentioned. Among the numerous educational establishments is the Exeter School, founded by the citizens in the time of Charles I, to which there are a number of free scholarships. It has 16 exhibitions to either of the universities of Oxford or Cambridge. The Exeter Diocesan Training College is also situated in the city. The charitable institutions of various kinds are numerous. The principal scientific and literary institutions are the Devon and Exeter Institution for the Promotion of Science, Literature and Arts, established in 1817, and possessing a valuable library; the Exeter Literary Society, established in 1835; and the Royal Albert Memorial College, Museum and Free Library. The college has over 1,000 students. Exeter is not an industrial town, its woolen manufacture, once one of the largest in England, being extinct; but it has iron foundries, manufactories of agricultural implements, paper mills, corn mills, tanneries, etc. Glove-making and lace-making are also carried on. By means of a canal, 5 miles in length and 15 feet in depth, vessels of 400 tons can reach the city, and there is a large floating basin. The Exe itself is not navigable to the city. Exeter is a place of remote antiquity, having been a British settlement long prior to the invasion of the Romans, by whom it was called *Isca Damnoniorum*. The city returns one member to Parliament. Pop. 48,664.

EXETER, N. H., town, one of the county-seats of Rockingham County, on the Squamscott River, the Boston and Maine Railroad, 26 miles east of Manchester and about 13 miles southwest of Portsmouth. Exeter was founded in 1638 by John Wheelwright, a Congregationalist clergyman, who was banished from Massachusetts. Massachusetts claimed control over the place until 1680. It was the capital of New Hampshire and the centre of military movements of the colony during the Revolution. The town is well known as the seat of the Phillips Exeter Academy (q.v.), established in 1781. The Robinson Female Academy is located in Exeter. The town contains a large public library and a number of manufacturing establishments, cotton mills, iron, brass and machinery factories; also manufactories of boxes, umbrellas, automobile tubes, asbestos and rubber novelties, casings and shoes. Pop. 4,897.

Consult Fassett, ‹Colonial Life in New Hampshire›; Bell, ‹History of the Town of Exeter› (Exeter 1888).

EXETER, Pa., borough of Luzerne County, 10 miles west of Scranton, on the Lehigh Valley Railroad. It has extensive agricultural, coal and lumber interests. Fort Wintermooth nearby is the principal object of interest. Pop. 3,537.

EXETER BOOK, or CODEX EXONIENSIS, a manuscript anthology of Anglo-Saxon poetry in the library of Exeter Cathedral. It was presented to the chapter by Leofric, first bishop of Exeter (1050–72), contains 246 pages of vellum, and is the extant original copy of some valuable remains of Anglo-Saxon literature. The text with a translation is to be found in Gollancz, ‹The Exeter Book› (1895). Consult Tupper (ed.), ‹Riddles of the Exeter Book› (1910).

EXETER COLLEGE, Oxford. This college, originally called Stapledon Hall, was founded in 1314 by Walter de Stapledon, bishop of Exeter, sometime Lord High Treasurer of England, who removed to this place his scholars from Hart Hall and made a foundation for a rector and 12 fellows. In 1404 Edmund Stafford, bishop of Exeter, added two fellowships and obtained leave to give the college its present name. In 1565 Sir William Petre, Secretary of State, added eight; in 1636 Charles I annexed one for the Channel Islands, and, lastly, Mrs. Shiers left certain rents in 1770, out of which two fellowships were founded. Under the authority of 17 and 18 Vict., cap. lxxxi, the fellowships (a number of which were appropriated to various archdeaconries or counties) were reduced from 25 to 15, and were thrown open; they are now 12 in number, three of them in suspense. From the revenues of suppressed fellowships over 20 scholarships were founded, eight of which (called Stapledon scholarships) are limited to persons born or educated in the diocese of Exeter, and one or more to persons born in any of the Channel Islands, or educated at Victoria College, Jersey, or Elizabeth College, Guernsey. In 1915–16 there were 32 scholarships and 181 undergraduates.

EXETER HALL, a large building formerly on the north side of the Strand, London, opened in 1831. It was capable of containing over 5,000 persons. In it the «May Meetings» of the several religious societies were held. It became in 1880 the property of the Young Men's Christian Association. In 1907 it was sold and demolished. «Exeter Hall» became by metonomy a term of opprobrium, to indicate the views of aggressive evangelists in their relation to public questions.

EXFOLIATION, a process of concentric or spheroidal weathering, whereby the rock tends to scale off in thin and often curved plates. It is usually explained as follows: Rock is a poor conductor of heat. During the day a boulder or ledge becomes heated for a few inches from the surface, while the interior remains unaffected. The consequent expansion causes the surface to spall. At night the surface cools quickly over an interior that may still be warm and the shrinkage again tends to make the surface scale off. In rocks made up of several minerals, like a granite, this process is intensified by the fact that each different mineral has a different rate of expansion and hence tends to tear away from its neighboring minerals. The process is particularly characteristic of deserts, where there are great extremes of temperature.

EXHAUSTIONS, Method of. The ancient geometricians employed the method of exhaustion for determining the areas of curves and for the solution of similar problems. The method consists in comparing the magnitude to be determined with rectilinear magnitudes; thus, the area of a curve with an area of a polygon constructed so as to be comparable with the curve in question. The use of the method is exemplified in the second proposition of ‹Euclid's Twelfth Book.› The method was applied with all the rigorous logical exactness for which the Greek geometricians are so famous. See GEOMETRY; MATHEMATICS.

EXHIBITION, Industrial. See EXPOSITION, INDUSTRIAL.

EXILARCH. The title of an officer in Jewish communities in Persia. In 624 the Jews rendered the Mohammedans considerable assistance in their campaign and in consequence the exilarch was recognized as the chief of the Jews. His functions were civil and judicial. Later the gaon of Sora and the head of the College of Pumbedetha shared his authority, the gaon being of equal rank, and when the office of exilarch was vacant performed the duties of the office. The exilarch assumed all the pomp of a prince. His induction into office was attended with pomp and ceremony. The office was in existence for seven centuries and ceased with the death of Saadiah who was assassinated in 942. It was revived again for a few years about the middle of the 12th century.

EXILE, voluntary or involuntary prolonged absence from one's country; also, a person long absent from his country. Involuntary exile or expulsion for crime, particularly for murder and other serious offenses, can be traced back to a very ancient period. It was known among the early Greeks and was the penalty not only for murder but for offenses affecting the general interests, chiefly the former. Exile often took the form of expulsion, with death or some other penalty as the alternative, or of simple transportation, as to a foreign land. Sometimes confiscation of property was an added penalty. In Rome under the empire, exile or expulsion was known in two forms: *deportatio* and *relegatio*. The first was often punishment for political criminals, but later its use was extended. It involved banishment, generally to an island, with forfeiture of civic rights and usually of property. *Relegatio* was a much less severe form of punishment, involving no loss of civic rights by the offender.

The rights of aliens who are voluntary exiles in the country to which they flee after committing political or other crimes is usually fixed by treaty. Generally those guilty of political crimes only are not subject to extradition. They are, however, subject to the laws of the country in which they reside. See ALIENS; CITIZENSHIP.

Transportation for crime was abolished in England in 1857, but it still survives among some nations, as Russia, this country maintaining penal settlements in Siberia. The tendency to-day, in keeping with advancing civilization, is toward its utter abolition.

EXMOOR, a wild and hilly district in the extreme southwest of Somersetshire, extending also into Devonshire, England. It was formerly a forest, but, with exception of a considerable portion lately cultivated, it is now mostly heath and marsh. It embraces ranges of hills of considerable elevation (the loftiest being Dunkerry Beacon, 1,707 feet), and in the time of the Druids was a favorite spot for the celebration of their religious rites. Red deer still exist here in a wild state. Good descriptions of Exmoor may be found in Blackmore's ‹Lorna Doone,› and Sir Conan Doyle's ‹Micah Clark.›

EXMOUTH, ĕks'mŭth, **Edward Pellew**, VISCOUNT, English naval officer: b. Dover, England, 19 April 1757; d. 23 Jan. 1833. He served as midshipman in the *Blonde* frigate during the American Revolution, and greatly distinguished himself at Lake Champlain. In 1808 he had attained the rank of vice-admiral, and in 1814 he was made Baron Exmouth. In 1816 he proceeded to Algiers in command of a combined fleet of English and Dutch ships to enforce the terms of a treaty which the dey had violated. He bombarded the city for seven hours and inflicted such immense damage that the dey consented to every demand. Twelve hundred Christian slaves were by this exploit restored to liberty. Lord Exmouth was raised to the dignity of a viscount for this service. He was commander-in-chief at Plymouth 1817–21.

EXMOUTH, England, seaport, market town in the county of Devon, on the English Channel at the entrance to the estuary of the Exe. It is one of the favorite resorts on the coast of Devon, for sea-bathing and, owing to its sheltered situation and salubrious climate, has risen into favor as a winter resort. The chief industry is fishing, and the shipping trade is considerable; the new docks are commodious. Exmouth was one of the principal ports of the country in the reign of Edward III; but subsequently it became a mere fishing hamlet. Late years it has increased steadily in population and trade. Pop. 11,962.

EXNER, Karl, Austrian physicist: b. Prague, 1842. He received his education at Vienna and Zürich and in 1885 was chosen president of the Chemico-Physical Society of Vienna and seven years later became lecturer at the University of Innsbruck and from 1894 to 1904 held the chair of mathematical physics there. He retired in 1904. He has written ‹Ueber die Frauenhoferschen Ringe› (1877); ‹Ueber das Funkeln der Sterne› (1881); ‹Ueber Beugungserscheinungen› (1885); ‹Ueber die polarisierende Wirkung der Lichtbeugung› (1892); ‹Genesis der Erklärung des Scintillation› (1901).

EXNER, Siegmund, Austrian physiologist: b. Vienna, 1846. He was educated at the universities of Vienna and Heidelberg and in 1875 was named to the chair of physiology at the former institution. In 1891 he became a director of the Physiological Institute. For original researches on the physiology of the nervous system he was twice awarded a prize by the Vienna Academy of Sciences. He has written ‹Leitfaden bei der mikroskopischen Untersuchung tierischer Gewebe› (2d ed., 1878); ‹Untersuchungen über die Lokalisation der Funktionen in der Grosshirnrinde des Menschen› (1881); ‹Die Innervation des Kehlkopfes› (1884); ‹Die Physiologie der facettierten Augen von Krebsen und Insekten› (1891); ‹Entwurf zu einer physiologischen Erklärung der physichen Erscheinungen› (1894). With Gad he was joint editor of the *Centralblatt für Physiologie* after 1887.

EXNER, Wilhelm Franz, Austrian technical expert: b. Gänserndorf, 1840. He received his education at the Vienna Polytechnic Institute and in 1874 became industrial-school inspector in the Ministry of Commerce. He was one of the founders of the Vienna Industrial Museum in 1879 and became its first director. In 1882, 1885 and in 1891 he was elected to the Chamber of Deputies. He has published ‹Das moderne Transportwesen im Dienste der Land — und Forstwirtschaft› (2d ed., 1880); ‹Werkzeuge und Maschinen zur Holzbearbeitung› (1878–83); ‹Die Hausindustrie Oesterreichs› (1890); ‹Das K. K. Technologische Gewerbe-Museum in Wien im ersten vierteljahrhundert seines Beistandes› (1904).

EXODUS, Book of. The book of Exodus is the second book in the Old Testament; and, of course, occupies the same position in the collection known as the «Five Books of Moses» or the «Pentateuch,» which constitutes the first division of the Hebrew Bible. Its Hebrew name is *Weēllch shemōth*, «And these are the names,» or, in abbreviated form, *shemōth*, «Names» after the opening words of the book. The designation *Exodus*, which means, *Coming out*, that is, from Egypt, originated with the early Greek translation known as the Septuagint, and is meant to be descriptive of the contents of the book.

Contents.— The book falls naturally into four divisions of unequal length: (1) Oppression of Israel in Egypt (i, 1–ii, 22); (2) Preparations for the departure (ii, 23–xii, 29); (3) Exodus and march to Mount Sinai (xii, 30–xix, 2); (4) Giving of the Law and building of the tabernacle (xix, 3–xl, 38). The closing chapters of the book of Genesis record how the Hebrew nomads, after living in Canaan for several generations, were driven by famine to Egypt, where they were assigned to a district in the eastern portion of the Delta. There they remained for many generations (i, 7). In the course of time a new dynasty ascended the throne of Egypt, under which a period of oppression set in, from which the Hebrews were delivered under the leadership of Moses. After some wanderings in the desert, the fugitives encamped at the foot of Mount Sinai, where a covenant was established between the local God Yahweh and Israel, a law was given for the purpose of regulating the life of the covenant people in harmony with the will of their God; and a tabernacle, in which the people or their representatives might meet with their God, was built.

Composition.— In its present form the book is a compilation of material taken from three originally separate sources, commonly designated by the letters J, E and P. (For proofs of this assertion and for the significance of the symbols see article PENTATEUCH). The P sections can easily be separated from the rest; to distinguish E from J is more difficult, especially after chapter iii. The J and E narratives were written first, and the combination of the two was made long before P was written. The two earlier documents contained a full account of all the important events connected with Israel's stay in Egypt and with the exodus, also at least a brief record of the journey from the Red Sea to Mount Sinai. There followed an account of the giving of the law, the rebellion of the people, Yahweh's anger, Moses' intercession and the divine response. The P account was written by one who shared the common postexilic conception that the age of Moses was the period during which Yahweh was nearer to Israel than at any subsequent time; consequently he introduced more of the miraculous in his history, and attempted to trace the beginning of the religious practices and institutions of his day to that unique period in Israel's history. The latter tendency manifests itself especially in the priestly sections xxv, 1–xxxi, 18 and chapters xxxv–xl. For an analysis of the book of Exodus according to the sources used in its compilation consult any modern Commentary on Exodus, or any Old Testament Introduction. The contents of each source are printed consecutively in Kent, C. F., 'The Student's Old Testament'; Carpenter and Battersby, 'The Hextateuch'; Brightman, E. S., 'The Sources of the Hexateuch.'

Legal Sections.— In addition to the historical material derived from the three sources indicated, Exodus contains three groups of laws, which at first existed independently but later were embodied in E or the combined JE. (1) The *Ten Words*, commonly called the *Decalogue*, xx, 1–17; found, with few variations, also in Deuteronomy v. In both cases some of the commandments are expanded by certain hortatory additions, but the original form can easily be restored. (2) A second *Decalogue*, xxxiv, 10–28; which bears a more primitive aspect than the other and lacks the ethical emphasis. Most scholars hold that the decalogue in xxxiv is earlier than that in xx; the latter is considered by many a compendium of the teaching of the 8th century prophets, while the other is generally assigned to the period of the Judges or of the early monarchy. (For a fuller discussion of the two decalogues and of their relation to each other consult Eiselen, F. C., 'The Books of the Pentateuch,' chap. xvii). (3) *The Book of the Covenant*, xx, 22–xxiii, 19. The laws in this code deal with a great variety of subjects, and it requires considerable adjustment to make any systematic arrangement possible. Originally the arrangement may have been on the principle of the decalogue, in the sense that it contained 10 separate decalogues, each containing two groups of five laws. Corresponding to the two divisions of the decalogue the Book of the Covenant may be divided into two groups of laws, each consisting of five decalogues. (1) Judgments, dealing with civil and criminal cases; (2) Religious and humane laws. The five decalogues of the first group are not difficult to reconstruct; of the second group only four exist, though traces of the fifth appear. The Judgments deal with the following subjects: (1) The rights of slaves, xxi, 2–11; (2) Assaults, xxi, 12–27; (3) Domestic animals, xxi, 28–36; xxii, 1, 4; (4) Responsibility for property, xxii, 5–15; (5) Social purity, xxii, 16–20 *plus* Deut. xxii, 13–27. The religious and humane laws deal with: (1) Kindness, xxii, 2, 3, 6, 7, 21–27; xxiii, 4, 5; (2) Justice, xxiii, 1–3, 6–8; (3) Duties to God, xx, 23–26; xxii, 28–31; (4) Sacred seasons, xxiii, 10–19.

Many of the laws in the Book of the Covenant are strikingly similar to Babylonian laws, chiefly those found in the law code of Hammurapi (q.v.), king of Babylon about 2100 B.C. (Consult Johns, C. H. W., 'The Relation between the Laws of Babylonia and the Laws of the Hebrew People'). This similarity has an important bearing on the question of the date and origin of the Hebrew code. One widely accepted view is that the Book of the Covenant is essentially a collection of Mosaic decisions, expanded and modified to meet the needs of the Hebrews in Canaan during the period of the Judges or of the early monarchy. However, there is much to be said in favor of the view that it is a Canaanite production, based on the Babylonian legal system, and that it came to the Israelites from the Canaanites (Luckenbill, D. D., 'Israel's Origins' in *American Journal of Theology*, XXII, p. 44).

The Song of Moses.— This poem, in chapter xv, was originally independent of its present context. From verse 17 it is clear that the poem in its present form cannot be earlier than the reign of David or even that of Solomon (compare also verses 13 and 15). It is not improbable, however, that it is the expansion of a shorter poem composed at the time the events commemorated took place (compare verse 21).

Bibliography.— In addition to the discussions already mentioned the following works in English may be named: Bacon, B. W., 'Triple Tradition of the Exodus' (Hartford 1894); Bennett, W. H., 'Exodus' (New Century Bible,' Edinburgh no date); Cornill, C. H., 'Introduction' (London 1907); Driver, S. R., 'Exodus' ('Cambridge Bible,' Cambridge 1911); and 'Introduction' (1891); new ed., (1910); Gray, G. B., 'Introduction' (New York 1903); McFadyen, J. E., 'Introduction' (New York 1905); McNeile, A. H., 'Exodus' ('Westminster Commentaries,' London 1908). Also articles on «Exodus» in Hastings, 'Dictionary of the Bible' and in 'Encyclopædia Biblica.'

FREDERICK CARL EISELEN,
Professor of Old Testament Interpretation, Garrett Biblical Institute.

EXOGAMY, the usage by which in many primitive races a man is forbidden to marry a woman of his own stock or tribe. See MARRIAGE; TRIBE.

EXOGENOUS (ěks-ŏj'ē-nŭs), **PLANTS**, an old and now disused name for dicotyledons. Monocotyledons were similarly known as endogenous plants, or endogens. See BOTANY.

EXONERATION, in a general sense, the discharging from some liability or obligation. In a limited sense it is now applied mostly to the right of a surety to call upon the principal debtor to pay the guaranteed debt and relieve the surety from his liability. Consult De Colyar, 'Treatise on the Law of Guarantees and of Principal and Surety' (London 1900); Redfield, 'Law and Practice of Surrogate's Courts' (7th ed., New York 1910); Williams, 'Principles of the Law of Real Property' (22d ed., Toronto 1914).

EXOPHTHALMIC GOITRE, enlargement with turgescence of the thyroid gland, accompanied by protrusion of the eyeballs, breathlessness, palpitation and anæmia. Also called Basedow's (q.v.) or Graves' disease.

EXORCISM, the act of expelling evil spirits by adjuration. The word is of Greek origin, *exorkismos*, from the verb *exorkizo*, which in classic Greek means to put one on oath, but in the New Testament to drive out by adjuration. Demonic possession was a notion generally entertained by the Jews in the time of Christ; and that it was entertained by Jesus Christ and his apostles is as certain as any fact recorded in the Scripture. (Matt. xii, 27; Acts xix, 13). Hence, till modern times it was believed by all Christians, though now it is repudiated expressly or tacitly, or is explained in a naturalistic sense, or at least ignored by very many who profess belief in the gospels as a divine revelation and the very word of God. The Catholic Church, while it does not stand committed to the popular beliefs of the faithful upon this matter, nor to the views even of her most eminent doctors, except so far as she may have formally adopted them in her authoritative symbols, claims to possess and to exercise in these days no less than in apostolic times the power to expel evil spirits from the obsessed or possessed, and exorcism is formally pronounced prior to the administration of baptism and the blessings of chrism (or holy oil) and of holy water. One of the minor orders of clergy in the Catholic Church is that of the «exorcist,» and the ritual of the Church to this day has an official formula of prayers and adjuration for driving out demons. Pope Innocent I (d. 417) forbade exorcists to exercise their ministry save with the express permission of the bishop, and that rule is still in force.

EXORCIST, the name of one of the minor orders of the clergy in the Roman Catholic Church. See HOLY ORDERS; EXORCISM.

EXOSMOSIS. See OSMOSIS.

EXOSTEMMA, a genus of American shrubs and trees of the natural order *Rubiaceæ*, several species of which yield barks sometimes used in medicine. Though closely related to the genus *Cinchona* (q.v.) which yields quinine, the species of this genus are lacking in similar alkaloids. Saint Lucia bark and Caribbee bark, obtained from West Indian species, are probably the best known.

EXOSTOSIS, a bony excrescence from the osseous structure. See TUMOR.

EXOTERIC. See ESOTERIC.

EXOTIC, an appellation applied to a foreign plant not acclimated or naturalized. It is implied that the exotic is more or less of a rare or tropical character and can be preserved only in greenhouses.

EXPANSION. See AMERICAN EXPANSION POLICY; TERRITORIAL EXPANSION OF THE UNITED STATES.

EXPANSION, in physics, is the increase in the bulk of bodies, in consequence of a rise in their temperature. This is one of the most general effects of heat, being common to all forms of matter, whether solid, liquid or gaseous. Expansion of three kinds is recognized: (1) linear (2) superficial; and (3) cubical. The last only is applicable to liquids and gases, as they have no definite form. Most solids and liquids expand uniformly as their temperature increases, each substance having its own peculiar rate of expansion. This statement is true, however, only for usual temperatures. It has been found that as temperatures are increased beyond normal limits the rate of expansion also increases. The ratio of increase in bulk for each degree rise in temperature as referred to the original volume at a temperature of zero is called the coefficient of expansion. Solids expand equally in all directions, so that the coefficient of cubical expansion for solids is three times the linear coefficient. Liquids expand much more for the same rise in temperature than do solids, and gases still more proportionally. With gases, moreover, the bulk depends very largely upon the pressure acting upon it, gases being readily compressible. However, gases do not differ materially in their coefficients of expansion. It is found that under a constant pressure the co-efficient of cubical expansion for all gases is about 1/490. The expansion of liquids varies considerably, but, in general, the denser the fluid the less the expansion; thus water expands more than mercury, and alcohol more than water; and, commonly, the greater the heat the greater the expansion; but this is not universal, for there are cases in which expansion is produced, not by an increase, but by a diminution of temperature. Water furnishes us with the most remarkable instance of this kind. Its maximum of density corresponds with 39.2° F. This fact is of the utmost importance in the economy of nature. When the surface of rivers and lakes is cooled the upper or surface layer of water sinks and warmer water from below takes its place till the whole mass is cooled to 40°. After this the circulation ceases; the colder layer being less dense remains at the top until it freezes. The maximum density point of sea water is considerably lower than that of fresh water, and varies with the quantities of the salt contained in it. The expansion of water is about the same for any number of degrees above or below the maximum density point. Thus, if we heat water 5° above 39.2° it occupies the same bulk as it does when cooled down to 5° below 39.2°. The force with which water expands in the act of freezing is shown when glass bottles are filled with water and sealed; the glass is broken in pieces when the water freezes. A brass globe, whose cavity is an inch in diameter, may be burst by filling it with water and freezing it; and the force necessary for this effect is 27,720 pounds. The expansive force of freezing water is due to the tendency which water in solidifying is observed to have to arrange its particles so as to form prismatic crystals, crossing each other at angles of 60 degrees and 120 degrees. Various methods have been tried to ascertain the specific gravity of ice at 32°; that which succeeded best was to dilute alcohol with water till a mass of solid ice put into it remained in any part of the liquid without either sinking or rising. The specific gravity of such a liquid is 0.92, which, of course, is the specific gravity of ice, supposing the specific gravity of water at 60° to be 1. This is an expansion much greater than water experiences even when heated to 212°, its boiling-point. We see from this that water at the instant of solidification receives a sudden and considerable augmentation of bulk. See HEAT.

The coefficients of expansion of some of the commoner solids and liquids on the Fahrenheit scale are approximately as follows:

Glass, 1/75,000; iron, 1/50,000; gold, 1/40,000; copper, 1/36,000; silver and brass, 1/33,000; tin, 1/31,000; lead and zinc, 1/23,000; mercury, 1/11,700; water, 1/3,870; ether, 1/2,570; chloroform, 1/1,150.

Economically the importance of expansion is very large, particularly in the temperate zone. Here the variation of natural temperatures between winter and summer is about 80°. In all buildings, bridges, concrete constructions, etc., expansion joints are inserted to take up the variation due to the changes in temperature. In instruments of precision this variation becomes of the utmost importance, requiring delicate adjustments, as in the compensating pendulum. See PENDULUM.

EXPATRIATION, the voluntary renunciation of the rights and liabilities of citizenship in one country, in order to become the citizen or subject of another. The right of a citizen of one country to renounce his allegiance in order to adopt another country as his own has and is still much disputed. It seems most reasonable that the mother country and not the individual should decide the question. In the early part of the 19th century the United States was almost the only nation that claimed for individuals the right of expatriation without the consent of the government of which they were citizens or subjects. The European nations, as a rule, maintained that the permission of the sovereign was necessary; and the enforcement by England of the claim was one of the causes of the War of 1812. The right of voluntary renunciation of allegiance to the United States by one of our citizens was unsettled, so far as legislation was concerned, till the Act of Congress of 27 July 1868 asserted that expatriation «is a natural and inherent right of all people,» but the action of the Department of State had previously seemed practically to admit the right. The first formal recognition of this principle was secured in an expatriation treaty with the North German Confederation, signed 22 Feb. 1868. The position of Germans with regard to naturalization has been somewhat altered by the German law of 1913, which declares that «a person does not lose his nationality if, before acquiring a foreign nationality, he has applied for, and received, the written permission of the competent authority of his home State to retain his nationality.» England first recognized the right of voluntary expatriation by act of Parliament in 1870, and immediately concluded an expatriation treaty with the United States. This act was amended in 1914 with the intention of making the status of naturalized citizens uniform throughout the Empire. All the leading nations of Europe now recognize the right, including, besides those mentioned, France, Austria, Russia, Italy and Spain.

The right of the individual to expatriate himself has always been a cardinal doctrine with American statesmen. The whole subject of expatriation is regulated by the law of 2 March 1907. Under this statute an American citizen is assumed to have changed his citizenship when he becomes naturalized in any foreign state. When an individual who has been naturalized in the United States has resided for a period of two years in the foreign state from whence he came, or five years in any foreign state, he is presumed to have divested himself of his American citizenship. An American woman who marries a foreigner assumes the nationality of her husband. If a resident of the United States on the termination of the matrimonial bond, she may reassume her citizenship, or if in a foreign state, by registration within a twelvemonth with the American consul. A foreign woman who acquires through marriage with an American citizenship in the United States retains her status if she continues to reside in the country. The problem of assimilation has in the United States assumed an aspect of extreme gravity since the outbreak of the Great European War. On questions growing out of the war there has been maintained a persistent agitation by the representatives of foreign governments, with the object of influencing American citizens of their respective races and through them stimulating loyalty to these foreign governments so as to influence American opinion on their behalf, to the grave endangerment of American neutrality. Pressure has been brought to bear on legislators and through them on the national administration. Unwarrantable interference with the internal concerns of the United States led to the dismissal of Dr. Dumba (q.v.), the Austrian Ambassador. See CITIZENSHIP IN THE UNITED STATES; ALIENS; NATURALIZATION.

EXPECTATION. See PSYCHOLOGY.

EXPECTATION SUNDAY, the Sunday before Whitsunday. Acts i, 4, Christ commanded the disciples «that they should not depart from Jerusalem, but wait for the promise of the Father.» They waited till the day of Pentecost and the promise was fulfilled.

EXPECTATION WEEK, the week, or rather the nine days, which elapsed between the ascension of Jesus and the Pentecostal effusion of the Spirit, because during that interval the apostles and early Church waited in expectation that the promised Comforter would come.

EXPECTORANT, a remedy used to increase the amount of secretion of the lower respiratory tract — the trachea and bronchi. Such remedies act: (1) Through nervous influences, like those of ipecac, antimony, senega; or (2) they increase the amount of blood flowing around the bronchi; or else (3) they stimulate the mucous membranes of the bronchi as they are excreted. To this latter class potassium iodide, chloride of ammonium, the aromatic balsams and squills belong. They are useful in chronic stages of catarrhal bronchitis. See BRONCHITIS.

EXPECTORATION, technically termed sputum, is a physiological secretion, but when there is an excess of secretion of mucus in the bronchi and trachea, which is expelled by hawking or coughing, it becomes a diseased condition. Its examination and determination are essentials in the diagnosis of chest ailments. Excessive expectoration is found in bronchitis, in pneumonia, in tuberculosis, in gangrene of the lung and in influenza. In all of these conditions the sputum carries the germ of the disease and should be disinfected. Miscellaneous expectoration in the street and public places should be prohibited by law. To properly disinfect the sputum it should be received in a paper spit-cup or appropriate pocket-flask, and later destroyed. A mixture of carbolic acid, 1 to 25 of water, or of chlorinated lime, a teaspoonful to a pint of water, should be used in spittoons if these are essential. In cases of tuberculosis and influenza particularly, great care should be taken of the sputum and of all handkerchiefs, towels, napkins and other linen that come in contact with the patient. See DISINFECTION; INFLUENZA; TUBERCULOSIS.

EX PEDE HERCULEM, ([know] Hercules from his foot), a proverb meaning that from a part we may be enabled to test the whole structure of a thing. The proverb is founded on the story that Pythagoras determined the stature of Hercules on the basis that the Olympic stadium measured exactly 600 times the length of Hercules' foot. In proportion as this stadium exceeded others which were 600 times the length of a normal foot, so much larger was Hercules than the normal man. Kindred are the expressions, «Ab uno disce omnes,» «From one (treacherous Greek) know the whole (race),» (Virgil, 'Æneid' II, 65–66), and «Ex ungue leonem,» «(know) the lion from his claw.»

EXPEDITIONS TO LATIN AMERICA. See DISCOVERY OF AMERICA.

EXPERIENCE MEETING, a religious gathering whereat some of those present recount their spiritual experiences. Such meetings are common in the Methodist denomination and other sects hold such meetings at stated intervals.

EXPERIMENT, an operation designed to discover some truth, principle or effect, or to establish or illustrate it when discovered. It differs from observation in the fact that the phenomena observed are, to a greater or less extent, controlled by human agency. Experiment distinguishes the modern method of investigating nature and we owe to it the rapid strides made in chemistry, physics and other sciences.

EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

EXPERIMENTAL PSYCHOLOGY. See PSYCHOLOGICAL APPARATUS.

EXPERT. One having special knowledge or skill in a particular subject; a specialist; specifically, in law, one qualified to give expert testimony in a judicial proceeding. See EVIDENCE.

EXPERT TESTIMONY. A branch of the law of legal evidence which may be defined as testimony in the form of an opinion, based upon facts proved in an action by other witnesses, or upon facts assumed to have been proved, concerning matters involving scientific or technical knowledge.

The value of expert testimony was recognized in the Roman law and was incorporated in that system of jurisprudence. In the law of some continental countries the system has always been firmly established. Indeed, in those countries, all forms of opinion evidence was and still is freely accepted: the courts giving it such weight as it seems entitled.

In the very earliest period of the English law, however, expert testimony was unknown. At that time a jury was selected from among persons already possessing knowledge of the facts of the case to be tried. In other words, during the early development of English law, the witnesses composed the jury and their verdict was based upon the facts within their own knowledge, and no effort was made to assist them. Gradually, however, the practice of taking testimony in open court came into vogue, and it was later seen, in order that an impartial verdict might be rendered, that the jury should be composed of unbiased persons, whose minds were not hampered by conclusions theretofore formed.

As a general rule in the English common law, which is, with slight modifications, the law of the United States, testimony of opinions has never been admitted as evidence. Our courts require and allow testimony as to facts only, and consider it the province of the court and jury to draw conclusions and form opinions from the facts proved. An exception to this rule is found in expert testimony. Since a jury represents only the average intelligence of the community, cases were early encountered where it was difficult or impossible for the jury to reach a reasonable conclusion from the facts proved before them, and to obviate the defect in the trial system, the courts gradually brought to its assistance expert witnesses, to aid in correctly determining questions presented. At that stage expert testimony was confined almost entirely to that of physicians. Causes of death or effects of physical injuries were then and still are the most common questions with which juries must deal, and the determination of such issues is dependent largely upon the opinions of skilled physicians, familiar with the conditions, testifying as experts. In later years in England and in the United States, expert testimony has been availed of to assist juries in various other classes of cases. The theory of the courts in allowing such testimony is, that the jury, or where the action is tried without a jury, the trial judge, is not competent to draw its own conclusion from the facts proved, without the aid of such testimony. In that event witnesses possessing technical or peculiar knowledge upon the subject are allowed to give their opinions as evidence for the enlightenment of judge or jury.

Within the last few years, the practice of employing expert testimony has grown rapidly and has resulted in the creation of a class of witnesses who might be termed professional experts, and who command large fees for their services. This has conduced to a result which has brought about much criticism, adverse to the system, based largely upon the fact that the testimony of expert witnesses involving lengthy technical discussions is one if not the principal cause of the unreasonable length of modern trials; upon the further fact that the testimony of the modern expert, with its technicalities and extreme length, tends rather to obscure than to enlighten the minds of a jury; but principally upon the fact that such testimony has proved in a great many cases to be so partisan as to be wholly unreliable. This criticism is not unmerited.

The creation of the class of so-called professional experts whose services demand large compensation has resulted in a condition where opposite opinions may be obtained in any number. Some of the recent prominent murder trials have hence afforded an interesting spectacle of arrays of experts with conflicting opinions retained by the respective parties, at great expense, whose examination and cross-examination has consumed days and even weeks, exhausting the patience of the judge, consuming the time of the courts, perplexing instead of clearing the issues, and weakening the confidence of the public in its system of justice.

Before the testimony of an expert witness is admitted, he must be qualified as an expert; in other words it must be shown by his own testimony that he has a knowledge derived from experience or study not possessed by the ordinary persons in regard to the particular subject to which he intends to testify. Whether or not the witness has proved himself an expert is determined by the trial judge in his discretion.

The method usually adopted to get the testimony of an expert witness before the jury, after his qualification, is through the form of a hypothetical question. A question is put to the witness by the counsel of the party calling him, the question containing in detail the facts which the counsel believes have been proved and the witness is asked his opinion upon the assumption that the facts assumed are true. Such hypothetical question is often of great length, containing, as it does, a statement of facts that may have required days to prove. After the question is answered by the expert, he is usually subjected to a long cross-examination by the opposing counsel to test his skill and knowledge and the correctness of his conclusion. That the ordinary jury places little weight upon the conclusions of an expert based upon the facts contained in a hypothetical question may be inferred from the fact that the counsel putting the question may assume facts which have not been proved to the satisfaction of the jury. Again the question is often so long and involved that its meaning is soon lost.

In other cases, however, where the witness has knowledge of the facts, the hypothetical question is not necessary. For instance, the opinion of an expert in handwriting may be given after his comparison of the disputed writing with an admitted sample of handwriting used as a standard of comparison; and the physician who has examined a physical injury, or the alienist who has examined a person claimed to be insane, may testify as to his opinion based upon the knowledge acquired by him through such examination without the medium of a hypothetical question.

The courts do not consider expert testimony of great importance, or in any case binding on the jury. It is allowed solely for the purpose of assisting the jury and the courts take occasion to instruct a jury to attach such weight to expert testimony as in their minds it seems entitled or to disregard it altogether if they deem fit so to do. Such an instruction will be upheld even if there is no conflict in the expert testimony introduced.

In spite of the just criticism to which the modern development of expert testimony has been subjected, the doctrine has its uses and is necessary to our system of jurisprudence.

Thus, such testimony is absolutely indispensable to prove the custom in a trade; to prove the tensile strength of materials; the probable cost of buildings or works; the chemical composition of materials; the presence of disease and the cause and effects of disease or physical injury and the cause of death; the seaworthiness of vessels and other nautical matters; and to assist the jury in various other matters not within the knowledge of the average judge or juryman.

Various remedies through legislation have been suggested to remedy the abuses to which expert testimony has been subjected, such as limiting the number of such witnesses to be called upon a trial; limiting the length of the testimony, forbidding an expert witness receiving any compensation beyond the ordinary fees of witnesses and even to the extent of forbidding expert testimony in some classes of cases, the most recent suggestion in connection with criminal cases being the creation of a board of experts retained and compensated solely by the State whose services may be invoked by either the people or the accused.

It may be suggested that the evil will, in time, work its own remedy through the agency of the courts without the aid of legislation. The judge presiding at the trial of an action has a wide discretion in allowing or disallowing the testimony of experts, and it may be said that a too liberal policy of allowing expert testimony without limit is largely the cause of the abuse.

HENRY M. EARLE,
Attorney, New York City.

EXPIATION, Day of. See ATONEMENT.

EXPLANATION. An event is explained when it is exhibited as an instance of a law, or true universal proposition. For example, the fall of a raindrop is partly explained if it is regarded as an example of the tendency of water to fall to the earth, and it is still further explained if it is regarded as an example of the gravitational attraction which each body has for every other. The explanation becomes even more satisfactory if the velocity and course of the raindrop are found to conform to the mathematical formulæ concerning gravitational motion in a retarding medium. In other words, the function of physical explanation is to reduce the world of physics from an incoherent mass of particular, disconnected facts, to the far more manageable domain of a few reasonable simple laws, even though these laws go beyond the particular facts which form their basis. The ideals of explanation are the same everywhere, though but seldom can the perfection of physical explanation be attained. Even teleological explanation, or explanation, not by the causes of natural science, but by purposes, attempts to reduce what it regards as the complex of deeds of some agent to the performances of some more or less stable character — that is, of some character which acts in a more or less uniform manner.

The criteria of a good explanation are largely dependent on the particular field within which the explanation is made. There are certain general methods of explanation which have been found especially adapted to the facts of physics, others with a peculiarly psychological field of usefulness, others again which serve best in the discussion of moral conduct. The good new explanation, though like every innovation, it must in some way conflict with established traditions, will almost invariably follow in a general way the explanatory traditions of its appropriate field. There is one kind of explanation, however, which is almost never of service. This is the explanation that goes back to some more or less occult force, principle or faculty. See INDUCTION.

EXPLOITS RIVER, a river of Newfoundland, rising in the southwest part of the island and flowing in a northeastern direction through Red Indian Lake and emptying into the Bay of Exploits after a course of 160 miles. Large steamers ascend it for about 11 miles and light draught vessels for over 100 miles. It almost divides the island into two equal parts.

EXPLORATION IN AMERICA. As the routes followed by explorers of North America were determined by its physical contour, a brief geographical survey is necessary to understand the progress of its exploration. Thus, considered, the continent divides itself into four geographic provinces: the Atlantic coast region, the eastern mountains, the central region and the western mountains. The first embraces the coastal plain and Piedmont plateau lying east of the Appalachians; the second the Appalachian Mountains and their northern extension to the Gulf of Saint Lawrence; the third the whole Mississippi Basin, the Great Lake region and the Hudson Bay drainage. The last province is the great cordillera of western North America, which lies west of the Mississippi Basin and includes the Rocky Mountain system, Pacific Mountain system and the Great Basin region lying in between.

The Atlantic seaboard, which was the scene of the earliest exploration and settlement, is separated from the central region by the Appalachian barrier. Hence the Saint Lawrence, lying beyond the northern terminus of this barrier, is the only easterly flowing river which drains any part of the central province; and as in an unexplored wilderness watercourses naturally offer the easiest routes of travel, it was by its valley that explorers first penetrated the continent. A way through the barrier was found by following the Hudson and its westerly tributary, the Mohawk, which is connected with Lake Ontario by a lowland area.

The central province is covered by a network of waterways extending nearly two-thirds of the distance across the continent, from the inland margin of the Appalachians on the east to the front of the Rocky Mountains on the west. It is separated by low divides into three distinct drainage systems: the rivers emptying into the Gulf of Mexico through the Mississippi; the waters which feed the Saint Lawrence; and the rivers tributary to Hudson Bay.

The western mountain belt stretches northward from Mexico through the United States and Canada to the Arctic Ocean. Its southern section is interlaced by a series of rivers tributary in part to the Rio Grande, flowing into the Gulf of Mexico; and part to the Colorado River, flowing into the Gulf of California.

The easiest route across the continent lay near the present northern boundary of the United States, where the head waters of the Missouri reach far into the western mountains, only 500 miles from the Pacific, and separated by but one divide from the Columbia River Basin, which leads directly to the Pacific. Geographically, then, the explorations of our country fall into four groups: (1) those along the Atlantic seaboard, made by colonists of various nationalities; (2) those along the Mississippi, made by the Spaniards from the south, the French from the north and pioneers breaking through the passes of the Appalachians from the the Atlantic seaboard; (3) those made by the Spaniards northward from the Mexican border; and (4) those of the western mountains, made by Americans and of comparatively recent date.

Though the Cabots discovered North America in 1497 and claimed it for England, it was Spain who first attempted its exploration. Ponce de Leon, who had sailed with Columbus on his second voyage and subsequently become governor of Porto Rico, set out in 1513 in search of the "Fountain of Youth." Sighting an unknown coast at lat. 30° 8′, he named the land "Florida," and turning south explored both sides of the peninsula. When he attempted nine years later to plant a colony on these shores, he was driven off by Indians.

But Spanish interest was aroused. In 1519 Cortes achieved his infamous conquest of Mexico, and the fame of its wealth inspired others to seek the New World. Pánfilo de Narvaez obtained a grant to conquer and govern Florida, by which was meant all the rest of the continent, stretching indefinitely northward from the Gulf of Mexico. With 300 men he landed at Tampa Bay in 1528 and marched northward, suffering terrible hardships. Disappointed at not finding the gold they sought, they returned to the coast near Appalachee Bay and set out for Mexico in improvised boats, but were wrecked by the way. Of the whole party, Cabeza de Vaca and three others were the only survivors. For six years they wandered: up through Mississippi, across the Mississippi River near Memphis, along the Arkansas and Red rivers to New Mexico and Chihuahua; at last reaching Sinaloa on the Gulf of California, where they were found by Spaniards and taken to Mexico (1536).

Cabeza's written account of their experiences, published after his return to Spain, falsely attributed great wealth to Florida. So when Hernando de Soto, fresh from the conquests in South America, which had given him riches and fame, obtained permission to conquer Florida, many flocked to join him. He sailed in nine ships with 620 men, maintaining great display. Landing at Tampa Bay in 1539, the procession wandered westward, ill-treating the natives, for three years in pursuit of gold through the wilderness of the present Georgia, Alabama, Tennessee and Mississippi to the banks of the Mississippi River. They crossed above the Arkansas, penetrated westward until frightened back by the roving prairie tribes, and returned to the Mississippi, where De Soto died and was buried in its waters at the mouth of the Red River (1542). His followers under Moscoso built seven brigantines, descended to the Gulf and reached the Spanish settlement on the river Panuco, 311 survivors all told. Thus it was De Soto who first attracted attention to the Mississippi. Alonso de Pineda had discovered its mouth in 1519, and named it "Espiritu Santo," and Cabeza de Vaca crossed it about 1530; but neither of them recognized its importance.

The fate of this expedition discouraged coastal explorations for a time. But the Spaniards in Mexico were already pushing their way up into the heart of the continent. In 1539 Marcos de Niza, a priest, penetrated New Mexico and came back with reports of the wealth of Cibola, a name which he applied to seven cities somewhere to the north. These were long supposed to be mythical, but have since been identified as the seven Zuñi villages in New Mexico.

The tale led Vasquez de Coronado to set out in 1540. Part of his expedition he sent by water up the Gulf of California under Hernando d'Alarçon, who discovered the Colorado River and ascended it for 85 leagues. The other part he led overland in the direction of Cibola, which he found and conquered (about lat. 35°); and then on into Kansas to about lat. 40°.

The belt of country bounding Mexico on the north received the name "New Mexico" from Antonio Espejo, an explorer who started north in 1582 with Indian guides to the rescue of three missionaries who had been deserted the previous year. Following the Rio Grande del Norte, he came to Cibola and, after learning that the missionaries had been killed, continued to explore the region and returned by the river Pecos.

The colonizer of New Mexico was Juan de Oñate. He entered the country in 1597 with 130 families and founded the first capital, San Gabriel (second oldest town in the United States), near Santa Fé. In succeeding years he carried his explorations westward through Arizona, in 1604 following the Gila River to the Gulf of California. The following year he founded Santa Fé.

While this was going on in the interior, other nations were interested in the coast. It must be remembered that Columbus was in search of a western passage to Asia when he came upon America. But the idea did not die. A similar quest brought the Cabots to the shores of North America; and later, as the vast extent of the new country began to be realized, one explorer after another searched the coast for a water route by which to pierce the continent. When at last the waters of the Saint Lawrence were found to lead no farther than the Great Lakes, explorers still pushed westward along the tributaries of the Mississippi or attempted to round the continent on the north through the ice-blocked seas.

In 1524 Giovanni da Verrazzano, sent by Francis I of France, examined the shores from South Carolina to Newfoundland, and wrote to the king the first known description of them. He brought back a theory of an inland sea approaching the Atlantic coast about the middle of the continent; and it was to find this "Sea of Verrazzano," as a possible route to Asia, that the king sent Jacques Cartier in 1534 to the Gulf of Saint Lawrence (previously discovered by Jean Denys of Honfleur). In the course of three voyages he explored the Saint Lawrence as far as Montreal, believing that he had found the western passage.

Cartier attempted to plant a colony near the site of Quebec; but for many years France's efforts in that line were doomed to failure. Equally unsuccessful were Jean Ribaut, who in 1562 brought over a band of Huguenot colonists to the site of Beaufort, S. C.; and René de Laudonnière, who founded Fort Caroline two years later at the mouth of the Saint John's River, Florida. In 1565 Pedro Menendez de Avilés came to colonize Florida for Spain, and massacred the inhabitants of Fort Caroline. Laudonnière escaped to France, but Ribaut (who had just arrived from his second voyage with reinforcements for the colony) was killed while attempting to escape along the coast.

Menendez was the first to establish Spanish rule firmly in Florida. He founded Saint Augustine (oldest town in the United States) in 1565, sent a mission to the Rappahannock in 1570, and explored Chesapeake Bay and the Potomac.

England sent out her first colonists to Jamestown, Va., in 1607. Among the number was Capt. John Smith, an indefatigable explorer of the neighboring rivers and Chesapeake Bay.

Another Englishman, Henry Hudson, sent out in 1609 by the Dutch East India Company, explored the coast from Nova Scotia to Chesapeake Bay, and then ascended the Hudson River to Albany. It was during the following year that, in the search for a northwest passage, he discovered the strait and bay that bear his name.

France first gained a foothold in North America through the efforts of Samuel de Champlain. The years 1603–07 he spent in exploring the Saint Lawrence and the shores of New England, making the first accurate map of that coast. After he founded Quebec in 1608, he became interested in inland exploration, which twice led him into the United States. In 1609 he set out with 11 men to aid the Hurons against the Iroquois, descended the Richelieu in canoes, portaging part of the way, and pushed on through Lake Champlain to about Crown Point; and again in 1615 he accompanied a great war party of Indians by way of the New York lakes into the heart of the Iroquois country, south of Lake Oneida.

From this time fur-traders and missionaries spread over the country bordering the Saint Lawrence and its tributaries, gradually approaching the Mississippi. The Spaniards had not followed up their discovery, failing to understand its importance. Nearly a century after De Soto's journey the French at the north began to have an interest in the Indian traditions regarding the "Great River." About 1635 a trader, Jean Nicollet, was sent to a tribe near the head of Green Bay, Wisconsin. From there he went with Indian guides up the Fox River, portaged to the Wisconsin and descended that until he came "near the sea," as he reported; probably mistaking the "Great Water" described by the Indians for the sea. By 1658 two other French traders, Radisson and Groseilliers, reached the head of Lake Superior and explored the surrounding country.

When these rumors of a great river to the west reached Frontenac, the governor of Canada, he sent Louis Joliet to explore it in company with Jacques Marquette, a Jesuit. Meeting at Saint Ignace, they set out with five men and two canoes, skirted the north shore of Lake Michigan and Green Bay, and ascending the Fox River, were guided by Indians across the portage to the Wisconsin, down which they passed, reaching the Mississippi 17 June. For one month they floated down the great stream, noting the mouths of its tributaries as they passed, until they came to an Indian village opposite the mouth of the Arkansas. By this time they knew that the river emptied into the Gulf of Mexico, and supposing themselves nearer the mouth than they actually were, they turned back through fear of Spaniards, returning by way of the Illinois and the western shore of Lake Michigan, which they reached by portage. Two years later Marquette met his death while attempting to establish a mission on the Illinois. His work among the Indians was taken up by Father Claude Allouez, also a Jesuit, who established several missions and traversed much of the country around lakes Superior and Michigan between 1665 and 1680.

Already another explorer was searching for the Mississippi. Robert Cavalier de La Salle was one of those who had come to Canada in pursuit of the passage to China, and guessed that it lay by way of the Mississippi, which he supposed emptied into the Gulf of California. In 1669 he crossed from Lake Ontario to a branch of the Ohio, and followed that river as far as Louisville. The next year he reached the Illinois from the end of Lake Michigan and explored it for some distance. For years he went back and forth through the region and established trade with the western Indians. In 1680 he sent Louis Hennepin, another Jesuit, with two men down the Illinois to ascend the Mississippi. On the way they were taken prisoners by the Sioux and carried up the great river to the Falls of Saint Anthony, which Hennepin named. There they were joined by the famous trader Daniel Greysolon Du Lhut, who for two years had fearlessly explored the region around the end of Lake Superior and the head of the Mississippi. He had just come by way of the Saint Croix River from his fort on the site of Duluth and now joined Hennepin on his return journey by the Wisconsin.

At last, in 1682, La Salle attained his goal. With Henri de Tonty and a large party he reached the Mississippi from the foot of Lake Michigan by way of the Chicago and the Illinois, and descended to its mouth. On 9 April La Salle took possession in the name of King Louis of France and gave the name Louisiana to all territory drained by the Mississippi. After his return he sailed for France and obtained permission to transport colonists to the new province. He reached the Gulf of Mexico, but was unable to find the mouth of the river, and put in at Matagorda Bay. There he built Fort Saint Louis, and then started overland to find the Mississippi and reach Canada to obtain supplies for the colonists, but was murdered by one of his men near a fork of Trinity River, Texas.

Where La Salle had failed, Pierre Le Moyne d'Iberville was to succeed. In 1699 he entered the Gulf of Mexico and explored the region around the mouth of the Mississippi, leaving a colony at Biloxi, which was afterward transferred to Mobile. With him was one already known as an explorer of the northern region, Pierre Le Sueur. He in 1695 had discovered and named the Saint Peter (the Minnesota) River and observed a quantity of green earth near it; and now, in the belief that it was copper, he led a party of men up the river to work it and establish a fort on the Blue Earth (Green) River.

Just at this time (1703) Baron La Hontan, a man who participated in many explorations in the north of the Valley, published an account of his wanderings which contains some valuable information with much that is false. He claimed to have discovered a river (La Rivière Longue) entering the Mississippi from the west near Lake Pepin and to have followed it to its source in a large lake at the foot of mountains, on the other side of which was another river which emptied into the Pacific. This figured on maps for years before it was found to be fictitious.

The right to "farm out" this great country of Louisiana was granted to Antoine Crozat in 1714 and agents were immediately dispatched to explore the tributaries of the Mississippi. Before the year was out St. Denis followed the Red River and crossed to the Rio Grande, where he came upon a Spanish mission and was imprisoned, sent to Mexico and ordered to return. La Harpe in 1719 pushed up the Red River and across to the Arkansas, reaching lat. 37° 21′. He established a post among the Indians, claimed all this country for France and defied the Spaniards in a letter to the Spanish governor. The exploration of the Missouri was attempted in 1719 by Du Tisné and followed up to six leagues above Grand River, at the peril of his life among hostile Indians, who attempted in vain to bar his passage.

In this southwestern section of the Valley French intrusion was resented by the Spaniards. Their claim to Texas rested on the exploration of its rivers by Francisco de Urdinola in 1575, and an expedition led across its borders by Hernando del Bisque in 1675. Farther west their control was assured by the work of missionaries. Father Kino, a Jesuit, had entered Arizona as early as 1658 and by 1679 had established five missions and become well acquainted with the country. On one of his expeditions he reached the mouth of the Colorado and discovered that Lower California was a peninsula, not an island, as was supposed.

With the expulsion of the Jesuits in 1767 the missions passed into the hands of the Franciscans, who inaugurated the era of Spanish exploration and settlement in California by a colony at San Diego in 1769. Years before pioneers from the East broke through the mountains and seized upon the country, these missionaries had permeated it and stamped their influence upon it.

Meanwhile the French at the north were every year sending traders and explorers into the interior. For some time they continued to use the routes followed by Marquette through Green Bay and by La Salle up the Chicago, but in 1716 they opened a new one by way of the Wabash and another in 1720 by way of the Miami. A dispute over boundaries arose between the English and the French. Governor Spotswood of Virginia urged upon the English the necessity of colonizing the Ohio Valley and in 1716 made his fantastic ride with the "Knights of the Golden Horseshoe" to see if a way through the mountains could be found. He crossed the Blue Ridge and the Shenandoah

Valley, but it was not until 1732 that the first settler, Joist Hite, entered the region.

Other efforts were being made to cross the mountains. When it was learned that the French were winning the allegiance of the Cherokees from the English, Sir Alexander Cuming, a Scotchman, set out in 1730 with a party from Charleston and made a circuit of 500 miles across the mountains, bringing back several Indians in token of renewed faith. In 1736 Col. William Mayo and a party of surveyors followed the Potomac to its springs and discovered a portage to waters flowing into the Monongahela. Another route was opened to the Kanawha, an affluent of the Ohio, in 1744 by Col. James Wood, a well-known frontiersman and explorer. Dr. Thomas Walker in 1748 led an expedition across the Virginia mountains, named Cumberland Gap and River and made a circuit through West Virginia.

As the country became better known public interest awakened and in 1748 a number of Virginians formed themselves into the «Ohio Company» for the purpose of colonizing the Ohio Valley. To anticipate them, the governor of Montreal dispatched Bienville de Céleron down the Ohio to bury at the mouths of its tributaries plates inscribed with the declaration that all territory drained by those waters belonged to France. In spite of this, the Ohio Company sent out Walker in 1750 to survey lands for settlement. He explored Kentucky and built the first house in the region now comprised in that State. Christopher Gist was also sent to explore routes to the north, select lands for settlement and investigate the Indian tribes. He made a circuit of 1,200 miles north to the Scioto and Miami and then south of the Ohio, visiting all the Ohio tribes and returning by way of the Licking, Kentucky and Roanoke rivers. On a second mission in 1751, he discovered a new gap from the Potomac to the Monongahela and explored the Kanawha.

The next year Gist acted as guide to George Washington when he went as emissary from the governor of Virginia to the French fort at the head of the Ohio to protest against the French occupation of the valley. His mission was fruitless, but he brought back a map of his route: up the Potomac, across the divide and along the Monongahela and Allegeny to the French fort near Lake Erie.

A most prominent figure in English exploration was George Croghan. Sent out by Pennsylvania in 1750 with the half-breed Montour to win over the Indians through the Ohio Valley to the English, he went far and wide, from tribe to tribe, attaining an influence over the Indians which was of invaluable service to the English during the French and Indian War. When peace was declared he was delegated to prepare the Indians for English occupation. Starting from Pittsburgh, he followed the Ohio, Wabash and Maumee to Detroit and reported that the way was open; whereupon the English troops, under Capt. Thomas Stirling, advanced to Fort Chartres and took possession of the country east of the Mississippi.

And now, with English control assured, settlement spread rapidly beyond the Appalachians. Much of the preliminary exploration was made by hunters, trappers and traders too numerous to mention, were they known. North of the Ohio the country was first settled by Moravian missionaries. Among the southern pioneers, James Smith followed the Kentucky and Tennessee rivers in 1766 and John Finlay explored northern Kentucky in 1767; but most prominent was Daniel Boone. His first venture was made in 1769, when he crossed the Cumberland Gap with James Robertson and spent two years exploring eastern Kentucky and Tennessee. Subsequently these two men took a prominent part in the settlement of this region.

With the advent of the American Revolution exploration received a check; but the expeditions of troops led by George Rodgers Clark into the Ohio Basin 1778–79 and by Gen. John Sullivan into western New York were not without geographical value. And in the Indian wars which followed (1790–94) the American expeditions under Harmar, Clark, St. Clair and Wayne added to knowledge of the Ohio Valley.

During the 17th and 18th centuries, while exploration and settlement had been pushed westward from the Atlantic seaboard over halfway across the continent, the Pacific coast was almost unknown. Balboa had discovered the Pacific at the Isthmus of Panama in 1513 and Cortes had sent several expeditions to the west coast of Mexico (1522–24). The first white man to reach the coast of California was the Spaniard Juan Cabrillo, who in 1542 traced it north as far as Monterey; and after his death the following year his pilot continued to Cape Mendocino. In 1576 the English seaman Drake reached lat. 43° in his coastal exploration. To the north the coast was unknown until Vitus Bering (1741), commanding a Russian expedition, visited it in lat. 60°. His voyage was followed by a swarm of Russian fur-traders, who, following the chain of Aleutian Islands during the latter part of the 18th century, gradually worked their way eastward and eventually reached the mainland of what is now Alaska.

In 1778 came Capt. James Cook, the famous English navigator, surveying the coast from Vancouver Island to the Arctic Ocean in his search for a northeast passage. When the published account of this voyage called attention to the rich fur-trade in the northwest, Americans were among the first to take advantage of it. In 1789 Capt. Robert Gray, of Boston, in the ship *Columbia*, cruised around the Horn and visited the northwest coast, carried a cargo of furs to China and returned to Boston by way of the Cape of Good Hope. Thus was the American flag first carried around the world. On a second voyage in 1792 he discovered and explored the lower reaches of the Columbia River. This all-important achievement, besides disclosing an easy route from the western mountains to the sea — thus paving the way for transcontinental exploration — formed the chief basis of our territorial claim to Oregon. When George Vancouver, who was exploring the west coast with two British vessels (1792), learned of the Columbia River through Gray, he sent a boat expedition to investigate it. Afterward he continued northward to extend Cook's explorations on the coast of Alaska and British Columbia.

As yet none had succeeded in finding an overland route to the Pacific north of Mexico. Cabeza de Vaca, in his transcontinental wanderings, had turned to the south when he reached the mountains. A Canadian, Varennes de la

Vérendrye, spent many years (1731–49) in the search for a route; at his own expense, for his government refused to back him. With his sons he made extensive explorations west of Hudson Bay, in the course of which he discovered (1731) the Red River and Lake Winnipeg, and his son Pierre penetrated to the forks of the Saskatchewan River (1739). In 1742 the two sons made a perilous journey to the southwest, across the Missouri and on to the Black Hills in western South Dakota.

In the struggle for the Ohio Valley the western route was forgotten for a time. But when that contest was settled the quest was renewed by Jonathan Carver of Connecticut. In 1766 he made his way westward by canoe through the Great Lakes and by Marquette's route to the Mississippi, which he ascended to the Falls of Saint Anthony. He explored the Minnesota River, spent a winter among the Sioux and in 1767 returned by ascending the Chippewa River and reaching Lake Superior waters by portage. While his journey added little to geographical knowledge, yet it served to awaken interest and led Richard Whitworth to join Carver in planning a transcontinental expedition, which was unfortunately prevented by the outbreak of the Revolution.

Meanwhile the English fur-trading companies, through the journeys of their agents, had contributed much to geographical knowledge, not only of Canada but of the United States. The Hudson Bay Company, since it obtained its charter in 1670 and established its first post (Fort Rupert) on the great bay from which it took its name, had, in spite of French interference, extended along the shores of the bay and its tributaries. After the English conquest of Canada in 1763 it had a clear field until the appearance in 1783 of a rival «Northwestern Company,» made up of Canadian merchants, which operated by the direct route from Montreal to the Great Lakes and rapidly pushed its control throughout the north and west. Its influence was extended to the west coast by Alexander Mackenzie in a journey (1792–93) from Lake Athabasca up the Peace River and across the Rocky Mountains, the head waters of the Fraser River and the Coast Range to the coast of British Columbia in the latitude of Queen Charlotte Sound. This was the first time the continent was crossed north of Mexico.

Thomas Jefferson in 1803 induced Congress to make an appropriation for the expenses of a transcontinental exploring expedition, a project that he had entertained for some 20 years. Nominally, Capt. Meriwether Lewis was leader of the party, with Lieut. (generally known as Capt.) William Clark second in command; but in point of fact all action was taken jointly and the expedition is always known as that of Lewis and Clark. While preparations were under way the purchase of the territory of Louisiana from France gave additional importance to the enterprise. Lewis and Clark, with 43 men, left Saint Louis, then a frontier trading-post, in three large boats, pushed their way up the Missouri and built a fort at the Mandan Village, about 50 miles above the present town of Bismarck, N. D. From this point some of the party were sent back and in the spring of 1805 the rest continued their voyage up the Missouri with 32 men. At the falls the heavy boats were left and canoes were constructed to continue the ascent of the river. Near the head of what they named the Jefferson (the western fork of the Missouri) they cached their canoes and with horses secured from the Indians crossed the Rocky Mountains to the Columbia, which they descended to the mouth, reaching the Pacific in November 1805. After wintering here the party retraced their steps to the east side of the Rocky Mountains and there separated; Lewis following the Missouri while Clark traced the course of the Yellowstone. At the junction the reunited forces continued their rapid down-stream journey, reaching Saint Lewis in September 1806. This was not only the most notable exploration ever undertaken by the United States government, but its complete success led to the many others which have followed up to the present day.

The head waters of the Mississippi were explored by Lieut. Zebulon Montgomery Pike, who ascended the river with a party of 20 soldiers in 1805. He reached Leach Lake drainage system and found the region already occupied by the agents of the Northwestern Company. Upon his return in 1806 Pike set out again with 23 men, with the idea of winning the allegiance of the Indians from the Spaniards and establishing an American claim to the region which had long been in dispute between the French and Spaniards. He ascended the Osage River in boats and crossed overland with horses to the Pawnee villages, where he took up the trail of the Spaniard Malgares, who in the previous year had made an excursion into this region from Mexico at the head of several hundred troops. At the Arkansas Pike detailed Lieut. James Wilkinson to explore that stream to the Mississippi and continued west with the larger section of the party, arriving in November at that high peak of the Rockies which now bears his name. During the winter, after terrible suffering from cold and hunger, he reached the Rio Grande. The Spanish authorities sent out a large force to capture the little band of explorers and they were conducted back through what is now known as Texas.

The roving fur-traders were quick to penetrate the regions pioneered by Lewis and Clark and Pike. During the years 1806–09 they extended their excursions well into the Rocky Mountains from the east. In Canada the Northwestern Company, ever active, pushed its outposts westward; and in 1808 one of its agents, Simon Fraser, reached the Pacific at the mouth of the Fraser River.

In 1810 John Jacob Astor, a New York furtrader, organized a company for the purpose of exploiting the trade on the Pacific slope. A vessel was dispatched to the mouth of the Columbia River to establish a post and an expedition sent overland to follow the Lewis and Clark route. This was the second party to cross the United States to the Pacific. Numbering three boats and 60 men under the leadership of one of the partners, Wilson Price Hunt, it left Saint Louis in the late summer of 1810 and pushed its way up the Missouri about 450 miles. Here the party wintered and in the spring continued by boat to the big bend of the Missouri; then with horses purchased from the Sioux proceeded overland in a southwesterly direction, crossed the Rockies near the head of the Big Horn River and followed the Snake River Valley to the Columbia. With only a fraction of his large party and after the most terrible suffering, Hunt reached the mouth of the Columbia in February 1812, and found Astoria, the post established by the party sent by sea. The American company was only just in time; the previous year David Thompson of the Northwestern Company had portaged across the Rockies from the Saskatchewan to the head waters of the Columbia and followed it to the Pacific, where, much to his disgust, he found the Americans already in possession.

In 1812 David Stuart, with a small party, started eastward from Astoria to make the difficult and hazardous journey to Saint Louis. He chose a route to the head waters of the Snake, across the divide to the Green River, a tributary of the Colorado, and across a second divide to the Platte, which he followed to its junction with the Missouri and continued down stream to Saint Louis, arriving in April 1813, after a journey full of peril and hardship.

In 1814 Astoria passed into the hands of the Northwestern Company, which extended its trade over the entire Columbia River basin and established posts at various points. The eastern slope of the Rockies was occupied by American traders, with headquarters at Saint Louis and posts on the upper Missouri in the Green River Valley.

The government began to realize the importance of exploration. In the hope of discovering the sources of the Red River, a large expedition under Maj. Stephen H. Long left Pittsburgh on a small steamer in April 1819, wintered on the lower Missouri and during the following year made explorations and surveys in the country now included in Arkansas and Missouri. Long was sent again in 1828 to explore the head waters of the Mississippi, which he approached through the wilderness from the Miami River to Lake Michigan, thence to the junction of the Wisconsin and Mississippi and on to the Minnesota; a difficult route, but lying in a region which had been explored by French pioneers more than a century before.

Still the source of the Mississippi had not been discovered. The head water region, previously visited by Pike and long the stamping-ground of the fur-trader, had been again explored in 1820 by Gen. Lewis Cass, governor of Michigan, in company with Henry R. Schoolcraft. It was not until 1832 that the source was finally discovered in Lake Itasca by Schoolcraft and Lieut. J. Allen.

Capt. B. L. E. Bonneville, an officer of the United States army, in 1832 organized a party of trappers and hunters for the ostensible purpose of taking part in the fur-trade, but more to gratify his own ambition to explore the Far West. He left Fort Osage on the Missouri with 110 men, transporting his supplies by means of wagons, instead of using pack-animals, as all previous parties had done. Following Stuart's route of 20 years before along the valley of the Platte River, he crossed the mountains with his wagon-train and established a post at the head of the Green River. From this point as rendezvous his party scattered out in various directions, he himself exploring the Big Horn and Wind River mountains and extending one journey to the English trading-post on the Columbia. A party sent out by him visited Salt Lake and continued through to the Spanish settlement of Monterey on the Pacific.

During the years 1833–35 the Rev. Samuel Parker, a zealous missionary, made several hazardous journeys from the Mississippi waters to those of the Columbia. At this time the Hudson Bay Company, which had absorbed its rival, the Northwestern Company, controlled the entire Columbia River basin and claimed it for England, in spite of the protest of the few American settlers. In 1842 it came to the knowledge of the Americans that the English were making preparations to colonize the region and it was necessary that the authorities at Washington should be informed at once. For this purpose Dr. Marcus Whitman and A. L. Lovejoy set out in the dead of winter on a journey of 4,000 miles across the continent. They took a southerly route through New Mexico to the Arkansas, and Whitman reached Washington.

In 1841 Lieut. R. E. Johnson of the United States Exploring Expedition, commanded by Charles Wilkes, U. S. N., crossed the Cascade Mountains near Mount Rainier and, after making an extended journey in the Columbia River Valley, recrossed the Cascades to the coast. A detachment ascended the Willamette and crossed to the Sacramento Valley, which they followed to San Francisco.

With the exception of the Lewis and Clark expedition, the most important exploration of the century was done by Lieut. John C. Frémont, who had gained his first experience while assisting J. N. Nicollet, a French geodesist, employed by the United States government 1836–40, for making surveys in the upper Mississippi Basin. In 1842 Frémont, with 25 men, among whom was the famous scout, Kit Carson, made surveys of a region lying between the Missouri River and the Rocky Mountains, along the valleys of the Kansas and Great Platte rivers. In 1843 he was instructed to carry his surveys to the Pacific Coast. With a party of 40 men he made his way westward from the junction of the Kansas and Missouri rivers to the head waters of the North Platte, crossed to Green River, and traversing a region long known through the explorations of Bonneville and others, crossed another divide and descended Bear River to Salt Lake, which he explored. From there he went westward to the Snake River, and on to the mouth of the Columbia. After renewing the supply of provisions, Frémont retraced his steps to the Dalles of the Columbia, then turned southward to Klamath Lake, and made a hazardous journey through the Sierras which brought him into California along the valley of the American River, an eastern branch of the Sacramento. Traveling southward, he once more crossed the Sierras in lat. 35°, and returned to Saint Louis across the Great Basin region and the Rockies. On his third journey Frémont crossed the Rockies from the head of the Arkansas to the Green River Valley, then continued westward around the southern end of Salt Lake across the Sierras, near where he previously traversed them, and then turned northward along the Sacramento Valley and across the mountains to Klamath Lake. Here he was impelled to turn back by the news of the uprising in California, and converted his exploring party into a military expedition.

The southwest became better known through military operations during the Mexican War, and after its close many expeditions were sent out by the government, under both military and civilian leadership, most of them, however, in regions already explored.

Public interest in the construction of a transcontinental railway led to five extensive expeditions during the years 1852–57: the first exploring along the 32d parallel; the second near the 35th; the third near the 38th and 39th; the fourth near the 41st and 42d; and the fifth near the 47th and 49th. Various military explorations and surveys were carried on west of the Mississippi up to the outbreak of the Civil War.

In 1869 Maj. J. W. Powell made a daring exploration of the Grand Cañon of the Colorado. With only a few men, in small boats, he followed the Green and Colorado rivers from Green River Station to the mouth of the Virgin River. In the next two years he extended this exploration in the Colorado basin under government auspices.

The Pacific Railroad surveys practically completed the purely exploratory work of the United States; subsequent investigation was directed to minor details. During the years 1867–79 this work was carried on by various organizations which were created for both geographic and geologic research. Four of them were of special note: «The Geological Exploration of the 40th Parallel,» under Clarence King (King Survey); «United States Geographical and Geological Survey West of the 100th Meridian,» under Capt. Geo. M. Wheeler, U. S. A. (Wheeler Survey); «United States Geological and Geographical Survey of Territories,» under F. V. Hayden (Hayden Survey); «Geological and Geographical Survey of the Rocky Mountain Region,» under J. W. Powell. In 1879 the United States Geological Survey was created for this purpose and the other organizations discontinued. The acquisition of Alaska in 1867 gave American explorers a new field. See Alaskan Explorations.

EXPLOSION, a sudden bursting, generally due to the rapid production of gaseous matter from solids or liquids. Thus the explosion of gunpowder is due to the sudden formation and expansion of gases into which the powder is converted by chemical agency. Explosions are often caused by the elastic force of steam confined in boilers, and by spontaneous combustion. See Explosives.

EXPLOSION CRATERS. Although many of the great craters on volcanic peaks are due to explosion, the name is applied to holes not connected with lava outflows. Most of these holes are in plains and they are rimmed by a ridge of fragmental materials evidently blown out of the hole by an explosion. Craters of this class are the «maars» of the Rhine Valley, the craters of Eiffel, Auverne, Montecchio, Albani, Nemi, Astromi and Faifa in southern Europe, of Nassibe in Madagascar and Lonar, India. The latter, as described by Dr. Blandford, is a hole about a mile in diameter, 300 to 400 feet deep, in a great plain of old lava, similar to the rocks on the sides of the hole. The latter are bent up slightly. There are several notable explosion craters in Mexico, on the plateau near Orizaba Peak in Puebla and in Valle Santiago at Xico, Tacambaro, and on the northern part of Sonora. The Afton craters in New Mexico, 31 miles northwest of El Paso, the crater of Zuñi Salt Lake, New Mexico, and the wonderful Crater Mound in east-central Arizona are also believed by some geologists to have been caused by the explosion of volcanic steam. As to the competency of this agent to cause a crater there are some notable illustrations in historic time, notably the great Bandai Sai eruption in Japan in 1888 which made a vast crater on a mountain where there had been no volcanic activity for many centuries. It was not attended by lava flow. The eruption of Krakatoa in 1883 is another impressive instance. Consult Darton, N. H., 'Explosion Craters' (*Science Monthly*, November 1916).

N. H. Darton.

EXPLOSION ENGINE. See Internal Combustion Engine.

EXPLOSIVE GELATINE, blasting gelatine or gum dynamite, an explosive material resembling wine jelly in appearance. It was invented by Nobel in 1878, and consists of soluble cellulose nitrate dissolved in nitroglycerin. Originally, the solution was effected by warming the nitroglycerin and adding the perfectly dry soluble cellulose nitrate, called nitro-cotton, little by little, with stirring, whereby the nitroglycerin was made to dissolve from 4 to 10 per cent of the nitro-cotton: Then the solution was effected by the aid of a solvent like acetone, which was afterward evaporated off. All of these processes of manufacture were dangerous. In 1889, Lundholm and Sayer discovered that if the nitroglycerin and nitro-cotton are mixed with warm water and stirred up by compressed air, gelatinization sets in, and may be completed by pressing out the water and working the mass in malaxating machines. Explosive gelatine is a gelatinous mass, looking something like new honey in color, and varying in consistency from a tough leather-like material to a soft jelly, in accordance with a variety of circumstances, such as the quantity and chemical composition of the nitro-cotton used, and the methods of manufacture. In general, the thinner the gelatine, the more sensitive it is to detonation; but, on the other hand, a thin gelatine is subject to liquefaction and possibly also to exudation, which would make it dangerous in storage, transportation and use. Specially strong detonators are required to explode blasting gelatine; or ordinary detonators may be used with primers of dynamite or gunpowder: In order that detonation should be transmitted through a mass of explosive gelatine it must be confined; for, unlike dynamite, a train of it cannot be exploded in the open, except by means of an extremely powerful initial detonation. The sensitiveness of the material is still further diminished by the solution in it of camphor, or other substances rich in carbon and hydrogen, like benzine or nitro-benzine. While dynamite and nitroglycerin are much less liable to be exploded by a blow when frozen, the reverse is true of frozen explosive gelatine. Though while in the unfrozen condition explosive gelatine is less sensitive to shock or blows than either nitroglycerin or nitrocellulose, it is, when exploded, a more powerful explosive than either of them. This is due to the fact that when nitroglycerin is detonated, there are unused oxidizing materials in the gaseous products; and when cellulose nitrate is detonated, there are unused combustible materials in the products. When, therefore, these bodies are mixed in the right proportions, the products will be those of complete combustion. Explosive gelatine has the advantage over dynamite in that it is practically unaffected by water and therefore can be stored in water. It is, on the whole, less liable to freeze than dynamite. It possesses an advantage over guncotton in being plastic and can, therefore, better adapt itself to the irregularities of the bore-holes in loading. The specific gravity of explosive gelatine is from 1.5 to 1.6. If heated slowly, beginning at 60° C., it will explode at 204° C. (399.2° F.). On rapid heating it explodes at 240° C. (464° F.). If ignited when frozen even small quantities may explode. Pure explosive gelatine is used for blasting in unusually tough rock or for blasting under water, or for military purposes. It is put up in cylindrical «sticks» in paper wrappers like dynamite. For general use in blasting it is too violent, and therefore «gelatine dynamites» are made by mixing this costly and powerful material with diluents. A great many different dopes are used, but a good example of a gelatine dynamite is «gelignite,» which is made by mixing 65 per cent of explosive gelatine with 35 per cent of an explosive wood-pulp dope, giving a substance consisting of nitroglycerin 62.5 per cent, nitro-cotton 2.5 per cent, sodium nitrate 26.25 per cent, wood pulp 8.4 per cent, and sodium carbonate 0.35 per cent. «Forcite» is a similar modification of explosive gelatine containing 50 per cent of wood pulp.

EXPLOSIVES (from Lat. *explosus*, p.p. of *explodere*, to drive out, to drive out a player with clapping, to explode; from *ex*, out + *plaudere, plodere*, to clap, strike, applaud), are substances which easily react at comparatively low temperatures with the formation of a considerable volume of highly expanded gas, the evolution of heat and light and the production of sound. At ordinary temperatures they may be solid bodies like gunpowder or liquid like nitroglycerin or gaseous like fire damp mixtures. They may consist wholly of a single chemical compound like mercuric fulminate, or of mixtures of combustible substances with supporters of combustion or oxidizing agents like blasting powder, which is a mixture of charcoal, sulphur and sodium nitrate. Though the temperature is different for each explosive they can all be caused to explode if heated to the explosion temperature, which under given circumstances are for nitrogen chloride, 93° C.; mercuric fulminate, 152° C.; emmensite, 165° C.; nitrostarch, 175° C.; dynamite and guncotton, each 180° C.; and blasting gelatine, 204° C.; nitroglycerin, 218° C.; blasting powder, 270° C.; picric powder, 273° C.; rifle powder, 275° C.; best sporting powder, 315° C.

History.— The inventor of gunpowder, the oldest of explosives, and the place where it originated, are not known. The invention has been ascribed by different authors to Marcus Græcus, Albertus Magnus, Roger Bacon and Berthold Schwarz; to the Arabians, whose works were largely used by Marcus Græcus in his writings; to the Hindus, because of certain passages occurring in the code of Gentoo laws prepared by Indian savants by order of Warren Hastings in the 18th century; and to the Chinese because of certain statements made by Marco Polo. There seems to be little doubt that this confusion exists (1) because modern meanings have been given to words and phrases used in the old manuscripts; (2) because of the intentionally confusing methods employed by the writers of the Middle Ages; and (3) because gunpowder for use in guns was not the invention of any one person, but was really the result of a progressive development.

It is recorded that what moderns call «Greek fire,» and the ancients called «naphtha,» was employed in the defense of Constantinople in the 7th century and that these fiery compositions were propelled against the enemy by means of arrows from bows, or in hollow vessels of stone or iron thrown by war engines. Though consisting at first of pitch, rosin, sulphur and similar easily inflammable and highly combustible substances, it is easy to imagine that in the tentative development of these materials of war nitre was added to the combustible substances and that there was thus produced a deflagrating composition for use as bursting charges in bombs and grenades and for the manufacture of devices analogous to modern firecrackers and rockets with which to frighten and confuse their foes.

The supposition that gunpowder was known before it was applied for use in guns is supported by the older historians. All the components and mixtures for Greek fire similar to gunpowder were already known in the time of Hassan-al-Rammah (1290). From an exhaustive search of the literature Guttmann arrives at the conclusion «that gunpowder was gradually developed from Greek fire, and that it was known for years before cannons and guns were thought of. The use of purer materials in making it developed its propulsive power, and led to the subsequent invention of cannons and guns. The Arabians were the first to make gunpowder-like mixtures, probably about 1280 A.D., while the idea of utilizing their propulsive force, that is the invention of guns and cannons, belongs to the monk, Berthold Schwarz, of Freiburg, Saxony; the date of the latter invention being probably 1313 A.D.» It is accepted as indisputable that gunpowder mills existed at Augsburg, Germany, 1340, and at Spandau, Germany, 1344, and that the English used gunpowder in guns at the battle of Crécy, 1346.

Though many improvements were made in the manufacture of gunpowder, such as in the preparation and purification of the raw materials from which it was produced; the methods of incorporation; and its granulation to adapt it to special uses, this substance remained unrivaled until the end of the 18th century, when the French chemist Berthollet proposed the substitution of potassium chlorate for the potassium nitrate and produced by this means a much stronger and quicker powder, but one which was also much more dangerous than gunpowder. Beginning with the discovery of mercuric fulminate by Howard, an English chemist, 1800, there was added to the achievements of the 19th century the discovery of nitrogen chloride by the French chemist Dulong, 1812; nitrostarch by Braconnot, 1832; guncotton by Schoenbein of Basel, Switzerland, 1845; nitroglycerin by Sobrero at Turin, Italy, 1846; the invention of blasting powder by L. DuPont of Wilmington, Del., 1856; the discovery of diazo compounds by the German chemist, Griess, 1860; the invention of dynamite by A. Nobel of Sweden, 1866; smokeless sporting powder by Schultze of Potsdam, Germany, 1867; blasting gelatine by Nobel, 1878; military smokeless powder by Vieille of France, 1886; hard-grained smokeless sporting powder by Richard von Freeden of Walsrode, Germany, 1889; homogeneous smokeless powder composed of a single chemical substance in a state of chemical purity by Charles E. Munroe of Newport, R. I., 1890; and the discovery of triazoic acid by Curtius of Kiel, Germany, 1890, while in the meantime picric acid, which was discovered by Woulfe 1771, was shown to possess explosive properties and adapted for use in shell, it having been pointed out by Sprengel, 1873, that it contains a sufficient amount of available oxygen to render it, without the help of foreign oxidizers, a powerful explosive when fired with a detonator.

This growth has been coincident with the development of the chemical and physical sciences and has been the more rapid, the more completely experimental methods of research have been perfected and applied. In addition to those enumerated above this advance in the science and art of explosives has been chiefly due to the labors and intelligence of Hess, Lauer, Trauzl and von Lenk in Austria; Abel, Cundill, Debus, Dewar, Dixon, Dupré, Majendie and Noble in England; Berthelot, Chalon, Daniel, Desortiaux, Gay-Lussac, Lavoisier, Le Chatelier, Mallard, Maurouard, Roux, Sarrau, Turpin and Violette in France; Bunsen, Dittmar, Guttmann, Liebig, Meyer, Schischkoff, Upmann, Will, von Förster and von Romocki in Germany; Abbot, Barnard, Craig, Emmens, Judson, Hill, Maxim, Mixter, Mowbray, Quinan, Rodman, Count Rumford and Woodbridge in the United States; Mendeléeff in Russia; Cronquist in Sweden and Hebler and Lunge in Switzerland. See the biographical sketches of Abel and Berthelot who were especially prominent in this science.

Theory of Explosives.— When wood or other combustible substances containing hydrogen and carbon are ignited in contact with air they burn, giving forth heat and light and are converted into water and carbon dioxide, which pass off as invisible and highly expanded gases. As the wood is subdivided so as to expose a continually increased surface to the air the rapidity of the combustion is increased until, when the wood is reduced to dust like sawdust and suspended in the air so as to be intimately mixed with it, the velocity of the combustion is so great and the evolution of the gases so rapid that the reaction becomes an explosive one and such a mixture of sawdust and air is an explosive. All inexplosive combustible substances can, when finely divided and intimately mixed with air, form explosives and volatile liquids and gases are especially likely to do so. Many accidents have arisen from the ignition of mixtures of air with the dust of charcoal, coal, flour, malt, soap, starch, sugar, zinc, wood and other solids; with the vapors of alcohol, ether, gasoline and other naphthas, spirits of turpentine and other liquids, or gases like ethylene, coal gas, hydrogen and marsh gas since each of these substances, though in themselves non-explosive, form explosive mixtures with air if they be mixed with it in the right proportions. The best proportions are those in which the volume of oxygen in the air present is just sufficient to convert all of the hydrogen in the combustible into water and all of the carbon into carbon dioxide, or, in other words, to produce complete combustion. Less violent explosions may occur when the proportion of air is greater or less than the «best proportion,» the limit being fixed in each case by the character of the combustible substance, the quantity of the mixture, the temperature and pressure to which it is subjected and the manner in which it is ignited. Mixtures of these substances whose proportions are outside of these limits may be ignited and may burn, but do not explode.

If pure oxygen in the proper proportions be substituted for air in the above mixture the velocity of the reactions will be still greater, and the energy set free in unit of time and consequently the violence of the explosion will be greatly increased. Besides the proportions that determine the limits between explosion and combustion will be extended. Such mixtures if confined and out of contact with the air will still take fire and explode. Oxygen may be supplied either in the free state or in solid bodies which contain it and which give it up when heated to comparatively low temperatures. Among such solids are the nitrates of metallic radicles, like ammonium nitrate, potassium nitrate (India saltpetre), and sodium nitrate (Chile saltpetre); chlorates such as potassium chlorate; peroxides like sodium peroxide, and many others. If these solids be dried, finely divided, and intimately mixed with a combustible, in the right proportions, a solid explosive is produced. Often, as in the case of mixtures of charcoal and saltpetre the temperature to which they must be heated in order that combustion shall begin, called the point of ignition, is so high that they are difficult to ignite and in such cases a small portion of a substance like sulphur, which has a low point of ignition, is incorporated in the mixture.

Another method by which oxygen may be brought into intimate contact with combustible bodies so as to form an explosive is through the action of nitric acid upon them by which nitrogen and oxygen combined as NO_2 is introduced into the molecule. Three cases present themselves. First, when the combustible body is a simple or mixed primary alcohol and the nitric acid reacts with the acidic hydrogen. Second, when the combustible substance is a hydrocarbon or its derivative and the nitric acid reacts with the hydrogen of the hydrocarbon or the hydrocarbon nucleus. Third, when the reaction leads to the union in the hydrocarbon of NO_2 through the intervention of a nitrogen atom. The products of the first case are organic nitrates called also nitric esters. The products of the second case are nitro-substitution compounds. Those of the third are called nitroamines. Examples of the first case are ethyl nitrate from ethyl or grain alcohol, glycol nitrate from ethylene glycol, glyceryl nitrate (nitroglycerin) from glycerol (glycerin), mannitol nitrate from mannitol (mannite), starch nitrate (nitrostarch) from starch, and cellulose nitrates (guncotton and pyroxylin) from cotton. Examples of the second case are mono and di nitro benzene from benzene, tri nitro phenol (picric acid) from carbolic acid (phenol), nitrotoluenes from toluene, and nitro-naphthalenes from naphthalene. An example of the third is ethyl. These explosives differ markedly from mixtures like gunpowder, for, whereas in the mixtures the combustible substance and the oxidizing agents are in different masses, in the explosive compounds like nitroglycerin, they are both in the same molecule. Therefore in the latter the contact is more intimate and the reaction takes place with greater velocity.

In addition to the explosives of the characters described above is another class of chemical compounds, of which mercuric fulminate, silver amine (fulminating silver), acetylene, the azides and diazo benzene nitrate are notable examples, whose explosive properties are due to a phenomenon (namely, a molecular disruption), which is quite unlike that of combustion ascribed to those of the previous classes. This case of disruption arises from the fact that these substances are endothermous compounds, or in other words, that they absorb heat during their formation and are therefore reservoirs of energy.

Classification of Explosives.— Following the foregoing theories of their constitution and behavior, explosives may be classed as

(1) *Nitrate mixtures.*— Amide powder (charcoal, potassium nitrate, and ammonium nitrate); amidogene (bran or starch, charcoal, magnesium sulphate, potassium nitrate and sulphur); ammonal (metallic aluminum and ammonium nitrate); azotine (petroleum, charcoal, sodium nitrate and sulphur); blasting powder (charcoal, sodium nitrate and sulphur); carbazotine (bark or wood pulp, lampblack, ferrous sulphate, potassium nitrate and sulphur); Courteille's triumph safety powder (charcoal, peat, coal, oleaginous matters [animal or vegetable], metallic sulphates, sodium nitrate and sulphur); diorrexine (sawdust, sodium nitrate, potassium nitrate and sulphur); fractorite (rosin, dextrine, potassium dichromate, ammonium nitrate); gunpowder (charcoal, potassium nitrate and sulphur); haloxyline (charcoal, sawdust, potassium ferrocyanide and potassium nitrate); Himly's powder (hydrocarbons and potassium nitrate); Nordenfeldt and Meurling's powder (hydrocellulose, potassium nitrate and sulphur); pyrolithe (charcoal, sawdust, sodium carbonate or sulphate, potassium nitrate, sodium nitrate and sulphur); saxifragine (charcoal, barium nitrate and sulphur); schneiderite (mononitronaphthalene and ammonium nitrate).

(2) *Chlorate mixtures.*—Asphaline (hydrocarbons, potassium sulphate, potassium nitrate, potassium chlorate); Berthollet's powder (charcoal, potassium chlorate and sulphur); britainite (naphthalene, potassium nitrate, ammonium nitrate, potassium chlorate); Callow's powder (orpiment, potassium ferrocyanide and potassium chlorate); carlsonites (naphthalene, or dinitrobenzene and other combustible substances with ammonium perchlorate); cheddite, (nitro body, oil and potassium chlorate); comet powder (rosin and potassium chlorate); cycene (cane sugar, paraffin oil or coal dust, potassium nitrate and potassium chlorate); Ehrhardt's powder (tannic acid, charcoal, rosin, potassium nitrate and potassium chlorate); Hahn's powder (charcoal, spermaceti, antimony sulphide and potassium chlorate); Himly and von Trutschler-Falkenstein's powder (coal tar, potassium nitrate and potassium chlorate); Horsley's powder (nutgalls and potassium chlorate); Kellow and Short's safety powder (tanbark or sawdust, potassium nitrate, sodium nitrate, potassium chlorate and sulphur); Knaffi's powder (ammonium ulmate, potassium nitrate, potassium chlorate and sulphur); Melland's paper powder (porous paper which has been soaked in a paste composed of starch, charcoal, potassium ferrocyanide, potassium chromate, potassium nitrate, potassium chlorate and water and dried); Oriental powder (gum gambier and potassium chlorate); Parone's explosive (carbon disulphide and potassium chlorate); Pertuiset's powder (sulphur and potassium chlorate); pyrodialites (mixtures of coal tar with chlorates or perchlorates and with or without nitrates, nitrosubstitution compounds, charcoal and oxidizing salts); pyronome (rye flour, charcoal, metallic antimony, sulphur potassium chromate and potassium chlorate); rossellite (asphalt oil and potassium chlorate); Siemen's powder (a solid hydrocarbon, potassium nitrate and potassium chlorate); thorite (cane sugar and potassium chlorate); tutonite (metallic sulphides, sulphur and potassium chlorate); and white powders of Augendre and Pohl (cane sugar, potassium ferrocyanide and potassium chlorate).

(3) *Oxidizing mixtures.*— These are mixtures of combustible substances with oxidizers other than the nitrates, chlorates or perchlorates. Among such bodies may be named sodium peroxide, potassium permanganate, potassium dichromate, liquid air and liquid nitrogen tetroxide. As examples we have mixtures of sodium thiosulphate with sodium peroxide; metallic aluminum with sodium peroxide; cotton wool with liquid air, and panclastite, which is a mixture of carbon disulphide with liquid nitrogen tetroxide.

(4) *Organic nitrates or nitric esters and mixtures containing them.*— Esters: Guncotton, which is a cellulose nitrate of high nitration and practically insoluble in a mixture of ether and alcohol at ordinary temperatures; nitrocellulose, a term applied to all cellulose nitrates; nitroelectrite (isomannitol nitrate); nitroerythrite (erythrol nitrate); nitroethyl (ethyl nitrate); nitroglucose, a nitrate produced from grape sugar; nitroglycerin, pyroglycerin or glonoin oil (glyceryl trinitrate); nitrolactose (nitrated sugar of milk); nitrolignin (nitrated wood); nitromannite (mannitol nitrate); nitromethyl (methyl nitrate); nitrostarch or xyloidine (starch nitrate); nitrosugar or nitrosaccharose, a nitrate produced from cane sugar; pyroxylin, collodion cotton, nitrocotton or pyrocellulose, are cellulose nitrates of medium nitration and practically completely soluble in a mixture of ether and alcohol at ordinary temperatures. In this class is also to be included the explosive mixtures into which these esters enter as essential components and of which the dynamites are conspicuous examples. These are classified, according to the nature of the *dope* or absorbent, into

A. *Dynamites with an inert base.*— Nobel's dynamite No. 1, giant powder No. 1; dynamite blanche de Paulilles; dynamite de Vonges; E. C. dynamite; S. 1, dynamite; Rutenberg's explosive; dynamite rouge, all consist of nitroglycerin with kieselguhr; Hill's powder (nitroglycerin with precipitated silica); Mowbray's mica powder (nitroglycerin with asbestos); Hercules powder (Extra No. 1); (magnesia powder, nitro-magnite; dynamagnite; fulgurite; nitroglycerin with magnesia alba); dynamite de boghead (nitroglycerin with ashes from Boghead coal); selenitic powder (nitroglycerin with plaster of Paris); Horsley's powder No. 1 (nitroglycerin, alum and magnesium sulphate); metalline nitroleum (nitroglycerin, red lead and plaster of Paris); renish dynamite (nitroglycerin, kieselguhr and naphthalene); dynamite noire (nitroglycerin, sand and coke); mataziette (nitroglycerin, sand, ochre, charcoal and resinous matter); porifera nitroleum (nitroglycerin, sponge or vegetable fibre and plaster of Paris); Burstenbender's explosive (nitroglycerin, spongy vegetable substances with glycocoll or chondrin); Morse's explosive (nitroglycerin with rosin); Borland's carbo-dynamite (nitroglycerin with charcoal from cork); white dynamite (nitroglycerin with lime-guhr); boritine (nitroglycerin, kieselguhr and boric acid); fluorine (nitroglycerin, kieselguhr and calcium fluoride).

B. *Dynamites with an active base.*— *a.* Consisting of nitroglycerin absorbed by a gunpowder like dope—Ammonia dynamite; ammonia krut; ammonia powder; Coad's explosive; Champion's powder; colonia powder; Dittmar's powder; dynamite No. 2; dynamite au charbon; dynamite d'ammoniaque; dynamite grieses de Paulilles; extra powder; Fowler's explosive; giant powder No. 2; Gotham's powder; Hercules powder; Horsley's powder No. 2; Judson's powder; Jupiter powder; lithofracteur; Monakay's explosive; miner's powder Co. dynamite; Neptune powder; potentia; petrolithe; sebastine; thunderbolt powder; Titan powder; virite powder; Vulcan powder.

b. Consisting of nitroglycerin absorbed by or gelatinized with a cellulose or ligno-cellulose nitrate — Blasting gelatine; cellulose dynamite; Clark's explosive; Dean's explosive; Dittmar's explosive; extra dynamite; explosive gelatine; glyoxyline; grisoutine; gum dynamite; nitrogelatine; palcine; Punshon's explosive; Schultze's dynamite; straw dynamite; Trauzl's dynamite.

c. Consisting of nitroglycerin or an explosive gelatine incorporated with wood pulp or sawdust and a nitrate, principally sodium nitrate. Such dynamites are styled lignin-dynamites — Ætna powder; amidogene; Atlas powder; Brain's powder; carbonite; diaspon; dualin; dynamite de Krummel; dynamite de Lanky; forcite; gelatine dynamite; gelignite; giant powder; Hecla powder; meganite; miner's friend powder; grisoutite; kadmite; petralithe; rendrock; rhexite; safety nitropowder; Schultze dynamite; stonite; stowite; vigorite.

d. Other dynamites.— Americanite (nitrol glycerin and methyl alcohol); Castellano's powder (nitroglycerin, fibrous material, earth and nitrobenzine); cerberite (nitroglycerin, wood oil, nitrobenzine, wood pulp and sodium nitrate); Engle's powder (nitroglycerin, ammoniacal salts, saltpetre, pyroxyline, nitrostarch, nitromannite, nitrobenzine, and water glass); glukodine (nitroglycerin and nitrosaccharose); perunite or terrorite (nitroglycerin, nitromethyl, nitroethyl and pyroxylin); thunder powder (nitroglycerin and nitroglucose).

e. Low freezing dynamites.— Ordinary dynamites freeze at temperatures prevailing in the northern and middle Atlantic states from October to May. When frozen they are difficult to detonate and are therefore not only inefficient but dangerous and particularly when being thawed. To overcome this defect nitrosubstitution compounds such as some of the nitrotoluenes and, more recently, esters such as nitrated di- and polyglycerins are introduced as components of dynamite. These are styled *L. F. dynamites* and put upon the market with a designating term of this kind.

C. *Organic nitrate mixtures other than dynamites.*— Casteau's explosive (nitrodextrine and ammonium nitrate); Cooppal's powders (resinous bodies, barium nitrate, and nitrocellulose); diflamyr (metallic nitrates and nitrocellulose); flamminore (collodion cotton, ammonium sulphate and ammonium nitrate); grenée powder (paraffin; agar-agar, nitorcellulose, potassium nitrate, and barium nitrate); explosive P, (nitrocellulose and ammonium nitrate); potenite and tonite (guncotton and barium nitrate).

(5.) *Nitrosubstitution compounds and mixtures containing them.*— Compounds: Nitrobenzenes; nitrocresols; nitrocumenes; nitronaphthalenes; nitronaphthols; nitrophenols; nitroresorcinols; nitrotoluenes; picric acid or caroazotic acid (trinitrophenol); picramic acid; styphnic acid or oxypicric acid (nitroresorcinol); trinitrotoluene (T. N. T.); trotyl; tetranitraniline; tetranitronuthyl-aniline (tetryl, tetralite).

A. *Mixtures containing nitrosubstitution compounds.*— Abel's powder; ammonite: amvis; bellite; boritine; Borlinetto's powder; Boyd's powder; bronolithe; Brugere's powder; explosive A; explosive C; explosive N; cremonites; Du Bois-Raymond's powders; duplexite; ecrasite; emmensite; Faversham powders; Favier explosives; ferrifractor; Fontaine's powder; Gathhurst powder; gelbite; Geserick's powder; Girard's powder; hellhoffite; Hill's powder; Johnite; joveite; kinetite; lyddite; macarite; melinite; oxonite; plastrotyl; rackarock; roburite; romite; securite; streetites; triplastite; Volney powders.

(6) *Fulminates.*—Compounds: Copper and silver, acetylides; diazonbenzine nitrate; fulminating gold (auramine); fulminating silver (argentamine); mercuric fulminate; mercuric triazotate; lead and nitrogen chloride (chloramide); nitrogen iodide (iodamide); silver fulminate; and triazoic acid, also called hydrazoic acid and azoimide.

In addition to these classes there are seven groups of explosives which have received such widespread notice as to merit especial mention here, though the members of each may all be and many of them are included in the classes given above. These groups are Sprengel explosives, safety or flameless explosives, permitted explosives, and smokeless powders, shell explosives and grenade and bomb explosives.

Sprengel Explosives.— These explosives were invented by Dr. Hermann Sprengel, 1873, and he advocated their use because of their safety, as they are non-explosive during manufacture, storage and transportation, but are very powerful explosives when prepared and detonated. His plan was to employ mixtures of combustible and oxidizing substances, which should be kept separate until needed for use, the bodies to be employed in the compounding of the explosives being either all liquid or part liquid and part solid, for by taking advantage of the liquid state speedy and intimate mixing could be realized and the explosives could be compounded on the spot and at the time they were wanted for use. Among the oxidizing agents proposed were the nitrates and chlorates, which are solids, and nitric acid and nitrogen tetroxide, which are liquids. Among the combustible substances were the nitrosubstitution bodies, carbon disulphite and petroleum. A conspicuous example of a Sprengel explosive is rackarock, which was used in blowing up Flood Rock in Hell Gate, N. Y., and which may be made by pouring mononitrobenzine upon potassium chlorate crystals. Other examples are some forms of emmensite; explosive A; hellhoffite; oxonite; panclasite; and Parone's explosive.

Safety or Flameless Explosives.— These explosives are for use in fiery mines, particularly coal mines, where there is a chance of an accident arising through the ignition of the fire damp from the flame or incandescent particles given off by the explosive as the blast is fired. Among the earlier devices employed to prevent this was the mixing in the dope of the dynamite or with the powder of a quantity of washing soda, alum, Epsom salts or other salt containing a large amount of water of crystallization that would be set free when the mixture was fired. In 1883 Mallard and Le Chatelier discovered that when explosives were detonated unconfined in air containing 10 per cent of methane (marsh-gas), the fire damp could not be ignited if the temperature of detonation was below 2200° C., owing to the cooling of the gases due to their rapid expansion and to the retardation of the inflammation of the fire-damp. An investigation by the French Fire Damp Commission showed that, among others, certain salts of ammonia and especially ammonium nitrate, were capable of reducing the temperature of the gases produced by detonation very materially, the temperature of the gases from explosive gelatine being reduced from 3090° C., when detonated alone, to 1493° C., if detonated when mixed with 88 per cent of ammonium nitrate. In August 1890 the French government prohibited the use of black powder in fiery or dusty mines and permitted the use in them of explosives whose gases are not combustible and the detonation temperature of which does not exceed 1900° C., where blasting is to be done in the rock, nor 1500° C., where the work is to be done in the coal seam. Among the explosives designed to meet such conditions and styled abroad safety or flameless explosives are: Ammonite; amvis, aphosite; bellite; benedite; britainite; cambrite; carbonite; Casteau's explosives; dahmenite; Favier's explosive; fractorite; Geserick's powder; grisoutine; grisoutite; nitroferrite; progressite; roburite; securite; westphalite; wetterdynamite.

Permissible Explosives are those which have passed the tests by the United States Bureau of Mines and which have been placed by it on the Permissible List of Explosives for Use in Coal Mines, established in 1908. There were 137 explosives on the permissible list 15 April 1916 classified as «ammonium nitrate,» «hydrated,» «organic nitrate» and «nitroglycerin» explosives. Rules for testing and regulations for use of these explosives are supplied in free publications of this Bureau. By the use of these explosives safety in mining coal is increased.

Smokeless Powders are high powered propellents used as substitutes for gunpowder in firearms and cannon. They are formed of the highest grade of cellulose nitrate only, like indurite, or of the medium grade only, like pyrocellulose powder, or they may be mixtures of different grades together with metallic nitrates like the B. N. powders. Another class are mixtures of cellulose nitrates with nitroglycerin and a restrainer, like vaseline; ballistite, cordite and filite being examples of this kind. In robin-hood, gold dust, and gelbite, we have examples of such powders made from nitrosubstitution compounds and oxidizing agents. Other smokeless powders are amberite; Erackett's powder; cannonite; Curtis and Andre's powder; Du Pont powder; E. C. powder; fulgor; granulite; hornite; J. B. powder; kolfite; poudre J; poudre S; pyrocollodion; rifleite; Schultze powder and Walsrode powder.

Shell Explosives.— For charging armor piercing and other high explosives shell very stable, insensitive, detonating explosives are required. Nitroglycerin, dynamite, guncotton and explosive gelatin were tried but found too dangerous. Picric acid was known to be powerful and, when condensed by fusion, so insensitive that it could be safely fired from modern guns, but it was found difficult to detonate it when it was compressed in the shell. Turpin in France in 1886 solved the problem by causing a mercury fulminate detonator to act on pulverulent picric acid contained in a cavity in the compressed picric acid. For attack on warships shells are required that will pass through the armor and explode when on the inside. According to Marshall nitroaromatic explosives, such as picric acid, generally detonate on the face of the armor. This is accomplished by ammonium nitrate explosives. The first complete demonstration was made at the United States Naval Proving Ground, Indian Head, Md., in 1897 under Capt. W. T. Sampson, U. S. N., when a shell containing 8.25 pounds of Joveite (moronitronaphthalene, picric acid and ammonium nitrate) penetrated a sheet of the harveyized armor of the United States Steamship *Kentucky* 14.5 inches in thickness and burst on the other side of the plate. Compressed picric acid is known in France as melinite; in England as lyddite; Germany, granatfüllung 88; Italy, pertite; Japan, shimosite; Sweden, coronite; Spain, picrinite; and Austria, ecrasite. In many instances other substances are mixed with the picric acid. Thus in France to reduce the melting point and avoid the formation of cavities from crystallization or «piping» trinitrocresol is mixed with the picric acid. A mixture of 60 per cent trinitrocresol and 40 per cent picric acid is known as cresylite 60/40. It melts at 85° C., but at 65° is sufficiently plastic to permit of its being compressed into charges which, on cooling, are compact, amorphous and very homogeneous. In Austria ammonium cresylate is mixed with the picric acid. Since picric acid is corrosive, and may, by action on the metal of its containers, produce dangerously sensitive compounds, and also because the supply of it is limited, trinitrotoluene has come to be largely used as the bursting charge for detonating shells. Schneiderite (mononitronaphthalene 10 per cent and ammonium nitrate 90 per cent) is used at Creusot for this purpose also. Macarite (T. N. T. and lead nitrate) is also used.

Grenade and Bomb Explosives. Ammonal, cheddite, compressed gun cotton, picric acid, smokeless powder, T. N. T., and tonite are used for charging hand grenades and bombs.

Methods of Firing Explosives.— Explosives may be made to explode by heating them to their explosion temperatures. This may be accomplished by a flame, a spark, an incandescent body, friction, percussion, concussion, pressure or chemical action, provided the resulting temperature is sufficiently high. Gunpowder was originally ignited in muskets, guns and boreholes by the application of a torch, a glowing tinder or a heated iron rod. Later muskets were fired by the sparks from a flint striking steel. Joseph Egg, an English gunmaker, 1815, invented percussion caps and to-day all fixed ammunition is fired by percussion primers, while the charges in very large guns are fired by friction primers or by electric primers. In firing blasts a train of powder was laid from the mine to a safe distance by which to convey the inflammation. Later quills, straws or paper or wooden tubes were used to hold the train and permit of the charge being tamped so as to secure the advantage which comes from confining an explosive. Bickford of Tuckingwall, England, 1831, invented the «running» or «tape» or «safety» fuse, in which a core of gunpowder is enclosed in a tube of jute yarn impregnated with a waterproof composition, and this is to-day largely used in firing blasts. Dr. Watson of England, 1745, succeeded in igniting gunpowder by means of electric sparks, and in 1749 a battery of 11 guns was fired by means of a frictional electric machine at Annapolis, Maryland. Dr. Robert Hare of Philadelphia, 1832, invented the method of firing gunpowder charges by means of the electric current, using low tension fuses, and he had for some time prior to this employed the voltaic battery, in eudiometrical experiments, for igniting explosive mixtures of gases. Sir Charles Wheatstone, 1856, introduced the magneto-exploder in blasting, and Moses G. Farmer of Newport, R. I., 1871, invented the dynamo-electric machine with which to generate the current and applied it to firing electric ignitors or detonators, and to-day great guns, military and naval mines, and torpedoes and many blasts, especially those in which several charges are to be fired simultaneously or where the blast is under water, are fired by this means.

It has long been known that when a notable quantity of a mixture of two volumes of hydrogen with one volume of oxygen is ignited at any point, the inflammation extends almost instantaneously throughout the mass and a most violent explosion ensues. This phenomenon is called detonation, and this mixture has long been known under the name of detonating gas. Certain chemical compounds such as nitrogen chloride, nitrogen iodide and mercuric fulminate undergo an almost instantaneous decomposition, giving rise to violent explosive effects, if heated, struck or rubbed, and they are known as detonating explosives. At first guncotton, nitroglycerin and dynamite were fired by ignition, as gunpowder had been, but Nobel, 1866, discovered that if a quantity of mercuric fulminate was detonated in contact with nitroglycerin or dynamite they then underwent a detonating explosion also. E. O. Brown of the chemical department at Woolwich, England, 1868, discovered that not only could dry compressed military guncotton be detonated in this way, but that if the dry charge, called a primer, was in contact with wet guncotton, the latter was detonated also, even though it was saturated with or submerged under and in contact with water. There are then two kinds of explosion, namely, explosion by simple combustion and explosion by detonation. Explosives of the gunpowder class undergo only the first kind of explosion. Explosives of the nitric ester or nitrosubstitution classes undergo both kinds of explosions. Explosives of the fulminate class practically undergo only the second kind of explosion. A marked difference between the two kinds of explosion is found in the velocity with which the explosive reaction is propagated within the mass of the explosive. Thus in detonating gas, which can undergo both kinds of explosion, Bunsen found, when using very narrow tubes where only combustion could take place, that the velocity of the reaction was 34 metres per second, while Berthelot, using long and wide tubes in which detonation could take place, found that the velocity of the reaction was 2,810 metres per second. Experiments made by laying trains of the materials and firing them showed that while the velocity of combustion of gunpowder in the open air is but from 1.5 to 3.4 metres per second, the velocity of detonation of dynamite and of guncotton is about 6,000 metres per second. Provided each explosive gave the same volume of gases, having the same temperature and that the conditions were in all other respects alike, it is evident that the explosion in which the reaction velocity was the greater would be the more violent one. But they are not alike, since guncotton, nitroglycerin and mercuric fulminate, besides being endothermos compounds, are completely resolved into gases, while gunpowder, besides being a mixture, yields but about 44 per cent of gaseous products. The pressure developed by gunpowder when fired in a space completely filled by it is, from Noble and Abel's experiments, 6,150 atmospheres. The theoretical pressure developed by guncotton, notroglycerin and mercuric fulminate when detonated in contact with bodies, are respectively 24,000 atmospheres, 25,000 atmospheres and 28,000 atmospheres. Investigation has shown that no other explosive known will give in contact an instantaneous pressure at all comparable with that of mercuric fulminate.

Owing to these differences in behavior explosives have been distinguished as high explosives and low explosives. Gunpowder and explosives of the nitrate class, together with smokeless powder are low explosives. They act with comparative slowness and are used where it is desired to lift or push a load without cracking it or in propelling projectiles. Nitroglycerin and explosives of the class of nitric esters or nitrosubstitution bodies are high explosives. They are shattering and crushing in their effect. Detonators containing mercuric fulminate are used to fire high explosives, the detonators being themselves fired by means of a Bickford fuse or by an electric current. The high explosives are usually put up for use in paper cylinders, and, when loaded for shipment, these are called cartridges or «sticks.» Usually several sticks are required for one borehole. In this case the detonator is inserted in one of these sticks, usually the last one inserted in the hole, and this stick is then called the priming cartridge or «primer.»

Direction in Which Explosives Explode. — There is a very common but erroneous belief that gunpowder explodes upward and that high explosives explode downward. It arises from the fact that if a quantity of dynamite be laid unconfined upon the surface of the rock on detonating it the rock will often be fractured, whereas if gunpowder is thus placed and fired, it produces no effect whatever upon the rock. The facts are that each explosive tends to act in all directions about the centre of explosion. As exposed in air they are subjected to the weight of the air above them and are to that extent under confinement. When the high explosive is detonated the gases are set free so fast that the air acts as a tamping agent; when the gunpowder explodes the gases are generated so slowly that they have time to move the air. Besides the «pressure in contact» exerted by the high explosives is enormously greater than that of the low explosives. That high explosives exert pressure in all directions was demonstrated by Munroe by fastening blocks of guncotton of equal size and weight on opposite sides of a plate of iron, but at some distance apart, by means of light cords or wires, suspending the plate in any position and detonating both charges simultaneously when holes were blown through the plate away from each of the charges. Although high explosives usually produce a shattering effect when fired unconfined upon a body the effect is markedly increased by increasing the confinement. Thus in the method of breaking boulders and large masses of stone called «plastering,» after the charge is laid upon the stone and fused, one or two shovelfuls of earth are placed over it before firing. In «blockholing,» when it is desired to break the rock into fragments of definite size, a small hole is bored in the rock and the explosive inserted in this cavity whereby the gases obtain a greater leverage.

Explosions by Influence. — In detonating explosive substances it has been found that the influence of the detonation is exerted to a distance all about the mass depending on the kind and the amount of the explosive used and its environment and that a second charge of explosive within the sphere of influence may be detonated by the detonation of the first charge without being in contact with it. Thus in accidental explosions in explosive works the initial explosion occurring in one building may detonate the explosives in other buildings unless care is taken in the construction of the works to separate the buildings by a safe distance from one another. Care, too, must be taken in forming fixed ammunition that the primers are not heavily charged with fulminate, and that the cartridge's are so packed that the accidental explosion of one cannot explode the others by influence. Application of this principle is made in military engineering in the operation of countermining, the enemy's submarine mines being blown up by firing a heavy torpedo charged with guncotton in the vicinity of them. To-day large quantities of explosives are frequently used in big blasts. According to Eissler, it is an almost daily occurrence in California for 20,000, 30,000 and even 50,000 pounds of explosives to be used in a single charge. The system of large blasts has even become common in hard rock excavations, such as quarries and railroad cuttings, and in these large blasts it is common practice to dispose the larger part of the mass of explosive so that it may be exploded by influence and not by contact or by propagation of flame or fire.

The largest single blast ever fired was that used in the blowing up of Flood Rock at Hell Gate in the East River, N. Y., 10 Oct. 1885. There was used in the blast 240,399 pounds of rackarock and 42,331 pounds of dynamite, or 283,000 pounds of explosive. There were 13,000 separate charges of rackarock embedded in drill holes with a dynamite cartridge on top of each, and there were 591 primary charges of dynamite placed on timbers 25 feet apart within the mine. When all the charges had been placed in the excavation and the primary charges connected with the firing batteries, the mine was filled with water, the primary charges were exploded by the electric current and these exploded the 13,000 other charges by influence through the intervening water. Munroe founded on this principle a method of testing the relative sensitiveness of explosive substances.

Uses of Explosives. — The uses of explosives as propellents in war and in the chase; as rupturing agents in mining, quarrying and engineering operations, and as an essential component of fireworks is well known. It is not so generally known that they are employed for saving life and property in signal lights, rockets and guns; in projecting lines from the shore to stranded ships, and, in case of fire, to the upper stories of high buildings; in casting oil upon the water to quell a raging sea; and in railroad torpedoes to prevent collisions. Gunpowder guns are also used in bridge building to project a line across a chasm which is to be bridged, and they are used in the whale fishery to project the harpoons, while the latter may carry an explosive charge with which to stun or destroy the whale. Detonating explosives have been improperly used in taking fish; in burglarious operations against safes and vaults and in anarchistic outrages. Dynamite has been used to knock the blocking from the ways when launching ships. Fired on an iron plate placed on the top of a pile and covered with a tamping of earth or clay, it has successfully replaced the pile driver. It has been found efficient in excavating holes in which to plant telegraph and telephone poles and fence posts; in driving water out of quicksands in which foundations are to be laid or shafts to be driven; in slaughtering cattle; in breaking down ice dams to prevent inundations; in blowing up buildings to prevent the spread of conflagrations; in razing unsafe walls of burned buildings; in destroying wrecks which endanger navigation, and in freeing vessels which are hard aground on shoals. The farmer uses them in breaking boulders, grubbing stumps and felling trees; in shaking the soil to fit it for deep-soil cultivation, and, in wine growing districts, to free the soils from the phylloxera: while their aid has been sought in breaking droughts and diverting hailstorms from their courses. The iron founder uses them in breaking large castings. The iron smelter employs them to clear out obstructions in blast furnaces while the latter are still in operation. Munroe proposed using detonating explosives as a means of testing the integrity of large masses of metal and their resistance to shock.

Transportation of Explosives. — It is well known that the transportation of explosives is a necessary menace. Munroe pointed out that in 1904 there was not less than 600 cars of explosives on the railroads of the United States each day. In 1905 the matter of regulating the transportation of these and other dangerous substances was taken up by the American Railway Association and a bureau of supervision was created. Later the matter was taken up by the United States Congress and by its acts of 4 March 1909 and 18 June 1910, this supervision and regulation was entrusted to the Interstate Commerce Commission which, on 2 July 1914, issued a pamphlet of 196 pages containing its regulations for the safe transportation of explosives, inflammables and other dangerous substances, and these now control.

Explosives Industry in the United States. — The reports of the United States census for 1900, 1905 and 1909 contain much descriptive and historical besides statistical matter regarding this industry. From the reports of the census for 1914 it appears that in that year there was produced 7,685,036 pounds of gunpowder; 208,316,125 pounds of blasting powder; 3,560,581 pounds of nitroglycerin; 223,000,073 pounds of dynamite and 18,113,601 pounds of permissible explosives. The comparative condition of the industry from 1840 to 1914 is shown in the following table:

TOTAL PRODUCTION AND VALUE OF EXPLOSIVES IN THE UNITED STATES BY DECADES, 1840–1914.

	No. of establishments	Capital	Average No. of wage earners	Products	
				Pounds	Value
1840...	137	$875,875	496	8,977,348	....
1850...	54	1,179,223	579	....	$1,590,332
1860...	58	2,305,700	747	....	3,223,090
1870...	36	4,099,900	973	....	4,237,539
1880...	54	6,585,185	1,340	....	5,802,029
1890...	69	13,539,478	2,353	98,645,912	10,993,131
1900...	97	19,465,846	4,502	215,590,719	*16,950,976
1905...	124	42,307,163	5,800	....	29,602,884
1910...	86	50,167,976	6,274	487,481,252	40,139,661
1915...	111	71,351,414	6,306	486,824,427	41,432,970

*This value is for the explosive substances only. When materials of all kinds produced in these establishments are included, the value is $17,125,418.

The establishments reported for 1914 were most numerous in the sections where mining or engineering operations were carried on most extensively. Pennsylvania had 33 factories, Ohio 11, Illinois 9, New Jersey 8, West Virginia 7, Oklahoma 6 and California 5. The production is largest in the East. See DYNAMITE; FIRE-DAMP; GUNCOTTON; GUNPOWDER; NITROGLYCERIN; MAXIMITE; PICRIC ACID; STABILITE; TRINITROTOLUENE, «T. N. T.»

CHARLES E. MUNROE,
The George Washington University, Washington, D. C.

EXPONENTS AND EXPONENTIALS. The symbol x^n is used in elementary algebra to denote the result of multiplying x by x, the result by x, and so on, till n-1 multiplications have been made. It is read, «x to the nth power,» or simply «x to the nth.» n is said to be the exponent of x. Clearly this manner of defining exponents only applies to real integers. While the generalization of the notion of exponents has proceeded step by step, it is perhaps best to give directly the widest extension of the notion that is possible in ordinary complex algebra. e^x, the so-called exponential function, is defined as $1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\ldots+\frac{x^n}{n!}+\ldots$, which always converges when x is finite, be it real or complex. Log x is defined as a value of y for which $e = yx$ is then defined as ey log x. It will in general be many valued. By the selection of certain values of xy as the so-called principal value, the following laws may be established.

$$x^m.\ \ x^n = x^{m+n}$$
$$(x^m)^n \ = x^{mn}$$
$$x^m.\ y^m \ = (x\,y).^m$$

It will be found that when m is an integer, m will have its conventional meaning, and that $x^{\frac{m}{n}}$ will stand for $n\sqrt{x}^{-m}$ where $n\sqrt{x}$ is a number which, when raised to the nth power, will yield x.

While e^x is *the* exponential function, functions the argument of which appears in an exponent are often known collectively as exponential functions.

EXPOSITION, Industrial. The promotion of trade and manufactures by means of collections of works of industry and art has no claim to the merit of novelty. In modern times, however, the idea has been more systematically carried out, and was probably suggested by the good effects produced by two institutions of a like nature — the galleries of rare productions of art or nature collected by the wealthy and educated, and the exposure for sale of ornamental and useful articles in the stores of individuals, and more particularly on a large scale at the great fairs which in former times were more important features of commercial enterprise than they now are. The beneficial effect thus derived from the exhibition and comparison of the manufactured products of different localities could not long escape notice. In England this knowledge was brought to practical purposes in the 18th century, when the Society of Arts in 1756–57 not only offered prizes for specimens of manufactures, but exhibited the works of the competitors. In France an exhibition embracing all kinds of manufactures was held in the year 1798, and another under the consulate of Bonaparte in 1802, and the gratifying results attained led to the idea of holding them every three years, which was carried out as far as the political troubles of the country would allow. Many exhibitions were subsequently held at different cities on the continent of Europe, and in the British Islands exhibitions of a more or less local nature were held in Dublin, Manchester, Liverpool and Birmingham, as well as in London in the premises of the Society of Arts. All these had been generally successful, but the necessity of having an exhibition on an international scale had become with some a fixed idea. This was first brought fairly before the British public in 1848 by Prince Albert, then president of the Society of Arts. In 1849 the project for an exhibition in which all nations might join began to take a tangible shape; and it was at last determined by government to issue a royal commission to deal with the matter, which was gazetted 3 Jan. 1850. The better to enable the commissioners to enter into contracts and otherwise incur obligations, subscriptions were procured to a guarantee fund, the queen leading the list with $5,000. A vast structure of iron and glass, generally designated the Crystal Palace, built from the design of Joseph Paxton, was erected in an incredibly short space of time in Hyde Park, London, and was opened by Her Majesty on 1 May 1851. The extreme length of the building was 1,851 feet, the width 408 and the height about 64 feet. The entire area was about 19 acres. In the ground floor and galleries there were about eight miles of tables set apart for the exhibitors. The articles sent for exhibition were divided into four great sections: Raw materials, machinery, manufactures and fine arts. The number of exhibitors was about 15,000. The exhibition remained open until 11 October, and the number of visitors during the 144 days amounted to about 6,170,000. After all expenses were defrayed there was a balance of $700,000 left. The immense success of the undertaking encouraged the local and national exhibitions of Dublin and New York in 1853 and of Munich in 1854; and the French nation in 1855 opened its first Exposition Universelle. The main building was an imposing structure of white stone and of classic architecture. The buildings were erected in the Champs Elysées, and covered about 24 acres. There were in all about 24,000 exhibitors, and the contents were pronounced greatly in advance of those exhibited in London in 1851. It was said that continental manufacturers had taken lessons from the British exhibition which the British had failed in fully profiting by, and so exhibited a vast improvement in works in which the latter considered themselves unrivaled. This was followed by the national exhibitions of the Dutch at Haarlem and the Belgians at Brussels, both in 1861, and the following year by the second great international exhibition held in London. It occupied a vast brick building, lighted by a roof and two immense cupolas of glass, and erected in the garden of the Horticultural Society at South Kensington. The space covered was about 17 acres. There were 26,348 exhibitors in the industrial division, of whom 8,487 were British, and in the fine art division 2,305, of whom 990 were British. The aggregate number of visitors from 1 May to 31 October was 6,211,103, giving an average of 36,328 per day. The productions, which came from almost all parts of the globe, were divided into 40 classes, and included manufactures of all kinds — machinery, chemical products, railway plant and ordinary vehicles, animal and vegetable products used in food or manufacture, architecture, painting, sculpture, engraving, etc. This exhibition was also eminently successful and enabled the public to judge of the progress or shortcomings of British home manufactures and art as compared with others. In 1865 a rather important exhibition was held in Dublin which was a pecuniary failure. The second French International Exhibition was opened on 1 April 1867, and closed on 3 November. On 1 May 1871 the first of the British annual international exhibitions of fine arts and industry was opened by the Prince of Wales. On 1 May 1873 the first Austrian international exhibition was opened by the Emperor Franz Josef with great pomp and ceremony. The building was situated in the Prater, or, as it may be called, the park of Vienna and was 2,940 feet in length, with an average breadth of 570 feet. A great exhibition was opened by President Grant at Fairmount Park, Philadelphia, upon the occasion of the centennial festival of the American Declaration of Independence. It occupied 60 acres and had nearly 10,000,000 visitors. A third French International Exhibition was held at Paris in 1878; area occupied 140 acres; visitors 17,000,000. A fourth French International Exhibition was opened by President Carnot in 1889 to commemorate the centenary of the Revolution, the visitors to which numbered over 25,000,000. One of its chief features was the Eiffel tower, of iron, 984 feet high. The series of exhibitions which were held at South Kensington, London, included The Fisheries (1883), The Health (1884), The Inventions (1885) and the Exhibition of Colonial and Indian products (1886); the latter of which was visited by 5,550,749 visitors. Besides these, exhibitions have been held in Edinburgh (1886), at which there were 2,769,632 visitors; Manchester (1887) at which there were 4,765,000 visitors; and Glasgow (1888), with 5,748,379 visitors. In 1899–1900 a huge International Exhibition was held at Paris, but, though visited by about 47,000,000 persons, was not a financial success. It occupied the Champ de Mars and extensive areas on both sides of the Seine.

In 1893 the fourth centenary of the discovery of America by Columbus was celebrated by the World's Columbian Exposition, at Chicago. It excelled all predecessors in conception, scope and grandeur. Every nationality contributed to the exhibits and many countries possessed their own buildings. The "White City," as it was called, was opened by President Cleveland 1 May and closed 30 October. It occupied about 600 acres, at Jackson Park, on the shore of Lake Michigan, including the "Midway Plaisance." Nearly every State in the Union was represented by its own edifice. The principal buildings were Machinery Hall, the Art Palace and those devoted to transportation, mining, electricity, agriculture, manufacture and liberal arts (covering 44 acres), government, administration, fisheries, horticulture and anthropology. The total admissions for the period named were 27,539,521, and the receipts from this source $10,317,814. The largest attendance on any one day — Chicago day, 9 October — was 716,881. Other notable exhibitions in the United States were the California Mid-Winter Exhibition, held in San Francisco in 1894; the Cotton States and Industrial Exposition held in Atlanta, Ga., September to December 1895; the Tennessee Centennial Exposition, held in Nashville, Tenn., 1 May to 31 Oct. 1897; the Trans-Mississippi Exposition in Omaha, Neb., 1 June to 1 Nov. 1898; the Pan-American Exposition, in Buffalo, N. Y., from 1 May to 2 Nov. 1901; the South Carolina Inter-State and West Indian Exposition, held in Charleston, from 1 Dec. 1901 to 1 June 1902, and the World's Fair at Saint Louis, Mo., in 1904, in celebration of the Louisiana Purchase, drew 19,694,855 attendance and cost $15,000,000; the Lewis and Clark Exposition in Portland, Ore., 1 June to 15 Oct. 1905; the Jamestown Tercentenary Exposition, at Hampton Roads, Va., 26 April to 30 Nov. 1907; the Alaska-Yukon-Pacific Exposition at Seattle, Wash., 1 June to 30 Nov. 1909; the Panama-Pacific Exposition, to celebrate the opening of the Panama Canal, held at San Francisco, 20 Feb. to 4 Dec. 1915, drawing a total attendance of 18,871,957; the Panama-California Exposition, at San Diego, Cal., 1 Jan. to 31 Dec. 1915.

The Brussels Exposition in Belgium, 23 April to 14 Nov. 1910, drew 13,000,000 people; the Turin Exposition, 30 April to 31 Oct. 1911, celebrated the 50th anniversary of Italy as a kingdom. See Fairs and Shows.

EXPOSITION OF ORACLES OF THE LORD by Papias of Hierapolis, an important Greek work in five books to which the date 145–60 is assigned. It is described by Lightfoot as "among the earliest forerunners of commentaries, partly explanatory, partly illustrative, on portions of the New Testament," and is a connecting link between the Apostolic and the Apologetic ages, explaining the less understood of Christ's sayings in the light of definite Apostolic traditions concerning them. No complete copy of the work has been discovered, but it is known through the excerpts quoted by the early Christian Fathers Irenæus and Eusebius. See Papias.

EXPOSITION OF THE SACRAMENT, in the Roman Catholic ritual, the public showing of the Blessed Sacrament, accompanied with certain ceremonies, for the veneration of the faithful. Until the 16th century the practice was not general, taking place only on the feast of Corpus Christi, but within the last 300 years the practice has become general. Formerly permission of the bishop was required for an exposition. The 40-hour adoration is now a common practice in the larger Catholic centres even in the United States. The ceremony is begun and ended with a mass. Consult Maier, 'Die liturgische Behandlung des Allerheiligsten ausser dem Opfer der heiligen Messe' (Ratisbon 1860) and Raible, 'Der Tabernakel einst und jetzt' (Freiburg 1908).

EXPRESS SERVICE. A transportation system for parcels which require a safer and quicker delivery than can be had through the common freight service.

The creation and development of express service in the United States and the extension of the American express system, under American control, throughout the length and breadth of the civilized world and beyond, affords convincing proof of unique constructive and administrative genius along the lines of greatest utility to mankind.

One of the most prominent, successful and progressive express companies, now operating on every continent, began some 70 years ago with a simple service for delivery of packages between a few Eastern and Western points. To-day, the same organization has, in addition to traffic in the United States, British North America and the Latin-American republics, at least a dozen agencies with commodious quarters on leading thoroughfares in principal European cities, each fully equipped with men, wagons and horses for the most rapid and effective express service.

As part of its routine business, the company is in touch with 30 of the world's largest banking institutions and has shipping and banking correspondents at all large cities and ports in both hemispheres. As a means of comparsion with express conditions of half a century ago, when the system was merely an adjunct to the railroads, a brief outline of the work now being carried on in progressive express companies will be of interest. Since the express plan first began, in 1838, the relations of the railroads toward the express companies have, by mutual consent and to meet ever-growing demands, been reversed. The railroads, in their own interests, so far as carriage of express freight is concerned, are now adjuncts of the express companies.

The most modern American express service, when conducted on a large scale, is conducted under five divisions: (1) The transportation of merchandise; (2) transfer of money, precious stones and other valuables, securities, etc.; (3) purchasing and selling merchandise; (4) forwarding of imports and exports; (5) issuance of money orders, letters of credit, travelers' checks and the transmission of money by telegraph.

The «check» system has been so perfected that travelers in foreign countries save time and avoid delay by their use, as they are promptly recognized and cheerfully cashed or accepted by the principal hotels, steamship and sleeping-car companies, by many railroad companies and by merchants, shopkeepers and others, in settlement of accounts. They are issued in the denominations $10, $20, $50, $100 and $200.

For those traveling in the United States, Canada, Mexico, Central and South America, these checks afford the advantages of a secure and convenient means of carrying funds immediately available, combined with the avoidance of the risk of loss of money by fire or destruction and of annoyance of negotiating personal checks in places where such may be unacceptable. Being cashed by agents of the companies and by banks in all the principal cities and pleasure resorts of the United States, the Canadas, Mexico, Cuba, Central and South America, accepted in payment of fares by the principal steamship companies and many railroad companies throughout the United States and received as cash by agents and conductors of the Pullman Palace Car Company and by many hotels in settlement of account, travelers' checks are found to be a most satisfactory form of credit for use during a tour.

«Letters of Credit» now form a usual express office specialty. These documents are drawn in sterling and are available in all parts of the world. Through the Letters of Credit system, checks may be obtained from express agencies at all important points. Every foreign express correspondent has a cable address, also every express agency.

The «C. O. D.» system and bank of account collection are among the useful developments of express service. «C. O. D.» shipments are subject to collection of bill or invoice for the goods, with prompt return of proceeds made at a small charge for such service. C. O. D. shipments to foreign countries are usually made under the same system as applies to domestic points.

Several of the big express companies attend to the collection of accounts, bills, notes, drafts, etc., in any part of the commercial world. Collections in United States and Canada are effected with unusual promptness and at less risk and cost to payee than by other methods. Collections in foreign countries of drafts or deposits, or by powers of attorney, are undertaken by express companies through their own organizations in Europe or through banking correspondents. The proceeds of C. O. D.'s or collections are transferred by cable when patrons desire, with a charge for collecting, plus only the cost of cablegrams.

The transfer of money is another useful and much appreciated feature of express service. Purchases are made and commissions executed for patrons, in the quickest possible time, at places in United States, Canada and Europe, by a special department. Besides attending to orders for the purchase or sale of goods and property, including household supplies, this department pays tax bills, redeems articles pawned, collects baggage at railroad stations, secures seats at theatres, berths on sleeping cars, staterooms on steamboats, baggage and staterooms on European steamers. Rare goods or books or articles requiring exact matching, or the maker or seller of which is unknown, are obtained without annoyance or loss of time to patrons.

Imports and exports of every class and size are handled by express companies as a part of their regular business. Bills of lading, bills of exchange and all other documents of that character are prepared and attended to from first to last.

Money orders and drafts are issued by several express companies for any amount, at the posted rate of exchange, in sterling, francs, lire, lei, marks, kroner, rubles, kronen, gulden, finmarks, Turkish pounds, Mexican dollars, local dollars, pesos, rupees, yen and United States dollars on all parts of the commercial world.

The regular transportation service of express companies includes merchandise, parcels, produce, money, bonds, valuables and baggage. The routes extend over 250,000 miles of railroads in the United States alone. Shipments are frequently made in through express cars with burglar and fire-proof safes for valuables and iron express trunks for parcels, all in charge of special armed messengers. The swiftest trains are almost invariably used for express service. The aim of the companies is to cover the ground in the least time at the lowest rates. They accept entire responsibility for loss or damage. Some express companies run special express trains to facilitate business during very busy seasons. Other companies have this feature as a permanent arrangement.

Novel and highly useful features of the most modern express service are the securing of ocean passages, European railroad tickets and passports for patrons at a nominal charge. It is only necessary for those who desire to utilize express companies in this way to state their wishes — the companies do the rest rapidly, perfectly and inexpensively.

So much for the work-scope of express companies to-day as compared with that of earlier periods. Before reviewing briefly the evolutionary processes connected with express service developments it may be well to mention what has been brought about through the use of express enterprise and by such methods as are peculiar to the service.

1. The creation of wagon service, and, in connection with this, special cars and trains for transportation of express matter at high speed.

2. The creation of transportation business for carriage to and from all advantageous producing points of game, poultry, fish, oysters and fruit to localities where these commodities are not easily obtainable.

3. The creation of a novel method of selling goods for merchants by collecting on delivery the amount of invoice and returning cash to the shipper.

4. The creation of a method of collecting the proceeds of negotiable paper and assuming, for the time being, responsibility of endorsers.

5. The creation of an efficient means of safe transportation of moneys and valuables shipped by individual citizens and by firms, banks, railroads and the government. As much as $4,000,000,000 have been shipped in the United States through the express companies in a single year in this manner.

6. The creation of a vast and perfect network of money-order agencies. The present number of these agencies is estimated at 40,000.

7. The creation of improved facilities for immediate transportation of foreign goods from ports of entry to destination. Heavy bonds are demanded by the government and given for proper execution of this service.

Commonly, the express company owns its terminal facilities, and rents from the railroads the cars on which its traffic is carried. These cars are usually attached to the regular passenger trains, and the employees of the express company accompany the shipments, and attend to the delivery to local agents along the route. The contract with the railroad company secures to the express company exclusive rights to operate over that line. For the privileges conveyed the railroad company receives from 45 to 55 per cent of the gross collections on the merchandise traffic. In some instances, however, the share of the railroad reaches 60 per cent, and even 70 per cent, and in a few exceptional cases all of the express earnings in excess of the actual expenses are paid to the railroad.

Under the law the express company is a common carrier, and its rates are under the supervision and control of the Interstate Commerce Commission — as well as under the jurisdiction of State Railway Commissions in most of the States. For the purpose of fixing rates the Interstate Commerce Commission has divided the area of the United States into five great zones: (1) The country lying east of the Mississippi River and north of the Ohio River: in this zone the minimum rate per 100 pounds has been fixed at 60 cents. (2) The country lying south of the Ohio River and east of the Mississippi, together with a small section west of this river: in this zone the minimum rate per 100 pounds is 65 cents. (3) The trans-Mississippi country extending to the intermountain section: in this zone the minimum rate per 100 pounds is 70 cents. (4) The intermountain country: in this zone the minimum rate per 100 pounds is $1.05. (5) The Pacific Coast States, in which the minimum rate per 100 pounds is 70 cents. The whole territory is divided into 950 «blocks» having a uniform length of 69 miles, and widths which vary from 45 miles along the northern border to 62 miles along the southern border; in about 100 of these blocks there are no express offices. The blocks are subdivided into «squares» or sub-blocks. The blocks are designated by numbers running in series from right to left across the map, the northernmost row beginning with 101, the next row toward the south beginning with 201, the next southerly row beginning with 301, and so on. Transportation is then designated as from 403F (Portland, Oregon) to 952A (New York, N. Y.).

Express charges are based on a classification into three divisions: (1) ordinary merchandise; (2) specials; and (3) what is commonly called «Section D»— newspapers, books, printed matter, seeds and scions, etc. Bulky and fragile merchandise is charged multiples of the first-class rates; as, for example, carriages at six times first-class, and racing shells or airships at eight times the first-class rates. As is the case with freight traffic on railroads there has been established by the express companies a schedule of «commodity rates» which allows the transportation of merchandise of relatively low value at a reduction from the regular rates (which would be prohibitive) — a lower class rate on carload lots, or a first-class rate on goods which would regularly take several times that rate. On the regular tariff the limit of liability on the part of the express company is $50 on a shipment not exceeding 100 pounds in weight. If the property shipped is valued at more than this figure the rate is higher, and the higher rate must be paid to secure the full value of the package in case of loss or damage. The express company is liable only to the extent of the valuation declared by the shipper, and when the full charges have been paid or charged on that valuation.

Origin and Evolution of the Express Idea. — The «Express» idea sprang from the system of sending parcels in care of coach-drivers, by stage-coach, and from the shipping of such parcels in care of captains, by coasting vessels.

When the railroads took the place, gradually, of the coaches, much parcel traffic was performed by means of the steam cars. Then the conductors of these cars had to assume responsibility for safe-keeping. Eventually, this transfer overcrowded them with work. A division of duties naturally followed. Finally, the railroads insisted that their employees should choose between railroad and the supplemental delivery traffic.

The principal events following this decision were:

1838–39. The starting of an express company to operate in New England. Alvin Adams, who later began business for himself in New York, was with this company.

1839. «Harnden's Express» started between New York and Boston.

1840. «Adams' Express» began operations between the same points.

1840–45. Other expresses opened up business, extending service to Philadelphia, Baltimore, Washington, Buffalo, Pittsburgh, Detroit, Chicago, Cincinnati, Louisville, Saint Louis and New Orleans.

The men most active in the new field at this time were William F. Harnden, William B. Dunsmore, Henry Wells, Edward P. Sanford, Samuel M. Shoemaker, Johnston Livingston, and William G. Fargo.

Almost all of the western transportation was carried on over the Ohio, Mississippi and Missouri rivers, with their tributaries, which included canals then recently completed in several of the States to connect those rivers with the lakes.

From 1840 the construction of railroads continued uninterruptedly, express business expanding in proportion. Then came the inauguration of express «continuous lines,» enabling goods to be carried quickly between many points without transfers.

At this period people sent their letters by express as being safer than the government's mail service. In course of time the authorities at Washington protested, and finally prohibited by law the private conveyance, without United States contract, of private letters.

1848. The stampede of gold-seekers, 1848–49, to California, brought out a great extension of the express system. Money and gold-dust were transmitted direct from the coast to eastern points through the express companies, many new agencies being established for the purpose.

1854. In this year a consolidation of express interests took place. «Adams & Co.» bought up Harnden's business and worked several minor Eastern routes and secured the right to much Southern traffic.

During the same year the «American Express Co.» first established in 1841 was formally organized, to operate from the East to the Far West.

The «United States» express also came into existence in 1854 to operate along the New York and Erie Railroad and the route running westward.

1854–55. About this time «Wells, Fargo & Co.» were organized. They started the famous «Pony Express» and several stage lines Other firms competed in these special forms of rapid transportation.

1855. The «National» Express Company began operations in this year, with routes between New York, Albany, Troy, Saratoga, Whitehall, Rutland and Montreal.

1858. Wells, Fargo and Company and the Pony Express lines organized the «Overland Mail Co.,» which, until the completion of the Union Pacific Railroad, carried the whole of the United States mails between the Missouri River and the Pacific Coast. By this time the express had become a recognized necessity in the commercial and individual transactions of the country. Its lines had amplified in every direction. It had attracted to itself sufficient capital to place it on a firm financial basis. Obligations to ensure the safe and speedy transmission of merchandise, valuables and money were readily assumed. When loss or damage occurred, due reparation was promptly made. Thieves were and are, to-day, followed up by them until caught and punished.

1861. Henry S. Plant and associates organized the «Southern Express Co.,» which operated principally in the Southern States.

1861–65. Upon the breaking out of hostilities, the express was the only means of communication between soldiers in the field and their friends at home. Government securities, being purchased largely by the people, were sent by government through the express, it being officially recognized that, during that critical period, the express was much safer than the official mail service.

After the war a contract was made by the United States government with the Adams Express Company, acting for itself and other companies, to transmit all securities and moneys of the government by express.

1865–1918. This period represents a phenomenal growth of the express movement. The present organization of the great companies, each with experience of over half a century to guide it, is practically perfect in its workings, and labors continuously at high tension to keep even pace with calls which increase day by day.

The establishment of the parcel post in 1913 and its subsequent extension to larger packages had marked effect on the business of the express companies. A scaling down of rates by the Interstate Commerce Commission in 1914 seemed likely to affect the financial condition of the companies. The United States Express Company retired from business on 30 June 1914. But the later years have witnessed but little diminution of the bulk of the traffic and the profits. For valuable packages and for promptness in transmission and delivery the express company is an unequalled public utility.

The first statistics of the express business were gathered in 1890. In that year 18 companies were operating over routes which aggregated 174,060 miles. At the close of the fiscal year which ended 30 June 1916, the general business was in the hands of eight companies operating over a total of 297,139 miles: of this, 253,750 miles were on steam railroads, and 43,389 miles on other routes — electric railways, steamboats and stage routes. The mileage served was divided among the companies as follows: Wells, Fargo and Company, 107,529 miles; American, 74,280 miles; Adams, 45,153 miles; Southern, 34,765 miles; Canadian, 12,050 miles; Great Northern, 9,838 miles; Northern, 6,275 miles; and Western, 5,249 miles. The combined revenues of all the companies for the fiscal year were $173,709,411, of which sum $172,655,204 was from the ordinary domestic express transportation business. Out of these revenues the express companies paid for exclusive privileges and transportation of merchandise to the carrying companies, $87,971,137, leaving their net revenues at $85,971,136. To this was added an income of $5,497,238 from the money-order and similar non-transportation business. Out of the net revenues, $68,020,529 was paid out in expenses, and $4,527,474 for maintenance. Taxes amounted to $1,548,761, and the total net profit on the year's business was $10,560,650.

The largest carrying business was done by the American Express Company, amounting to $57,039,124; Wells, Fargo and Company were second, with $45,366,216; and Adams Express Company third, with $42,018,735. The largest net profit was made by the Southern Express Company, 9.5 per cent on the year's business; as compared with 6.3 per cent by Wells, Fargo and Company; 5.8 per cent by the American Express Company; and 5 per cent by Adams Express Company.

The latest available official statistics as to the capital, property and equipment of express companies in the United States are those for the fiscal year ended 30 June 1914. In that year the combined working capital of all the large companies amounted to $186,815,717, of which sum $75,760,300 was stock. The real estate owned was valued at $16,446,269, and the equipment at $17,547,845: the latter sum included 155 railroad cars valued at $603,787. The number of money orders, travelers' checks, letters of credit, telegraphic transfers of money, etc., was 24,209,695, representing the aggregate sum of $537,099,796.

Consult Chandler, W. C., 'The Express Service and Rates' (Chicago 1914); Interstate Commerce Commission, Document 4198, 'Express Rates, Practices, Accounts and Revenues' (Washington 1913); and the annual reports of that commission.

EXPRESSED OILS, in chemistry, oils obtainable from bodies by pressing, to distinguish them from mineral and essential oils, which last are obtained by distillation.

EXPRESSION. Our mental states, and particularly our emotions, are closely linked with certain muscular and physiological associates, which are exhibited in perhaps the greatest detail and variety by the muscles and blood vessels of the face. These associates are denominated expressions; they include not only the visible muscular and vascular phenomena which have already been indicated, but also a vast number of more or less obscure respiratory, circulatory and secretory changes. These changes and movements are at times striking in their apparent inutility, so that much labor has been spent in the effort to elucidate their reason for being. The first explanation of the expressions which possess much interest at the present day is that of Darwin. In accordance with his evolutionism, he regards many emotional expressions as rudiments of actions which have been useful to the animal either in its individual history or in the history of the race. An acquired example of this sort is the pointing of the pointer dog. Other expressions are held to be the result of tendencies opposing those which would be called into play by the opposing emotion. A dog approaching its master playfully will evince in its relaxed muscles, in its bent back, in its flexed limbs, in its wagging tail and ears laid back, actions exactly the opposite of the tense sinews, the straight back and forward pointed head, the rigid extended limbs, the uplifted tail and ears which betoken its desire to attack another dog and serve to frighten its antagonist or to facilitate its attack. The third factor in the production of emotional expression, according to Darwin, is the direct overflow of the excited nervous system into motor channels, as in the case of trembling from fear.

Wundt retains Darwin's third principle of expression, but replaces the other two by the principle of association, which causes an experience to assume the physical correlates of related experience, and the principle of the connection of movement with sense-ideas, which includes all cases of movements which indicate or symbolise the object of the emotion or its desired result. The facial expression of dislike is an example of the former of these principles; it represents an attempt to eliminate a bitter-tasting substance from those parts of the mouth where it will be tasted most. Exemples of the second principle are the stare of surprise or the clenching of the fist in anger.

James retains Darwin's first principle that many expressions are rudimentary purposeful actions, and Darwin's third principle of nervous overflow. He adds to these what is equivalent to Wundt's principle of the association of analogous sensations, and two new explanations of expression. The first of these is that not only are formerly useful emotional expressions retained as rudiments, but that their physiological consequences and concomitants undergo a like atrophy and schematisation. Besides all these, there is a class of reactions susceptible to no very simple explanation. These have been perpetuated in a more or less mechanical manner, independently of their mode of origin. Perhaps the greater number of facial expressions belong to this class.

In accordance with the James-Lange theory of the emotions, which holds that they are constituted by their expressions, James maintains that there are distinct and different expressions of every emotion. This has been denied by Cannon, who has made perhaps the most thorough physiological investigation into the actual nature of emotional expression. He finds that all intense emotions are characterized by the increased secretion of adrenalin and the liberation of the carbohydrates stored in the liver. These reactions are directly serviceable to the individual in whom they happen (1) because they cause the blood to be driven from the abdominal viscera to the muscles, heart, brain and lungs, where it is more needed in any sudden action; (2) because they release an immediately available store of energy; (3) because they cause the heart to act more vigorously and more rapidly; (4) because they increase the clotting power of the blood and decrease hæmorrhage in case of injury. The milder emotions, on the other hand, are characterized by a directly antithetical physiological process, in which the normal action of the digestive system and other abdominal vicera is helped rather than hindered. The milder emotions are associated with a preponderant activity of the cerebro-spinal nervous system, while the violent ones belong rather to the sympathetic system. See EMOTION.

EXPULSION. Usually this word is used to describe the act of depriving one or more members of a political or corporate organization, or of a society, of their right of membership. The act is frequently brought about by a vote of the organization or society after the submission of a committee report, for some violation of duty or some other offense rendering such member or members, in the opinion of their associates, unfit or unworthy.

It is provided in the Constitution of the United States that the members of the Senate or House of Representatives may expel members of their respective bodies, by a two-thirds vote, for disorderly conduct.

Corporations have the right of expulsion in cases where good order and proper control make the exercise of such power essential as, for example, (1) when the offense is not within corporate duties, but nevertheless disgraceful or infamous, or (2) when the offense is against his duty as a corporation member or officer or director, or (3) when the offense is of such a character as to infringe corporation rules and the statutes at the same time.

Before a person can be expelled from a corporation or society for disgraceful conduct outside of the jurisdiction of such organizations, a previous conviction by jury is necessary. If the offense is against or in violation of corporation or society rules or duties, a trial and conviction may be had before the authorities of the organization.

The word «expulsion» is also used to describe the ejection of people from meetings when they create a disturbance or otherwise make their presence obnoxious. Those who convene meetings have, under the law, the right to expel objectionable persons, providing they use only as much force as is necessary for the purpose.

Club members are liable to expulsion under the rules of the club to which they belong. They have an appeal to the courts for reinstatement on the ground that membership in a club is a form of property.

Non-members of any organization, if present at any meeting of such organizations, are liable to expulsion.

The Constitution of the United States provides that Federal judges cannot be expelled from their posts during good behavior. See DISFRANCHISEMENT.

EXPUNGING RESOLUTION. See CENSURE, CONGRESSIONAL.

EXTENDED ORDER. See INFANTRY; TACTICS, MILITARY.

EXTENSION, in physics and metaphysics, that property of a body by which it occupies a portion of space. Extension is an essential as well as a general property of matter, for it is impossible to form a conception of matter, however minute may be the particle, without connecting with it the idea of its having a certain bulk and occupying a certain quantity of space. Every body, however small, must have length, breadth and thickness; that is, it must possess the property of extension. Figure or form is the result of extension, for we cannot conceive that a body has length, breadth and thickness without its having some kind of figure, however irregular. In logic, extension is the extent of the application of a general term, that is, the objects collectively which are included under it; thus European is more extensive than French, Frenchman, German, etc. Matter and mind are the most extensive terms of which any definite conception can be formed. Extension is contrasted with comprehension or intension. See PHYSICS.

EXTENSION. While our spatial experiences undoubtedly contain many elements which are noted for a peculiarly spatial nature, the predominance of psychological opinion is that certain experiences possess the unanalyzable primitive attribute of extension. Though the existence of this attribute is denied by Wundt and is attributed to all sensations by James, it is generally held that it exists and is confined to cutaneous, visual and possibly to kinæsthetic sensations. The «vastness» which James mentions as pertaining to such experiences as those of hearing is in all probability a complex of various degrees of intensity, clearness and other sensory attributes.

While sight and touch are endowed with the attribute of extension, this extension is only two-dimensional. Everything which we see is stretched out over the surface of the retina, and everywhere we feel is stretched out over the surface of the skin. The transition from two to three dimensions involves an appeal to experiences which are neither visual nor cutaneous, and which, in a large measure, are not specifically spatial. In the case of vision these are (1) The difference between the images on the two retinæ. (2) The experience of strain in the muscles which make the two lines of vision converge. (3) The experience of strain in the muscles of accommodation. (4) The experience of clearness of vision when the eye is focused on an object, and of blurredness when it is not. (5) Geometrical perspective. (6) Atmospheric perspective. (7) The partial obliteration of more remote objects by nearer ones. (8) The parallax of the various objects of vision, consequent upon motion of the head or of the entire body. (9) The visual angle subtended by known objects. (10) The effect of light and shade.

In the case of touch, the muscle and joint sensations indicating the position of the various parts of the body are of the utmost importance in giving knowledge of the third dimension.

The various tactile and kinæsthetic limina of extension are discussed under LOCALITY (q.v.). At the fovea of the eye, the lower limen of visibility, or «minimum visibile,» is probably the angle subtending a single cone or from half to a whole minute of arc. Objects subtending smaller angles can be perceived, and even compared in size, but it appears that this is due to the differences in the intensity of the stimulus exert and the sensation they cause, quite apart from the extensity of the latter, and that the real area stimulated is at least an entire cone. The least distance at which two objects can be distinguished is about a minute of arc at the fovea, but near the periphery of the retina it is as great as two degrees or thereabouts. The sensation experienced when a small point of light is seen often lacks all colors. It takes a larger area of stimulus to evoke color, and often a still larger area to evoke the color which we should normally associate with the source of light.

Extension obeys Weber's law (q.v.). The least noticeable increment of a linear visual object is about one-fiftieth the length of the latter, if movement of the eye is allowed. It is considerably larger when the eye is kept at rest; but as is obvious, measurements with the eye at rest are by no means easy. The field of vision is rather irregular in outline. It extends (from a line connecting the centre of the pupil to the macula lutea) about 80 degrees outward, 65 degrees inward and 65 degrees downward. Of this, about two-thirds can be seen by both eyes. (See SPACE). Consult James W., 'Principles of Psychology' (New York 1890); Külpe, 'Outlines of Psychology' (London 1909); Titchener, E. B., 'Text-Book of Psychology' (New York 1910); Wundt, W., 'Grundzüge der physiologischen Psychologie' (Leipzig 1908–11); 'Introduction to Psychology' (London 1912).

EXTENSION TEACHING. See HOME ECONOMICS; UNIVERSITY EXTENSION.

EXTENUATING CIRCUMSTANCES, in legal practice, those circumstances, in connection either with the position of the prisoner or with the act alone, which are taken into consideration by the court in mitigation of the punishment. The previous good character of the person convicted may always be proved as a circumstance giving him some claim to leniency of punishment. Besides character, there are other circumstances, the presence of which in a case sometimes serves to mitigate the sentence, sometimes to take the act done out of the category of crime altogether. One is youth. Thus, no act done by any person under seven years of age is a crime. Defective mental power in the person convicted will always be considered in determining the severity of his sentence. Such disease of mind as prevents a man from knowing that the act he does is wrong will excuse him from the consequences of an act otherwise criminal. Drunkenness, when voluntary, is not held an extenuating circumstance, but if a man is made drunk by the fraudulent administration of drugs, and while under their influence kills another, not knowing what he does, the act is not a crime. It is a good excuse for persons charged with crime that they have been compelled by others by threats of death or great violence to do the criminal act; and the acts of a married woman in presence of her husband are presumed to be done under his coercion, and so, unless the presumption is rebutted, will be excused. Ignorance of the law is no excuse for an offense. Nor, in general, will ignorance of facts be a good excuse, though in particular circumstances it might form a valid defense. Sir James Fitzjames Stephen states, in language purposely vague, to represent the vagueness of the law, a principle under which the stress of necessity is held to excuse acts otherwise criminal: «An act which would otherwise be a crime may in some cases be excused if the person accused can show that it was done only in order to avoid consequences which could not otherwise be avoided, and which, if they had been followed, would have inflicted on him or on others whom he was bound to protect inevitable and irreparable evil, that no more was done than was reasonably necessary for that purpose, and that the evil inflicted by it was not disproportionate to the evil avoided.»

EXTINCT ANIMALS. Many animals which inhabited the earth in bygone periods have entirely disappeared, leaving not even a modern representative of their race. Others, no doubt, were known to prehistoric peoples, concerning which no record has come down to us. But within the period of recorded observations, many animals have lived and died out; various causes contributing to their extermination, not least among these being the presence of mankind. Man reconstructs the face of the earth to suit his needs: he cuts down forests, plows or burns over prairie lands, changes the course of rivers, drains the swamps and thus destroys the natural environment of many of nature's wild children. Then, too, he destroys creatures directly; he kills them for food, for clothing or for other utilitarian purposes; he hunts them because he fears them, as dangerous foes to himself or to his agricultural pursuits; he destroys them for his sport; and, finally, he draws them from feral conditions by domestication. Not only thus does man directly injure the wild creatures, but his coming, accompanied by exterminating influences, kills out certain other creatures. These, when man has destroyed their natural prey, practically die of starvation before they can adapt themselves to changed conditions. Then the domestic dogs, cats, etc., help on the work of slaughter in certain ways, by preying upon wild life.

That prehistoric man was partially responsible for the extinction of certain animals, scientists are agreed; but they are also assured that except in the cases of the horse, the camel, and perhaps the domestic dog, the extinction was due more to their inability to adapt themselves readily to the changes of climate of that remote time than to human agency. The wild progenitors of the horse and camel have not been known in historic times. That aboriginal man in Europe aided the elemental forces in their work of destruction, by hunting to death the mastodon and the great cave-hunting lions, bears and hyenas, and other huge creatures of his time, is most probable; but in America this is not at all likely to have been the case.

Since the earliest records were made, however, various species have been eliminated from the European fauna; many from that of the other continents as well. In the days when the Romans fought the Dacians, various members of the cat family were common along the Rhine-Danube frontier, among them, lions, tigers, leopards and wild-cats. They found also the great herds of wild cattle, which have entirely vanished. The ibex, too, is gone, and, but for the protective legislation, the chamois and the deer would have been exterminated as well. The bear, the beaver, the wolf and the wild boar have all gone within the last 10 centuries, from Britain, the wild-boar, which was hunted by royal cavalcades, disappearing at the close of the 17th century.

Records concerning Asiatic animals show few cases of extinction except those of a few cases of a species of sea-cow native to the Commander Islands, off the Kamchatkan coast. This animal, the rhytina, was pursued for its flesh, chiefly, and, so far as is known, the last survivor was killed in 1768. Among the same islands lived the now extinct Pallas's cormorant, a great bird also exterminated because of its edible quality.

Animals which are restricted in habitat to small islands seem liable to suffer from the inroads of man, more surely and swiftly, because they have no adequate means of escape, many such examples being furnished of birds whose power of flight is limited. Such species, especially in the Australasian and South Sea islands, have been in almost all cases destroyed; notably several representatives of the moa tribe in New Zealand, the dodo, the solitaire and certain parrots, rails and fowls. The disappearance of the gigantic edible tortoises from the islands of the Indian Ocean and from the Galapagos presents another striking instance of the extermination of animals owing to man's depredations.

Both Africa and America have presented fields for indiscriminate slaughter. In the former continent, where once there roamed great herds of antelope, countless buffaloes and elephants the slaughter has been so great since the middle of the 19th century as to leave many of these denizens of plain and forest extremely rare if not altogether extinct. The search for hides was perhaps the strongest destructive force; but the European hunters for «big game» and their followers have done much in the same direction. The mountain zebra, the quagga and various species of antelope are examples of this; while the giraffe to escape entire extinction has retired to almost inaccessible regions in the Kalahari Desert and northward.

As for America, with her long list of lost species, most people are more or less acquainted with the efforts that have been made (and sometimes with signal success), within the past few years, to save, by protective legislation, such of her native birds as are still found, and to prevent the wholesale slaughter of her wild denizens of field and forest. The best-known example of extinction is furnished by the bison (q.v.), which roamed in vast herds over the grass lands, until it was destroyed by hide-gatherers; so that now there are no wild bison except one small herd, carefully protected by law, dwelling beyond the North Saskatchewan River. In 1903 it was estimated that only 34 wild bison were left in the United States, and about 600 in Canada; and even these remnants had more or less degenerated from the superb original type of the plains. Such large animal species living under strenuous conditions and necessarily breeding slowly, urgently require protection at this time. The unremitting warfare against all the animal kind that began with the destruction of the great land turtles and moas in prehistoric times, now extends to the remotest places of the earth. With the arming of every savage tribe, and with shooting expeditions often organized on a large scale and even carried out under the guise of scientific exploration, all large animal types are to-day threatened with a speedy extinction. A typical case of natural restriction accelerated by man is that of the muskox (q.v.). Circumarctic in the Pleistocene this curious animal, yielding in quantity a strong underwool with a texture as fine as silk, is now confined solely to the treeless arctic wastes of North America and the islands to the north. Cut off by the white hunter everywhere to the south, the Eskimo rabbit-catchers of the far north, always hard on the muskox, are now killing with modern rifles the northern remnants of the original herd. The American sea-elephant and the monk-seal are also practically gone. The long lists of birds, from the great auk and the «passenger-pigeon» to the California condor, give evidence how much this continent has been depleted as to its wild life. Many fishes, too, have decreased or wholly disappeared; and there is no doubt that, but for timely protection, many species, now small, would soon follow these vanished representatives of the earlier fauna and swell the already lamentably long list of extinct animals.

On the high seas the reckless killing of larger animals goes on as relentlessly as on land. The great Cetaceans were abundant down both coasts when America was discovered. Since then the Biscayan whale, *Balaena glacialis*, the Greenland whale, *Balaena mysticetus*, and the much wilder *Balaenoptera physalis* have in turn been brought to the verge of extinction. No less the widely distributed «cachalot,» *Physeter macrocephalus;* while a lengthening list of lesser marine forms is being rapidly hunted out. The greatest destruction has taken place since the invention of the «shot harpoon» by Sven Foyn (at first a sealer), about 1870. By that time owing to wildness and scarcity the older methods of whale capture were no longer capable of returning a profit. With the introduction of power launches few forms can now escape. The monetary loss resulting from this indiscriminate slaughter has been enormous. From 1835 to the wane of the fisheries about 1872, in 19,943 American voyages some 300,000 whales were captured, yielding oil and bone worth $272,000,000. At the meeting of the American Association for the Advancement of Science in Chicago, 1907, a resolution was passed to aid «in any way practicable those measures legislative, international and local which will prevent the now imminent extermination of the great marine vertebrates, especially the cetaceans and manatees, seals, green and other turtles on the coasts of the United States, or on the high seas.» (See EXTINCTION OF SPECIES). Revised by G. R. WIELAND.

EXTINCT RACES. See MAN, PREHISTORIC RACES OF.

EXTINCTION, Tribal. Certain broader inferences as to the nature of arrested evolution and extinction of races or types, rather than the species, can be drawn only from a systematic examination of the geologic-paleontologic record. It is now clearly recognized that periodic emergence and subsidence of the continents has been going on as far back as the fossil records extend, with resultant biologic diastrophism. It is also recognized that the initial expansion or climacteric of groups mainly occurs soon after their first appearance.

As a consequence the inadaptive and unfit species are crowded out, not alone by those nearly of their own kind, but by the successful forms of other groups. Earth, sea, and air, as suggested, must tend to hold to some numerical mean of population. But the higher a group in the scale of organization, the more delicate is the adjustment to environment. Rapid adaptive change, like over-specialization, much increases liability to extinction by cataclysm. The relatively successful forms are swept away by renewed environmental disturbance if too rapid to neutralize by a further course of direct evolution, or by catagenetic change. For this reason alone the relative tenure of races as such is longest in the lower forms. The higher groups such as Limulids may show a remarkable persistence, or, like the Testudinata, a relatively long life; but «immortal types» are mainly inconspicuous like the Foraminifers. That such so often occupy abysmal oceanic or other zones least subject to change, sets a further visible boundary to the course of extinction. Still another is set by the fact that higher types also tend to persist in the zones and regions of least change — «asylums.»

The inherent organic quality which as fixedly as gravity sets and holds evolution in its course was aptly termed by Cope «bathmism.» This is the force that evolves, and also kills; but the bathmic causes of extinction are even harder to scan than are direct bathmic factors. Reduced to its simplest elements, life must be regarded as a property of matter, and plasm certainly exhibits in closed environments a high degree of stability. It may also exhibit characters little removed from those of strictly inorganic substances (Chunder-Bose); although wholly senescent or absolutely unchanging types are not theoretically indicated — that is, taking the entire duration of the rock succession as a time unit. However, when the common factors of change, bathmism (or ontogeny), environment, heredity and selection, are inactive, the organism shows little progression; and this indicates climatic change, taken in its very broadest sense, as the chief evolutionary stimulus. There is a further inference of primary value gained from the study of devolution or catagenesis as opposed to anagenesis. No races are exempt from the totality of climatic factors. The precision of the phenomena of plant succession would alone warrant this statement. It follows that while surprising modifications may take place when races decline, there is, during the anagenetic movement, a melior mean of form toward which all types strive — each according to its capacity, and in delicate adjustment to environment. Consequently the idea that lines of descent take the form of the «paleontologic tree,» and lead back continually to main primitive stems, must as a rule express too much. A far simpler course of parallel development and parallel decline is indicated. As to when, in the course of this universal parallelism, direct evolution or ascendancy reached its high noon would at present be only a subject of speculation. But from a physical point of view there must be such a point of time, probably denoted by the appearance of persistent bipolar ice caps. Morphologically the appearance of the oak in the lowermost Cretaceous may denote the evolutionary crest. Beyond are palms and grasses.

EXTINCTION OF SPECIES. The antithesis of evolution is extinction. Direct evolution leads by insensible degrees to replacement by changed descendants or to actual decadence and disappearance of types. Study of the phenomena of elimination sheds much light on the nature of life and the general evolutionary course. Also, the fossil record peculiarly lends itself to such a study, being so largely a record of extinctions.

The particular reasons for the extinction of animals and plants are not always obvious and may be very difficult of interpretation. Barring some factors to be mentioned later, the same variations of environment and most of the forces of selection considered as necessary to the production of new species are also powerful agents in the extermination of established forms. The history of many species may be compared to that of an individual. It has its birth, its growth, its decline, its death. Also, the laws of evolution show that many other species undergo modifications or changes which ultimately transgress or supplant the original assemblage of specific characters, so that a new species results by a process of mutation. Furthermore, many other species, while retaining their strictly specific characters, may be translated into different genera through modifications of their generic characters.

The continuance of a species depends upon its harmony with its environment. A perfectly stable and continuous environment is obviously a natural impossibility. The physical conditions of any region of the earth are in a state of constant change, sometimes very gradual and extending over long periods of time, sometimes sufficiently rapid to be measured by ordinary standards. The organic agencies surrounding any species are also not permanent; migrations are continually going on; the areas occupied by various organisms are being extended or reduced; periods of excessive or repressed fecundity often occur; there are times of abundance and scarcity of food, increase and diminution in the number of enemies, and so on. Any material change in the physical or organic environment must produce a readjustment among the individuals composing a species; their number may be lessened or increased, or they may be forced into conditions of life which produce changes in habits, place or abode, food, function, structure or organs.

The study of a geographic life-province shows that the organisms inhabiting it are in the state of a moving equilibrium. Minor changes in the physical conditions, as slight differences in temperature, moisture, elevations, etc., may be compensated for by a readjustment among the organisms themselves. In some cases this readjustment may be favorable to many of the species, while in others it may initiate changes which ultimately result in extinction. More profound changes in the physical environment necessarily produce a greater effect upon the animals and plants, and may result in the extermination of many and the considerable modification of others, so that a distinctly transmuted fauna and flora would occupy the region.

The forces already mentioned, though operative to a greater or less degree, are not believed to affect so immediately the equilibrium of a species or the general equilibrium of a biotic province as the invasion of new species, either by extension, migration or evolution. The struggle for existence amid gradually changing physical conditions alone is not so aggressive as the invasion of a new assemblage of plants and animals; for in the former the struggle is the normal result of the physical and organic forces of an environment in which the adjustments have been made and an equilibrium reached; in the other there is the direct addition of a new set of opposing forces, requiring the immediate readjustment of both invading and invaded organisms.

A census of the animals and plants of any region will show a great variation in the number of individuals representing the various species. Some are abundant, some common, while others are rare. Now, since the normal impulse of the individuals of each species is to increase inordinately, the fact that some are of rare occurrence shows that forces are at work tending to check their multiplication, and the relative rarity of a species, as compared with others of the same genus, is taken as an indication of approaching extinction.

The development of spines, thorns, prickles or horns on animals and plants has been shown by the writer to represent an advanced stage of evolution within the type, as well as the degree of differentiation of the organism, the ratio of its adaptability to the environment and the measure of its vital power. The study of the life histories of spinose forms shows that they are simple and inornate during their young stages, and their phylogeny shows that they were all derived from non-spinous ancestors. It is further believed that spines represent an extreme of superficial differentiation which may become fixed in ontogeny, and also that spinosity represents a limit to morphological and physiological variation. Therefore, after attaining the limit of spine differentiation, spinose organisms leave no descendants, and out of spinose types no new types are developed.

The factors as above partly noted affecting the continuance or life of a species may be divided into two classes: (1) those residing within the individuals of a species itself (intrinsic), and (2) those extraneous to the species (extrinsic). The action of either the intrinsic or extrinsic factors tends to result either in extinction or in the mutation of a species into another form. In both cases a specific type disappears or is eliminated, although only in the first instance is the species exterminated in the sense that it has left no descendants. Within the limits of this article but little more than a descriptive statement of these principal factors can be attempted. It should also be borne in mind that there is an overlapping and interdependency among the factors, causing them to react upon each other. Thus, an unfavorable environment due to change of climate may affect the food (extrinsic), which in turn may affect the vitality of the species, possibly resulting in degeneracy (intrinsic). Likewise, parasitism and disturbances in symbiotic relationships produce far-reaching, complex effects.

Intrinsic Factors of Extinction.— Under this head may be considered such factors as (1) lack of power of adaptation; (2) lack of vitality; (3) overspecialization; (4) old age (gerontic stage of evolution); (5) pathologic condition; (6) degeneracy; (7) inbreeding; (8) mutation. When a species cannot accommodate itself to changes of climate, food, etc., or in any way becomes fixed, it must perish unless it can find a suitable and constant environment — a physical impossibility. The waning vitality so plainly expressed by many species must be considered as evidence of approaching extinction. Such species usually occupy restricted geographic provinces, they are generally not numerically abundant, and their powers of reproduction are more or less retarded or repressed. An animal or plant which becomes so specialized that it can live only under certain peculiar conditions stands a chance of extermination whenever the harmony of these conditions is disturbed. Thus a plant which depends upon a certain species of insect for its fertilization will succumb if the insect seeks other food or is itself extirpated from any cause. Also, an animal depending solely upon a species of plant for food, or requiring a certain elevation or range of temperature for its continuance, will be exterminated when these are disturbed, unless it can adapt itself to the change. Specialization in general is manifested by the departure of organs or sets of organs from what is normal to the class. It results in the extreme differentiation of previous structures, or in their suppression, generally due to disuse or restraint, and also in a perversion of their original function. It has been shown by the study of many instances of extinct species preserved in the rocks of past geological periods, that each species has its period of birth, youth, maturity and old age, which often may be recognized by distinctive individual or numerical characters; so that whenever a species can be shown to possess what are known as gerontic or old-age characters it can be safely predicated that its extinction is near at hand. Pathologic characters in a species indicate the same conditions as disease in an individual, and point clearly toward extermination. Adverse conditions may affect the entire fauna and flora of a region, producing dwarfed, depauperate and pathologic species. Their history is usually very brief and their places are taken by organisms in accord with the environment. Retrogressive evolution indicates that the race has not only ceased to advance, but is declining. The history of any genetic line of species shows that whenever retrogressive characters appear and constitute dominant features the rapid decline and extinction of forms possessing them is imminent. The reduction of species numerically, and its restriction within narrow geographic limits, lead to inbreeding and the consequent impairment of virility. The small herds of European bison preserved by the Russian government in the forests of Lithuania and the Caucasus are rapidly declining, both numerically and in vitality, due almost wholly, according to recent reports, to inbreeding. Each species now existent must have had an ancestor from which it has been derived through one or more of the many processes of evolution. Some of these ancestral types may be still living, while others are extinct. Going back to past geologic times (for example, to the Carboniferous) each species was derived by evolution from ancestral species. Both the ancestors and all the species once living in the Carboniferous are now extinct. Life, however, was continued on into the next age through modified descendants of a percentage of true Carboniferous species. The rest were exterminated and left no descendants. In the first instance it is extinction by mutation and in the second extinction by extermination. It seems probable that ever since the earth has been fully tenanted with a varied life there has been a fairly constant ratio at all times between the number of species just exterminated, the number of primary species originating by the mutation of ancestral forms, the number of species arising by the special differentiation of the primary species, and the number of species adapting themselves to the changes which are dominant during the succeeding geologic period.

Extrinsic Factors.—Agencies outside of the organism itself which in their operation may cause extermination of species may be grouped under the following heads: (1) Unfavorable physical environment; (2) changes affecting the food-supply; (3) preponderance of enemies; (4) the agency of man; (5) cataclysms. A physical environment which can properly be considered unfavorable must act on the individuals of a species in an adverse manner, and necessarily the result is deleterious to its continuance. The unfavorable characters of the environment may be various, as too high or too low temperatures, excessive moisture or dryness, unsuitable altitude, storms, winds, polluted and sediment-laden waters, etc., any of which if not normal to the requirements of the organisms will have a repressive effect on their growth and multiplication. The persistence of these inhibitory conditions will generally cause the speedy extinction of the species. The life of any organism is so dependent upon the stability of the food-supply that any change which seriously affects the kind and amount of food reacts immediately upon the species which rely upon it for sustenance. The extinction of a species from any cause involves either the extinction of the organisms dependent wholly upon it, or their adaptation to new conditions. Such of these as have lost their plasticity, either from high specialization or gerontic development, will perish. The invasion of any province by a new fauna or by a new flora or by both combined will initiate a struggle for supremacy of occupation which will drive out some species, exterminate others and modify still others. In these changes the food is an important element in determining the success or failure of a species to maintain itself. On the other hand, abundance of food leads to sluggish habits and tends to produce increase in size. In this way may be explained the prevalence of many large contemporaneous species of reptiles in the Mesozoic, and of large mammals at different epochs in the Tertiary. This increase in size exposed them to increasing danger from starvation, from changes in climate and from competition with smaller active and more numerous animals. It is difficult to estimate how far in some cases the extinction of a species may have been due to the invasion of noxious bacteria or other parasitic organisms. It can only be predicated that their ravages are sometimes of such a nature that the ranks of a species are thinned out to the verge of extinction, and it is quite possible that actual extermination occasionally has occurred through this cause. Dr. Falconer believed that insect enemies have prevented the increase and extension of the elephant in India, and Darwin likewise stated that the increase of large quadrupeds in some parts of South America was prevented by insects and blood-sucking bats. It is doubtful, however, whether these agents were ever the primary and sole causes of the extinction of any large animal. The most vulnerable point of attack in the extermination of large animals is their young or their eggs. Animals of large size usually lay few eggs or bring forth very few young, and usually at infrequent intervals. The eggs or the young are easily destroyed by small creatures that would be powerless before the full-grown animals. The downfall of the great reptiles at the end of the Mesozoic has been explained by Morris as due (1) to the lack of care reptiles in general take of their eggs or young; (2) to the smaller number of eggs laid by the large species as compared with the smaller, whose continued existence in some measure is owing to their fecundity; and (3) to the progressive development of the mammals into egg-eating and predaceous placental forms of higher intelligence, at the close of the Mesozoic.

Agency of Man.— Man, being the dominant organism of the existing fauna and flora, has since his establishment had an increasing effect in the restriction and extension of contemporary plants and animals. As compared with the ordinary forces of nature, which in general work in an almost imperceptible manner when measured by human standards, man's influence has been incisive, profound and very rapid. He has been the only animal that has attempted to conquer nature in an intelligent manner for his own ends. Noxious animals and plants have been persistently attacked until many of them through reduction in numbers or by extinction have ceased to be a menace to his well-being. His inordinate greed has also led him to exterminate harmless useful animals by wholesale slaughter, chiefly because they offered little or no resistance, and also from a false notion that nature's resources are inexhaustible. (See Extinct Animals). Along with man's conscious destruction of life, he has indirectly and without purpose accomplished the extermination of species to which he was wholly indifferent. This fact necessitates the division of this topic into two parts: (1) organisms directly exterminated by man, and (2) organisms indirectly exterminated by man. It is well known that the remains of early prehistoric man are found associated with the bones of extinct animals. Among these may be mentioned the mammoth, mastodon, cave-bear, cave-hyena, sabre-toothed tiger, Irish elk, woolly rhinoceros, the giant birds of Madagascar and New Zealand,

and many others. While it is impossible to assert positively that their extermination was due wholly to man, yet undoubtedly man was one of the most powerful agents. Otherwise it is difficult to account for the disappearance of an animal from a continent that in some parts, at least, would furnish the proper climate and food for its continuous existence, from the time of primitive man down to the historic period. Even with the crudest of weapons, man with his superior cunning and intellect could successfully wage a war of extermination on such animals as the mammoth and mastodon by a method already mentioned; namely, that of killing the young.

Coming now to within the historical period, there are quite a number of well-authenticated cases of the extermination of species that can be traced directly to man as either the principal or sole agent. A few instances will be mentioned in this connection, and the list could be easily extended. Probably the best-known example of an animal exterminated by man is the dodo (q.v.), a large flightless bird related to the dove, formerly living on the island of Mauritius. Its clumsy helpless condition made it an easy prey, and the introduction of cats, dogs and pigs into the island hastened its extermination. On the islands of Rodriguez and Bourbon of the same group were found the solitaire (q.v.) and at least two other species of birds related to the dodo. They also soon disappeared after man's occupation of the islands. The great auk (q.v.) formerly ranged from the northeastern coast of the United States northward to the Arctic regions, and thence along the shores of northern Europe. It was at one time extremely abundant, but the last two individuals seen were taken near Iceland in 1844. The great northern sea-cow (q.v.) and Pallas cormorant, natives of the Commander Islands, became extinct near the close of the 18th century. The disappearance of the ure-ox from Europe is also well known. When the Bermudas were first settled in 1612, a food-bird known as the cahow bred in almost incredible numbers on several of the smaller islands. By 1616 it was almost exterminated, and a reference to the bird in 1629 states that it no longer existed. Singularly enough no remains of this bird were discovered until about 1913 when several cahow skeletons were found in the Bermudas by the naturalist, A. E. Verrill. The sickle-bill, a bird formerly used for making the royal robes in the Sandwich Islands, is now no longer living, having been hunted to extinction.

The introduction by man of various species of plants and animals into a region where they formerly did not exist has in some cases profoundly changed the native fauna and flora. A single well-authenticated illustration will suffice, though many more could be adduced. The island of Saint Helena was discovered about the year 1506, and at that time was densely covered with forests. In a little more than 300 years, fully five-sixths of the island had become entirely barren, and, as reported by Dr. Hooker, most of the existing vegetation was not indigenous but consisted of plants introduced from Europe, Africa, America and Australia. These exotic species, together with the goats, were carried to the island through the agency of man. The goats destroyed the forests by eating the young plants, and the native vegetation could not compete in the struggle with the introduced species. It is estimated that 100 peculiar and indigenous species were extirpated in this manner, and all record of them is lost except a few species preserved in the Kew herbarium.

Besides the species already exterminated by man, it should be noted that many others were once abundant and widespread that are now reduced in numbers and restricted in range. Their final extinction seems to be a matter of a few years only. Among these may be mentioned the American buffalo, the fur-seal, the beaver, the elephant and the big-tree of California.

The violent catastrophes of nature seldom affect more than a very limited area of the globe, and species that are cosmopolitan or of wide geographic distribution would not be in danger of extermination. When, however, it is realized that some species are so restricted in their province as to occupy a single valley or a small island, then it is easy to believe that at rare intervals some great and sudden upheaval, subsidence, hurricane or volcanic outbreak may have destroyed all the individuals of certain localized species, if any such were within the area of disturbance. A West Indian hurricane in 1898 is believed to have totally destroyed a species of humming-bird peculiar to the island of Saint Vincent, though it is doubtful whether the great eruption of Krakatoa in 1883 and of Mont Pelée in 1902 exterminated a single species of animal or plant.

A review of the various causes of extermination shows that on account of their diversity and often extremely slow action it is difficult in any particular case to explain the total disappearance of a species unless a detailed knowledge can be obtained of the principal agencies affecting in any way the harmony of its surroundings or its ability to maintain its numbers in its natural province.

CHARLES EMERSON BEECHER (1856–1904).
Revised by G. R. Wieland.

EXTORTION, in general, the taking from another of something through illegal compulsion. It has been defined as a technical term of the common law to be "a crime committed by an officer of the law, who under color of his office corruptly and unlawfully takes any money or thing of value that is not due to him, or more than is due, or before it is due." At common law, the offense is a misdemeanor punishable by fine and imprisonment, and subjecting the guilty person to removal from office. In the New York Penal Code extortion is defined as "the obtaining of property from another, with his consent, induced by a wrongful use of force or fear, or under cover of official right." Consult 'Encyclopædia of Pleading and Practice' (Vol. VIII, 23 vols., Northport, N. Y., 1894–1909).

EXTRA-UTERINE GESTATION. See PREGNANCY.

EXTRACT, a term to denote all that can be dissolved out of a substance by a specified menstruum, such as water, alcohol, ether, etc. In modern pharmacy the term is applied to two kinds of preparation from vegetables. One is obtained by digesting the plant in water or other solvent, and evaporating or distilling away the excess of solvent till the extracted matter is sufficiently inspissated. The other is obtained by bruising the plant in a mortar, separating the juice, warming it till the green coloring matter separates, and filtering it off. The juice is next heated till the albumen coagulates, and again filtered. The juice is now evaporated to a syrup, the green coloring matter added and well mixed, and the evaporation is thereafter continued till the required concentration is attained. Extracts must be capable of being redissolved, so as to form a solution like that from which they were derived. Extracts are used in cookery, medicine and the manufacture of perfumery.

EXTRACT OF MEAT is a soft, yellowish-brown, solid or very thick syrup, which is employed as a portable soup. It is now manufactured on the large scale by processes proposed by Liebig. Finely chopped flesh is exhausted with water, the extract is heated, when, at 133° F., albumen coagulates; afterward the blood coloring matter also separates, and when these are removed and the clear liquid is evaporated at a low temperature, the extract is ready. This substance has a characteristic odor of roast meat, has a strong taste, dissolves in water, and forms a not unpalatable soup, without, however, nutritive value. It contains no fibrin, gelatine, albumen or fat, but creatine, inosic acid and other organic bodies are present, and it is especially rich in potassic salts and in phosphoric acid. It has the invaluable property of not spoiling by keeping; and has been extensively used by travelers, explorers and by expeditionary forces. Consult 'Meat Extracts and Similar Preparations' in Bulletin 114, Bureau of Chemistry, United States Department of Agriculture.

EXTRADITION is the surrender of a criminal who has escaped from a territory under one government and taken refuge in a territory under another government. Extradition has two specific meanings in the United States. In the first place it refers to the surrender by one State government of a criminal who seeks asylum from another State of the Union in which he is held to be guilty of a heinous crime. (See EXTRADITION, INTERSTATE). In the second place, it refers to the surrender of a criminal by one nation to another. The demand for extradition made by one nation of another is a matter of international law, and implies merely the control to be exercised by one nation over the right of affording asylum claimed by another. The Jay Treaty of 19 Nov. 1794 with Great Britain specified for powers of extradition during a period of 12 years. After its expiration in 1807 no provisions for international extradition were renewed until 1842 when the Ashburton treaty of 9 August of that year with Great Britain was concluded, in which extraditable offenses were enumerated. France on 9 November was the next country to enter into a treaty of extradition with the United States, since when treaties have been arranged with some 24 foreign governments providing for the mutual extradition of criminals, fugitives from justice, charged with heinous crimes, among which are enumerated robbery, burglary, arson, rape, embezzlement and the making and circulation of counterfeit money. In order to justify a claim for extradition, it is necessary to establish that the supreme political authority in the country where the crime has been committed has made a demand for the criminal's surrender; that an inquiry has been made into the facts of the case by a judge or United States commissioner, under direction of the President, in cases where the demand comes to the United States government from abroad; that a complaint be made on oath before the judge or commissioner; that a warrant be issued by the judge or commissioner for the apprehension of the party charged; that the charge be supported by suitable evidence; that a certificate be sent to the President of the United States signed by the commissioner, and stating that the charges are sufficiently well grounded to warrant a surrender; that such certificate so satisfy the President that he grant the writ of surrender.

The British extradition act of 1870 makes special provision that no criminal shall be surrendered for a political offense, and that the criminal shall not be tried for any but the crime of which he was demanded. In 1890 an extradition treaty was ratified between Great Britain and the United States extending somewhat the list of extraditable offenses in the direction of the commercial crimes of fraud and embezzlement. Consult Moore's 'Treatise on Extradition and Interstate Rendition' (1891); Clark, E., 'Treatise upon the Law of Extradition' (1904); Biron and Chambers, 'Law Practice of Extradition' (1903); Hawley, 'Interstate Extraditions' (1890); Spear, 'Law of Extraditions, International and Interstate' (1884).

EXTRADITION, Interstate. The New England Confederation of 1643 provided for mutual extradition of criminals between the different provinces; the Articles of Confederation did likewise; and the Constitution provides for it between the States, which are independent countries in all save the functions they have resigned to the general government. But the wording of the provision, though as definite as it can safely be made, leaves room for the widest difference in construction, and the evasion of the mandate in a large share of the cases that arise. It is: "A person charged in any State with treason, felony, *or other crime,* who shall flee from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime." But must the offense be a crime by the law of the State requisitioned as well as of the State demanding? The judicial decisions say decidedly no — that "the obligation to surrender the fugitive . . . is the same as if the alleged act was a crime by the laws of both." On the other hand, the State executives, for obvious reasons, have stubbornly refused to tie their hands from exercising discretion, and have again and again acted on the theory that the offense must be a crime by the law of their own State. Thus, in the Dorr Rebellion (q.v.), Governor Cleveland of Connecticut refused to extradite Dorr — though Dorr was actually using Connecticut soil to organize an attack on Rhode Island — on the ground that the latter's treason laws were not valid outside itself; and Governor Seward of New York refused to surrender persons charged with stealing slaves (though his predecessors had done so), on the ground that it was not a crime by New York law, by common law or the common consent of civilized nations. Even the principles of decision are not agreed upon. In some States the courts hold that the courts of the State making the demand are entitled to decide as to the sufficiency of the cause; in others their own courts make their own law without regard to that of the other States. Still another question is, whether the governor has any discretion in the matter, supposing his State law to demand extradition. The answer is somewhat startling; it is, that the governor legally has no discretion, that he is imperatively bound to issue the warrant, but if he does refuse, there is no power to compel him and no punishment for the refusal. The Constitution, in other words, has issued an imperative mandate with no provision for its enforcement. Indeed, it is difficult to see how there could be any; the only remedy being a State impeachment of its executive for malfeasance, which is out of the question in such cases. The forms of interstate extradition are provided in the act of 1793. The accused must be indicted in the State where the offense is committed; if the magistrate before whom the charge is brought is satisfied of its truth, he issues a warrant for the arrest of the criminal, and a copy is forwarded to the executive of the State, who makes requisition for the fugitive's surrender on the executive of the State to which he has fled. If the latter is satisfied of the legality of the process and the sufficiency of the evidence of guilt, he is to issue a warrant for surrender; but habeas corpus proceedings may always be interposed. The expense of the proceedings and transportation is borne by the State making the demand.

EXTRAORDINARY RAY. See LIGHT.

EXTRATERRITORIALITY, in international law, the privilege granted to citizens of foreign powers of being exempt from the laws of the land of their abode and, in general, of enjoying the rights and privileges of their country of origin. In general, the right to exercise state authority and state law is limited to the territory of the state in question and a strict limitation of this view would place all persons within a state under the laws of that state, to the exclusion of all other laws. In the common intercourse between nations and peoples there have grown up certain well-recognized and clearly-defined exceptions to the exclusive exercise of state authority. These exceptions are in favor of sovereigns or heads of foreign states, their official representatives, officials performing certain duties by authority of a foreign state and with the consent of the state in which they operate, public vessels and their crews, citizens of Europe or America in certain Oriental countries, and public armed forces passing through a foreign territory. Extraterritoriality is the ordinary term used to designate the immunity from local jurisdiction enjoyed by these classes, such immunity varying according to the official character, or according to the state. Immunities are customary when granted to certain official personages in any foreign state and conventional in the case of other persons, whose treatment is regulated by agreement.

The head of a foreign state is accorded complete exemption from local jurisdiction. His person is inviolable, nor is he liable to any laws. His suite are accorded equal privileges. Should he or members of his suite abuse these privileges the remedy is to request him or them to leave the country, or to expel them in extreme cases.

Official representatives of a foreign state, such as ambassadors, are granted immunities similar to those accorded the head of their state, are inviolable, exempt from civil and criminal jurisdiction, enjoy freedom of worship, right of asylum and jurisdiction over their official personnel.

Consuls are usually granted such immunity as enables them to perform their functions, including limited exemption from taxation, exemption from military service and jury duty, inviolability of office and archives.

Public vessels, when in the territorial waters of another state, are subject only to the necessary harbor regulations for safety, anchorage, etc. The personnel are exempt from local jurisdiction while in the performance of their duties.

Citizens of European and American states have been granted special exemptions in certain Asiatic countries. Turkey after 1535 granted almost total exemption from local jurisdiction to citizens of France and other European powers. (See CAPITULATIONS, TURKISH). In other states of non-European civilization, such as China, Persia, Siam, Morocco and Japan, the same principles were applied as to Turkey. In 1899 Japan became a member in full of the family of nations when extraterritorial rights other than those of officials were abolished. In non-European countries several of the European states have developed elaborate judicial systems with jurisdiction over the persons and places exempt from local jurisdiction. (See INTERNATIONAL LAW; NATIONALITY; SOVEREIGNTY). Consult Moore, J. B., 'Digest of International Law' (1906); McLaughlin and Hart, 'Cyclopedia of American Government' (New York 1914).

EXTRAVAGANTES, two collections of decretals and constitutions of popes which were made up subsequent to 1317. Before the *Extravagantes* the Canon Law comprised the *Decretum* of Gratian (about 1150), the *Liber Sextus* (1298), the *Clementinæ* (1317) and several other official collections of papal decretals. No further collections were made by papal command, nor were any further collections officially promulgated; nevertheless, two collections were made by jurists, the *Extravagantes* of John XXII and the *Extravagantes Communes;* and these, though lacking official promulgation, came in time to be recognized as part of the Canon Law. The *Extravagantes* of John XXII consist of constitutions of that Pope only; the *E. Communes* comprise decretals of several popes between 1281 and 1484. The *Extravagantes* are so called because they wander out beyond (*extravagantur*) the limits of previous collections. Consult Bickell, J. W., 'Über die Entstehung und den Heutigen Gebrauch der Beiden. Extravagantensammlungen des Corpus Juris Canonici' (Marburg 1825).

EXTRAVAGANZA, ěks-trăv-a-găn'za, in music and the drama, a species of composition designed to produce effect by its wild irregularity and incoherence; differing from a burlesque in being an original composition and not a mere travesty. See DRAMA; STAGE.

EXTRAVASATION, in contusions and other accidents, occurs when blood vessels are ruptured by the injury and the blood finds its way into the neighboring tissues. A good illustration may be found in an ordinary bruise, when the part becomes blue in consequence of the vessels having been ruptured and blood having escaped into the tissues. Extravasation in the cranium is a most serious accident, as the pressure on the brain which is the result often produces death very rapidly. The term is, however, applied to the escape of any fluid into the tissues from the vessels or cavity containing it.

EXTREME UNCTION, a sacrament of the Roman Catholic Church for the bodily and spiritual comfort of the sick whose death is deemed to be imminent. The words of the apostle Saint James in his epistle, ch. v, 14, 15, "Is any among you sick," etc., are interpreted as relating to this sacrament. The unction therefore is administered to the sick and to those only who are in danger of death from sickness or from injury or accident; hence, it is not administered to persons under sentence of death, nor to those about to undergo a dangerous surgical operation, or the like; nor to persons bereft of their reason; neither is it administered to children who have not reached the age of reason; for the principal end of this sacrament is, not restoration of bodily health, but forgiveness of sins. "If he has committed sins they shall be forgiven him." In the passage from Saint James are found all the essential conditions of a sacrament, namely, the "outward sign," to wit: the anointing and the prayer of faith; and the "inward grace," typified by the outward sign, namely, forgiveness of sins. The divine institution of this sacrament is implied in the words of the epistle of Saint James where it recommends its use and declares its efficacy for the remission of sins. Nevertheless extreme unction is not administered save after the person has made confession of his sins and received absolution in the sacrament of penance. In administering extreme unction the priest performing the ceremony must use olive oil that has been consecrated by the bishop; he dips the thumb of his right hand into it and, by marking them with the sign of the cross, anoints the organs of the five senses, pronouncing at each anointing the words, "By this holy unction and by his most tender mercy may the Lord forgive thee whatsoever sin thou hast committed by sight" (*per visum*), or "by hearing" (*per auditum*), etc. The origin and history of extreme unction have been subjects of extended and violent discussion and, as a result, a large controversial literature has come into existence. Extreme unction was practised in the early Church, but not until the 11th century was it called a sacrament. Such it was decreed by Pope Eugenius IV at the Council of Florence (A.D. 1439). Its ceremonial, etc., was definitely established by the Council of Trent (A.D. 1551). The English Lutheran and other evangelical churches do not admit the contention that it is a sacrament. The Greek Church includes it among its sacraments; the application, however, differs in some respect from that practised by the Roman Church and is not limited to cases of supposed mortal illness. (See SACRAMENTS). Consult Buckley, T. A., transl., 'The Catechism of the Council of Trent' (London 1852); Puller, F. W., 'The Anointing of the Sick in Scripture and Tradition' (London 1904); Toner, P. J., 'Extreme Unction' (in 'The Catholic Encyclopedia,' Vol. V, New York 1909).

EXTRUSION. See VOLCANISM; and section on *Volcanism* in article on GEOLOGY.

EXUMA, ěks-oo'mä, **Great** and **Little,** two of the Bahama Islands. The Great Exuma is 30 miles long and 3 miles wide and has a good harbor. Little Exuma has also a good harbor. The two islands together with Exuma Keys have an area of about 150 square miles. Pop. 3,465.

EYAS, ī'as, in falconry (q.v.), a hawk reared from the nest.

EYB, īb, **Albrecht von,** German author: b. Franconia 1420; d. 1475. He was educated at Pavia and was made archdeacon of Würzburg at the age of 29. He afterward was in the service of Pius II. In 1472 appeared his 'Ehestandsbuch,' a work on marriage, of which there have been frequent reprints. A recent edition is that of Hermann (Berlin 1890). Consult Hermann, 'Albrecht von Eyb und die Frühzeit des deutschen Humanismus' (1893).

EYCK, īk, **Hubert van,** Flemish painter: b. Maaseyck near Liège, Belgium, 1365; d. Ghent, 18 Sept. 1426. It has been claimed that he and his brother Jan were the inventors of oil painting. For transparent and brilliant coloring and minute finish their works have never been surpassed. Their masterpieces are for the most part in Ghent, Bruges, Antwerp, Berlin, Munich and Paris. The only painting that can now certainly be assigned to Hubert is the altarpiece with folding doors, 'The Adoration of the Lamb,' begun by him and finished by Jan, and afterward presented to the cathedral of Saint Bavon, Ghent, where only the two central divisions now remain, the wings being in the gallery at Berlin, with the exception of those representing Adam and Eve, which are in the Brussels Museum. The number of authentic works painted by the brothers is 24, but the number of attributions at auctions between 1662 and 1912 is over 400. Consult Weale, 'John and Hubert Van Eyck' (1908 and 1912).

EYCK, Jan van (also called **Jan van Brugge,** or **John of Bruges**), Flemish painter:

b. Maaseyck about 1381; d. Bruges, 9 July 1441. Hubert (q.v.) gave him his first instruction in the principles of the art, and his talents were so rapidly and vigorously developed that he soon surpassed his brother. The two resided at Bruges, then much frequented by the noble and the wealthy on account of its flourishing commerce. About 1420, or soon after, they went to Ghent for a considerable time, to execute together a work which Jodocus Vydt, a Flemish noble, had engaged them to do. This is the celebrated 'Adoration of the Lamb' for the cathedral of Ghent; a painting which contains above 300 figures, and is a masterpiece. It is painted on wood, with side panels which contain the portraits of the two artists and also of their sister Margaret, who it is now believed never had a corporeal existence.

The reputation of this celebrated painter became very notable, even during his lifetime, by his great share in the introduction of oil painting; the original invention of which has been incorrectly ascribed to him by many. It was a general custom, before his time, to have for the background of the picture a flat gold ground, from which the figure stood out without perspective, as may still be seen in numberless works of earlier date. Van Eyck followed this practice in his earlier efforts, but, as he made further advances in his art, conceived the idea toward which there had been hitherto only some distant advances of giving a more natural grouping and perspective to his figures by a natural background. In this he succeeded so eminently, as many of his still remaining works prove, that he may be called in this respect the father of modern painting, since he gave the art a new turn and impulse, and laid the foundation of that high degree of improvement which it afterward attained in the brightest era of the great masters who succeeded him in the Netherlands and in Italy. In the art of painting on glass he is considered as the author of the mode of painting with colors delicately blended and yet so firmly fixed that obliteration was impossible — an object before attained only by joining together (in mosaic) several small panes of different colors. The school of which he was, in some measure, the founder, does not yield in celebrity to the best contemporary or succeeding artists, although it must be allowed to be often defective in the representation of the extremities of the human body — a fault occasioned by that excessive delicacy which prevented the study of naked forms, and of anatomy in general. On the other hand, the face, dresses, grouping, distribution of light and shade are always superior, and the color brilliant and splendid, in the works of the painter and most of his scholars. Many of his paintings are still preserved, either in churches and museums, or in private collections.

EYDE, Samuel, Norwegian chemist and inventor: b. Arendal 1866. He was educated in his native country and also in Berlin. He was a practising engineer in Norway, Sweden and Germany. With Dr. Christian Birkeland of Christiana, he set about producing fertilizers from the air (nitrogen) and limestone by electricity. After a long experimental stage the idea was reduced to practice in 1903, when they began to manufacture the fertilizer with three men and a small motor. Within the following 10 years Eyde had plants aggregating 200,000 horse power, employed 400 chemists, engineers, etc., and about 14,000 other employees. The output of his works reached 2,000 barrels of Norway saltpetre per day. In 1914 he acquired another plant with 200,000 horse power. Notodden, Saaheim and Eydehavn are now towns supported entirely by these new industries. The war of 1914 hindered development along the lines mapped out by Eyde but gave a great impetus to the manufacture of explosives to which much of the capacity of the plants was diverted as early as May 1915.

EYE, the peripheral organ of vision. It receives light-energy, transforming it into nerve stimulus, which latter is transferred to the brain by means of nerve fibres.

Anatomy and Physiology.— The human eye has in general a spherical form, with a segment of a smaller sphere superadded anteriorly. The average antero posterior diameter is 24.26 mm.; transverse diameter 23.7 mm. The eyeball of a man is slightly larger than that of a woman. The middle point of the cornea is called the anterior pole, diametrically opposite to which on the sclera is the posterior pole. The line of union between the two poles is the geometric axis. The equator of the eye is a circle equidistant from the poles. (Fig. 1).

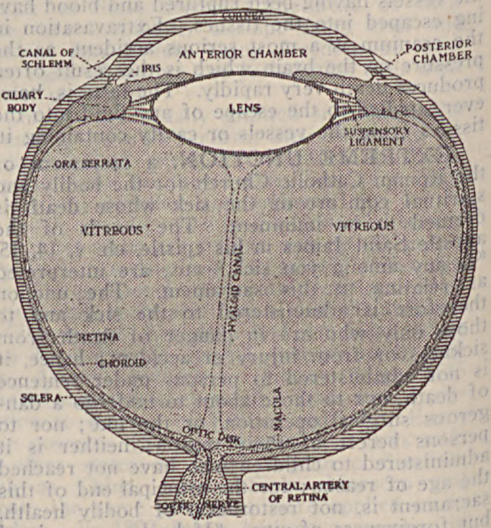

Fig. 1. — Horizontal section of the eyeball.

A shallow, circular furrow (sulcus scleræ externus), filled out with conjunctiva, separates the transparent cornea from the opaque sclera. The cornea is elliptical in shape, the horizontal diameter of 12 mm. being slightly greater than the vertical diameter. Between the margin of the cornea and the equator are the insertion lines of the recti muscles. (Fig. 2).

Posteriorly the optic nerve, with its sheaths, forms a cord, 5 mm. in diameter. Around the nerve some 20 arteries (short posterior ciliary arteries) enter the sclera to supply the chorioid. (Fig. 6). On either side of the nerve, in the horizontal meridan, the long posterior ciliary artery with its nerve pierces the sclera and enters the perichorioidal space. The posterior part of the globe has been called the arterial half, because here nearly all the nutrient blood enters the eyeball. The venous

blood leaves by way of the venae vorticosæ — two superior and two inferior, just behind the equator. (Fig. 3).

The eye is composed of a variety of tissues, and is divided into three main zones according to its development. The posterior zone, the largest, extends from the entrance of the optic nerve to the insertion lines of the recti muscles. Here begins the middle zone, the anterior limits of which are marked by the sulcus scleræ externus. The narrow anterior zone embraces cornea and iris. The cornea and sclera make up the firm, fibrous capsule of the eye, lending form and shape and protecting the delicate inner layers from injury.

There are four principal coats to the eyeball, i.e., (1) sclera and cornea (fibrous capsule); (2) chorioid (vascular layer); (3) pigment epithelium; (4) retina. (Fig. 7). In the posterior zone all four coats are easily separated from one another. In the middle zone the sclera undergoes no change, but the other three coats are transformed into one organ, the ciliary body. In the anterior zone the sclera becomes differentiated into the cornea; while elements from the chorioid, pigment epithelium and retina form the iris.

The contents of the eyeball are the vitreous, the lens and the aqueous. In that part of the eye occupied by the aqueous the iris is suspended, dividing it into an anterior and a posterior chamber. (Fig. 1).

On its inner surface the sclera is separated from the chorioid and ciliary body by the perichorioidal space. All the blood vessels and nerves supplying the uvea (that is chorioid, ciliary body and iris) pass through the sclera in canals — emissaria. The sclera is divided into three layers — episclera, containing blood vessels of its own and having more loosely arranged bundles; sclera proper, with its dense texture and the absence of vessels, and the lamina fusca, characterized by the appearance of chromatophores — branched connective tissue cells, containing pigment granules. (Fig. 7). In general, the scleral tissue is that of a tendon. In the sclera the bundles run in every direction, while in a tendon the bundles are parallel with one another. The fixed cells lie between the bundles. Posteriorly the sclera is continuous with the sheath of the optic nerve; anteriorly it goes over into the cornea. (Fig. 1). The narrow zone of transition between the cornea and sclera is spoken of as the limbus.

The cornea occupies about one-sixth of the circumference of the eyeball. (Fig. 1). It contains no blood vessels, but is nourished by lymph from loops of blood vessels adjoining it. The cornea is strongly curved, and has a weak refractive power because it is thinner in the centre than at the periphery. It has five layers (from without inward) — (1) Epithelium; (2) Bowman's Membrane; (3) Stroma; (4) Descemet's Membrane; (5) Endothelium.

The epithelium of the cornea is a stratified pavement epithelium of some five or six layers. The basal cells lying on Bowman's membrane are tall cylindrical cells. In the second layer the cells become rather cuboid in shape. From the third layer on they grow flatter, until those of the surface layer are exceedingly flat. The superficial flat cells present a perfectly smooth and even surface, giving the cornea its brilliancy and lustre. Between the epithalial cells are minute nerve endings, endowing the cornea with exquisite sensibility. Bowman's membrane contains no nuclei. It has a smooth anterior surface, while posteriorly it merges with the stroma, of which it is considered a modified part.

The Stroma — substantia propria — comprises about 90 per cent of the cornea. It is made up of connective tissue lamellæ, running

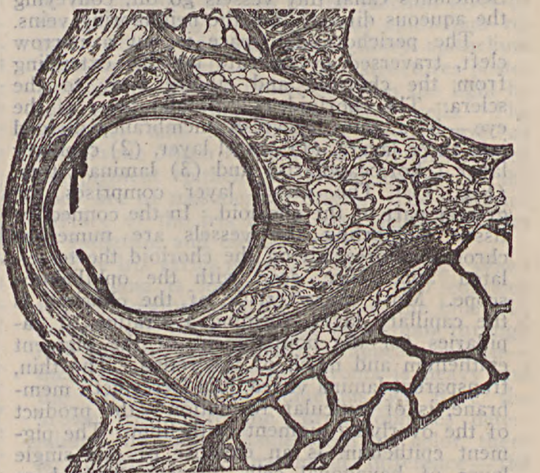

Fig. 2.

in all directions. Between the lamellæ are the fixed corneal cells. Leucocytes wander into the cornea, and into the epithelial layers, and are called wandering cells, in contradistinction to the fixed cells. The stroma is covered on its posterior surface by the homogeneous, elastic membrane of Descemet. This is a true membrane having two sharply defined contours. It is of cuticular formation, being the product of the

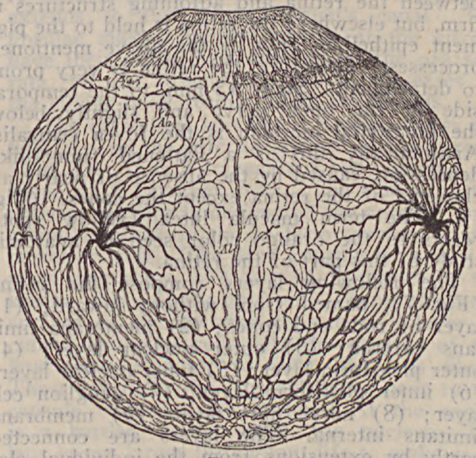

Fig. 3.

underlying endothelium. It increases in thickness with age. A single layer of endothelial cells lines not only Descemet's membrane but extends over the trabeculæ at the angle of the anterior chamber onto the anterior surface of the iris.

Opposite the external scleral furrow, on the internal surface of the fibrous coat of the eye, is another circular depression — sulcus scleræ internus. This is partly filled by a loose meshwork, triangular in shape, going over from the cornea to the iris. To the scleral side of the meshwork one finds an irregular lumen — the canal of Schlemm. (Fig. 1). This lies protected in the sclera on all sides, except its inner wall which comes in contact with the aqueous. The aqueous finds its way into the canal by a process of filtration. On the scleral side of Schlemm's canal tiny vessels go off, conveying the aqueous directly into the neighboring veins.

The perichorioidal space is but a narrow cleft, traversed by delicate lamellæ extending from the chorioid and cilliary body to the sclera. The chorioidea — vascular layer of the eye — is a thin brownish membrane, divided into three layers, (1) vessel layer, (2) capillary layer (choriocapillaris) and (3) lamina vitrea. (Fig. 7). The vessel layer comprises the greater part of the chorioid. In the connective tissue supporting the vessels are numerous chromatophores, giving the chorioid the tessellated appearance seen with the ophthalmoscope. Most characteristic of the chorioid is the capillary layer, forming a stratum of capillaries for the nourishment of the pigment epithelium and much of the retina. The thin, transparent lamina vitrea, like Descemet's membrane, is of cuticular formation — the product of the overlying pigment epithelium. The pigment epithelium is an expanse of one single layer of hexagonal cells, present everywhere from the optic nerve to the pupillary margin. Each hexagonal cell gives off a number of processes which project inward among the rods and cones.

The retina (Fig. 7), fourth of the principal layers of the eyeball, is a soft transparent membrane, extending from the optic nerve to its jagged anterior margins — the ora serratea — opposite the insertion of the recti muscles. At the anterior and posterior margins the union between the retina and adjoining structures is firm, but elsewhere the retina is held to the pigment epithelium only by the above mentioned processes. Therefore, the retina is very prone to detachment. Some 3.5 mm. to the temporal side of the optic nerve and slightly below the horizontal meridan is the fovea centralis. Anatomically this is a flattened funnel-like depression, caused by the absence of nearly all elements of the retina except the cones. (Fig. 1). The term macula lutea (yellow spot) refers to the orange color seen in anatomic study of this part of the retina.

The following layers compose the retina (Fig. 7), named from without inward; (1) layer of rods and cones; (2) membrana limitans externa; (3) outer nuclear layer; (4) outer plexiform layer; (5) inner nuclear layer; (6) inner plexiform layer; (7) ganglion cell layer; (8) nerve fibre layer; (9) membrana limitans interna. The layers are connected partly by extensions from the individual elements and partly by a supporting framework — the fibres of Mueller.

The rods are cylindrical structures; the cones flask-shape. Both possess a thinner outer half and a thicker inner part. The rods contain the visual purple, which bleaches out readily in the cadaver but regenerates in the dark when the relationship to the pigment epithelium is undisturbed. The cones are found in all parts of the retina; in the fovea there are no rods. The membrana limitans externa is a very delicate sieve-like membrane, having a perforation through which each rod and cone sends a prolongation to its own nucleus in the outer nuclear layer. The outer plexiform layer is essentially a supporting layer, composed of proximal portions of rods and cones on the one side and of fine extensions from the inner nuclear layer of the other side. The inner nuclear layer contains the nuclei of Mueller's fibres and nerve cells. There are also larger cells in this layer provided with Nissl's granules. The sixth layer, inner plexiform layer, resembles the outer plexiform layer and belongs to the supporting tissue. The ganglion cells of the next layer are multipolar and send off numerous dendritic processes into the underlying inner plexiform layer. The nerve-fibre layer, with its neuroglia cells, is composed of afferent and efferent fibres passing to and from the optic nerve. In this layer the larger vessels of the retina are lodged. Finally, the very thin glass membrane — membrana limitans interna — separates the nerve-fibre layer from the vitreous.

The retina is composed of three neurons, or nervous units, named as follows in the sense of their conduction. The rods and cones, with the outer nuclei, belong to the first neuron. This unit serves for the reception of the individual light impressions. The nerve cells among the inner nuclei form the second unit. These cells come in contact with elements from the first and third neurons. The latter is represented by the ganglion cells, the axis cylinders of which reach through the optic nerve, the chiasm, and optic tract to the brain.

The rods and cones, outer nuclear layer and part of the outer plexiform layer are nourished by the chorio-capillaris. All the other layers have a vessel system of their own in branches of the arteria centralis retinae and veins of the same name. The blood vessels are the only elements in the retina of mesodermic origin; all else is derived from the ectoderm. In the peripheral portions of many eyes one encounters peculiar cavities due to cystoid degeneration. These are the spaces of Lessing or Ivanoff's retinal oedema.

The optic nerve (second cranial) unites the retina to the brain. (Fig. 2). That portion of the nerve lying within the wall of the eye is termed bulbar or intraocular. The orbital or retrobulbar portion lies between the eyeball and the canalis opticus. Another division is into a medullated and non-medullated portion. At the lamina cribrosa the medullary sheaths cease; in consequence the nerve-fibre layer of the retina has no sheaths of Schwann, and is transparent. The cord is surrounded by three sheaths; outer, dura mater; middle arachnoid; and inner, pia mater — all continuous with the membranes of the brain. Between the dura and the pia is the intervaginal space. This is divided by the arachnoid into two cavities, an outer, subdural, and an inner, subarachnoid. Both communicate with spaces of the same name in the cranium. The pia mater closely invests the nerve substance sending numerous trabeculae among the nerve-fibres and separating them into incomplete bundles. About 20 mm. behind the eyeball the central artery and vein of the retina enter the nerve at right angles and continue in its axis to the retina.

They are surrounded by connective tissue carried in with them from the pia mater. The nervous element is composed of extremely numerous fibres estimated at half a million or more, with its own supporting framework the glial cells. The lamina cribrosa is the perforated space in the sclera for the entrance of the nerve fibres.

The circular area in the inner opening of the optic nerve canal, corresponding to the area of the lamina cribrosa, is called the disc or papilla. This space, consisting of conducting fibres only, receives no impressions, and is known as Mariotte's blind spot. The cupping or hollowing of the disc may be physiological, or pathological as in glaucoma. An arterial ring — Circle of Zinn — surrounds the optic nerve entrance into the sclera.

The ciliary body, with a breadth of 5 or 6 mm., forms a girdle around the eyeball, corresponding to the middle zone. It is divided into a flat, broader posterior part — orbiculus ciliaris — which is succeeded anteriorly by a system of some 70 processes — corona ciliaris. Between the ciliary processes are the ciliary valleys.

In the equatorial region, in the suprachorioidal lamillae smooth muscle fibres make their appearance, developing anteriorly into the ciliary muscle — or muscle of accommodation. The outer bundles of the muscle run in a meridianal direction. This is replaced inwardly by a system of circular bundles — Mueller's muscle. In myopia the meridianal bundles are more developed; in hyperopia the circular bundles.

A layer of blood vessels covers the inner surface of the muscle, being a direct continuation of the chorioid. Over this vascular layer the lamina vitrea of the chorioid and the pigment epithelium spread out. The innner surface of the ciliary body is lined by a single layer of epithelium — which represents the retina. This ciliary epithelium is everywhere very uneven, due to tiny elevations and depressions to which it clings — the whole arrangement forming the reticulum of Heinrich Mueller. Lastly, the membrana limitans interna comes forward to clothe the ciliary epithelium, just as it clothes the retina posteriorly. The ciliary epithelium secretes the aqueous and has largely to do with the nourishment of the lens and vitreous.

The iris has its insertion on the anterior surface of the ciliary body. (Fig. 1). Severed from connections it has the form of a circular plate — like the diaphragm in optical instruments. The outer margin is the ciliary border. The circular opening in the middle is the pupil. This latter is located slightly to the nasal side. The anterior surface is divided by a zig-zag line 1.5 mm. from the pupillary margin, into an inner, pupillary zone, and an outer ciliary zone. Trabeculae of connective tissue containing vessels traverse the iris, converging toward the centre, like the spokes in a wheel. Depressions between the trabeculae are termed crypts. In the ciliary zone running circularly are the contraction furrows, corresponding to the creases in the palm of the hand. The lesser arterial circle of the iris is situated under the zig-zag line. It is formed by an anastomosis from the radiating vessels which enter the root of the iris. These radiating vessels are derived from the greater arterial circle of the iris, which is located in the vascular layer of the ciliary body. (Fig. 3). The greater arterial circle is in turn derived from an anastomosis of branches from the two long posterior ciliary arteries. When the stroma is delicate the sphincter muscle may be seen as a whitish band, 1 mm. in width, immediately adjoining the pupillary margin.

The stroma bearing the blood vessels and comprising the bulk of the iris is a continuation of the chorioid, by way of the vascular layer of the ciliary body. The pigment epithelium remains the same; while the ciliary epithelium takes on pigment; so that the structures posterior to the iris are protected from the light by two strata of highly pigmented cells. The sphincter and the dilitater muscles are of ectodermic origin formed by a differentiation of the pigment epithelium. Other muscles of the body are of mesodermic origin. The posterior surface of the iris has a very delicate system of radiating and circular markings.

The iris varies greatly in individuals. When the stroma is loose and sparse and contains few chromatophores the result is the blue iris, because the black pigment epithelium through the delicate veil anteriorly appears bluish — the blue eye. When the stroma is heavy and the chromatophores numerous we have the brown iris,- here the chromatophores determining the color. Aside from the color, there is, therefore, an anatomical difference — the blue iris being the light thin one; the brown iris the heavy thick one.

Vitreus, corpus vitreum, is a transparent jelly-like substance consisting of an exceedingly delicate meshwork, the interstices of which are filled out by fluid. It has the transparency of water — may be felt in a basin of water but not seen. It contains no blood vessels, no nerves, and depends for its nourishment on adjoining structures, principally the ciliary body. A canal beginning at the front of the papilla extends to the lens — Cloquet's canal. The fibrillae making up the stroma of the vitreus have their origin just anterior to the ora serrata, on the orbicularis ciliaris. Diseases of the ciliary body readily affect the vitreus.

The crystalline lens lies in a della—fossa patellaris — on the anterior surface of the vitreus. (Fig. 1). It is a transparent body, having the shape of a biconvex lens. The centre of the anterior surface is designated the anterior pole, a similar point on the posterior surface of the posterior pole. The lens capsule is a typical glass membrane, like that of Descemet or the lamina vitrea of the chorioid. Lining the inner surface of the anterior capsule is a layer of cuboid epithelial cells. At the equator of the lens these elongate to form the lens fibres. Those layers of the lens substance next to the capsule comprise the cortex. At the centre is a harder, denser mass, the nucleus. The lens grows larger throughout life to make room for the ever-increasing number of lens fibres within its body.

Posteriorly the lens is held to the anterior border layer of the vitreus by a firm union in the shape of a ring — Ligamentum hyaloideo capsulare. The zonular fibres are the main support of the lens. They are structureless, non-nucleated fibres, clear as glass. They are firmly attached to the ciliary body on the one side and to the anterior and posterior surface of the lens, near the equator, on the other side. (Fig. 1).

The cornea and lens are the media of the eye principally concerned in the transmission of light to the retina and in the formation of images upon it. The rays of light striking the cornea are refracted to pass through the pupil. The lens now brings them to a focus on the retina, producing an inverted image. The lens by the action of the cilliary body adjusts itself to focusing objects at different distances — accommodation. When the ciliary muscle con-

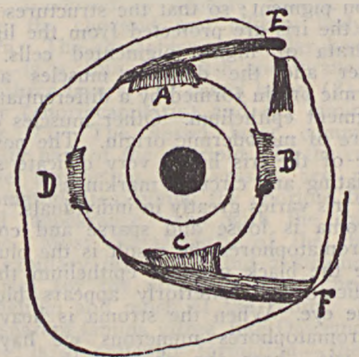

Fig. 4.

tracts the lens increases its convexity and shortens its focus, as in the act of reading. At about 45 years of age the lens, owing to the sclerosis of its fibres, begins to lose its elasticity. This is the condition of presbyopia — old sight. In myopia the focal image is formed in front of the retina, usually due to too great length of the antero-posterior diameter of the globe. In hyperopia the eyeball is too short. Astigmatism is the condition in which the rays of light do not converge to a point on the retina. It is ordinarily due to inequality of curvature of the cornea (or lens).

By the field of vision we mean the space in which one can see, while steadily gazing at a point in the direct line of vision. The field does not extend regularly in all directions. It

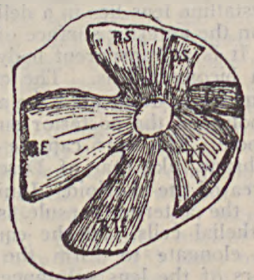

Fig. 5.

reaches farthest toward the external side, where it extends over 90°. The field for colors grows smaller in the following order: blue, red and green. Defects in the visual field are termed scotomata.

The orbit is the pyramidal cavity in which the globe lies. Its walls are formed by seven bones of the face; namely, frontal, sphenoid, ethmoid, nasal, lacrimal, superior maxillary, and palate bones. These bony walls separate the orbit from the following cavities: the intracranial, the frontal, the nasal, and the antrum of Highmore. Diseases of the sinuses frequently involve the orbit. The anterior opening of the orbit is its base. Here the walls become thickened into a strong bony rim — margin of the orbit — to defend the eyeball against injury. At the upper margin of the orbit is the supra-orbital notch for the passage of artery and nerve of the same name. At the lower margin is another notch for the infra-orbital artery and nerve.

The globe is lodged in the orbit in a cushion of fat, and is held in place by connective tissue, the ocular muscles, and the eyelids. The periosteum of the orbit extends over its margin anteriorly to form the fascia tarso-orbitalis. Surrounding the posterior two-thirds of the eyeball, the connective tissue of the orbit becomes condensed into a capsule (Tenon's capsule above mentioned). (Fig. 2).

Posteriorly the orbit has three apertures: (1) optic foramen for the optic nerve and ophthalmic artery; (2) superior orbital fissure, opening into the middle fossa of the skull and transmitting nerves for the ocular muscles and the first branch of the trigeminus; (3) the inferior orbital fissure, connecting the orbit with the temporal fossa and serving for the passage of the second branch of the trigiminal nerve. Near the apex of the orbit is the ciliary ganglion, for the supply of the ciliary muscle and iris. Abnormal protrusion of the eye is exophthalmus. Absence of the bulb is anophthalmus.

The ocular muscles are divided into extrinsic and entrinsic muscles. The latter are the dilatator and the sphincter pupillae. There are six extrinsic muscles, four recti and two obliques. The four recti muscles and the superior obliques have their origin around the margin of the optic foramen (Fig. 5), and diverge as they come forward to form the muscular funnel. The four recti muscles are attached by short tendons, to the sclera, 7 to 9 mm. from the cornea (Fig. 4).

The oblique muscles have a more complicated course. The superior oblique runs along the upper inner wall of the orbit to send its tendon through the trochlea and thence backward to its insertion in the upper half of the eyeball behind the equator. The inferior oblique arises near the lower inner margin of the orbit anteriorly and goes backward to its insertion behind the equator about in the horizontal meridian. (Fig. 4).

The muscles are innervated by three nerves. The oculo-motor nerve supplies the internal, superior and inferior recti, and the inferior oblique. Also the levator palpebrae superioris and the two interior muscles of the eye, (sphincter pupillae and ciliary muscle) are innervated by it. The external rectus has the abducens nerve; the superior oblique the trochlear. The nuclei for these various nerves lie upon the floor of the fourth ventricle.

By the action of the extrinsic muscles we use both eyes synchronously and have binocular vision. Disturbance of the muscular balance causes diplopia, because images are thrown on non-identical parts of each retina. Orthophoria is normal balance of the eye muscles. Strabismus, squint, is the condition in which only one eye fixes an object at a time. Paralysis of the ocular muscles is opththalmoplegia.

The eyelids are in origin folds of skin

(Fig. 2), which have pushed their way over the bulb to protect it. The eyebrow, supercilium, limits the upper lid, while the lower lid passes without any sharp line of demarkation into the cheek. The palpebral fissure separates the two lids. Temporarily the lids join each other at a sharp angle — external canthus. The inner canthus is of horse-shoe shape, embracing a small fleshy growth — the caruncle. The surface of the lids next to the globe is lined by a mucous membrane — palpebral conjunctiva. When the eyelids are shut the entire conjunctiva forms a closed sac. Each lid is supported by a dense connective tissue plate — the tarsus. The upper lid is elevated by the levator palpebrae superioris, which has its origin at the apex of the orbit, and is inserted into the tarsus. The orbicularis palpebrarum closes the lids. This is a flat, cutaneous muscle surrounding the palpebral fissure in the form of a circle. Drooping of the upper lid is called ptosis.

The lacrimal gland, organ secreting the tears, is situated in a depression in the upper, outer wall of the orbit, near the margin. Smaller accessory glands are located along the inner margin of the upper tarsus. The tears contain but a small amount of solids, principally sodium chloride (hence salty tears). Psychic weeping occurs only in man. After removal of the gland the eye is kept moist by the secretion of the conjunctiva. Through the puncta the tears pass into the canaliculi and thence into the lacrimal sac. The latter is contracted below the nasal duct, emptying into the inferior meatus of the nose. Only when the secretion is much increased does any great quantity of tears discharge into the nose. Inflammation of the tear sac is called dacryocystitis. At the free margin of the lids there is a narrow strip — inter-marginal space — where the conjunctiva and the skin merge. The anterior margin is rounded and has swinging from it the cillia. The posterior margin is very sharp. Just in front of it is a row of orifices, mouths of the meibomian glands — sebaceous glands — embedded in the tarsal plates. They secrete oil to prevent the tears from running onto the checks. The modified sweat glands of Moll empty into the follicles of the lashes.

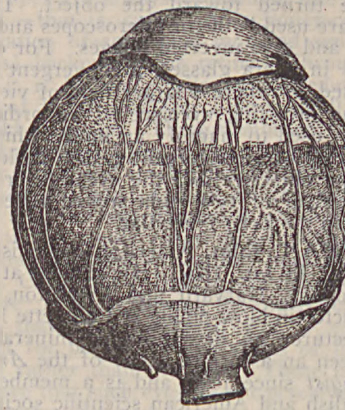

Fig. 6.

Comparative Anatomy.— In man the eye attains its highest state of development. The farther we descend the scale of animal life the simpler the eye and the more restricted its functions. In the lower orders there are eyes which distinguish between light and darkness only. In the higher orders, as the vertebrata, the eyes perceive more or less perfect images.

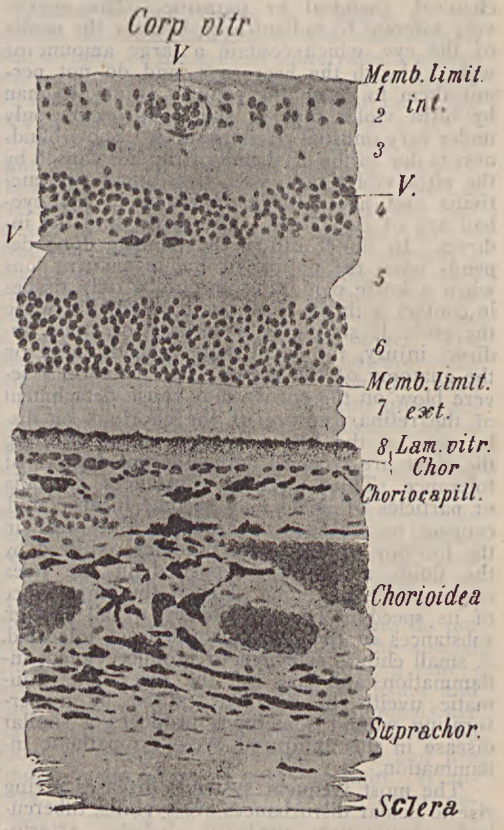

Fig. 7.

In many unicellular organizations—animals and plants, bacteria and protozoa — sensitiveness to light is a property of the body as a whole. In the more highly organized, multicellular animals certain cells have the function of responding to light, all others having lost it. The simplest form of visual organ consists of an epithelial cell connected with a nerve fibre. The cell has the power of transforming light into another form of energy that can be conducted along the nerve fibres to a central nerve organ. The eye of man is essentially reducible to an enormous number of sensory epithelial cells united to form the retina and optic nerve. These latter are the necessary parts of the eye, with the formation of which the development of the eye begins. All other parts of the eye develop later, and are designed for nutrition, protection or optical purposes. Thus the cornea and sclera protect the delicate retina, while the chorioid nourishes it. The cornea and lens refract the light and the iris, by means of its pupil, regulates the amount of light. Man and the higher animals are endowed with two eyes. Most insects and some crustaceans have two complete eyes with a number of single supernumeray ones. Some mollusks have as high as several hundred eyes which lie along their mantle.

Diseases of the Eye.— The morbid changes of the eye and its appendages vary according to the site of the disease. The causes of diseases are in a general way physical, mechanical, chemical or parasitic. The eye is very tolerant to radiant heat, because the media of the eye, which contain a large amount of water, absorb the heat rays, and do not permit them to reach the retina. Injury to man by ultra violet rays in sun light occurs only under very unusual circumstances. Snow blindness is due to the erythema of the lids caused by the ultra violet rays, with consequent conjunctivitis and photophobia. Injuries to the eyeball are of two kinds — the direct and the indirect. In direct injury the damage done depends upon the nature of the instrument — as when a knife perforates the globe only tissues in contact with the blade are harmed. But when the globe is struck by a baseball or stone, indirect injury, the harm done depends more on the anatomy of the organ. For instance, a severe blow on the cornea may cause detachment of the retina, rupture of the chorioid, or dislocation of the lens. Foreign bodies entering the globe are received with different degrees of tolerance. Thus, organic substances, as cilia or particles of wood may become incapsulated, causing no subsequent trouble. But steel in the interior of the globe becomes oxidized by the fluids and being deposited in the uvea causes siderosis bulbi. Hence the importance of its speedy removal. Copper, of all foreign substances in the globe, is the least tolerated. A small chip is sufficient to produce violent inflammation and loss of the eye. The traumatic uveitis in one eye caused by a perforating wound sometimes produces a similar disease in the uninjured eye — sympathetic inflammation.

The most frequent systemic diseases giving rise to ocular disturbances are syphilis, tuberculosis, rheumatism, nephritis, diabetes, arteriosclerosis, diseases of metabolism and chronic intoxications. Between the ages of 5 and 15, in inherited syphilis, the cornea often becomes the seat of a cellular infiltration with new-formed blood vessels — the salmon patch — interstitial keratitis. Those afflicted with the disease usually exhibit a peculiar formation of the face and head. The bridge of the nose is sunken in. The frontal eminences are very prominent. The incisor teeth are abnormally shaped (Hutchinson's teeth). Frequently there is accompanying hardness of hearing. Bad teeth are not infrequently the cause of ocular symptoms and disease — as chronic iritis,—which clears up when the mouth receives proper attention. Other foci causing ocular disorders may be located in the tonsils, accessory nasal sinuses and intestinal tract. Acromegaly exhibits many ocular manifestations, as hypertrophy of the margins of the orbit and thickening of the skin of the lids. The accompanying disease of the pituitary body causes characteristic bitemporal hemianopsia. «Graves Disease» produces exophthalmus, sometimes so great that the lids can no longer cover the eyes. Acquired syphilis is responsible for at least 25 per cent of all cases of iritis. Atrophy of the optic nerve is found above all in tabes. It usually develops in the initial stage of tabes, at a time when the ataxic symptoms are slight or absent. Another eye symptom which likewise makes its appearance early in this disease is the Argyll-Robertson pupil, in which the pupil reacts to accommodation and convergence, but not to light.

Many cases of impaired vision (amblyopia) and of blindness (amaurosis) are due to poisons introduced into the system which affect the optic nerve. Chief among these poisons are alcohol and tobacco, alone or combined. Other poisons causing amblyopia are lead, quinine and chloral. Nephritis (Brights Disease) may cause oedema of the lids and albuminuric retinitis. Diabetes produces cataract and hemorrhages in the retina.

BERNARD SAMUELS, M.D.,
New York City.

EYE STRAIN, the result of using the eyes under adverse conditions. It is occasioned frequently by a lack of balance of the ocular muscles, but may be due also to the use of improper glasses or to the need of glasses. Its effects are serious; it is a great cause of waste of nerve force, causes headache, hysteria, chorea, convulsions, etc. It is remedied by proper glasses or by surgical operation.

EYEBRIGHT, a common name for the plants of the genus *Euphrasia* (q.v.).

EYEPIECE, the lens or system of lenses in any optical instrument which lies next the eye and enables the image formed at the focus of the instrument to be observed. Its purpose is to form the image of a large field by pencils which, since they must enter the pupil of the eye, are necessarily of small divergence. Eyepieces are usually made of two lenses. The lens nearer the eye is called the eye-lens, the other the field-lens. In the Ramsden eyepiece, eye-lens and field lens are equal and planoconvex, and have the convex sides turned toward one another. In the Huygens eyepiece the field-lens has a larger focal length than the eyepiece, and the curved surface of both lenses are turned toward the object. These eyepieces are used both for microscopes and for telescopes and give inverted images. For erect images, as in opera glasses, a convergent eyepiece is used, or where a larger field of view is desired the inverting eyepiece of an ordinary telescope is used to magnify an image which is itself inverted by a convergent system of lenses between the objective and the eyepiece proper, or by a system of two right-angled reflecting prisms, as in the Zeiss binocular.

EYERMAN, John, American geologist: b. Easton, Pa., 15 Jan. 1867. He studied at Lafayette College, Harvard and Princeton, and was instructor in blow-piping at Lafayette 1888–93 and lecturer on determinative mineralogy. He has been an associate editor of the *American Geologist* since 1890, and is a member of many English and American scientific societies. He has published 'Notes on Geology and Mineralogy' (1889); 'Mineralogy of Pennsylvania' (1891); 'Course in Determinative Mineralogy' (1892); 'Bibliography of North American Vertebrate Palæontology' (1889–93); 'The Genus Temnœyon' (1895); 'A Study of Genealogy' (1898): 'General Index of the Wills of Northampton County, 1752–1802' (1898); 'The Old Grave Yards of Northampton' (1889–1901); 'Some Letters and Documents' (2 vols., 1900); 'Genealogical Studies' (1902).

EYESIGHT IN THE LOWER ANIMALS presents some curious differences from that in man and his nearer allies. The rudimentary eyes of the lower invertebrates can hardly be of more service than to convey an impression of the difference between day and night; many such come out of the ground, or rise to the surface of the sea, at night to sink again into darkness when the sun rises. In echinoderms, the starfishes for example, eyes are found that contain «many clear oval bodies imbedded in pigment, which,» Huxley says, «appear to represent the crystalline cones of a compound eye.» (See EYE). Among mollusks the organs of vision range from none at all in certain deep-sea species through all degrees of complexity to the highly developed eyes of the squid. Bivalves that creep about near shore, daily exposed between tides and subject to capture, have many eye-spots on the edge of the mantle, which are so sensitive that the shadow of a boat or of a man will cause instant closure of the shells. This is most noticeable in the scallops (Pecten), where a row of eyes glisten like jewels when the shell is open; and in the ark-shells (Arca), where a great number of eyelets are gathered in round groups forming compound eyes. In most univalve mollusks there are two eyes on the head at the base of the «feelers»; but in the land-snails the eyes are usually at their tips. Experiments show that snails are very short-sighted and see better in a subdued than in a bright light; but some seem to perceive subjects well several inches away. The eye of an octopus or a squid is very large and perfect, and as useful as that of a predatory fish which the squid resembles in habits. Among the trilobites and crustacea, also, the agile, prey-hunting species are provided with efficient compound eyes, usually set at the end of stalks that may be turned in any direction. These eyes are always compound, like those of insects — that is, consist of a honey-comb-like aggregation of somewhat modified simple eyes (facets) backed by one retina. Through each facet, it is believed, falls an exceedingly fine pencil of light, revealing a very small part of the field of vision. These combined fragments are supposed to form a sort of mosaic picture on the retina and in the insect's brain; and its field of view must depend on the number of facets and the approximation to the globular form of the whole external eye. The nature and value of insect-vision has been much discussed. Carpenter ('Insects and their Structure and Life' 1899), reviewing the controversy, concludes that the compound eye is especially adapted for perceiving sensations of light and motion rather than of form. There is reason to believe that such eyes do not perceive objects at a greater distance than six feet, while there is no doubt that they are able to appreciate color-sensations; in fact, the theory of the cross-fertilization of flowers by insects largely depends on this assumed ability. Dragon-flies, which have very large protruding eyes, of many thousand facets, often approach close to a person and hover there, evidently studying the details of the moving object (one's self) that has attracted their attention.

Vision among fishes is adapted to the medium in which they live, and varies from total atrophy of the eyes in subterranean waters and sea-abysses to eyes so large as to equal half the head. The relative size and position of the eyes in the head varies with habits in a bewildering degree, as fishes depend largely on eyesight for finding food and escaping enemies. Those that creep along the bottom, or dwell at intermediate depths, for instance, have the eyes on top of the head, looking upward; but to catalogue these adaptations would require a long essay. In most of the families the eyes are so situated in the side of the head that the vision is monocular — that is, only one eye can be used at a time for viewing an object. The species that chase fleeing prey, however, can look forward with both eyes. Such eyes need to change the focus rapidly, and this quick accommodation to distance is not effected by an alteration of the convexity of the lens, as in birds and mammals, but by a muscular change in its position with regard to the retina. The structure of the fish-eye is substantially the same as that of the human eye, with the important exception that in all deep-sea fishes only the rods (see EYE) exist in the retina, the cones being absent; the conclusion is that these fishes do not perceive color, which seems to be the special function of the cones. Furthermore, a difference in the retina of the deep-sea fishes and other creatures indicates that these animals are «day blind,» that is, have eyes adapted to the gloom in which they constantly live and are blinded by the glare of a strong light. It appears, however, that there is no regular decrease in size of the eye, from a small or normal form at the surface to the immense and well-developed eye that characterizes many of the fishes dwelling in the oceanic abysses. The pelagic fishes with largest, most efficient eyes, are those living at a depth of from one to 300 fathoms and possessing light-organs, while below that stratum both light-organs and eyes decrease in size until the deep floor of mid-ocean is reached, when again big-eyed species occur. The only present explanation of the latter fact is that those abysses are lighted by the glow of innumerable phosphorescent invertebrates, by whose light the fish seek their food.

Little need be said of the vision of amphibians and reptiles, which is probably rather dull and restricted. These animals, like many fishes, depend more on the sense of smell than on sight to guide their actions, and have, in addition, good hearing.

Vision of Birds.— The power of vision attains its highest development among birds; and nowhere but in human faces is the eye so expressively beautiful or so exquisitely adapted to its service as an optical instrument. Birds possess the keenest and most farsighted vision, and also extraordinary power of swiftly altering the focus of the eye to changing distances, accompanied by astounding acuteness in mental calculation. A swallow or nighthawk sweeping and dodging in the air is catching insects almost invisible to our eyes and excessively agile; a hawk chasing a swift-winged and quick-turning sparrow or a leaping grasshopper must have eyes that can follow exactly every movement. More wonderful is the work of an eagle or vulture, which while soaring so high in the sky that it appears to us a mere speck sees and defines an object on the ground that we could hardly notice or recognize at a hundred yards, and darts down upon it with the speed of a bullet. Imagine the farsighted keenness of this act and then the perfection of the apparatus by which the focus of the eye is changed in accord with the speed of the bird's descent, keeping the object always in clear view and stopping at precisely the right instant to escape collision. A hummingbird will dash past one's eyes like a gleam of light and halt at rest on a twig without fail. A woodcock or partridge will rush at high speed through a tangled wood and never touch a twig. These feats are evidence of the perfection of birds' eyes, especially in the faculty of accommodation to quickly varying distances.

Eyesight among mammals is relatively less important than among birds, or even to mankind, for their alert hearing and keen sense of smell give them much information. Vision among them varies with their manner of life, and is restricted to their needs in each case. The most farsighted and useful vision, probably, is that of the large grazers on the plains — deer, antelopes, giraffes, horses, etc., although they use but one eye at a time. The beasts of the chase, like owls among birds, have eyes in front, so that they observe with both at once, and of these perhaps the wolves, foxes and wild hunting dogs are best endowed. Here as elsewhere structure of the eye and quality of vision are in adaptation to the habitual needs of each kind of animal, and are always correlated with the power of locomotion.

Ernest Ingersoll.

EYETEETH, CANINE or **CUSPIDATE TEETH**, two teeth in the upper jaw, the fangs of which project in the direction of the eye. See Teeth.

EYLAU, ī'low, or **PRUSSIAN EYLAU**, Germany, town on the Pasmar River and the lake of Arschen, 22 miles south of Königsberg. It was the scene of a battle, fought 7–8 Feb. 1807, between the French under Napoleon (q.v.) on the one side and the allied Russians and Prussians on the other side. (See Ney). The French force numbered about 70,000, of whom fully 18,000 were killed. The allied forces were about the same in numbers, with a loss of more than 18,000. Pop. about 3,000.

EYLAYET. See Vilayet.

EYMERICUS, Nicolas, Spanish theologian: b. Gerona, Catalonia, 1320; d. 1399. In 1334 he entered the Order of Preachers, later attaining the rank of Grand Inquititor. He also was appointed chaplain to Pope Gregory XI and judge of heretics in 1356. He lived many years at Avignon during the reigns of Clement VI and Benedict XIII. He was the author of the severe 'Directorium Inquisitorum,' which was the standard code of procedure in the Inquisition for nearly one hundred years.

EYNARD, ā'när, **Jean Gabriel**, French banker: b. Lyons, 1775; d. 1863. For his participation in the outbreak at Lyons against the Convention, Eynard became *persona non grata* to the authorities and sought aslyum in Switzerland and later in Genoa, where he amassed a fortune. In 1810 he removed to Geneva, and was Ambassador of the Geneva Republic at the Congress of Vienna in 1815. In the following year he helped to organize the administration of Tuscany, which he represented at the Congress of Aix-la-Chapelle in 1818. He advocated the independence of Greece and for his services to this cause was made a Greek citizen. His personal contribution to the Greek revolutionaries amounted to Fcs. 700,000 ($140,000). His recommendation of Otho of Bavaria for the throne of Greece was adopted. He bequeathed his fortune of about $12,000,000 to various charitable enterprises. He wrote 'Lettres et documents officiels relatifs aux divers événements de Grèce' (1831) and 'Vie de la baronne Krüdener' (1849). Consult Rothpletz, 'Der Genfer Jean Gabriel Eynard als Philhellene' (Zürich 1900).

EYRE, âr, **Edward**, American financier: b. Dublin, Ireland, 25 March 1851. He was educated at the Jesuit school, Belvidere Place, Dr. Quinn's Preparatory School, and at Trinity College. He entered the employ of Grace Brothers and Company, becoming junior partner in 1876 and full partner four years later. He was one of the original founders of Grace House, Chile, in 1882, and became successively manager, vice-president and president of the W. R. Grace Company, New York, in 1903–06. Since 1906 he is a member of the board of managers of the London branch of W. R. Grace Company. Mr. Eyre took prominent part in bringing about a settlement of Peru's foreign debt after the war with Chile, and for some time was manager of the railroad systems handed over by Peru to its creditors. In 1892 he negotiated with Chile for the settlement of the claims against her made by the holders of the Peruvian bonds, due to the seizure by Chile of the guano deposits and other properties which formed part of the guarantee of the bonds from Peru. In 1898 Mr. Eyre, on behalf of an American syndicate, obtained from Nicaragua a concession for the construction of an interoceanic canal through that country, the project being subsequently held up by the government of the United States; the text of this concession was used later by the United States government in its treaty with Colombia and appears almost verbatim in the treaty actually concluded between the United States and the Republic of Panama. Mr. Eyre was a member of the board of directors of 'The Catholic Encyclopædia' and the council of the Westminster Catholic Federation and is an ex-president of the Marquette League. He published a criticism of Viscount Bryce's 'South America: Observations and Impressions.'

EYRE, Edward John, English explorer and colonial governor: b. Yorkshire, 5 Aug. 1815; d. Tavistock, Devonshire, 30 Nov. 1901. He went to Australia in 1833; in 1839 discovered Lake Torrens, and in 1840 explored its eastern shores and the adjacent Flinders Range. He then commenced his perilous journey along the shores of the Great Australian Bight, and reached King George's Sound, in western Australia, a distance of 1,200 miles, accompanied by a single native boy, having left Adelaide more than a year before. In 1845 he published 'Expeditions into Central Australia.' After filling several governorships he was appointed governor of Jamaica in 1862. In 1865 he was confronted with a negro rebellion which he crushed with some severity, and was recalled. On his return to England John Stuart Mill and others took measures to have him indicted for murder, but failed. In regard to this question Carlyle was one of his most strenuous defenders.

EYRE, Sir James, English jurist: b. Wells, Somersetshire, 1734; d. 1 July 1799. In 1747 he was appointed scholar of Winchester and two years later became a student of St. John's College, Oxford. In 1753 he went to London, took up the study of law, and in 1755 was called to the bar. He became counsel to the Corporation of London and recorder in 1763. In 1772 he was made Baron of the Exchequer and knighted, becoming chief Baron 15 years later. In 1793 he was made chief justice of the Court of Common Pleas. From June 1792 to Jan. 1793 he was chief commissioner of the Great Seal. Consult Foss, 'Lives of the Judges of England' (1848–64).

EYRE, Jane. See Jane Eyre.

EYRE, Jehu, colonel in the Continental army: b. 10 Jan. 1738; d. July 1781. Eyre is the name of a family that for seven centuries has been famous in the English history, the founder having come over the sea with William the Conqueror. The legendary account states that when, at the battle of Senlac, or Hastings, the Norman leader, early in the conflict, was knocked by a missile off his horse, he lay senseless on the ground, until a soldier stepped forward and loosened his visor, which gave him air. Thereupon William, reviving, asked for his benefactor and knighted him on the spot, giving him the name of "eyre"— one of the variants of a word that is older than English spelling. In the feudal division of land, this Norman Baron le Eyr — whose crest was a leg in armor, couped and spurred, he having lost a leg in the battle — was given a fief in Nottingham, the manor house being at Rampton. The family is now extinct in the peerage. The first American ancestor, George Eyre, coming from Worksop, settled at Burlington, N. J., and married in a family of Friends. He had three sons who, in the Revolution, became "Free" or "Hickory" Quakers and were prominent in the service of the Continental Congress. Coming to Philadelphia to learn shipbuilding, two of the sons married sisters, the daughters of their master.

On the fall of Fort du Quesne and its renaming after Pitt, Jehu Eyre traveled with a party of his mechanics to build boats for the transportation of the King's forces down the Ohio. While there, he learned about cannon and artillery, visiting also Braddock's Field — then piled with the bones of the slain. After the Lexington news, he organized in Philadelphia a military company, which guarded Independence Hall. Besides providing boats for the crossing of the Delaware, he took part in the battle of Trenton and Princeton; in which latter, his younger brother, Colonel Benjamin George, was aide to Washington. In 1777, Jehu was made colonel of an artillery regiment which served at Brandywine, wintered at Valley Forge, and garrisoned the forts on the Delaware, while Proctor, with his artillery, was away on Sullivan's Expedition (q.v.). He left five children. Consult Keyser, '*Pennsylvania Magazine of History and Biography*' (1879).

William Elliot Griffis.

EYRE, Wilson, American architect: b. Florence, Italy, 30 Oct. 1858. He was educated in Italy until 1869, at Newport, R. I., from 1869 to 1872, at Lenoxville, Canada, from 1872 to 1874, and at the Massachusetts Institute of Technology, where he was graduated in 1876. From 1876 to 1881 he was with James P. Sims and from 1881 to 1912 was in independent practice. In the latter year he became senior partner with John G. McIlvaine. He has built many buildings in Philadelphia and New York, also several buildings for Newcomb Memorial College, New Orleans, the Detroit Club, Detroit, etc. He is a member of the American Institute of Architects, the National Academy, etc.

EYRE LAKE, a salt lake of South Australia, lying due north of Spencer Gulf, 35 feet below sea-level, in the driest part of the continent, where the rainfall is only five inches per annum. Area 3,706 square miles. During Mesozoic times, a large gulf extended from the Gulf of Carpentaria to Lake Eyre. Its southern arm usually contains salt water; the remainder is a vast salty plain formed from alluvium carried down by the large rivers of Central Australia which now enter it only at flood time.

EYRIA (ī'rĭ-a) **PENINSULA**, on the south coast of South Australia, triangular in shape, its base being formed by the Gawler Range, while its sides are washed on the southeast by Spencer Gulf, and on the southwest by the Great Australian Bight. It is a rich wheat-growing country.

EYTELWEIN, ī'tel-vīn, **Johann Albert**, German engineer: b. Frankfort-on-the-Main, 1764; d. 1848. In 1799 he became director of the Berlin Architectural School; afterward he was placed in charge of the hydraulic operations for improving the navigation of the Niemen, Oder, Warthe and Weichsel. He also had charge of harbor improvements at Memel, Pillau and Swinemünde. He established a system of weights and measures for the kingdom of Prussia. His works include 'Praktische Anweisung zur Bauart der Faschinenwerke an Flüssen und Strömen' (2d ed., 1818); 'Vergleichung in den preussischen Staaten eingeführten Masse und Gewichte' (2d ed., 1910); 'Handbuch der Statistik fester Körper' (2d ed., 1832); 'Handbuch der Hydrostatik' (1826); 'Auflösung der höhern numerischen Gleichungen' (1837).

EYTH, Eduard, ĕd'oo-ārd īt, German poet: b. Heilbronn, Würtemberg, 2 July 1809; d. New Ulm, 28 April 1884. He was author of a volume of 'Poems' (1843); 'Pictures in Frames' (1856); and a version of the 'Odyssey.'

EYTH, Max, German agriculturist: b. Kirchheim-unter-Teck 1836; d. 1906. He came to England in 1861, and entered Fowler's agricultural implement works at Leeds as engineer that same year. In 1863–66 he served in Egypt as chief engineer to Halim Pasha, and introduced the steam plow into Egypt. He published 'Das Agrikulturwesen in Ægypten'

(1867); ‹Steam Cable Towing› (1868); ‹Das Wasser im alten und neuen Ægypten› (1891); ‹Wanderbuch eines Ingenieurs: In Briefen› (1871–84); ‹Lebendige Kräfte› (1905).

EYTINGE, ĕt′tĭng, **Rose**, American actress: b. Philadelphia, 21 Nov. 1838; d. 1911. She made her début as an amateur in Brooklyn, N. Y., 1852, and the following year played through the West in a stock company. From 1862 to 1869 she played in various theatres in New York and then went abroad with her second husband, George H. Butler, consul-general to Egypt. On her return thence in 1871 she took the rôle of Cleopatra at the Broadway Theatre, to the Antony of Frederick Warde. Among her parts were Nancy Sykes in ‹Oliver Twist›; Gervaise in ‹Drink›; Ophelia to the Hamlet of the E. L. Davenport, and Desdemona with James W. Wallack as Othello and Davenport as Iago. She created many parts, including Rose Michel, Amande Chandoce in ‹Led Astray,› and Felicia in the play of that name, but was especially successful in her playing of Shakespearean roles, notably Cleopatra, Lady Macbeth and Hermione (in the ‹Winter's Tale›). She wrote ‹It Happened This Way,› a novel; ‹Golden Chains,› a play; and has dramatized Browning's ‹Colombe's Birthday,› and Dickens' ‹Dombey and Son›; ‹David Copperfield›; ‹Oliver Twist›; ‹Tale of Two Cities.› She also published ‹Recollections,› and ‹Memories› (1905). Consult Clapp and Edgett, ‹Players of the Present› (New York 1899); and Winter, ‹The Wallet of Time› (2 vols, ib., 1913).

EYUK, ā-yook, Asia Minor, a village situated about 75 miles southwest of Amasia, and noted for its remarkable groups of ruins. The ruins are the remains of a colossal palace of the Hittites, whose capital Hatti (modern Boghaz Köi) is only a short distance from Eyuk. Consult Garstang, ‹The Land of the Hittites› (New York 1910); Olmstead, C., and Wrench, ‹Hittite Inscriptions› (1911); Winckler, ‹Nach Boghaz Köi› (1914).

EYZAGUIRRE, ā′ē-thā-gē′rā, **Agustin**, Chilean statesman: b. 1766; d. 1837. He became a prominent figure in 1810 in the movement for independence and three years later was a member of the first Junta. In October 1814 he was captured by the Spaniards at Rancagua and spent the three years following in captivity on the island of Juan Fernández. In 1823 he was chosen president of the provisional Junta and soon after vice-president of the Republic. In 1826 he became acting President, on the resignation of Freire, but was deposed in January 1827 by malcontents in the army.

EZEKIEL, one of the greater Hebrew prophets. To him is attributed one of the larger prophetic books of the Old Testament, the visions and utterances which it contains beingly expressly attributed, in the work itself, to Ezekiel. He was the son of Buzi, a priest, and was carried captive, in the time of Jehoiachin, 597 B.C., about 11 years before the destruction of Jerusalem under Zedekiah. His prophecies are mostly in chronological order, those excepted which are launched against foreign nations. The central idea in the book is that Jerusalem because of its corruptions is doomed, and that the future of the chosen people is with the exiles of Babylon. Ezekiel marks the transition from the prophetic to the priestly period. There is no direct quotation from Ezekiel in the New Testament, but there are a few allusions to his utterances, especially in the Book of the Revelation, which, in the concluding portion, distinctly looks back to the temple arrangements prophesied in the last chapter of Ezekiel. The substantial genuineness and authenticity of the prophecies of Ezekiel have not been seriously impugned either in the Jewish or Christian Church, and nearly universal suffrage has been given in favor of their canonicity.

EZEKIEL, Book of. The third of the «major,» or longer, prophetical books of the Old Testament, derives its title from its author, the priest-prophet who bore the name «God strengtheneth.» The Hebrew form is represented more closely in the English of I Chronicles xxiv, 16 by the name Jehezkel, a priest ascribed to David's time. No one else in the Old Testament bears this name, although the familiar Hezekiah, «Yah strengtheneth» or «hath strengthened» is of similar import. The author, as one of priestly rank, was among the eight or ten thousand men of standing who with their families were taken to Babylonia in the first exile, 597 B.C. The company of which he was a member formed a community, presided over by its own elders, on the banks of the river Chebar. American excavations in central Babylonia have identified this with the canal Kabaru, «the Grand Canal,» which ran near the ancient, famous seat of Babylonian worship, the city of Nippur. Here Ezekiel lived in his own house, where the elders and people resorted to him to inquire of Jehovah (viii, 1; xiv 1; xx, 1; xxxiii, 30–32). Here, too, in the ninth year of the captivity, his wife died, and he restrained himself from the usual signs of mourning that he might impress upon the people a sense of the stupefying grief that was soon to fall upon them through the destruction of Jerusalem. Ezekiel's familiarity with the worship of the temple leads to the inference that he was already an active priest before the captivity. It was not until the fifth year of the exile (592 B.C.) that he became conscious of his prophetic call through an impressive and repeated vision which assured him that he had the work of a prophet to perform as a spokesman of God (i–iii). For at least 22 years, until 570 B.C. (xxix, 17), Ezekiel continued to interpret the Divine will and purpose to his fellow exiles, using every ingenious device of symbolic action and figurative speech to arouse their curiosity and interest and make his message penetrate the «hard forehead and stiff heart.» The contents of the book of Ezekiel are arranged, for the most part, in chronological order and fall also into clearly marked topical divisions. Chapters 1–24 contain oracles from the beginning of the prophetic ministry in 592 to the investment of Jerusalem by the Babylonian armies in January 587 B.C.; these deal with the approaching fall of the city. Chapters 25–32 pronounce judgment upon Israel's ancient neighbors, Ammon, Moab, Edom, Philistia, Tyre and Egypt; they prepare the way for Israel's complete restoration to her land, freed from the old, troublesome neighbors. The oracles of this second section of the book are dated within the period of one or two years from January 586 to March 585 or 584 B.C., except for a slight addition made by the prophet in the year 570. Chapters 33–48 contain the direct prophecies of restoration with which Ezekiel sought to encourage and guide his fellow exiles after the destruction of Jerusalem in the summer of 586 B.C. The second division of these prophecies of restoration (40–48) is dated as late as 572; this contains Ezekiel's detailed plans for the restored temple and worship, and the systematic redistribution of Palestine among the 12 tribes, the Prince, the priests and the Levites. Ezekiel's early ministry was contemporary with the later years of Jeremiah. Though the two men were as different as possible in their mode of thought and expression and in some of their conceptions, they were in full agreement in their central emphasis, at this time, upon the certainty of Jerusalem's destruction and of a restoration after long years. Ezekiel, too, even more clearly than Jeremiah, enunciated the doctrine of the individual's relation to God, in contrast to the earlier prophetic message of the nation's relationship, and reiterated Jeremiah's teaching of a new spirit within guiding the life in the Divinely appointed ways. Ezekiel renews the charges of bribery, greed, oppression of the defenceless, social corruption and blood guiltiness that the 8th century prophets had made against the people; but he gives equal or greater prominence to the corrupt worship that had come flooding into Jerusalem under Manasseh and again under Jehoiakim. His references to economic crimes, which the earlier prophets had painted so vividly, seem rather general and perfunctory, while his pictures of the idolatrous practices in the temple are most concrete and vivid (viii, 5–8). To him it is clear that Jehovah must vindicate upon his people his outraged honor and holiness. As in Deuteronomy, the priestly demand for purity of worship and the prophetic demand for moral character are united; but in Ezekiel the ritual conception of holiness is much more prominent than the moral. This writer is in fact more fully the heir of priestly ideals and the precursor of the age of ritual dominance than the successor of the great ethical and spiritual prophets of the centuries immediately preceding. In the development of Levitical organization Ezekiel's ideals stand between the simpler arrangements of Josiah's time and the completed hierarchy of post-exilic Judaism. His influence upon later generations in furthering the eclipse of the prophetic religion by sacerdotalism was important. Attributable to him is the conception of a sacred nation isolated from all others, which played so large a part in rebuilding and preserving the Jewish community after the exile and which led also to the exclusive, ceremonial ideas that culminated in Pharisaic Judaism. This prophet's influence was equally determinative in shaping the Messianic hopes of later centuries. In this stream of influence issuing from his teachings we may distinguish elements which ultimately came to flow in very different channels. On the one hand, he gave the beautiful picture of the good shepherd (34). In this he described the manner in which the former rulers and strong ones had taken advantage of their position to secure the best water and pasture and wantonly to destroy and foul that which they could not themselves consume. In contrast, he promised the era of justice and safety when God himself would defend the flock and his servant David should feed and shepherd them. Again Ezekiel promised from God a new heart of flesh instead of their old stony heart; Jehovah's Spirit within them causing them to walk in all his ways (xxxvi, 22–27). On the other hand, he taught that God must re-establish and glorify his people in order to make his own name great among the nations which now despised him as a discredited deity unable to protect his own people from their enemies. He feels the mere restoration of Israel to the land inadequate in itself to vindicate the Divine power, and foresees a time when Israel, gathered out of all lands, shall dwell securely; then hordes from the north shall sweep down over the land, as the Scythians had come a generation before. Suddenly God will smite down, upon the mountains of Isarel, this awe-inspiring multitude of King Gog, there to lie as prey of the ravenous birds and beasts. Then Jehovah's holy name will be made known in the midst of Israel and the nations will know that he is the Holy One in Israel (38–39). Here holiness is evidently understood in its primary Hebrew conception of separateness or unapproachableness without the moral connotation that the great prophets had given it. This particular vision of Ezekiel seems to have been the original of that picture of the future which appeared in varied, fantastic forms in the Jewish apocalyptic writings of the two centuries before Christ and the opening years of the Christian era.

In this book the descriptions of symbolic acts and visions, characteristic of the Hebrew prophets, are carried to an extreme unknown in the earlier documents. Doubtless the elaborate, composite, human-animal figures conspicuous in the Babylonian sculptures influenced the form of Ezekiel's visions. The beings seen in the opening vision, each with the face of a man, a lion, an ox and an eagle, each with four wings, with human hands beneath the wings and feet like those of a calf, seem fairly to outdo the fantastic imaginings of the sculptors of Babylonia. An Amos or an Hosea thought in the pictures of the varied hills and skies and mountain torrents of Palestine; Ezekiel, on the endless plain by the sluggish canal, thought in pictures suggested by the most impressive work of the artists who had decorated the great temples for the ancient worship of this centre of mighty human power. With the audacity of faith belonging to the true interpreters of the unseen God, the exile prophet appropriated the symbols of the conquerors' religion to enforce his own lessons as to the power and purposes of the God of subject Israel. At times, the imagery of the prophet is more simple and becomes effective or even beautiful. An example in point is the picture of the Divine shepherd and the sheep, but generally the figures, even at their best, seem labored. A few poems are introduced here and there among the prose oracles. In the dirge sung over Tyre (xxvii, 3b–9a, 25b–36) we have one of the most elaborate and appropriate of the many poetic descriptions of the ship of state. In the lament for Egypt (xxxii, 19–32), both the conception and the form of the poem, with its varied haunting, baffling refrain are notable. In general, however, Ezekiel lacks the poetic power and the rhetorical passion of the greatest of Israel's prophets. The book shows the marks of deliberate literary composition far more even than that of Jeremiah, of whose repeated dictation to Baruch of sermons long before delivered, we are told. The books of Hosea and Isaiah suggest in their arrangement scattered memorials gathered by loyal followers. In the case of Ezekiel it seems evident that he committed his own teachings to writing with deliberation and that he finally composed the entire book in essentially its present form. The internal evidence of the book speaks of unity of plan and purpose and of date of composition. Although the text has suffered more than usual corruption through copyists' errors, the book as a whole is singularly free from later additions or expansions.

HENRY THATCHER FOWLER,
Professor of Biblical Literature and History, Brown University.

EZEKIEL, Moses Jacob, American sculptor: b. Richmond, Va., 28 Oct. 1844; d. Italy, 1920. Graduated at the Virginia Military Institute 1866, he served in the Confederate army during the last year of his course. He studied art in Richmond and Cincinnati 1866–70, and Berlin, Germany, 1870–74, where he was the first foreigner to win the Michael Beer prize (1873). While there he studied under Prof. Albert Wolf, and was admitted to the Berlin Society of Artists on the merits of his colossal bust of Washington, now in Cincinnati. Later he went to Rome, Italy, where he has chiefly resided save for frequent visits to America. He has exhibited in the chief American and European expositions. Large and small, including statues, portrait-busts, ideal groups, and relievos. His works number several hundred of which the best known are 'Cain, or the Offering Rejected,' an early ideal bust that showed considerable dramatic talent; 'Apollo and Mercury,' Berlin (1870); 'Religious Liberty,' Fairmount Park, Philadelphia (1874–76); bas-relief portraits of Farragut (1872), and Robert E. Lee (1873); 12 marble statues of artists for the Corcoran Art Museum, Washington (1880–82); marble busts of Beethoven (1884), Longfellow, and of Cardinal Hohenlohe (1888); bronze statue of Columbus in the Columbian Memorial building, Chicago, Ill.; statue of Mrs. Andrew D. White for Cornell University; bust of Lord Sherbrooke for Westminster Abbey; the fountain of Neptune for the town of Neptune, Italy; Confederate Soldiers' Monument in the National Cemetery, Arlington, Va., etc. In June 1903 the sculptor presented a bronze monument, 'Virginia Mourning Her Dead,' to the Virginia Military Institute.

EZION-GEBER, ē'zĭ-ŏn gē'bėr, a stopping-point of the Israelites on their journey from Egypt (Deut. ii, 8). It is probably indentical with the modern Ain-el-Ghudyan. It is mentioned also as the station of Solomon's fleet (I Kings, ix, 26; II Chron. viii, 17). According to Josephus it was known as Berenice in his day. Consult Musil, 'Arabia Petræa: Edom' (Vienna 1908).

EZRA, the Babylonian Hebrew priest surnamed «THE SCRIBE,» after whom, with his contemporary Nehemiah, the 'Books of Ezra and Nehemiah' of the Hebrew canon are named. By permission of King Artaxerxes I of Babylon, as leader of 1,754 of his countrymen he returned to Jerusalem 458 B.C. On the basis of a firman granted by the King, and by the appointment of the King's cup-bearer Nehemiah as governor of Judea 445 B.C., he was instrumental in purifying and re-establishing, under sanction of the law, the Jewish religion in Jerusalem, where it had become deeply corrupted. The drastic steps associated with the reforms of Ezra and Nehemiah were not acceptable everywhere and led to endless discussion, especially was this the case when a great number of the Jews were compelled to divorce the foreign wives they had married. The most famous of the early scribes, Ezra is referred to as «the scribe of the commandments of the Lord and of his statutes to Israel» (Ezra vii, 2) and as «a ready scribe in the law of Moses which the Lord, the God of Israel had given.» He was the first of the Sopherim or scribes who handed on the charge to the «Men of the Great Synagogue,» a body or succession of teachers which he founded and now represented by the rabbis. To Ezra is credited the introduction of Assyrian script, or the adoption of Aramaic handwriting in Judea in the 5th century B.C. In 444 B.C. Nehemiah describes Ezra as a scribe reading the 'Book of the Law' to the congregation of the children of Israel gathered on the plateau near the Water Gate, and the Levite priests reciting the 'Targums' or Aramaic paraphrases to enable the people to understand the laws. The reading occupied two days and was productive of impressive results. The important services rendered by Ezra to his countrymen on that occasion, and also in arranging and practically settling the canon of Scripture are especially acknowledged by the Hebrews, and he is even regarded by many as the second founder of the nation. Malachi, signifying «My Messenger,» the name assigned to the last book of the Old Testament, is identified by some authorities with Ezra. Some writers assert that Ezra returned to Babylon and died there at the age of 120 years. Josephus states that he died in Jerusalem and was buried there with great pomp. On the Shatt el-Arab near Korna the tomb of Ezra is venerated as a shrine. Consult Herford, 'Pharisaism' (New York 1912); Torrey, 'Ezra Studies' (Chicago 1910).

EZRA, Book of. For the discussion of the original union of Ezra with Nehemiah and Chronicles and for the date of the complete work, see CHRONICLES.

The book of Ezra covers the history from 537 B.C. to 458, although some would substitute another date for the latter one. Most of this period is described very briefly, with extended sections of which nothing is said; it is the narrative of the events of the year 458 that is most extended, chapters vii–x.

Chapters i–vi are claimed to rest upon certain official documents which were partly in Hebrew and much more largely in Aramaic. Whether this claim is true is a matter on which there is difference of opinion; it is probable that it is in large measure true, but perhaps not altogether. The remainder of the book, chapters vii–x, is evidently based upon memoirs of Ezra. These memoirs as they now appear are partly in the first person, having been quoted by the writer verbatim or with slight changes, and partly in the third person, having been considerably rewritten. Ezra vii, 27–ix, 15 are of the former kind; Ezra vii, 1–26; 10, of the latter kind.

The question of the historic city of Ezra and Nehemiah is one of much difficulty. The compiler seems to have had access to more accurate records for this period than for the earlier time covered in the books of Chronicles. Nevertheless, there are many unhistorical details in these books, and many that are doubtful. Ezra iv, 7–24a is out of its chronological order. The question of the proper order is one on which there is much difference of opinion.

The register of returning exiles in Ezra ii is substantially identical with that in Nehemiah vii, 6–73a, where it is put chronologically at a later point. The connection in Nehemiah is probably more nearly the original one, and the connection in Ezra is unhistorical.

The so-called Septuagint translation of Ezra and Nehemiah, which some have considered to be actually the version of Theodotion, is called 2 Esdras, Esdras being the equivalent of Ezra. 1 Esdras is a so-called apocryphal book, now known only in Greek. It contains the book of Ezra, practically entire, with small portions of 2 Chronicles and of Nehemiah. It is now generally accepted that the book of 1 Esdras is a variant recension of these portions, translated from a Hebrew and Aramaic original. There is considerable chronological rearrangement of the material, and the order of 1 Esdras is now considered to be on the whole superior. 1 Esdras iii, 1–v, 6 is the only portion which has no parallel in these other books.

W., 'The Books of Ezra and Nehemiah' ('International Critical Commentary,' New York 1913); Davies, T. W., 'Ezra Nehemiah, and Esther' ('Century Bible,' Edinburgh no date); Ryle, H. E., 'Ezra and Nehemiah' (Cambridge Bible, Cambridge 1897). See also the list under CHRONICLES.

GEORGE R. BERRY,
Professor of Old Testament Interpretation and Semitic Languages, Colgate University.

EZRA CHURCH (Atlanta), **Battle of.** On 20 July 1864 the Confederate army under General Hood was defeated at Peach Tree Creek, and driven into the inner defenses of Atlanta. On the 22d Hood attacked the Army of the Tennessee, and was again defeated, and General Sherman began the investment of Atlanta. He began to force Hood from Atlanta by moving upon his communications leading south from the city. The Army of the Tennessee was transferred from the extreme left of the investing line to the right, near Ezra Church, and Hood took measures to check its further extension and drive it back. On the night of the 27th he marched out of Atlanta with the greater part of his force, and on the 28th Gen. J. C. Brown's division was ordered to attack Logan's corps, then advancing on the right, and drive it back to and beyond Ezra Church. Brown drove in Logan's skirmishers, followed them 500 to 600 yards, and struck Logan's right, carried it at some points, but was quickly repulsed with great slaughter. He made a second attempt with no success and fell back. He had lost 694 killed and wounded and 113 missing. During Brown's attack four regiments from Dodge's and Blair's corps extended Logan's right, and took part in the action. Clayton's division attacked on Brown's right, but not until after Brown's first repulse, and by a misunderstanding his three brigades made isolated attacks upon Harrow's division, all of which were repulsed with great loss, some of the regiments losing 50 per cent. Walthall had led out his division while Brown and Clayton were engaged, and at 2 P.M., after they had been withdrawn, he was ordered to attack over the ground of Brown's fight. Walthall made several persistent efforts, but failed, although some parts of his force got within 50 yards of Logan's line. After more than an hour's severe fighting, in which he reports the loss of 152 officers and nearly 1,000 men, he fell back. At night Hood withdrew his troops to the works around Atlanta. The Federals in this battle numbered about 13,000 men; the Confederates about 18,000. The Union loss was 559 killed and wounded, 73 missing. The aggregate Confederate losses were apparently about 2,636 killed and wounded, and 200 missing. The estimates of Generals Sherman, Howard and Logan that the Confederate loss was from 5,000 to 7,000 are excessive. Consult 'Official Records,' (Vol. XXXVIII); Cox, 'Atlanta'; Sherman, 'Personal Memoirs' (Vol. II); The Century Company's 'Battles of the Civil War,' (Vol. IV).

E. A. CARMAN.

F

F the sixth letter of the English and Latin alphabets and all alphabets derived from the Latin. Its sound, technically called a "labiodental voiceless spirant," is produced by bringing the lower lip into loose contact with the upper teeth, the vocal cords being inactive. The character F, though it does not appear in the Greek alphabet of the classic period, had a place in the earlier Greek alphabet, and is believed to have there represented the sound of *v* or of *w*. It is called by Greek grammarians, digamma or double-gamma, being formed of two gammas (g hard, Γ) written one above the other (F). From the Greek it came into Latin and, finally, was used to express the sound which it has for us. That the sound of F in Latin was the same as in English, we know from what Quintilian says of the mode of uttering it. The Greek letter Φ (phi) represented in Latin and English by *ph*, appears to have been very different in sound from the F of the Latins; and that in the pronunciation of F Greeks found great difficulty is known on the authority of Cicero; their difficulty was like that which people of other speech than ours find in pronouncing th in then, this, and in thin, think. A like difficulty in pronunciation of the F of Latin must have presented itself to the inhabitants of the Spanish Peninsula, if not in the time of the Roman domination, then after; else the initial F of words from the Latin would not have been so generally changed by them into a mere breathing, represented by the letter h. Examples Lat. *faba* (bean), Span. *haba; fabulari* (to talk), *hablar; facere* (to make), *hacer*. In other languages, whether derived from one another or springing independently from a common original stem, as German, Anglo-Saxon, Greek, Latin, Celtic, etc., we see a different interchange as between F and P; thus to the English word fish answers the Latin *pisc* (*piscis*); to Eng. fire the Gr. *pyr*; to Eng. plow the Ger. *pflug*. In the local dialect of the English county of Somerset, F usually becomes V: fair becomes vair, friar vrier, five vive. As the Latin alphabet had but one character, V, to represent both the vowel U and the consonant V (or W) the Emperor Claudius ordered that in public inscriptions and state documents this consonant V should be represented by the F inverted, Ⅎ, and hence in monuments of that reign we find AMPLIAℲIT, TERMINAℲIT, OCTAℲIA, etc., for Ampliavit, Terminavit, Octavia, etc. The letter F in physics is a contraction for Fahrenheit.

F. F. V's (First Families of Virginia), a jocular term applied in the North, before and during the war, to the Southern aristocracy in general.

FA, fä, the name given by Guido to the fourth note of the natural diatonic scale of C, that is, the subdominant. In the major scale of C this tone is F.

FABELL, Peter, the chief character in 'The Merry Devil of Edmonton,' who sold his soul to Satan, and is said to have been derived from a real personage who died and was buried at Edmonton, Middlesex, in the reign of Henry VII (1485–1509).

FABENS, Joseph Warren, American miscellaneous writer: b. Salem, Mass., 23 July 1821; d. New York, 13 March 1875. Among his works are 'The Camel Hunt,' a narrative of personal adventure; 'Facts about Santo Domingo'; and 'The Last Cigar,' a book of poems.

FABER, fā'bėr, **Frederick William,** English theologian and hymn writer: b. Calverley, Yorkshire, 28 June 1814; d. Brompton, London, 26 Sept. 1863. He was a nephew of G. S. Faber (q.v.). He was educated at Balliol College, Oxford, where he came under the influence of John Henry Newman (q.v.), whom in 1845 he followed into the Roman Catholic Church. On becoming a Roman Catholic he founded a small community called Brothers of the Will of God, who three years later joined the oratory of Saint Philip Neri. He afterward established a branch of this oratory at Brompton, with which he was connected till his death. His prose writings are numerous, but it is by his beautiful hymns that he is best known. Of these 'Pilgrims of the Night' and 'The Land Beyond the Sea' are the most noted. See 'Life and Letters,' edited by Bowden (1869).

FABER, fä'bėr, **Frederik,** Danish zoölogist: b. Odense, Fünen, 1795; d. 1828. He was graduated in law in 1818, but had also given great attention to zoölogy and at 20 published 'Indledning til Dyrelæren til Brug ved den Naturhistoriske Undervisning.' He traveled in Iceland in 1819–21, and published the results of his investigations in 'Ueber das Leben der hochnordischen Vögel Islands' (1826), a work still of value; 'Prodromus isländischer Ornithologie' (1822); 'Naturgeschichte der Fische Islands' (1829), and articles in *Isis* and in *Tidsskrif for Naturvidenskaberne*. Several zoological species are named from Faber.

FABER, George Stanley, English theologian: b. Calverley, near Bradford, Yorkshire, 25 Oct. 1773; d. near Durham, 27 Jan. 1854. Having been Bampton lecturer in 1801, he shortly after published his lectures under the title of 'Horæ Mosaicæ.' From the first he adopted evangelical views, and soon began to aid them by his pen, particularly by 'The Doctrine of Regeneration in the Case of Infant

Baptism.' He was vicar successively of Stockton-upon-Tees, Redmarshall and Longnewton, holding the last appointment 21 years, when he resigned it to become master of Sherburn Hospital. His principal writings, in addition to those already mentioned, are 'A Dissertation on the Prophecies,' the most popular of all his works, and the 'Difficulties of Romanism,' of which a third edition appeared in 1853.

FABER, or FABRI, Jacques Lefèvre d'Estaples, French scholar: b. Estaples (Etaples), near Boulogne, about 1450; d. 1536. He was educated at the University of Paris and for a time taught in the College of Cardinal Lemoine. He visited Italy and in 1507 was given a home in the Benedictine Abbey of Saint-Germain-des-Prés by his friend Abbot William Briçonnet. Faber remained there for 13 years, becoming in 1520 director of the leper hospital of Meaux. Faber's writings displeased several high church officials but he was safe from persecution through the protection of Francis I. When the latter was taken prisoner in 1525 Faber was formally condemned. On Francis' return he was made royal librarian at Blois and tutor to the king's children. Princess Margaret, on becoming Queen of Navarre, took Faber to Nérac, where he spent his last days in peace. His works were numerous and included a French translation of Saint Paul's Epistles (1512), of the New Testament (1523), of the Pentateuch (1528) and the whole Bible in 1530. Consult the life by De Labatier Plantin (Montauban 1870) and that by Prossdij (Leyden 1900).

FABER, Johann Lothar von, German manufacturer: b. Stein, near Nuremberg, 12 June 1817; d. 1896. In 1860 he founded in his native town a manufactory of lead pencils, with only 20 hands employed. He made so many improvements in the manufacture that his factory gradually became the centre of that particular industry, and absorbed the trade of Germany and Austria. Particularly successful and profitable was the making of pencils of different grades, while his business capacity in distributing his goods did much to promote their popularity. He opened branches in the great cities of Europe and the United States. He was ennobled for his services to German industry. He established a plant in New York with a cedar yard and mills at Cedar Keys, Fla.; and in his factory at Noisy-le-sec, near Paris, over a thousand operatives were employed.

FABER, Johannes. See Fabri, Johannes.

FABIAN, fā'bi-an, belonging or relating to the famous Roman family, or clan, the Fabian used especially in the military phrase Fabian tactics, to denote tactics the chief point of which is to weary and exhaust the enemy. By such measures Quintus Fabius Maximus, surnamed Cunctatus ("the delayer") greatly harassed Hannibal in the Second Punic War.

FABIAN SOCIETY, an English socialistic organization, founded in January 1884, having its headquarters in London, and with affiliated branches in most of the principal cities and towns of Great Britain and Ireland. The society includes in its ranks some very prominent writers on social economy, including George Bernard Shaw and Sidney Webb, and publishes 'Fabian Essays' and 'Fabian Tracts.' In 1888 they began to hold public meetings. Above 700 lectures have been given in one year by members of the society. The Fabians aim to bring about the "emancipation of land and industrial capital from individual and class ownership and the vesting of them in the community for the general benefit"; "the extinction of rent"; and "the transfer to the community of the administration of such industrial capital as can be conveniently managed socially." They also advocate female suffrage. The recently formed research department has added to the society's activities. There is a society of the same name in the United States, which issues a periodical called the 'American Fabian.' Consult Shaw, G. B., 'The Fabian Society' (1892).

FABII, fā'bi-ī, **Arch of the,** a commemorative arch in ancient Rome at the entrance of the Sacred Way (Via Sacra) to the Forum Romanum. It was constructed about 120 B.C. by Quintus Fabius Maximus Allobrogicus in celebration of his victories over the Allobroges and Arverni. Its material was the calcareous Italian rock called travertin, and its design simple. Some few of the travertin blocks were excavated in 1882 not far from the site of the arch. Consult Platner, 'The Topography and Monuments of Ancient Rome' (1911).

FABIUS, fā'bi-us, the name of one of the oldest and most famous families of Rome, every member of which was massacred at Cremera 478 B.C., except Quintus Fabius Vibulanus, who became one of the decemvirate. Among the most noted of the family in later times are: Fabius Ambustus, dictator, 350 B.C.; Fabius Rullianus, to whose name Maximus was added, twice dictator, conqueror of the Samnites and Etruscans, 323–280 B.C.; Fabius Gurges, son of the preceding, consul of Rome; Fabius Pictor, the first writer of Roman history, 3d century B.C.; Fabius Maximus Verrucosus, considered the greatest of his family, surnamed "Cunctator," "the Delayer" (see Fabian), from his system of warfare, died 203 B.C.; Fabius Maximus Quintus, son and next in office to the preceding, afterward consul; Fabius Maximus Æmilianus, distinguished in the war of Persia and in Spain, consul 147 B.C.; Fabius Maximus Servilianus, pro-consul for Spain, censor 126 B.C.; Fabius Maximus Allobrogicus, consul 122 B.C.

FABIUS, The American. Name often given in the last century to George Washington, because of his habit of avoiding pitched battles after the manner of Fabius Cunctator.

FABLE (Lat. *fabula*, a narrative, especially a fictitious one), in literature, a term applied originally to every imaginative tale, but confined in modern use to short stories, either in prose or verse, which are meant to inculcate a moral lesson in a pleasant garb. Imaginary persons, animals and inanimate objects are introduced as the actors and speakers. The fables consist properly of two parts — the symbolical representation and the application or the instruction intended to be deduced from it, which latter is called the moral of the tale, and is indispensable to it.

Herder divides fables into (1) Theoretic, intended to form the understanding; thus a phenomenon of nature, as illustrative of the laws of the universe, is used to exercise the understanding. (2) Moral, which contain rules for the regulation of the will. We do not learn morality from the brutes, but view the great family of nature, and observe that she has connected the happiness of all living creatures with the unchangeable, eternal law of effort, and take example from the observance of this law by the lower orders of creation. (3) Fables of fate or destiny. It cannot always be made evident how one thing follows as a necessary consequence from another; here then comes in play that connection of events which we call fate, or chance, and which shows that things follow, at least after, if not from one another, by an order from above. Thus the eagle carries with her plunder a coal from the altar, which sets fire to her nest, and thus her unfledged brood becomes the prey of animals which she has already robbed of their young.

The oldest fables are supposed to be the Oriental; among these the Indian fables of Pilpay or Bidpai, and the fables of the Arabian Lokman, are celebrated. Æsop is well known among the Greeks, and was imitated by Phædrus among the Latin writers. Bodmer has published German fables of the time of the Minnesingers. The first known German fabulist is Stricker, who belongs to the first half of the 13th century, but the famous mediæval beast-epic of ‘Reinecke Fuchs’ (see REYNARD THE FOX) has a much more remote origin. Boner, who lived at the close of the 14th century, shows in his ‘Edelstein’ the true spirit of fable. Burkard Waldis may be mentioned in the 16th century. The most successful of German fable writers is undoubtedly Lessing. In the 17th century Gay among the English, and La Fontaine among the French, were distinguished. The writer last named made fable the vehicle of wit, and carried it to its highest stage of perfection. Among the most interesting modern productions in this department of literature the fables of the Russian, Ivan Kriloff, deserve special mention. See ALLEGORY; MYTH.

FABLE OF THE BEES. A satire on the state of English society, first published in 1705 in 200 doggerel couplets, under the title of ‘The Grumbling Hive or Knaves Turn'd Honest.’ It was republished anonymously in 1714 with ‘Remarks’ and an ‘Enquiry into the Origin of Moral Virtue.’ Another edition appeared in 1723 with the addition of an ‘Essay on Charity and Charity Schools’ and ‘A Search into the Nature of Society.’ This edition gave great offense and was indicted as a “public nuisance” by the grand jury of Middlesex, this action by the authorities giving it considerable notoriety. Satirizing the government and attacking the idealism of Shaftesbury, its sarcastic philosophy and pessimistic counsel were not improved by the author's cynical assertion that he was writing for “the entertainment of people of knowledge and education.” See MANDEVILLE, BERNARD DE.

FABLE FOR CRITICS, A. Lowell's ‘Fable for Critics,’ though considered by the poet himself a mere *jeu d'esprit*, is the best-known and the most successful literary satire in verse by an American. It was written at intervals between November 1847 and July 1848, and was published in October 1848. Its 1,700 lines of galloping anapæstic tetrameter, an admirable vehicle for its purpose, present a mixture of rollicking fun, satire and panegyric. Its title states its purpose. Lowell saw American literary criticism as often unfair and even foolish and over-dependent on British opinion. His fable presents Apollo, god of poets, delivering Olympian judgment, supposedly unbiased and final, upon American writers; and this fable is addressed to prejudiced and incompetent critics and to the undiscerning public. Perhaps a score of the best-known writers of the day are passed upon, with scarcely a verdict so severe as not to be tempered with commendation, and scarcely any praise that is not edged with a little raillery. Though written early in Lowell's career, the poem shows his characteristic independence in literary judgment, his fearlessness and his common sense. His estimate of the works of Emerson, Longfellow, Whittier, Holmes, Irving, Cooper and Poe, though anticipating the later and, in some cases, the better work of these writers, is remarkably just and has in the main been ratified by posterity. Many of the terse lines stick in the memory: Emerson “a Greek head on right Yankee shoulders”; Cooper, “who's written six volumes to show he's as good as a lord”; Poe,

“With his raven, like Barnaby Rudge,
Three-fifths of him genius, but two-fifths sheer fudge;
Who has written some things quite the best of their kind,
But the heart somehow seems all squeezed out by the mind.”

Though Lowell is unfair to Margaret Fuller and overvalues Maria Child and Sylvester Judd, his perspicacity and fairness are in the main as remarkable as his satire and his fun. The course of the fable is constantly interrupted by digressions; by a fling at literary bores; by satire on dependence upon Great Britain; by scathing but humorous denunciation of slavery; and by a noble eulogy of the Bay State.

In its combination of supernatural machinery, anapæstic meter and puns, and its use of all these for the purpose of literary satire, ‘A Fable for Critics’ is not original. Its predecessors run back for hundreds of years; perhaps its immediate ancestor was Leigh Hunt's ‘Feast of the Poets.’ But its mixture of humor, satire and panegyric is as original as delightful. It is far too long; its fun grows wearisome; much of its flavor has of course been lost through time; but its youthful and effervescent hilarity carries it along in spite of its faults. It still lives through a few wise and witty or noble and brilliant passages. Poe reviewed the poem in *The Southern Literary Messenger* (February 1849). For the text, with explanatory notes, etc., consult Scudder, ‘Complete Poetical Works’; id., ‘Russell Lowell, a Biography’ (pp. 238–253).

MARION TUCKER.

FABLES OF ÆSOP, the collection of old folklore or moralizing animal stories, attributed to the Greek fabulist Æsop (q.v.) who is said to have lived in the 5th and 6th centuries B.C. His reputation is based on these amusingly satirical “beast stories” with an apposite moral, adapted to contemporary events and incidents, which he narrated at banquets and festival gatherings, for the entertainment of guests and visitors. Artless, simple and transparent in construction, affecting no graces of style, the story is the main thing, the moral being always subordinate and never permitted to interfere with the principal theme. Insolent sarcasm, however, introduced into a fable, is said to have been the culminating incident which led to his assassination at Delphi. As oral productions, he did not commit his fables to writing but they were perpetuated by Xenophon, Aristotle, Plutarch, and other Greek writers. Aristophanes alludes to them as “merry tales” and in the ‘Wasps’ represents Philocleon as having learned Æsop's “absurdities” from conversations at banquets. Plato in ‘Phaedo’ represents Socrates as whiling away his last days in prison by versifying some of Æsop's fables “which he knew,” and although he excludes poets, Plato introduces Æsop as a moral teacher in his model ‘Republic.’ A collection of the ‘Fables,’ probably in prose, in 10 books, is recorded as made by Demetrius of Phalerium 345–283 B.C., for the use of orators; no copy of the collection, however, is known to exist. An edition in elegiac verse is also mentioned by Suidas. The earliest known reliable version of the ‘Fables’ is that of Babrius or Babrias, who, as related by Crusius, was a Roman and tutor to the son of Alexander Severus; he rendered the fables into Greek choliambic verse in the early part of the 3d century A.D. This version was long known in fragments only, until in 1842 a complete manuscript, now in the British Museum, was discovered by Mr. Minas in a monastery on Mount Athos. Phaedrus, a Thracian freedman, who lived in Rome in the time of Augustus, produced a version of the fables in Latin iambics, making, however, inferior paraphrases and additions, which for a long time cast doubt on their authenticity, until dispelled by an epigraphical discovery at Apulum in Dacia, and critical re-examination of the manuscript. In the 9th century Ignatius Diaconus made a version of 53 of the fables in choliambic tetrameters. Stories from Asiatic sources were added, notably from the Buddhist Jataka folklore of India, and ‘Æsop's Fables’ as known to-day are derived from the 14th century edition compiled by Maximus Planudes, a monk of Constantinople. Through succeeding centuries, translations were made into almost every known language. Among the curiosities of literature, an early translation from the Babrian edition into Syriac by Syntipas 100 B.C. is mentioned, which Michael Andreopulos rendered back into Greek. One of the latest translations is that of Douglas (1901) into the Celtic Manx dialect. The fables have also been prolific sources of inspiration for artists which may be said to have culminated in Tenniel's illustrations with their combination of rare artistic power, humorous observation and knowledge of animal life. (See FABLES). Consult Jacobs, J., ‘The Fables of Æsop; i. The history of the Æsopic fable; ii. The Fables of Æsop, as first printed by William Caxton, 1484, from his French translation’ (New York 1896).

FABLES OF PILPAY. See BIDPAI.

FABLIAUX, fä-bli-ō (Fr. from the Lat. *fabula*, a narrative, particularly a fictitious narrative), in French literature, the short metrical tales of the Trouvères (q.v.), belonging for the most part in the 12th and 13th centuries. These productions were intended merely for recitation, not for singing, and reflected the life of the period. They originated with the bourgeoise, made no pretensions to literary merit, embraced all subjects — tales of devotion, satires on clerical weaknesses and inconsistencies, conjugal mishaps and love episodes — and were generally conceived in a vein of ironical pleasantry, and in which the wit was coarse if pungent. From the fabliaux the short story form is derived. Fabliaux in fact were “merry recitals” to excite laughter, in contradistinction to the songs of chivalry, war and love of the period. They were usually based on a comic incident, real or probable, occurring in everyday human life. They were marked by considerable originality and diversity, and would appear to have been largely modelled on the Æsopic fable and its Asiatic parallels. Several of Chaucer's ‘Canterbury Tales’ are derived directly from fabliaux; and so are many of the stories of Boccaccio and of other Italian writers. Fabliaux were the forerunners of the ‘Heptameron,’ the ‘Cent Nouvelles Nouvelles,’ of Rabelais' ‘Pantagruel,’ of Prior and Swift's productions, and of Balzac's ‘Cent Contes Drolatiques.’ Fabliaux seldom ran to more than 400 lines; they related an event, the story being the mainspring of the recital, the deductions, inferences or lesson, to be drawn being subordinate or left to the imagination. The ‘Poenitentiale’ of Egbert in the 8th century condemned the “fabulas inanes” of the period showing that they were in vogue at that date, but the earliest known is that of ‘Richeut’ which appeared in 1159, a virile picture of the coarse manners and customs of the time. Among the better known writers of fabliaux were Rutebeuf, author of ‘Le Sacristan,’ ‘Frère Denyse’ and ‘Dit d'Aristote’; also Henri d'Andeli, and Jean de Condé. While the general run of fabliaux are condemned for vulgarity, coarseness and obscenity, they afford valuable pictures of contemporary life and development, and are rich in philological material. The usual male scorn of female “fourberies” or wiles is marked in ‘Chicheface et Bigorne,’ ‘Le Valet aux deux femmes’ and ‘Le Pecheur de Pont-sur-Seine’; the medical profession is satirized in ‘Le Vilain Mire’; the ecclesiastical, in the ‘Prêtre qui dit la Passion,’ ‘Les Perdrix’ and the ‘Prêtre aux Mûres’; while marriage is ridiculed in ‘Court Mantel’ and ‘Le Dit de Berenger.’ Of pathetic interest is ‘Housse Partie,’ while of idealistic tendency is ‘Le Chevalier de Barizel.’ Consult Montaignon, A., and Raynaud, G., ‘Recueil général et complet des fabliaux des XIIIème et XIVème siècles’ (6 vols., Paris 1872–79); Bédier, J., ‘Les Fabliaux’ (Paris 1893); Hart, W. M., ‘The Fabliau and Popular Literature’ (Baltimore 1908).

FABRE, Amant Joseph, ä-män zhō-zef fäbr, French author: b. Rodez, France, 10 Dec. 1842 (or 1843). A drama, ‘Joan of Arc’ (1890), made his name most widely known, his other works being largely represented by such books as ‘A Course in Philosophy’ (1870); ‘Washington, the Liberator of America’ (1882).

FABRE, Ferdinand, fär-dē-nän, French novelist: b. Bédarieux, France, 1830; d. Paris, 11 Feb. 1898. He deals almost exclusively with life in the Cévennes, his native district. Designed for the priesthood, for which he found he had no vocation, his gallery of portraits of French priests was the fruit of a large and deep experience, and is the most noteworthy that has ever been drawn. He published ‘Ivy

Leaves,' poems (1853); then the novels, 'The Courbezons' (1862); 'Julien Savignac' (1863); 'My Uncle Célestin' (1881); 'King Ramiro' (1884); and 'Mr. John' (1886). The remarkable novel, 'Abbé Tigrane' (1873), first won him great distinction; 'Lucifer' (1884), portraying the struggle among the clergy between Gallicanism and Ultramontanism, is doubtless his greatest work. Among his shorter stories are 'The Abbé Riotelet' (1891); 'Norine' (1890); 'Germany' (1891), etc. 'My Vocation' (1889) is a volume of leaves from his student diary. Consult Gosse, 'French Profiles' (1905).

FABRE, François Xavier Pascal, frän-swä zäv-yä päs-cäl, French painter: b. Montpellier, 1 April 1766; d. there, 16 March 1837. He was a pupil of David and produced in 1787 a painting representing the 'Execution of the Children of Zedekiah by order of Nebuchadnezzar,' for which he received the great prize of the Academy and was sent as a pensionary to Rome. He was believed to have been secretly married to the Countess of Albany, widow of the Young Pretender, who on her death in 1824 made him her sole heir and bequeathed to him valuable MSS. which had been left to her by Alfieri. Fabre gave them to the city of Florence. He was created a baron in 1830.

FABRE, Hector, Canadian journalist: b. Montreal, 1834; d. 1910. He was educated at L'Assomption, Saint Hyacinthe and the College de Montreal, studied law and in 1856 was admitted to practice. He soon abandoned this profession to enter journalism, becoming editor of *L'Ordre* of Montreal. From 1863 to 1866 he edited *Le Canadien* of Quebec and founded *L'Evénement* there in 1869. In 1875 he became a member of the Dominion Senate and seven years later was appointed Paris agent of the Quebec and Dominion governments. In Paris he founded a French-Canadian journal, *Le Paris-Canada*. He was Fellow of the Royal Society of Canada and published 'Esquisse biographie sur Chevalier de Lorimier' (1856); 'Ecrivains Canadiens' (1865); 'Confédération, Independence, Annexation' (1871); 'Chroniques' (1877).

FABRE, Jean Henri, French entomologist: b. Saint-Léons, Aveyron, 21 Dec. 1823; d. 1915. In early life he taught school and became professor of natural philosophy at the College of Ajaccio and later at the Lycée of Avignon. He is corresponding member of the Institut de France and chevalier of the Legion of Honor. Many years ago he retired to Sérignan, Vaucluse, and in this retreat produced his greatest work. 'Souvenirs entomologiques' (10 vols., 1879–1907). Among his other numerous works are 'La science élémentaire' (1862); 'Histoire de la bûche' (1866); 'Les ravageurs' (1870); 'Premiers éléments de physique' (1875); 'La plante' (1875); 'Les inventeurs et leurs inventions' (1880); 'The Life and Love of the Insect' (1911); 'Social Life in the Insect World' (1912); 'The Life of the Fly' (1913); 'The Mason-Bees' (1914); 'Bumble Bees' (1915).

FABRE, Marie Joseph Victorin, French poet: b. Janjac, Ardiche, 1785; d. 1831. At the age of 20 he achieved a brilliant success with 'Eloge de Boileau,' which was crowned by the Academy. His later works, however, did not bear out his early promise and he died in obscurity. These include 'Discours en vers sur les voyages' (1807); 'Eloge sur Pierre Corneille' (1808); 'La mort de Henri IV' (1808); 'Opuscules en vers et en prose' (1806) and 'Eloge de La Bruyère' (1810). His collected works were issued by his pupil, J. Sabbatier (Paris 1845).

FABRE D'EGLANTINE, Philippe François Nazaire, fē-lēp frän-swä nä-zär fäbr dä-glön-tēn, French dramatic poet: b. Carcassonne, 28 Dec. 1755; d. Paris, 5 April 1794. Having gained the prize of the Eglantine in the Floreal games at Toulouse, he assumed the name of that flower as a surname. He now wrote several theatrical pieces, of which however only two, 'L'Intrigue épistolaire' and the 'Philinte de Molière,' were successful. The latter is still considered one of the best character-pieces of the modern French stage. He engaged with ardor in the Revolution, in which he was associated with Danton, Lacroix and Camille Desmoulins. As deputy from Paris to the National Convention, he at first supported moderate principles, but afterward voted for the death of Louis XVI without appeal, and was chosen a member of the committee of public safety. He afterward became suspected by the Jacobins and being condemned to death was executed along with his colleague Danton (q.v.).

FABRE D'OLIVET, Antoine, French Provençal writer: b. Ganges (Hérault), 8 Dec. 1767; d. Paris, April 1825. He was one of the earliest leaders of the dialect and racial movement in southern France, and a descendant of Jean Fabre, «l'Honnête Criminel,» the hero of Fenouillot de Falbaire's famous drama of the same title. He was a mystic, a scientist and an erratic student whose literary food was of the most omnivorous nature. The wide range of his studies and sympathies is shown in the following partial list of his works: 'Notions sur le sens de l'ouie en général' (1811–19); 'Les vers dorés de Pythagore, expliqués pour la première fois et traduits en vers eumolpiques français' (1813); 'La langue hébraïque' (1816); 'De l'etat social de l'homme' (1822–24); 'Le Quatorze Juillet' (drama 1790); 'Toulon soumis' (historical opera in vers libres 1794); 'Le Sage de l'Indoustan' (drama 1796); 'Lettres à Sophie sur l'histoire' (1801) 'Le Troubadour' (1803); 'Caïn' (drama 1823). He also published considerable music. His influence in the re-establishment of the Languedoc as a literary tongue was due principally to his philological studies in Provençal.

FABRETTI, fä-brĕt'tē, **Ariodante,** Italian antiquary: b. Perugia, 1816; d. 1894. In 1860 he was appointed to the chair of archæology at Turin and in 1868 became director of the Museum of Antiquities there. He published several works on the antiquities of Perugia and became senator of the kingdom in 1889. His most important work is 'Corpus Inscriptionum Italicarum Antiquioris Ævi' (1867).

FABRETTI, Raffaele, Italian antiquarian: b. Urbino, 1619; d. Rome, 7 Jan. 1700. He was made papal treasurer by Alexander VII, and finally superintendent of the archives in the castle of San Angelo, which office he held till his death. Among his writings may be mentioned 'De Aquæductibus veteris Romæ'; 'De Columna Trajani'; and 'Inscriptionum Antiquarum Explicatio,' in the last of which much light is thrown on the discoveries made by himself in the Catacombs.

FABRI, fä'brē, **Felix** (German, *Schmid*), German monk: d. about 1502. He entered the Order of Preachers and became lector in the monastery of the order at Ulm. In 1480 he made a pilgrimage to Jerusalem and three years later went as chaplain with Johann von Waldburg to the Holy Land, returning via Cairo, Alexandria and Venice. At Ulm after his return he penned an account of this journey, which remains one of the most important travel narratives of the late Middle Ages. The Latin version is contained in 'Bibliothek des litterarischen Vereins' (Stuttgart 1849). A German version appeared in Feyrabend's 'Reyssbuch des heiligen Lands' (Frankfort 1584).

FABRI, Friedrich, German theologian: b. Schweinfurt, 1824; d. 1891. He received his education at the universities of Erlangen and Berlin. He held several pastorates, and in 1857 became director of the Missionary Society at Barmen, where he remained until 1884. He then retired to Godesberg-on-the-Rhine and became president of the Evangelical Society for the German Protestants in America. In 1889 he was appointed honorary professor at the University of Bonn. He wrote 'Bedarf Deutschland der Kolonien?' (3d ed., 1884); 'Briefe gegen den Materialismus' (1856); 'Die Entstehung des Heidentums und die Aufgabe der Heidenmission' (1859); 'Die politische Lage und die Zukunft der evangelischen Kirche in Deutschland' (3d ed., 1874); 'Staat und Kirche' (3d ed., 1872); 'Fünf Jahre deutscher Kolonialpolitik' (1889).

FABRI, Jacques L. D'Estaples. See Faber.

FABRI, Johannes, Roman Catholic prelate: b. Leutkirch, near Lake Constance, 1478; d. Baden, 21 May 1541. He changed his name of Heigerlin to Fabri or Faber, studied theology and canon law at the universities of Tübingen and Freiburg. He served as a member of the secular clergy for several years and in 1518 became vicar-general of Constance. He was on intimate terms with Erasmus, Melanchthon and Zwinglius and many thought that he agreed with their doctrines, but when the breach came he remained with the ancient Church. In 1522 he published a work against Luther, and thereafter his opposition to the Reformers was constant and formidable. His 'Malleus in Hæresim Lutheranam' (1524) earned for him the sobriquet of «Hammer of Heretics.» He was one of the ablest defenders of the old Church at Zürich in 1523, Speiers in 1529, and Augsburg in 1530. In 1531 he was appointed archbishop of Vienna and thereafter his polemical struggles were with the Moslems. His homiletical works were issued at Cologne (3 vols., 1537–41) and the polemical in 'Opuscula Quædam J. Fabri Viennensis' at Leipzig (1537). Consult Horawitz, A., 'Johannes Heigerlin genannt Faber, Bischof von Wien, bis zum Regensburger Convent' (Vienna 1884); and Janssen, 'History of the German People' (Vol. XIV, English trans., London 1909).

FABRIANO, Gentile da, jen-tē'lā dä fä-brē-ä'nō, Italian painter: b. Fabriano, about 1370; d. Rome, about 1450. His earliest work was perhaps the decoration of a chapel for Pandolfo Malatesta at Brescia. In 1423 he painted one of his best extant pictures, an 'Adoration of the Kings,' for the church of the Holy Trinity in Florence. To the same period belongs a Madonna with Saints (now in the Berlin Museum). A picture of the naval engagement between the fleet of Venice and that of the Emperor Barbarossa, which Fabriano painted for the Venetian Senate, so pleased them that they conferred on him the dignity of a patrician and a pension of a ducat *per diem* for life. Fabriano next worked at Orvieto, but was called thence by Pope Martin V, who employed him in adorning the church of Saint John Lateran with frescoes from the life of John the Baptist. Fabriano's pictures indicate a cheerful and joyous nature. He had a child-like love of splendor and rich ornamentation, but his coloring is never extravagant or meretricious.

FABRIANO, Italy, episcopal city 20 miles northeast of Perugia. It is situated at an elevation of 1,066 feet, in the midst of mountain scenery and in a fruit-growing region. This is the native place of the artist Gentile da Fabriano (q.v.), a large number of whose paintings are preserved here in churches and in the city hall. Paper, parchment, gunpowder, glue and felt-cloth are the chief manufactures. The paper and parchment factories were established in 1564. Pop. of the commune 23,752.

FABRICE, fä-brēs', **Georg Friedrich Alfred von,** German statesman: b. Quesnoy-sur-Deule, France, 1818; d. 1891. He entered the Saxon army in 1834 and rose to chief of the general staff and major-general in 1865. In the war between Prussia and Austria in 1866 he was chief of staff to Crown Prince Albert, who commanded the Saxon troops on the Austrian side. After the war Fabrice was appointed Saxon Minister of War. In this capacity he reorganized the Saxon army after the Prussian model. He was one of the prominent commanders in the war of 1870–71 with France, conducted the peace preliminaries at Versailles and commanded the German army of occupation in France. He again became Minister of War of Saxony in 1871 and Prime Minister in 1876. He was made a baron in 1878 and count in 1884. Consult Dittrich, 'General von Fabrice' (Dresden 1884).

FABRICIAN (fä-brĭsh'ăn) **BRIDGE,** Rome, a stone bridge joining Æsculapius Island with the left bank of the Tiber, built in 62 B.C. by Lucius Fabricius. It is the only Roman bridge that has lasted to our day. It is known at present as the Ponte dei Quattro Capi. Consult Platner, 'The Topography and Monuments of Ancient Rome' (2d ed., New York 1911).

FABRICIUS, fä-brĭsh'ŭs, **Gaius Fabricius Luscinus,** Roman general and statesman of the 4th and 3d centuries B.C. In 282 B.C. and again in 278 he was consul. In 282 he won a victory over the Lucanians and Bruttians and also led troops against Pyrrhus. He was noted for his incorruptibility. It is said that Pyrrhus once tried to secure favorable peace terms through bribery, but his offer was received by Fabricius with such disdain that Pyrrhus released his Roman prisoners. On another occasion an attendant of the king offered to poison his master for a consideration, but Fabricius informed Pyrrhus of his servant's treachery and the king again released all Romans held as prisoners by him. Fabricius was censor, together with Q. Æmilius Papus. He was awarded a triumph for his military victories, but at his death his means were so slight that his daughter was given a pension from the public treasury.

FABRICIUS, fä-brē'tsę-ŭs, **Georg**, German scholar: b. Chemnitz, Saxony, 1516; d. 1571. In 1546 he was made rector of Meissen and in 1570 Maximilian II made him poet laureate. His poetry was written mostly in Latin. In 1560 appeared his 'Poematum Sacrorum Libri XV.' Other important works were his 'Antiquitatum Libri II' (1549); 'Itinerum Liber Unus' (1551); and 'Roma' (1551). Consult Baumgarten-Crusius, 'De Georgii Fabricii Vita et Scriptis' (Meissen 1839).

FABRICIUS, Hieronymus, hī-ĕr-ŏn'ĭ-mus fā-brish'ĭ-us (Italian Fabrizion, Girolamo), Italian physician: b. Aquapendente, 1537; d. Padua, 21 May 1619. He studied at Padua under the celebrated Fallopius, whom he afterward succeeded in the anatomical chair, and had Harvey, the discoverer of the circulation of blood, for a pupil. Harvey acknowledged that the discovery of the valves in the veins made by his master put him on the way of his discovery. During the lifetime of Fabricius his merit was fully recognized by the public and the state, an anatomical theatre being built for him at Venice. His works were collected and published by Bohnius (1687).

FABRICIUS, Johann Albrecht, German scholar: b. Leipzig, 11 Nov. 1688; d. Hamburg, 30 April 1736. He was versed in almost every department of human knowledge, particularly in philology and ancient literature, and understood the art of using these stores of erudition to the greatest advantage. He was professor of rhetoric and moral philosophy in the gymnasium at Hamburg. He published a 'Bibliotheca Græca' (1705–28); 'Bibliotheca Latina' (1697); 'Bibliotheca Mediæ et Infimæ Ætatis' (1734); 'Bibliotheca Ecclesiastica'; 'Bibliotheca Antiquaria' (1713).

FABRICIUS, Johann Christian, Danish entomologist: b. Tundern, in the duchy of Schleswig, 7 Jan. 1745; d. Kiel, 3 March 1808. He pursued his studies at Leyden, Edinburgh and Freiburg in Saxony and under Linnæus at Upsal. His works upon entomology show the principles, the method and even the forms of expression peculiar to Linnæus applied to the development of a new, happy and fruitful train of ideas. From his intercourse with him he derived his first notions of his system of arranging insects according to the organs of the mouth. Fabricius obtained the professorship of natural history in the University of Kiel; and in 1775 appeared his 'System of Entomology,' which gave to this science an entirely new form. Two years afterward he developed in a second work the characters of the classes and orders, and demonstrated in the *prolegomena* the advantages of his method. In 1778 he published his 'Philosophia Entomologica,' written upon the plan of the well-known 'Philosophia Botanica.'

FABRIKOID, a material consisting of a base of cotton cloth, coated with a tough, flexible material and embossed by steel plates or rolls to produce the appearance and feeling of any desired natural leather grain. It is made in various grades, colors, widths and grains for different purposes. It is used for the upholstery of automobiles, carriages, furniture, for bookbinding, suitcases, purses, novelties, and in general for all classes of work where leather may be used, such as wall coverings, trunk linings, etc. Fabrikoid is waterproof, washable and non-absorbent, and has the pleasing appearance of the best leather. It is manufactured in rolls, averaging 60 yards in length and 36 to 54 inches in width.

FABRIZI, fä-brēt'sē, **Nicola**, Italian soldier: b. Modena, 1804; d. 1885. In 1831 for his part in the Modena insurrection he was imprisoned. When released he went to Marseilles and with Mazzini organized the Savoy expedition. He went to Spain and took part in the Carlist wars on the Liberal side, and afterward removed to Malta. In 1848 he fomented a revolution in conjunction with Crispi and again in 1860. He joined his forces with Garibaldi at Palermo and by the latter was made Minister of War and governor of Messina. Under a United Italy Fabrizi was elected to the Parliament of the kingdom.

FABRONI, or **FABBRONI**, fä-brō'nē, **Giovanni Valentino Mathias**, Italian scientist: b. Florence, 13 Feb. 1752; d. Pisa, 17 Dec. 1822. He left behind him a considerable number of valuable memoirs and treatises on matters relating to chemistry, agriculture, physiology, etc., of which the best known are 'Provvedimenti Annonarj'; his 'Discourses on National Prosperity'; on 'The Equilibrium of Commerce, and the Establishment of Custom-houses'; on the 'Effects of the Free Traffic in Raw Material'; on 'Rewards for the Encouragement of Trade'; on the 'Chemical Action of Metals'; on the 'Value and Reciprocal Proportion of Coins'; on the 'Scales and Steelyards of the Chinese,' etc.

FÁBULAS OF TOMÁS DE IRIARTE. In spite of the pronounced fondness of the Spaniards for the moralizing and the aphoristic in both spoken and written expression, the fable as a distinct genre did not come to its own in the Spanish language until the 18th century. In translations of both Oriental and Occidental material and sporadically in this or that literary work, in which it is used for literary purposes, the apologue material appears now and then from the Old Spanish period down; but as a form displaying any originality of treatment it first becomes important with the composition of the verse fables of Tomás de Iriarte (1750–91) and of Félix María Samaniego (1745–1801). While Samaniego draws in no slight degree upon the Æsopic stock and does not hesitate to utilize also the Latin Phædrus, the Frenchman La Fontaine, and the Englishman Gay, Iriarte shows far more independence of conception, and besides, as the very title of his work, 'Fábulas literarias' (1782), suggests he has not Samaniego's purpose of edifying the world at large but rather the restricted circle of men of letters. Literary criticism is, then, the compelling motive of the lessons that he frames and seeks to inculcate. He has the set aim of correcting,

through the ridicule which he directs upon them, the various defects from which Spanish literature is suffering. To do this he has no need of giving free rein to his imagination; on the contrary, he has only to give evidence of a sound literary judgment expressed in an easy and correct style and seasoned with a delicate humor. All these qualities are well exhibited in his fables, which, moreover, present a versification of a nature ever varied and ever harmonious. Iriarte's abiding fame is associated with the 'Fábulas literarias,' but it is worthy of record that he was a skilful writer of comedies, in several of which he satirized features of the social life of his time.

FABULOUS ANIMALS. See Fable; Heraldry; Unicorn.

FABVIER, fä'vyā', **Charles Nicolas, Baron**, French general: b. Pont-à-Mousson, 1782; d. 1855. In 1807 at the order of Bonaparte he went to Constantinople to strengthen that city's fortifications in view of an impending attack by a British fleet. After accomplishing this task he organized batteries of artillery for the defense of Ispahan against the Russians. In 1811 he was with Marmont in Spain and two years later became a member of the general staff with the rank of colonel. After the restoration of the Bourbons his political activity soon made a sojourn in England more desirable than to remain in France, and in 1823 he went to Greece and was made commander-in-chief of infantry. Reverses at Chios and at Athens impaired his position among the Greeks, and he returned to his native land in 1829. He was named Ambassador to Constantinople in 1848. He published 'Journal des opérations du VI, corps pendant la campagne de 1814 en France' (1819). Consult Debidour, 'Le général Fabvier, sa vie et ses écrits' (Paris 1892); id., 'Fabvier à l'Acropole' and 'Les dernières années due Général Fabvier' (in 'Séances et travaux de l'Academie des sciences morales et politiques,' Vols. CLIX, CLXI, Paris 1903, 1904).

FABYAN, or **FABIAN, Robert**, English historian: d. 1513. He was a member of the Drapers' Company and served as an alderman of London. In 1516 was published his 'New Chronicles of England and France.' He began with the arrival of Brutus and continued the history down to the battle of Bosworth Field in 1485. The work suffers much from the author's lack of scholarship. Fabyan is, however, valuable for his accounts of the London life of his day. Successive chroniclers continued the work down to 1558. Consult the edition by Sir Henry Ellis (London 1811).

FAÇADE, fä-sad' (Fr. «the front of a building»), the face or front of any building, particularly its principal face or faces; generally used of a building of magnitude or importance. A back elevation is termed a rear façade; a side elevation a lateral façade. See Architecture.

FACATATIVA, fä'kä-tä'tē-vä', Colombia, town in the department of Cundinamarca, 20 miles northeast of Bogotá. Its site is 8,500 feet above sea-level. Facatativá was an Indian fortress before the advent of the Spaniards. The last chief of the Chibchas, Triquesupa, was killed here in 1538 by one of Quesada's soldiers. The town has considerable trade with Bogotá. Pop. 7,000.

FACCIOLATI, or **FACCIOLATO, Jacopo**, yä'kō-pō fä-chō-lä'tē or -tō, Italian philologist: b. Toregia, near Padua, 4 Jan. 1682; d. Padua, 26 Aug. 1769. He devoted the greatest attention to reviving the study of ancient literature; and accordingly undertook a new edition of a dictionary in seven languages, which was called the 'Calepin,' from the name of its author, the monk Ambrosius Calepinus. His pupil, Forcellini, assisted him and the work was completed between 1715 and 1719. He now, in company with his industrious disciple, conceived the idea of a Latin lexicon, in which every word, with all its significations, should be contained and illustrated by examples from the classical writers, after the manner of the dictionary of the Cruscan Academy. This immense undertaking occupied them both for nearly 40 years. Facciolati directed the work, which is generally regarded as having been almost entirely executed by Forcellini. He left many Latin discourses which are characterized by Ciceronian elegance of style, but differ from their model by a precise brevity.

FACE. See Skull.

FACE WHEEL, called also **Contrate Wheel and Crown Wheel**, a wheel which has cogs projecting from the periphery at right angles to the plane of motion; as, in watches, the wheel situated nearest the crown and driving the balance.

FACETIÆ, fa-sē'shĭ-ē (Lat. «witticisms»), a collection of humorous sayings or tales, witticisms and jests. Among the earliest such is that known as 'Asteia,' generally attributed to Hierocles. Latin collections were common in the later Middle Ages, the most notable being the 'Liber Facetiarum' (1470) of Poggio Bracciolini.

FACHAN, or **FATSHAN**, China, in the province of Kwang-Tung, on the Tu-Kiang, about 20 miles west by south of Canton. Its iron and steel products have earned for it the name of the «Birmingham of China»; it has manufactures also of cloth and silk, bamboo and rattan articles, embroideries and porcelain. Its trade is in manufactured articles and the agricultural products of the surrounding country. Pop. 450,000.

FACIAL ANGLE, an anatomical term for the angle contained between two imaginary lines, one from the most prominent part of the forehead to the anterior extremity of the alveolar process of the upper jaw, opposite to the incisor teeth; the other from the external auditory foramen to the same point, serving to measure the elevation of the forehead. The angle is of great service in ethnology, but its magnitude is not an infallible criterion of the intellectual capacity of an individual. It is sometimes called Camper's angle, because the celebrated Dutch anatomist Camper was the first to draw attention to the importance of this method of skull measurement.

FACIAL NERVE. The seventh cranial nerve in the cerebro-spinal axis forms the chief motor nerve of the face. It originates in a group of ganglion cells lying in the floor of the fourth ventricle in the medulla. The fibres pass out through the temporal-bone lying by the side of the auditory nerve in the middle of the ear canal and are finally distributed to the chief muscles of the face. Affections of this nerve cause partial or total loss of power of the muscles of the face. See FACIAL PARALYSIS.

FACIAL NERVE PARALYSIS, paralysis of the motor nerve which controls the muscles of the face. The paralysis may extend to one or both cheeks; but, in most cases, when the cause has been treated recovery follows.

FACIAL NEURALGIA, a painful affection involving the chief sensory nerve of the face; the trigeminal or fifth nerve. This neuralgia may involve any of the branches and, because of their wide distribution over the shoulder, back of the neck, scalp and face may be felt in a number of locations. Very frequently the pain is in the jaw and is due to diseased teeth, toothache being a form of neuralgia of this nerve.

The pain may radiate from over the orbit, constituting supra-orbital neuralgia, or it may be distributed over the back of the head, constituting occipital neuralgia. Occasionally neuralgia of the fifth nerve gives rise to typical attacks of sick-headache. A particular variety which is extremely severe and is supposably due to disease of the sensory ganglia of the fifth nerve is known as tic-douloureux. Characteristic features of neuralgias of the face are the sudden shooting, darting pains, usually one-sided, unaccompanied with other constitutional disturbances. The cause is most frequently exposure to cold. From riding on the tops of omnibuses, sitting by the open windows of railroad cars, or by any open window with a draft blowing through, persons are very frequently affected. At times anæmia, gout and infection from bad teeth occasion facial neuralgia.

Treatment will depend largely upon the exciting cause. Heat, gentle massage, simple diet and free movements of the bowels are general measures to be carried out. Occasional surgical intervention is necessary to cure tic-douloureux. The medical treatment of neuralgias of the face is technical and involves the use of remedies that are dangerous in the hands of laymen.

FACIAL PARALYSIS, a partial or total loss of power in the muscles of the face. One side of the face alone is usually affected. Paralysis may result from any disease of or injury to the facial nerve, either inside of the skull proper, or in its external distribution. Paralysis of the face very frequently occurs in apoplexies. Here the disease results from a disturbance of the nerve in its intracranial portion. It also is occasioned by disease in the middle ear, but is most frequent following exposure to cold, during which the external branches are involved. This latter form is termed Bell's palsy (q.v.). The symptoms of facial paralysis may vary according to the number of branches of the nerve that may be involved. In a complete case the paralyzed side is flat and expressionless, the mouth is drawn toward the well side, making the well side look as though it were contorted and diseased. The patient is unable to whistle and may not be able to talk very clearly. The tongue may be protruded toward the well side. There may be inability to close the eyelids. Sensation is not involved. When the patient eats he may not be able to move the tongue on the paralyzed side of the mouth and he cannot fill out his cheeks on the flat side. The electrical reactions of the muscles at first may not be affected, but later what is known as the reaction of degeneration sets in. Most cases of facial paralysis due to peripheral trouble, as well as Bell's palsy, recover of themselves; others, due to hemiplegia or to inflammation of the middle ear or to fracture of the skull, recover less frequently.

Treatment is by means of tonics — iron, strychnine, arsenic and electrictiy. In intractable cases surgical anastomosis with other motor nerves may prove of service.

FACIAL SPASM. See TICS.

FACINGS, Military. See UNIFORMS.

FACSIMILE, făk-sĭm'ĭ-lē, an exact reproduction or likeness, as of handwriting, printed books, manuscripts, etc.

FACTOR (Lat. «a maker»). (1) An agent or substitute, especially a steward or agent of an estate, appointed by a landowner to manage the estate, collect rents, let lands, etc.; also an agent employed by merchants to transact business for them in other places, as to buy and sell, to negotiate bills of exchange, etc. He differs from a broker in that he is entrusted with the possession and disposal of the goods, property, etc., and may buy and sell in his own name. (See AGENT). (2) In arithmetic any one of the integers the product of which is a given number. A prime factor is a factor which is also a prime number. (3) In algebra, any one of the quantities which, when multiplied, produce a given algebraic expression.

FACTOR ACTS. A term applied to a number of American and English statutes validating sales, pledges and other business transactions of factors with bona-fide purchasers, pledgees, etc. Among the English statutes were those enacted in 1823, 1842, 1877 and 1889. The last-named statute in part extends the former statutes and in part re-enacts them. Many statutes having practically the same effect as those of England have been enacted in the United States. These acts were deemed necessary to relieve the extreme hardships often resulting from the application of the common-law doctrine that the purchaser buys at his peril, the vendor giving no better title than he has himself. This frequently resulted in the perpetration of numerous frauds by unscrupulous persons on innocent purchasers, pledgees and the like. By the terms of these acts any agent having possession of goods or the bill of lading, warehouse keeper's certificate, or other document of title, with the consent, actual or apparent, of the real owner, should be deemed to be the owner of the goods for the purpose of validating any lien, pledge or the like, made bona-fide by any person with such agent and for payments and advances made on the security of the goods or evidences of title thereto. It was further provided by some of these acts that such contracts were to be binding upon the real owner of the goods and all persons interested therein, even if the purchaser, pledgee or the like was aware of the fact that the person with whom he dealt was the agent and not the real owner. The tendency of recent legislation, both in England and in many jurisdictions in the United States, is toward extending the scope of the law in the direction of an entire abrogation of the common-law doctrine on the subject of contracts made with agents or others having possession of personal property or evidences of title thereto with the permission, real or apparent, of the owner. The principal by these statutes is compelled to use caution in the selection of persons who represent him in business transactions, as ordinarily third persons dealing bona-fide with such representatives will be protected. In a few States, however, persons dealing with agents, knowing them to be such, will not be protected. In a number of States factor acts restrict the doctrine to mercantile transactions and in other States the acts provide that the goods must have been entrusted to the agent for the purpose of sale in order to validate contracts made in relation thereto. See AGENT; CAVEAT EMPTOR; FACTOR.

EDWARD F. DONOVAN.

FACTOR OF SAFETY. See STRENGTH OF MATERIALS.

FACTORIES AND FACTORY INSPECTION. The American factory in the early days of the Republic was an outgrowth of the English factory. In the 18th century England was the centre of the world's mechanical progress. She manufactured not only for Great Britain and her colonies, but for a large part of the rest of the civilized portions of the globe. Early emigrants to America were not allowed to bring tools and machines for manufacturing and the laws of the mother country also aimed to hold skilled workmen. The result was that the immigrant weaver who sought to follow his trade in the New World when without a loom built one; the printer who wished to issue a newspaper had to build his own press; the tanner had to make his own vats and the currier to fashion his own beaming knife and table.

Because of these conditions American mechanics had to build largely from the very foundation and thus they became inventors and designers of machinery and introduced many improvements that otherwise might not have seen the light. The textile industries were the first to develop here; then came the iron mills, the flour and grist mills and the machine shops. At the close of the Civil War in 1865 the United States was a land of small shops, with here and there a factory of modest proportions. The war had given a great stimulus to the machine shops and when it was no longer necessary to turn out rifles and cannon, the machine men turned their attention to the mechanisms of peace. The reaper, the sewing-machine, the locomotive, the printing-press, the paper-machine, the roller-mill for flour and a thousand other mechanisms were developed and perfected and the shops grew into factories and gradually all New England, the Middle and later the Western and Southern States built factories of all kinds, thousands of which have grown to enormous proportions. New York City alone has over 10,000 factories and the 'Industrial Directory of New York State' is a book of 787 pages. In 1916 there were 285,000 factories in the United States, of which 46,000 were in New York State. The factory has become the backbone of our Western civilization. Here work is reduced to a scientific system and goods are manufactured at a fraction of the cost of former times. If the public pays as much for some things, it is because they demand so much better than formerly. The culmination of success in factory production is seen in the automobile. A better automobile is sold to-day for less than $400 than could be bought in 1906 for $1,500.

Factory methods have become so perfected in this country that construction engineers now make a specialty of factory buildings, usually confining themselves to one or more lines of industry and lay out the new buildings from the very foundations according to the most approved practice. Starting with the principle that the cube gives the most working space for the least cost of enclosure, the factory engineers go on to figure what height of story and how many stories are most economical for a given business. They lay out buildings with a view to the handling of a certain class of work to best advantage, that the different departments may move the unfinished work in the least wasteful manner and have the best conditions for good and rapid production. The sanitation and comfort of employees receives marked attention, as the principle is now well established that it pays the factory to keep the good will of its help.

The human element of the factory receives quite as much attention as the mechanical. Efficiency engineers have studied this problem from every angle and all large factories that pretend to scientific management now give close attention to methods of inspiring the workers to get results. Experimental departments are maintained to improve the machinery and processes. Elaborate systems of cost-finding and scientific estimating are common. Specialists are found everywhere in all kinds of factories, improving and systematizing, and there appears to be no end of development of these huge working machines, built up of combinations of men and machines all working toward the common end of turning out the largest quantity of a given product of the best quality in the least time.

English Factory Development.— By the middle of the 18th century the first English factory, in the present sense of the word, was built by Lombe Brothers. It was a silk-mill and the first in which the motive power was supplied from the outside and machinery did the work heretofore supplied by human hands. The power used was a water wheel. Arkwright came to the front with his water-frame, so-called, because water was the motive power. There began a rapid development in spinning machines, which were first applied to cotton, and in this industry we have the explanation how the earlier triumphs of the factory system were won. In the beginning of the 19th century, the modern factory system became established and the child-labor question arose. As the mills were first established by the streams, so that wheels might be moved by water power, it often happened that labor could not be had in the vicinity. Application was made to the almshouse for children who were indentured or bound out at a fixed rate and for a certain length of time. Forced to work whether sick or well, often 16 hours a day and given nothing for breakfast but water porridge, these children were visited with serious epidemics and the attention of the public was thus aroused. In 1802 the first factory act for the "Preservation of the health and morals of apprentices in cotton mills" was introduced by Sir Edward Peel, one of the large manufacturers of that time. All mills employing three or more apprentices, or 20 other persons, were subject to this act. The most important clause was that which fixed 12 hours as a working day and prohibited work altogether from 9 P.M. to 6 A.M.

First United States Cotton Factory.— In the earlier years of the factory in the United States, each home had its spindles and loom to fill the needs of its own members, the flax and cotton being grown, spun and woven by the individual householder, or the slaves on the plantations. England frowned upon all manufactures in her colonies and would allow no machinery or parts of machinery to be brought to them. However it could not fetter the brain, nor forbid the inventive genius; and Slatter and his associates, who came to America in the latter part of 1700, brought with them the knowledge which in 1803 built in Massachusetts the first American cotton-mill. The first mill to take cotton in its crude state and pass it through the different processes to the woven cloth was erected in Waltham, Mass., in 1813. The first type foundry was built in Philadelphia in 1794. The first glass-house was constructed in Pittsburgh in 1796. Other factories followed in rapid succession between 1796 and 1810.

Inspection Began in England.— The first factory inspection law was adopted in England about the beginning of the 19th century, as a result of the agitation caused by epidemics among children and women in factories, but it was not until 1819 that the law was made effective. The abuses became so great that the government was at last compelled to interfere in the interests of humanity. This began by asserting the right of the state to control industrial establishments where women and children were employed, but this necessarily involved the freedom of men in making contracts. The law was intended more particularly to meet the evils of the apprentice system, but it did not extend to factories, where children residing in the neighborhood were employed. From time to time this act has been amended and the authority of government extended, so as to make it generally effective for the protection of all labor. It was thus in England that the value of factory inspection was first determined by experience. Subsequently it was introduced into America. Massachusetts was the first American State to adopt a law of that character.

To-day there are factory laws in the United States based on the Massachusetts laws, for the examination and approval of plans of factories and tenement-houses, also for proper fire-fighting, means of egress and sanitary provisions; regulating the employment of labor of women and minors in manufacturing, mechanical and mercantile establishments and workshops; guarding of machinery; the construction of safety appliances of elevators; ventilation of factories and workshops; provision of toilet conveniences for the use of each sex employed in factories and workshops and various other sanitary regulations; uniform hours for meals for women and young persons; communication between the engineer's room and each room where machinery is run by steam; proper safeguards at hatchways, elevator openings and well-holes in public buildings, factories and mercantile establishments; competent watchmen and red lights in hotels; prohibiting during working hours the locking of any inside or outside door of any building where operatives are employed; weekly payment of wages; and sundry other matters; the granting of licenses to make, alter, repair or finish coats, vests, trousers or wearing apparel of any description in a room or apartment in a tenement or dwelling house; the examination of engineers and firemen and the inspection of boilers, granting of licenses and steam power to be used. Women are protected by law from overwork by their employers and children are excluded from factories until of proper age and Massachusetts has been from the first, and continues to be, in the advance in factory inspection and under this system her industrial establishments have become models for all the other States. It is a marked illustration of what such a law accomplishes for a community.

The New York State Department of Labor has a Bureau of Factory Inspection and sends out a large force of inspectors to see that the laws for the protection of employees are enforced.

International Association of Factory Inspection.— The International Association of Factory Inspection was organized at Philadelphia in 1886 and includes Canada and the States of Massachusetts, New York, New Jersey, Pennsylvania, Rhode Island, Connecticut, Maine, Michigan, Ohio, Minnesota, Illinois, Wisconsin, Missouri and Indiana. Each of these several States holds an annual convention of its inspectors, who meet to compare notes of their work for the year and as their proceedings are made public, each State may know the advancement the other is making in its labor laws.

In 1876 an act was passed in Massachusetts prohibiting the employment of children under 10 years of age. In 1883 the limit was extended by providing that no child under 12 years of age should be employed during the hours in which the public schools were in session. In 1898 the limit was raised to 14 years, providing that no child under 14 years of age can be employed at any time in a factory, workshop or mercantile establishment and no child under 16 years of age can be employed in a factory, workshop or mercantile establishment unless the employer procures and keeps on file a certificate and posts near the principal entrance a list of all such children employed. States that have adopted the factory inspection system have similar child labor laws, differing as to their age, to the age limit when they can be employed.

The Fifty-Eight-Hour-Law.— In the State of Massachusetts children under 18 years and women cannot be legally employed more than 58 hours in a week in a factory, workshop or mercantile establishment and every employer must post in a conspicuous place the number of working hours each day of the week, the hours allowed for meals, the hours when starting and stopping work and it becomes a part of the inspector's business to see that this is faithfully complied with. This has been the law of the State since 1894. Other States have enacted similar legislation.

In 1912 the United States Congress established a Commission on Industrial Relations to look into conditions in the principal industries of the country and to report upon all the problems growing out of the factory system. There is also a United States Bureau of Labor Statistics and, in 1916, 40 of the States maintained labor bureaus, many of which pattern their work after the Massachusetts Board of Labor and Industries. Eight-hour laws now exist in nearly all the States, providing for a limit of eight hours in work for State and in some occupations, as mining.

Sanitary Provisions in Factories and Workshops.— The laws of most States now provide the most rigid sanitary regulations in the interest of comfort, decency and health. These relate to factories, workshops, mercantile establishments, offices, schoolhouses and public buildings. It is required that these buildings shall be kept free from all effluvia arising from drains and that they shall have a proper number of water-closets provided for persons of each sex. It is also provided that during working hours these buildings shall be ventilated, that the air may not become injurious to the health of the persons employed therein. It also provides that all dust from the grinding or polishing of metals be carried away through suction pipes.

The Inspection of Boilers and Engineers' Licenses.— The Massachusetts law which has been copied in many States provides that "It shall be unlawful for any person to have charge of, or to operate a steam-boiler or engine, except boilers and engines of locomotive motor-road vehicles, boilers in private residences, in apartment houses of less than five flats, boilers under the jurisdiction of the United States, boilers used for agricultural purposes exclusively, boilers of less than eight horsepower and boilers used for heating purposes, limiting the pressure to 15 pounds to the square inch, other than these boilers above excepted; the person in charge must hold a license granted after a thorough examination by the inspectors appointed for this duty, who are expert engineers."

The Sweatshop System.— With the introduction of the sweating system in the United States came a revolution in the clothing industry which has left in its wake destruction and poverty; for prior to the introduction of this system there was not, as a class, a better-paid people than those engaged in the ready-made clothing trade. Looking backward only a few years we have the recollecton of a movement in sympathy with a people who were being driven from Russia and other European countries. The first duty upon arrival was to procure means to provide food and shelter for themselves and families, and, being without funds, the task became a very complicated one. The inducement to learn a good trade was freely offered them, provided they would work cheap enough to warrant a sufficient return for the knowledge bestowed upon them. The custom in vogue was that the apprentice should give from one to three months at very small pay, giving from 12 to 16 hours as a day's work. The profit to contractors employing this class of help was, of course, enormous. The immense amount of available labor, of this class, has been diverted to a new method of employment which is called the task system, and to which the term "sweating" system was aptly applied. The sweating system, if conducted in workshops located in buildings devoted exclusively to manufacturing purposes, would never have obtained its present prominence in the public mind; but the competition between the employers of labor under this system resulted in a complete revision of conditions; cheaper shops were secured; large quantities of work per day were imposed upon the employed, until finally the tenement of the contractor was made to answer the double purpose of home and shop. The crowded condition of these tenements, hardly sufficiently large for the accommodation of the family, was increased by the addition of the help to be employed. All traces of home privacy were obliterated, sanitary conditions became unmentionable, filth and disease abounded and the health of the public became endangered. When these conditions were made plain to the people, fear overcame them and appeals to the State legislature for the prevention of this system of manufacture were made. These appeals led to the enactment of laws tending to restrict the manufacture of clothing in tenement-houses. The first law enacted, like most which tend to elevate the conditions of those who are obliged to labor for their living, emanated from the legislature of Massachusetts. This law provided that any house, room or place, used as a dwelling and also used for the purpose of manufacturing, should, within the meaning of the law, be deemed a workshop. The law defines a workshop as meaning any premises, room or place wherein manual labor is exercised by way of trade, or for purposes of gain, but the exercise of such labor in a private house by the family, if a majority of the persons therein employed are members of such family, shall not constitute a workshop. The law also contained a provision which was intended to prevent the importation into the State of garments which had been made under unhealthful conditions and this was enforced until similar laws were enacted in other States, particularly in the State of New York, from which the majority of this class of clothing was produced. The law also provides that any family desiring to do the work of making, repairing or finishing any coats, vests, trousers or wearing apparel of any description, in any room or apartment, in any tenement or dwelling house, shall first procure a license, approved by the chief of the inspection department. Every room or apartment in which any garments are made shall be subject to the inspection and examination of the inspectors, for the purpose of ascertaining whether the rooms or apartments are clean and free from any contagious nature. If the inspector finds evidence of infectious disease present he shall report to the local board of health.

The laws of many States require that no building which is designed to be used above the second story as a factory, or workshop, or mercantile or other establishment and has accommodations for 10 or more above the second story, and no building more than two stories in height, shall be erected until a copy of the plans thereof has been deposited with the inspectors. Such buildings shall not be erected without sufficient egress or other means of escape from fire, properly located and constructed. Such inspector may require that proper appliances shall be provided in the floors, walls and partitions of such buildings to prevent the spread of fire.

FACTORY ACTS. See CHILD-LABOR; LABOR LEGISLATION.

FACTORY CONSTRUCTION. See BUILDING LAWS.

FACTORY MANAGEMENT. There are two accepted uses of the word "factory," the meaning in any given case depending largely on the context, and the term "Factory management" similarly partakes of this usage. As commonly used the term "factory" is understood to mean a group of elements made up of land and buildings, capital and credit, equipment and men, comprising what is known as the modern factory or establishment for the conversion of raw materials into goods for sale. *Factory management* in this sense is, therefore, the organizing and directing of men and materials for the production of goods through the medium of the factory.

The broader use of the term, however, includes any group of non-self-directing employees under the control of their employer, and it is so used particularly in reference to the series of problems arising wherever conditions of grouped labor obtain — in the railroad gang, the army, the construction crew — conditions reaching their climax in what we are familiar with as the modern factory. We may, therefore, encounter factory conditions and factory problems in fighting forest fires, for instance, though in no sense would a group of fire fighters be termed a factory. But it is just this broader use of the term which must not be overlooked, for it implies considerations of peculiarly far-reaching importance to the factory manager of to-day. For under present day factory conditions we encounter a complexity of relations and problems undreamed of a few years ago, and in order that the aims, and the ends, and the methods of modern industrial or factory management may be the more readily appreciated, it is necessary first to consider some of the fundamental problems which must be faced by those engaged in industry to-day. The massing of workers, the specialization of processes and the minute subdivision of labor, the economic dependence of the employee on the employer, the aggregation of capital and plant, and the keen competition in a world market — all conditions brought on directly by the industrial revolution and its succeeding developments — and finally with the more general dissemination of education among the workers themselves the growing insistence that labor have an increased participation in the operation and fruits of industry — the problems presented through these factors are all distinctly modern problems requiring distinctly modern methods of attack and solution. Some of the broader aspects of each of these factors will be briefly discussed.

The Massing of Workers.— The very act of bringing together a large number of employees brings with it entirely new problems. With a group of half a dozen workers we encounter certain problems; multiply this number by hundreds or even thousands, and our problems immeasurably increase not only in degree but also in kind. With any aggregation of persons for any purpose we encounter the psychology of the crowd — the something within us which arises when we become one of a throng and which may, upon provocation, develop into the spirit of the mob. In the case of industry, however, to these psychological considerations must be added a third: the non-self-directing character of the groups of workers, imposing as this does the oftentimes tremendous burden of the mere physical handling and direction of our force. Taken together, these factors underlie many of the extremely delicate and far-reaching problems of organization and of management which the factory manager of today must face. What are to be the relations of the group as a whole to each individual, to each superior and to the firm as an individual? What form of organization, how administered, will best serve the true interests of each of these bodies — employer and employed? The simple organization of the small one-man business will no longer suffice. How, in the more complex organization, can there be maintained the desirable personal contact, freedom of action and play of individual initiative, together with the submission to authority necessary wherever men are grouped together for profitable production? These and scores of similar questions of organization and of management present themselves for solution the moment we bring together large numbers of individuals for any industrial purpose.

The Specialization of Processes.— It is sometimes said that the minute subdivision of labor resulting from advanced specialization of processes is all wrong, and that we should return more nearly to handicraft work. To what extent is this claim well founded, and how, if at all, do the interests of the individual and of society at large and in the long run conflict in any solution which may be evolved? On the one hand, through the expertness which results with specialization of labor, and through the increased use of machinery, goods are more cheaply produced. Sooner or later the selling price must thereupon be lowered, resulting in turn in an increased demand for the product. This increased demand must be supplied by additional labor, which reacts beneficially on the worker either through more constant employment at the same wages or through the same amount of employment at higher wages. Society at large of course also benefits. On the other hand, in certain industries and for comparatively short periods of time the individual workers, upon the sudden introduction of labor-saving machinery, have suffered through being thrown out of employment and through being unable to secure new work or work to which they could adapt themselves. Here society at large and in the long run benefits at the expense of the individual. It may at least be fairly said that there are elements both of strength and of weakness in the modern factory system of production, and if so, how are we to preserve the strong points and at the same time eliminate the dangers of this method? Is it, or is it not, a fact that there is and of necessity must be monotony in industry? That there *is* in many cases seems indisputable, but how about the *necessity* of it — are not ways being found, and may there not be other ways found to alleviate and in cases to eliminate monotony, secure the advantages of high specialization of labor, and at the same time retain free scope for individuality and personal initiative? Such measures as the interchange of work and workers, the establishment of definite and proper tasks of short duration and the payment of a bonus for accomplishment of each, allowing and expecting on the part of each operative a more detailed knowledge of each step in the processes in which he is engaged, the various industrial partnership and profit sharing plans, the suggestion box and welfare work — such measures and many others may play their part here. These considerations, together with the very recently widespread extension of fatigue studies, form a comparatively open field in the realm of industry.

The Economic Dependence of the Employee.— Grave social problems arise through the economic dependence of the employee on his employer. Previous to the industrial revolution the apprentice or journeyman who had saved up a few dollars or who, in absence of these, had attached to himself a few regular customers, could withdraw from his employer and set up in business for himself. With the introduction of machinery and its accompanying demands, however, all this was changed; he could then no longer work for himself at his option because he lacked the necessary capital or the knowledge of the proper handling of capital, or the knowledge of all technical processes involved, with which to start his business, and he must perforce join the masses of hired workers dependent on the capitalistic entrepreneur. This change brought with it actual or implied obligations on the part of the employer, with corresponding obligations on the part of the employee. Foremost among the former was the social obligation of paying at least a living wage — unfortunately not always translated into action. Regularity of employment was another obligation. Proper working hours comprised an obligation notoriously overlooked until recently. The obligation of the worker as well as of the employer in regard to the determination of a proper day's work and a proper day's pay is constantly claiming the attention of the industrial world. Then how far beyond the providing of the bare necessities of life does the employer's duty extend? The attempt to answer this question plunges us at once almost hopelessly into the realms of reasonable costs and justifiable profits, of relative abilities and commensurate rewards, of standards of living and opportunities for advancement. The paying of at least a living wage, however, the maintenance of proper working conditions, accident insurance and the prevention of accidents and the provision for open channels for advancement — all these and many other duties which the employee can little effect, devolve as social obligations upon the management rather than upon the men, due simply to the relative economic positions of the two. It is correspondingly incumbent upon the employee to give his employer honest and whole-hearted co-operation and similarly to refrain from using unjustly to the detriment of the management any power he may possess or obtain through collective action.

The Aggregation of Capital and Plant.— So much for some of the broader aspects of some modern industrial problems viewed particularly from the standpoint of the employee. No less vital questions arise in the case of the employer. The very increase in size of plant and consequently in amount of capital involved, bring forth organization and managerial problems and policies only distinctly related to any questions of human relations. The mere act of keeping the wheels in motion smoothly requires organization and system to a degree unknown previous to the development of modern methods of production. Add to this the keen, worldwide competition, involving as this does the necessity of operating at a high efficiency in order to be able to survive in industry at all, and it must necessarily follow that these complex modern requirements of production must be met by complex modern methods of management. Where shall my plant be erected and how shall it be laid out; what is the minimum amount of equipment and labor necessary; how shall my business be organized and administered; what system of controlling each of the innumerable plant activities shall I use? Am I producing more cheaply than my competitors but losing money on the whole because my methods of buying or selling are archaic? What means of increasing production or decreasing costs with a given amount of labor and equipment may I take, and what are the interacting effects of these methods upon the larger questions suggested; how shall I deal with my employees, both individually and collectively, in order to attain the industrial ends of economical production, sale at a profit and growth to the point of diminishing returns with maximum prosperity for employer and employed? From among the scores of different ways in which each of these problems may be answered, how, for my particular case, am I to know and to utilize the one best way? It is upon this phase of the broader industrial problems — the technique of production and distribution — that a large part of the more recent literature on the so-called "efficiency movement" has been written. It is significant that Frederick W. Taylor, the pioneer and father of scientific management, never allowed simple efficiency in production to become with him an end in itself, but insisted both in his work and in his writings on adherence to the fundamental principles embodying the economic welfare of all persons concerned.

Democracy in Industry.—And finally, what is to be my attitude, be I manager or workman, in regard to democracy in industry and the distribution of the profits and losses arising through my participation? The maxim of a well-known railway magnate who, several years ago, gave expression to the sentiment "The public be damned" has been found to be no less an inadmissible working formula in industry than in railroading, perhaps much to the chagrin of several "captains of industry" who were wont to substitute "workman" in place of "public." Granted that we believe that a degree of democracy in industry is to be desired, there yet remains the delicate problem of balance as between the ideal and the exact degree which our particular concern under our particular conditions at any given time, can justifiably affect. Many a concern has faced the bankruptcy court through a maladjustment, either one way or the other, of this balance. Such questions, together with those of the division of profits, require for their proper solution the best informed and broadest minded men of the age, but most of all they require the close and active co-operation of both parties — capital and labor. Such are some of the questions presented to the modern factory manager. They are all more or less interrelated and no one of them can be properly viewed except in connection with the others. Collectively, all these questions form a background necessary to the adequate solution of any one of them. Each one, furthermore, is a life study and in the present discussion it is manifestly out of the question to attempt to cover the ground in any but a very broad survey. And in what follows in regard to the technique of factory management, a proper perspective must be maintained by keeping constantly in mind the broad social questions which must form the true background for a proper solution of these more tangible factors which arise for consideration in the every-day work of the executive.

Going back to our original definition we see that factory management as ordinarily considered deals, broadly, with land and buildings, capital and credit, equipment and men — that it is the organizing and directing of these elements in an establishment adapted to attain the ends of economical production, sale at a profit, and growth at least to the point where the effect of diminishing returns counterbalances the possible advantages of further expansion. The art of organizing and directing these elements of production, selling and finance, with all that this implies, constitutes the field of modern factory management.

Organization at once becomes the keystone upon which must be reared the whole structure which is to mold, guide and direct the activities of the business. Organization as such must be distinguished from the personnel which, at any given time, is entrusted with the task of making effective the policies and principles under which we are to operate. Although personality enters into and distinctly affects the minutiæ of organization, organization must, to be permanently effective, be independent of the personality of any one man or group of men. The form of organization under which we are to operate must be determined only after a careful analysis of first: the problems which we encounter; second: the conditions under which we must solve these problems; and to a less extent third: the character of the personnel available; and as the conditions vary, so must the solution (organization) vary. A study of the evolution of organization not only reveals most interesting ramifications, but also may furnish invaluable instruction to one entrusted with the delicate task of molding the form of organization best adapted to any given enterprise. The subject may profitably be viewed from two standpoints: organization in war, and organization in industry. If we go back to primitive times we find comparatively small hordes of savages making war upon the neighboring tribes. The conditions under which they operated were simple: small numbers of warriors, individual bodily encounter with primitive weapons only, a comparatively small territory covered on foot or on horse and hence an absence of the problems of engineering and transportation, maintenance largely individual by pillage, little or no division of labor, few administrative or technical details, few problems of correlation, complete mobility. The problems were those of secrecy, surprise, control — swift, absolute control in everything. The solution was correspondingly simple: one-man control by the best, often the physically strongest, warrior. As is true generally in warfare, delay in execution becomes often more fatal than mistakes in details due to unbalanced judgment. We thus get a pure «line» form of organization — orders and directions being passed down directly from the leader to his warriors, each of whom performed all functions pertaining to the work. Up until the extensive use of gunpowder in warfare the problems and the conditions under which they had to be solved differed comparatively little from those theretofore encountered. We find the solution to minor changes to consist of minor extensions and developments of the previous form of organization — a delegation of supervisory powers to lieutenants immediately over the men, reporting directly to the one superior, who is thus somewhat relieved of the minute details of execution. With the development of modern warfare of course all this was changed. It was then no longer mentally or physically possible for the one strong man to maintain the personal touch and exercise the close supervision of all details of the operations, although it was still necessary for him to keep final control and authority absolutely to himself. This in turn made necessary an augmented means of solution, and as a result we find the development of the staff — a cardinal principle of military organization to-day. Here we have a group of expert officers under the chief of staff, reporting to the officer in command upon the innumerable specialized and technical questions encountered in modern warfare, the commander thereafter taking such action upon their recommendations as he sees fit and passing his orders down through the now numerous officers of the line until they finally reach the man in the ranks.

In industry on the other hand, previous to the industrial revolution (if we except such works as the building of the pyramids and of the cathedrals and similar construction projects) we find no grouped labor. Passing through the successive stages of industrial development as described by Bucher, of housework, wage work, handicraft and commission work, and up until the development of the factory system, we find production carried on entirely by individuals or small groups of home-workers. The problems of control — as expressed in organization — therefore were extremely simple and in many cases non-existent, seldom necessitating more than a one-man organization and perhaps entirely naturally the organization of the army served as the model and was literally copied by those engaged in industry.

With the rise of the factory system of production, however, conditions were revolutionized. Then arose the intricate questions of human relations and material management outlined in the opening paragraphs. The problems encountered were far different from those of warfare, not the least significant of which was the substitution in industry of duty and the good of the individual, for the idea of force and the good of the state which forms the background of military discipline and control.

It is, however, perhaps not strange that the traditional forms of organization of the army should have still been embodied wholesale in the activities of industry, where they remained firmly entrenched until comparatively recently. It was not until near the last of the past century that these fundamental differences between military and industrial aims and methods became consciously recognized and embodied in the various forms of industrial organization which are offered to-day as more nearly applicable to industrial needs. In closing the discussion of organization, bare mention may be made of these modern tendencies and further details must be sought in the numerous writings on the subject. One of the earlier forms was the committee system. This exists in two forms — the committee with power to enforce its decisions and the committee with advisory duties only. In the latter case the organization retains most of the disadvantages of the staff, with few compensating advantages. Both forms are found to a limited extent in industry to-day. The departmental and the divisional forms differ somewhat in operation, but are little more than the extension of the principle of division of labor. None of these forms of organization necessarily differs in principle or operation from the regular line form of the military. A fundamental departure from the military, however, is found in the modern functional organization devised by Mr. Taylor in connection with the development of scientific management. Here the staff idea is utilized, but with this fundamental difference: in the staff the individual expert performs an advisory function only, while in the Taylor functional these same experts are given administrative authority to embody the results of their knowledge in orders issued direct to men under them as regards their particular sphere of action. Under conditions where this form of organization is necessary and applicable, surprising results are secured.

So much for the various forms of organization from which the factory manager must choose that best adapted to his particular circumstances. Of the other broad division of factory management as an art — the directing, the management of personnel and material — little need be said. Sufficient outline of the various factors to be considered has been suggested to give an insight into the nature of the problems involved. The problems of finance, of division of duties, of delegation of authority and responsibility, of purchasing, of storage of materials, of planning, of shop administration, of cost, of central control of all of these and the innumerable other necessary activities of the modern factory — all such questions arise in never-ending variety in the management of the plant — problems nowise different intrinsically from those of organization previously discussed, and problems requiring for their proper solution the same careful analysis and the same adherence to fundamental principles of proved soundness and practicability. See FACTORY SYSTEM; LABOR LEGISLATION; SCIENTIFIC MANAGEMENT.

HENRY H. FARQUHAR,

Consultant in Industrial Management and Instructor in the Harvard Business School.

FACTORY SYSTEM, The. Definition. — The word factory seems to have been first used in its modern sense about 1792. Previous to this time a factor had been an agent, and all compound derivatives of this word had carried with them the idea of agentship. But with the new system of industry introduced by the Industrial Revolution (q.v.) the term seems to have been used as an abbreviation of manufactory, and in the first factory act in England in 1802 was used interchangeably with mills to designate cotton manufacturing establishments. To-day the term factory covers any establishment, with its buildings and equipment, used for the manufacture of goods. The legal definition varies widely in different States, but is usually based upon the number of workers; thus an extreme definition of factory is «any place where two or more persons are engaged in working for hire or reward in any handicraft.» As a description this is a poor definition, for it leaves out of account the essential characteristics of the system. Better is C. D. Wright's definition, «a factory is an establishment where several workmen are collected for the purpose of obtaining greater and cheaper conveniences for labor than they could procure individually at their houses; for producing results by their combined efforts which they could not accomplish separately; and for preventing the loss occasioned by carrying articles from place to place during the several processes necessary to complete their manufacture.»

Not merely has the definition of the term broadened, but the scope of the factory system has widened also. Applied originally only to the textile industry, it has gradually been extended to other branches of manufacturing, until to-day it dominates the manufacture of agricultural implements, automobiles, boots and shoes, carriages and wagons, clothing, fire-arms, metallic goods of all sorts, musical instruments, rubber goods, slaughtering and meat packing, wooden goods, watches, etc. Most of the people employed in the mechanical industries of this country to-day are working under the factory system. Indeed the principles which govern the factory system in the concentration and division of labor, the use of non-human power and of labor-saving machinery, have also been applied to other fields of economic activity such as agriculture, fishing, forestry, mining, transportation, and even personal and professional service. There can be no doubt therefore as to the importance of so universal a system.

Domestic System.— We shall perhaps better understand the factory system if we contrast it with the system under which industry was organized, at least in England, just before its introduction. This was the domestic system. According to this manufacturing — which was then truly «making by hand» (*manus-facere*) — was carried on by small masters in their own houses, with the help perhaps of a journeyman and an apprentice or two. Such a master almost always owned the implements or tools of manufacture. In some cases the raw material was the property of a middleman who simply hired the domestic worker to work it up into finished goods, while he distributed the raw material to the homes of the workers and collected the completed product. The essential feature of the system, however, to which it owed its name, was the fact that manufacturing was carried on in his own house by the domestic worker, who usually also owned a plot of ground which he cultivated as a by-industry.

Factory System.—All this was entirely changed by the introduction of the factory system. The first series of changes that may be noted was the transfer of the industry from the home to the factory, the change in ownership of the implements of production from the artisan to the capitalist employer, and the change in the power that drove the machines from the muscles of the workers to the force of falling water, and later of expanding steam. A second characteristic of the factory system was the enlargement of the business unit. The textile industry was affected less than mining and the metallurgical industries; but transportation showed the greatest development along these lines. To-day, however, large-scale production is a common characteristic of almost all factory industries. As a result of these changes capital has become increasingly important in modern industry until our present system of industrial organization is often called a «capitalistic» system rather than a factory system.

Evils.— It is obvious that no such far-reaching change in industrial organization could be effected without serious disorganization and readjustment. The transitional period during which the factory system was instituted witnesses many serious evils, some of which have not yet been altogether eradicated, and which are consequently assumed by some writers to be inherent in the system itself. To a brief consideration of these we may turn. Five criticisms were noted by C. D. Wright in an account of the system given in the Tenth Census, as follows:*

(a) The factory system necessitates the employment of women and children to an injurious extent, and consequently its tendency is to destroy family ties and domestic habits and ultimately the home.

(b) Factory employments are injurious to health.

(c) The factory system is productive of intemperance, unthrift and poverty.

(d) It feeds prostitution and swells the criminal lists.

(e) It tends to intellectual degeneracy.

In answer to these criticisms it may be pointed out that the employment of women and especially of children has been regulated and greatly reduced by factory legislation. The employment of married women and of young children is, however, still unhappily too great. On the score of health the best equipped and managed factories undoubtedly compare very favorably with the environment under which work was carried on in the home under the domestic system, but the number of dangerous and injurious trades has multiplied. The resulting evils should, however, be cared for by legislation. The next two counts may be dismissed as untrue; the factory system as such cannot be held responsible for these evils and in fact works directly against such a vice as intemperance as inconsistent with efficiency. On the last point so eminent an authority as Prof. Alfred Marshall is of the opinion that the modern factory system makes higher demands upon the intellectual capacity of the workers than any system of industrial organization which has preceded it.

Advantages.— On the other hand certain positive advantages of the factory system of industry may be noted. It makes possible a vastly greater output. That this is not more equitably distributed is indeed a serious problem of social justice, but the inequity of our present system of distribution should not be made an indictment against the system of production which gives us more to divide. It has, moreover, greatly lessened the cost of production and hence lowered the price of thousands of articles, which have thus been brought within reach of everyone. One has only to point for illustration to the myriads of articles produced under the factory system which can be found in the 5 and 10 cent stores. And finally wages, both nominal and real, have increased under this system, so that the economic position of the average factory operative is better than that of a similar worker under the domestic system. All in all, in spite of certain dark spots, the factory system may be regarded as a long step forward in the march of industrial progress. See HISTORY, MODERN.

FACULÆ, the brighter spots sometimes observed on the sun's disc. Generally they are small at first and gradually assume large proportions. See SUN.

FACULTIES, Court of, an English ecclesiastical court, under the archbishop, which creates rights to pews, monuments and particular places and modes of burial, and has also various powers in granting licenses of different descriptions, as a license to marry, a faculty to erect an organ in a parish church or to remove bodies previously buried.

FACULTY, in ecclesiastical law, a privilege or license granted to any person by favor, and not as a right to do any act which by law he may not do. In the Roman Catholic Church, permission granted by an ecclesiastical superior to a duly qualified subject to hear confessions. Such permission only extends to the district over which the superior has jurisdiction. Thus, faculties are granted by bishops to the priests in their dioceses, and by the heads of religious houses to such of their subjects as they judge qualified to hear the confessions of the community. In the United States, the term faculty indicates the body of persons who are entrusted with the government and instruction of a university or college as a whole, comprising the president, professors and tutors. It is also used for the body of masters and professors of each of the several departments of instruction in a university; as, the law faculty, etc.

FACULTY OF ADVOCATES, an incorporated society of Scottish jurists, with a membership of about 400. Practice in the higher courts of the kingdom is confined to members of the Faculty, who for admission are obliged to pass a special examination. Justices are appointed from the membership.

FADEYEV, fä-dä'yĕf, **Rostislav Andreievitch**, Russian military writer: b. 1824; d. Odessa, 12 Jan. 1884. He made more than one campaign in the Caucasus, achieving a reputation as a scientific soldier that commands respect for his 'Sixty Years of War in the Caucasus' (1860); 'Russian Military Power' (1868); 'My Opinions of the Oriental Problem' (1870); 'Letters on Russia's Present Position' (1881); and many similar writings.

FADIENSKOI, or THADDEUS ISLAND, a Russian island of the Arctic Ocean, in the province of Yakutsk. It is 100 miles long by about 40 broad. The climate is very cold the greater part of the year, but the island is inhabited.

FÆCES, the residue of food, combined with the intestinal secretions, as it passes from the body. After chyme has passed into the large intestine it is then termed fæces. During health fæces consist largely of the undigested portions of the food taken into the body. They contain microscopically many epithelial cells from different parts of the intestinal canal; shreds of mucus, bits of meat-fibre, the character of which depends upon the ingested food, and which can be determined by the microscope; vegetable detritus consisting largely of parenchymatous and vascular tissues, plant-hairs, etc.; fat-globules; bacteria of many kinds; bile pigments; and other organic residues. As the chemistry of the fæces will vary widely according to the diet, charts of chemical composition are worthless. The consistency of the fæces also widely varies. Normally, fæces should be semi-solid; if too hard, constipation is probable; if too soft and watery, indigestion may be present, or some degree of colitis (q.v.). Large quantities of mucus indicate a colitis. The color of the fæces is of much importance in determining whether the normal functions of the intestine are being carried on. In health the fæces should vary from a light to an umber brown, white to yellow fæces indicating lack of bile-execretion or loss of fat-digestion. Very black fæces often result from excessive bile-elimination, but such are more likely to be present when the drinking-water contains small amounts of mineral constituents, notably iron. Many drugs modify the color of the fæces. In children, green to greenish stools indicate either the presence of certain pigment-forming bacteria, or they mean that there is excessive fermentation or putrefaction of the intestinal contents, leading to excess of oxidation of the bile-pigments. In either case castor oil is an excellent corrective. Tarry fæces, resembling coffee-grounds in color, usually indicate the presence of blood high up in the intestinal canal. If bleeding occurs in the large intestine or rectum, red is the prevailing tinge. Small quantities of blood color the fæces orange, like paprika. Cocoa and huckleberries cause a coloration of the fæces that may be mistaken for blood. Colorless or gray-colored stools usually indicate some form of biliary obstruction; or, perhaps from fatty indigestion, an excess of fat passed either from lack of bile-emulsion action or from loss of fat-absorption. Children taking cod-liver oil often have light-colored stools. These should be carefully studied to determine if digestion of the oil is taking place. Disturbance of the functions of the pancreas may also cause light-colored or fatty stools. The study of the color of the stools is of immense practical importance in medicine, and careful observation of this matter by the patient may be of immense service to the physician. In birds, fishes and reptiles, and in some mammals, urine is mixed with the fæces before they leave the body. See INTESTINES.

FAED, fād, **John**, Scottish artist: b. Burley Mill, Kirkcudbrightshire, 1820; d. Gatehouse-of-Fleet, Scotland, 22 Oct. 1902. In 1841 he went to Edinburgh to study, soon won a considerable reputation as a portrait and subject painter, and was elected a member of the Royal Scottish Academy in 1852. In 1851 he exhibited a work entitled 'The Cruel Sisters,' and this was followed by 'The Cotter's Saturday Night' (1854); 'The Philosopher' (1855); 'The Household Gods in Danger' (1856); 'Job and his Friends' (1858); and 'Boaz and Ruth' (1860). Going to London in 1862, he began to exhibit in the Royal Academy also, some of his pictures shown since that date being 'Catherine Seyton' (1864); 'Old Age' (1867); 'John Anderson, my Jo' (1869); 'After the Victory' (1873); 'The Morning before Flodden' (1874); 'Blenheim' (1875); 'In Memoriam' (1876); 'The Old Basket-Maker' (1878); and 'The Poet's Dream' (1883). His work invariably displays careful drawing, but his coloring is somewhat hard.

FAED, Thomas, Scottish artist: b. Burley Mill, Kirkcudbrightshire, 8 June 1826; d. London, 17 Aug. 1900. He was a brother of John Faed (q.v.), and at an early age became known as a clever painter of rustic subjects. The subjects of his brush are for the most part domestic or pathetic, which he depicted with a tender idealism that appealed strongly to the public taste. He was elected a member of the Royal Academy in 1864. Among his principal works are 'Sir Walter Scott and his Friends' (1849); 'The Mitherless Bairn' (1855); 'The First Break in the Family' (1857); 'His Only Pair' (1860); 'From Dawn to Sunset' (1861); 'The Last o' the Clan' (1865); 'Pot Luck' (1866); 'Worn Out' (1868); 'Homeless' (1869); 'The Highland Mother' (1870); 'Winter' (1872); 'Violets and Primroses' (1874); 'She Never Told her Love' (1876); 'Maggie and her Friends' (1878); and 'Rest by the Stile' (in the Metropolitan Museum, New York).

FAENZA, fä-en'zä (ancient FAVENTIA), Italy, episcopal city, in the province of Ravenna, on the river Lamone, 19 miles from the city of Ravenna. The cathedral of San Costanzo, begun in the 14th century, contains the exquisite early Renaissance tomb of Saint Savinus. It is noted for its glazed earthenware, called Faience (q.v.), the manufacture of which was famous from the 15th century and has been recently revived. Others of its manufactures are majolica, silk goods and refined sulphur. In the neighborhood are ferruginous and saline springs of considerable repute. Faenza is connected with the Adriatic by the Zanelli Canal, opened in 1782. It claims to be the birthplace of Torricelli. Its history extends into the times before the Christian era, and many changes in government took place before 1509, when it was annexed by Julius II to the states of the Church. In 1860 it became a part of the kingdom of Italy. Pop. of the commune 40,164.

FAERIE (fā'er-ē) **QUEENE, The.** An epic poem by Edmund Spenser, published in 1590 (Books I–III) and in 1596 (Books IV–VI); a fragment of another book, consisting of two cantos on «Mutability,» was published in 1609. The poem was planned in 12 books, each book containing 12 cantos; Spenser completed little more than half his design. His purpose, as set forth in his letter to Raleigh, was «to fashion a gentleman or noble person in virtuous and gentle discipline,»— thus like Castiglione's ‹The Courtier› and other influential books of the time, the ‹Faerie Queene› was designed to be a guide to conduct for men who were entering the service of the state. Conforming to current critical doctrine, instruction in the cardinal virtues characteristic of the illustrious prince is to be gained best through the study of poetry, not history or moral philosophy. (Besides the letter to Raleigh, consult also Sidney's ‹Defense of Poetry›). Accordingly, epic poetry was held to be an allegory of the perfect hero: Homer so portrays «the good governor» in his Agamemnon and «the virtuous man» in his Ulysses; Virgil combines the two in his Æneas, while Tasso's Rinaldo is the ideal «private man» and his Godfrey the ideal ruler. Based on this theory, the ‹Faerie Queene› was to deal with the «twelve private moral virtues, as Aristotle hath devised,» in the person of Arthur before he became king; Spenser hints that he may treat Arthur as king in a second epic.

The plan was to be worked out by devoting each book to the exploits of a knight distinguished for a cardinal virtue. Saint George, the Red Cross Knight (Book I), represents Holiness; Guyon (Book II) represents Temperance in the classical sense of self-restraint; Britomart (III), a female knight, stands for Chastity; Cambell and Triamond (IV) for Friendship; Artegal (V) for Justice; and Calidore (VI) for Courtesy. Prince Arthur, who stands for Magnificence or Magnanimity, appears in several books; first, in his quest for Gloriana, the Faerie Queene, and second, as an assistant to the hero of the book in a crisis. This does not indicate incoherence of design, as some critics maintain, but follows the familiar construction of the Arthurian romances, where Gawain or Lancelot or Perceval, or whoever happens to be «the greatest knight in the world,» is introduced at a crisis in the fortune of the hero whose adventures are being narrated.

Spenser's use of the Arthurian romances is interesting and original. None of the great knights familiar in Malory and elsewhere appears; none of the great stories afterward used by Tennyson finds a place. The Holy Grail, for example, is barely mentioned. Yet the basis of the plot is familiar to any reader of the metrical romances of France and England. The Faerie Queene holds a feast lasting 12 days, on each of which an «adventure» takes place. On the first day a «clownish young man,» who reminds us of Perceval or of Gareth, begs the boon of any «adventure» that may befall; he is sent with Una to free her parents from the thraldom of a dragon. On the second day a Palmer bearing a babe with bloody hands calls for a champion to slay Acrasia, the enchantress who wrought the woe, and Sir Guyon is assigned the task. On the third day Scudamore is sent to free Amoret from an enchanter, but his adventure is completed by Britomart. But all this explanatory matter is set forth in the letter to Raleigh; Spenser follows Virgil and other poets in beginning «in the midst,» and the epic did not arrive at the point where the setting could be given in verse. Moreover, Spenser follows the late mediæval romances in giving to familiar romance situations allegorical or mystical significance. Thus, Galahad's delivery of the Castle of Maidens, which in the Grail cycle had come to symbolize Christ delivering mankind from the Seven Deadly Sins, is used by Spenser. The quest, also, appears in many forms. For example, the quest of Red Cross for the dragon reaches a climax in a three days' battle in which the monster stands for Satan, who has long held the human race (Castle Mortal) in bondage; the three days' battle symbolizes Christ's victory over Death and Hell so often met in mediæval legend. Spenser's poem is filled with such reminiscences of the Arthurian romances; their influence on him is far more pervasive than the debt, largely exaggerated, to Ariosto and Tasso, from whom he derives, as from the classics, many matters of detail.

Spenser uses the technique of romance for a more carefully elaborated moral allegory than had been developed in the mediæval cycles. Thus, Book I shows how Holiness (Red Cross), accompanied by Truth (Una), slays the dragon of Error. Again the adventures of Guyon (Book II) symbolize the course of temperance through life, avoiding extremes of gloom or of false joy, avoiding wrath and excessive passion, conquering desires for wealth or sensual enjoyment. The allegory of the poem is complex: there is the type found in mediæval moral plays, representing the conflict of vices and virtues; there is the mystical interpretation of Christian doctrine; there is also translation of Plato's idealism into allegorical story. To blend with a conception so complex as this the Renaissance ideal of the perfect courtier (Spenser has in mind a man of affairs like Sidney, not a mediæval ascetic saint) rendered it impossible for the poet to use Malory's version of the Arthurian legend in any complete or definite way. Yet the chief clue to his method is to be found, not in his moral and religious allegory, which has been too much stressed in Spenser criticism, but in his purpose to shadow forth his conception of the greatness of Elizabethan England and of its destiny. To bring this out, he represents, in Prince Arthur, the English realm; Gloriana, the Faerie Queene, is Elizabeth *Tudor.* Fundamentally the poem means that the return of the old Welsh (Fairy) line, represented in the Tudors, to the government of England is the source of England's present greatness. He distinguishes carefully between fairy knights like Guyon and English knights like Saint George (Red Cross). The Queen of the Fairies appears to Prince Arthur in a vision of a type familiar in Celtic folklore, and promises in due time to give herself to him; England, personified in Arthur, seeks to realize this vision, made complete when Elizabeth rules. Thus the poem glorifies the ancestry of the reigning house according to the rules of Renaissance epic.

But there is yet more. Artegal, knight of Justice, loves Britomart, the martial spirit of England. Justice united with British might points out a new destiny. Artegal's quest is to free Irena (Ireland) from Grantorto (Philip of Spain). In this book also Prince Arthur rescues Belgæ (the Netherlands) from the Spanish monster, and Duessa (Mary of Scotland) is adjudged worthy of death. Thus certain crucial events in Elizabeth's reign are set forth: the conflict with Spain necessitated the crushing of the Irish rebellion, fomented by Philip; it necessitated also the aid sent to the Netherlands, crushed by Philip's vast cruelty, and the execution of Mary, the chief means through which Philip plotted the destruction of free England. In a later book, Spenser no doubt would have included the final triumph over the Armada. Furthermore, this exposition has a direct bearing on the foreign policy of Elizabeth and is a defense of that school of politics that held it to be England's duty to emerge from isolation, to take part in continental politics, to substitute for diplomatic intrigue positive action on behalf of the oppressed in the Low Countries and in France against the sinister shadow of Philip's ambition for world power. The poem is not merely a moral allegory of abstract virtues, not merely a glorification of the Queen, but a positive and almost defiant defense of a greater nationalism that led eventually to the establishment of British sea power and the imperial domain. Raleigh, «the Shepherd of the Ocean,» is recognized by Spenser as a leader in this progressive movement, as he also recognized Leicester and Essex and opposed the more conservative policy of Lord Burghley.

Besides these allegories of moral and political ideas, which appealed to Elizabethan love of symbolism and shadowed forth the romantic idealism of the time, are many lovely features that deepen the picture. Such are Calidore's wooing of the shepherdess Pastorella, as charming as the pastoral scenes in Shakespeare's ‹Winter's Tale›; or the flight of Britomart with her nurse to Merlin's cave, there to learn of Artegal; or the stories of Florimel and of Amoret. These stories, and many other strands in the complex web of Spenser's weaving, are of the very essence of romance — the light that never was on sea or land that Wordsworth meditated upon, or the faery lands forlorn recalled to momentary life in the poetry of Keats. In this is one secret of Spenser's influence upon later English poetry, an influence more pervasive than Chaucer's or Milton's or even Shakespeare's. It is not that he is a master of narrative: one who desires merely a story had best go elsewhere. It is not that he recreates the world of chivalry as Malory or Chrétien had seen it in earlier times. He draws upon all sources; ancient and mediæval, romance and allegory; his learning is enormous; one stanza may be compounded of samples from many fields. But it is all fused, through the magic of his imagination, into a new unity that we feel rather than see. His sources are a thousand romances, but he is romance incarnate.

Partly this is due to his wonderful stanza. The foundation of it is not *ottava rima,* as is often said, but an eight-line stanza adapted by Chaucer from the French and having the same rhymes: ababbcbc. To this Spenser added an alexandrine that repeats the third rhyme. Singularly adapted to the genius of one who has been called «the painter of the poets,» Spenser gets from it an astonishing variety of effects through his mastery of alliteration, vowel stress, repetition, and epithet. The music of bird song and running water is in it, the opulence of taste and touch («He seems to feel with his eyes»)— the pictures in language that the poets of the Renaissance sought to paint. These pictures are not alone of the kind often associated with his poem,— an enchantress in a Bower of Bliss, or some vividly wrought epic simile. Colin's fairy hill, a stream of living water at its base, guarded by fairies from every noisome thing; a little open place outside the stream, and beyond, as a frame for the picture, woods of matchless height that seemed to disdain the earth, is one example of his painting; another is the scene of the hundred furnaces in the Underworld, surrounded by swarms of dwarfs engaged in stirring the molten ore with great ladles, with the sudden apparition of the Fairy Knight, «glistering in armes and battailous array.»

Though Spenser's genius is not primarily dramatic, this element in his work is not wanting. He often refers to the theatres and to acting, and among his lost works we read of nine comedies. The masques of the «Faerie Queene» — the Temple of Venus, the Masque of Cupid, the Gardens of Adonis, the Seven Deadly Sins, the Masque of the Seasons, and others — form a constant element in his work. The journey of Guyon through the Underworld is both masque and drama, as is also the overthrow of the enchanter Busirane by Britomart. In comparison with these, the masques introduced by Shakespeare into his plays are pale and ineffectual. The tragi-comedy of Malbecco is excellent throughout, and reminds one, in its power of characterization and its edged humor, of Jonson or Massinger. Spenser's characters are not all pale abstractions, creatures of boundless virtue or ugly vice. Britomart has the spirit, the bravery, as well as the beauty of Beatrice, and like Beatrice she is adorably feminine. Una is as lovely and appealing as Hermione; Pastorella is another Perdita. Guyon's career is no succession of tilts with abstractions; the conflict is as real as in many an Elizabethan tragedy, with victory for his reward.

But these are mere details, their only service being to recall once more the infinite variety of the elements composing the poem. The abiding impression which it leaves upon the mind is that of a succession of marvelous dissolving views, a panorama in which the antique and mediæval worlds are blended with the epic-like life that England then was living. This life Spenser views through Merlin's magic glass, to which time and space are immaterial, and all human experience is but the semblance of things not seen.

EDWIN GREENLAW,
Kenan Professor of English in the University of North Carolina.

FAEROE ISLANDS. See FAROE ISLANDS.

FAESULÆ. See FIESOLE, Italy.

FAFNIR, fäf'nĕr, in the mythology of the Nibelungenlied, a son of the magician Hreidmar. In the form of a dragon he guarded the gold which was paid in atonement for the death of Otr, and was slain by Siegfried.

FAGAN, James Bernard, Irish dramatist: b. 18 May 1873. He was educated at Clongowes Wood College and Trinity College, Oxford. Intended at first for the church, the bar or the Indian Civil Service, he abandoned in turn all three and went on the stage. He was with F. R. Benson for two years, 1895–97, and with Sir Herbert Beerbohm Tree in 1897–99, retiring in the latter year. He produced 'The Rebels' (1899); 'The Prayer of the Sword' (1904); 'Hawthorne, U. S. A.' (1905); 'Under which King' (1905); 'A Merry Devil' (1909); 'The Earth' (1909); 'False Gods,' a translation (1910); 'The Dressingroom' (1910); 'Bella Donna,' an adaptation (1911).

FAGEL, fä'hĕl, **Frans Nicolaas,** Dutch soldier: b. Nimwegen 1645; d. Sluys 23 Feb. 1718. He was a nephew of Gaspar Fagel (q.v.), entered the military service in 1672. He distinguished himself in the battle of Fleurus 1690, and the famous defense of Mons, 1691, was directed by him. He also displayed great military talent at the siege of Namur, at the capture of Bonn and in Portugal 1703, in Flanders 1711 and 1712, at the battles of Ramillies (1706) and Malplaquet (1709).

FAGEL, Hendrik, BARON, Dutch statesman: b. 1765; d. 1834. He received his education at the University of Leyden and in 1787 became second secretary to the States-General; afterward he became secretary. With Van de Spiegel he was commissioned in 1794 to make a treaty of alliance with England and Prussia. When the princes of Orange became exiles Fagel accompanied them. In 1813 he was named Ambassador to England and remained in that post until 1824. With Lord Castlereagh he signed the London Convention, under the terms of which many of her colonies were restored to Holland. In 1829 Fagel was appointed minister without portfolio.

FAGEL, Kaspar or **Gaspar,** Dutch statesman: b. The Hague 1629; d. 1688. He was made pensionary of Haarlem in 1663 and seven years later became secretary to the States-General. He succeeded De Witt as grand pensionary. He allied himself with William of Orange and took a large part in having the latter declared hereditary stadtholder. To him also is due no small part of the credit for the accession of William to the throne of England after the Revolution of 1688. Fagel's incorruptibility and patriotism was demonstrated by his refusal of a bribe of 2,000,000 francs from Louis XIV.

FAGERLIN, fä'gĕr-lēn, **Ferdinand Julius:** b. Stockholm, 5 Feb. 1825. In 1854 he began his art studies and entered the Academy of Stockholm; thence he passed to Düsseldorf and finally became a pupil of Couture at Paris. From Düsseldorf he started on a professional journey northward for the purpose of studying sea and coast life in Holland. The pictures he then painted are true to nature, subtle in characterization and abound in wholesome humor.

FAGGING, in the schools of intermediate or secondary education in England, a term designating the services which boys of the lower forms are by custom obliged to render to the boys of the upper forms. Usually a lower-form boy is assigned to an upper-form boy, whose "fag" he is then said to be. For his master he performs various services, but never menial. Consult Hughes, 'Tom Brown's School Days.'

FAGIN, fä'gin, a despicable Jew in Dickens' 'Oliver Twist.' He is represented as training up children in crime in order to profit by their thievish practices and condemned to be hanged for receiving stolen goods.

FAGIUS, Paul (German, Büchlein), German reformer and Hebraist: b. Rheinzabern, in the Palatine, 1504; d. Cambridge, England, 1549. He studied at Heidelberg and Strassburg; at the latter place giving special attention to Hebrew under the direction of Wolfgang Capeto. He was made pastor at Isny in 1537 and here he continued his Hebrew studies under Elias Levita. He set up a printing press from which he issued several Hebrew works. In 1542 he became professor of Hebrew at Strassburg and later held similar chairs at Constance and Marburg. In 1546 he went to Heidelberg, where he joined the Reform Party. He was deposed in 1549, and in the same year was invited by Cranmer to England. He died soon after his arrival. Queen Mary in 1557 caused his body to be exhumed and burned. Fagius left several commentaries on books of the Old Testament. His 'Hebrew Grammar' (1543) was important in its day.

FAGNANI, fän-yä'nē, **Joseph,** Italian painter: b. Naples, Italy, 1819; d. 1873. He studied at Vienna and Paris, and came to the United States with Sir Henry Bulwer in 1849; here he painted 'The Nine Muses' (portraits of New York women), now in the Metropolitan Museum. He also painted many European celebrities.

FAGNIEZ, fa'nyâ', **Gustave Charles,** French historian: b, Paris 1842. He received his education at the Ecole des Chartes and the Ecole des Hautes-Etudes and secured a post in the department of national archives. Subsequently he was member of the commission of diplomatic archives under the direction of the Minister of Foreign Affairs. He was one of the founders of the Historical Society of France and became a member of the editorial staff of the *Revue Historique.* He has published several works dealing mainly with economic history. These include 'Etudes sur l'industrie et la classe industrielle à Paris au XIIIe et au XIVe siècle' (1877); 'La mission du père Joseph à Ratisbonne' (1885); 'Le père Joseph et Richelieu' (1894); 'L'Economie sociale de la France sous Henri IV' (1897); 'Documents relatifs à l'histoire de l'industrie et du commerce' (2 vols., 1898–1900); 'Le duc de Broglie' (1902); 'Corporations et syndicats' (1905).

FAGOT, a bundle of sticks or small branches of trees bound together. In times of religious persecution the fagot was a badge worn on the sleeve of the upper garment of such persons as had abjured heresy, being put on after the person had publicly carried a fagot to some appointed place, by way of penance. Among military men in England, fagots were persons hired by officers whose companies were not full, to muster and hide the deficiencies of the company, and thus cheat the government.

FAGOT-VOTE, in Great Britain, was a vote manufactured for party purposes by the transfer to persons not otherwise legally qualified of sufficient property to qualify them as electors. Estates were divided up into what was called 40-shilling freeholds, to each of which a bogus proprietorship (with a vote) might attach; but under the Franchise Act of 1884 this qualification was abolished and fagot-votes can no longer be manufactured.

FAGOT-WORM, a caterpillar of a moth of the genus *Eumeta,* which in Ceylon is common on the coffee-trees. It forms a pupa case of silk covered with small sticks, so that it looks like a bundle of fagots; and local folk-lore explains that these worms are the abode of the souls of persons who in their lifetime were thieves of firewood. These moths are related to the bag-worm moths (q.v.).

FAGOTTO, fa-got'tō, a brass wind instrument, blown with a reed, which can be taken in pieces and carried like a bundle of fagots, hence the name; a bassoon (q.v.).

FAGUET, fa'gā, **Emile,** French litterateur and academician: b. La Roche sur Yon Vendée, 17 Dec. 1847; d. Paris, 7 June 1916. He was educated at the Lycée Charlemagne, Paris, and was graduated from l'Ecole Normale in 1867. He taught for some time at La Rochelle and Bordeaux. Later he came to Paris, where he became professor of poetry in the university in 1890, and was elected to the Academy in 1900. His works include 'La tragédie au XVIe Siècle' (1883); 'Le Théâtre contemporain' (1880–91), comprising his dramatic criticisms; 'Dix-huitième siècle' (1890); 'Seizième siècle' (1893); 'Drame ancien, drame moderne' (1898); 'Histoire de la littérature française' (1900); 'La politique comparée de Montesquieu, Rousseau, et Voltaire' (1902); 'Propos Littéraires' (1902); 'La Pacifisme' (1908); 'Les Préjugés nécessaires' (1911); 'Monseigneur Dupanloup, un grand évêque' (1914). He rehabilitated especially the literature of the 17th century, and took an active interest in the criticism of the modern drama, of politics and even of philosophy.

FAGUS, the typical genus of the Beech family (*Fagaceæ*). The genus has five species, natives of the northern hemisphere, only one of which, the common beech (*F. Americana*), is native to the United States. All the species are trees with smooth gray bark and serrate leaves, the flowers and leaves appearing together. The name is from the Greek, to eat, referring to the edible nuts. See BEECH.

FAHAKA, an edible globe-fish (*Tetraodon fahaka*), singular in inhabiting the fresh waters of the Nile.

FA HIEN, fä hē-ĕn', Chinese monk and explorer: he was born in Wu-Yang, province of Shan-si, in the 4th century, A.D. In the 15 years from 399 to 414 he traveled in India, Khotan and Tibet in the company of other Chinese pilgrims to the great Buddhist festivals. He penetrated Kashmir, Kabul, Kandahar, the Punjab and central India. In all he spent 10 years in India in quest of information about Buddhism and its founder. He also sought complete texts of the 'Vinaya-pitaka.' He went to Ceylon and there copied other sacred texts. From Ceylon he journed to Java, whence he re-entered his native country. His 'Fo-kue-ki,' written after his return, is a full account of his wanderings in the Buddhist countries. This work appeared in a French translation (Paris 1836) and in English by Beal (2d ed., London 1884), Giles (Shanghai 1877), and Legge (Oxford 1886). Consult Beazley, 'Dawn of Modern Geography' (3 vols., Oxford 1904–06); Giles, 'History of Chinese Literature' (New York 1901).

FAHLCRANTZ, fal'krănts, **Christian Erik,** Swedish divine and poet: b. Stora Tuna, Falun, 1790; d. 1866. From 1839 to 1852, in conjunction with Almqüist and Knös he issued the *Ecclesiastical Journal.* He wrote several polemical works and also several long poems. He was appointed bishop of Westerås in 1849. His greatest work is the humorous satire 'Noach's Ark' (1826). Consult 'C. E. Fahlcrantz: Samlade Skrifter' (7 vols., Oerebro 1866).

FAHLCRANZ, fäl'krănts, **Karl Johann,** Swedish landscape-painter: b. Dalecarlia, 29 Nov. 1774; d. Stockholm, 1 Jan. 1861. Studying nature diligently, he became a self-educated artist. He was acquainted only with northern scenery, but has given it with great fidelity and spirit.' His principal productions are in the possession of the King of Sweden.

FÄHLMANN, fäl'man, **Friedrich Robert,** Russian philologist: b. Esthonia, 1800; d. 1850. At the University of Dorpat he studied medicine and philology and in 1842 was appointed lecturer on the Esthonian language at that seat of learning. He collected a vast amount of material which he edited. His biographer, Kreutzwald, published it under the title 'Kalevipoeg' (1857–61).

FAHNE, fa'nē, **Anton,** German historian: b. Münster, 1805; d. 1883. At Bonn and Berlin universities he studied medicine, law and theology. He is remembered for his histories of episcopal sees, cities and noble houses of Westphalia and the Rhine District. They include 'Forschungen aus dem Gebiet der rheinischen und westfälischen Geschichte' (5 vols., 1864–75); 'Denkmale und Ahnentafeln in Rheinland und Westfalen' (6 vols., 1883); 'Lioland; Ein Beitrag zur Kirchen-und Sittengeschichte' (1875).

FAHRENHEIT, fä'ren-hīt, **Gabriel Daniel,** German physicist: b. Dantzic, 14 May 1686; d. Amsterdam, 16 Sept. 1736. He settled in Holland, where in 1720 he first conceived the idea of using quicksilver instead of alcohol in thermometers — a discovery by which the accuracy of the instrument was very much improved. He took, as the limit of the greatest cold, that which he had observed at Dantzic in the winter of 1709. The space between the point to which the quicksilver fell at this temperature, and that to which it rose in boiling water, he divided into 212 parts. About 1724 he discovered the fluctuation of the boiling point of water, which he had made one of the fixed points of his thermometer. Fahrenheit's thermometer owed its beginnings to the invention of a thermometer by Newton, described in the 'Philosophical Transactions' for 1701. Newton's instrument was a tube filled with linseed oil, and the starting-point of the scale was the temperature of the human body, which Newton called 12. Newton divided the space between his datum and the freezing-point of water into 12 equal parts, and stated that the boiling-point of water would be about 30 of these degrees on the scale. Fahrenheit, when he began to work with Newton's thermometer, did not find the scale minute enough for his purposes. He therefore first doubled the number of degrees, making the scale number 24 instead of 12. Finding he could, by mixing ice and salt, obtain a temperature below freezing, Fahrenheit next adopted this for his starting-point and counted 24° up to body heat, making the freezing-point 8 and calling boiling water 53. Later on he again divided his degrees into four. It will be seen that if the above figures are multiplied by four, the result is the thermometric scale called after him which is still in use. He was elected to the Royal Society of London in 1724, and contributed five papers on physics to the 'Transactions' for that year.

FAIDHERBE, Louis Léon César, loo-ē lā-ôṅ sā-zär fā-därb, French general and author: b. Lille, 3 June 1818; d. Paris, 29 Sept. 1889. Entering the army in 1840, he became lieutenant in 1842. From 1854 till 1861, and again from 1863 till 1865, he was governor of Senegal, in which capacity he considerably extended the French possessions there. After the fall of Napoleon III, he was summoned by the government of National Defense to France and appointed commander of the army of the north, and at Baupaume and Saint Quentin displayed military ability of a high order. In the latter part of his life he went on a mission to Egypt to study the monuments and hieroglyphics. He was called to the Senate in 1879, and was Chancellor of the Legion of Honor. He wrote valuable monographs on Senegal, the Sudan and other parts of Africa, including 'L'Avenir du Sahara et du Sudan' (1863); 'Collection complète des inscriptions Numidiques' (1870); 'Nouvelles inscriptions Numidiques' (1872); 'Langues Sénégalaises' (1887); and 'Le Sénégal: la France dans l'Afrique Occidentale' (1889). On the Franco-German War he published 'Campagne de l'Armée du Nord en 1870–71' (1872).

FAIENCE, fā'äns', spelled also formerly *fayence* and *fayance*. Originally this term was given to designate the opaque tin-enameled ware made in France which came into being by imitating, first at Nevers (1600), the Italian majolica. (See MAJOLICA). A long mooted point is whether the term is derived from the Italian town Faenza or from Faïence, in France. The term was later used to express any tin-enameled ware, such as Delft (see DELFT FAIENCE) and those made in imitation elsewhere. It has at last become the term for any art pottery, hence takes in majolica, Persian lustre pieces, Hispano-Moresque, and even the lightly glazed «Henri Deux» (see SAINT PORCHAIRE) ware, Wedgwood (see WEDGWOOD), Palissy (see PALISSY); and the modern felspathic art-decorated «stone china,» etc., have been termed *faience fine,* or *faience anglaise.* Among connoisseurs the word faience is still, generally, considered to define a soft, porous bodied earthenware covered with opaque tin-enamel and decorated in colors. This takes in the following factories:

Of 16th century fabriques in France the earliest was Nevers (the Conrades), to be followed by Rouen (see ROUEN), Palissy ware; Lyons, Beauvais, Rennes. Outside France, Hirschvogel was working in Nuremberg; Talavera (Spain) and Delft (see DELFT FAIENCE) were active centres of faience. In the 17th and 18th centuries the following factories (among others) were added: Paris (Claude Révérend), Saint Cloud (the Chicaneaus), Bordeaux, Clermont-Ferrand, Sceaux-Penthièvre (Chapelle), Sinceny, Strassburg and Haguenau (the Hannongs), Moustiers (see MOUSTIERS), Marseilles (the Clerissys, Savy, Viry, etc.), Niderviller (Lemire), Lunéville (Cyfflé), Sarreguimines, Aprey (Ollivier), Lille (Boussemaert), Saint Denis, Apt, La Rochelle, Valenciennes, Bourg-la-Reine, Varages, Rubelles, Orléans, Saint Amand-les-Eaux, Desvres, Aire, Saint Omer, Chantilly, Creil, Saint Paul, etc. French ceramists of note for decorative wares in modern times are Deck, Boulenger, Guidan, Optat Millet, Ulysse de Blois, Parvillée, Haviland, etc.

Faience Fine.— When Astbury or Heath (undecided which), in England, discovered (1720) the use of ground flint (silica) to give a white slip coating to the colored local clays, they were enabled to make a ware similar in appearance to Delft; but the slip did not fuse and a glaze had to be added. The noted «cream-colored» body (see POTTERY) soon developed and revolutionized pottery making the world over. «China clay» and «china stone» (felspar clays) added to the flint produced a perfectly white hard body, and the English had the *faience fine* or *faience anglaise* that put an end to making coated or enamelled wares. It is the «standard» body used universally to this day.

perature, and that to which it rose in boiling water, he divided into 212 parts. About 1724 he discovered the fluctuation of the boiling point of water, which he had made one of the fixed points of his thermometer. Fahrenheit's thermometer owed its beginnings to the invention of a thermometer by Newton, described in the 'Philosophical Transactions' for 1701. Newton's instrument was a tube filled with linseed oil, and the starting-point of the scale was the temperature of the human body, which Newton called 12. Newton divided the space between his datum and the freezing-point of water into 12 equal parts, and stated that the boiling-point of water would be about 30 of these degrees on the scale. Fahrenheit, when he began to work with Newton's thermometer, did not find the scale minute enough for his purposes. He therefore first doubled the number of degrees, making the scale number 24 instead of 12. Finding he could, by mixing ice and salt, obtain a temperature below freezing, Fahrenheit next adopted this for his starting-point and counted 24° up to body heat, making the freezing-point 8 and calling boiling water 53. Later on he again divided his degrees into four. It will be seen that if the above figures are multiplied by four, the result is the thermometric scale called after him which is still in use. He was elected to the Royal Society of London in 1724, and contributed five papers on physics to the 'Transactions' for that year.

FAIDHERBE, Louis **Léon César**, loo-ē lā-ôṅ sā-zär fā-därb, French general and author: b. Lille, 3 June 1818; d. Paris, 29 Sept. 1889. Entering the army in 1840, he became lieutenant in 1842. From 1854 till 1861, and again from 1863 till 1865, he was governor of Senegal, in which capacity he considerably extended the French possessions there. After the fall of Napoleon III, he was summoned by the government of National Defense to France and appointed commander of the army of the north, and at Bapaume and Saint Quentin displayed military ability of a high order. In the latter part of his life he went on a mission to Egypt to study the monuments and hieroglyphics. He was called to the Senate in 1879, and was Chancellor of the Legion of Honor. He wrote valuable monographs on Senegal, the Sudan and other parts of Africa, including 'L'Avenir du Sahara et du Sudan' (1863); 'Collection complète des inscriptions Numidiques' (1870); 'Nouvelles inscriptions Numidiques' (1872); 'Langues Sénégalaises' (1887); and 'Le Sénégal: la France dans l'Afrique Occidentale' (1889). On the Franco-German War he published 'Campagne de l'Armée du Nord en 1870–71' (1872).

FAIENCE, fā'äns', spelled also formerly *fayence* and *fayance*. Originally this term was given to designate the opaque tin-enameled ware made in France which came into being by imitating, first at Nevers (1600), the Italian majolica. (See MAJOLICA). CLEMENT W. COUMBE.

FAILLON, Michel Etienne, mē-shel ā-tē-en fā-yôn, French historical writer: b. Tarascon, France, 1799; d. Paris, 25 Oct. 1870. He was a Sulpician and visited Canada in 1854 to investigate the houses of that order. He wrote lives of noted French-Canadian religionists such as Mme. d'Youville (1852); and Mlle. France (1854); a history of the Church in North America (1853), and a comprehensive history of the French in Canada, three volumes of which appeared (1865–66) before his death. His 'Life' was published at Paris in 1877.

FAILLY, fa'yē', **Pierre Louis Charles de,** French soldier: b. Rozoy-sur-Serre, 1810; d. 1892. He received his military training at Saint-Cyr and after graduation joined the army in Algeria. At the outbreak of the Crimean War he was gazetted brigadier-general. He was a division commander in Italy in 1859 and took part in the battles of Magenta and Solferino. In November 1867 he defeated Garibaldi at Mentana. At the beginning of the war with Prussia in 1870 the emperor appointed him commander of the Fifth Army Corps. At Beaumont on 30 Aug. 1870 he commanded the right wing of McMahon's army, but was forced to retreat, leaving McMahon's right unprotected and resulting in his retreat being cut off. The direct result was the capitulation after Sedan, and an immediate consequence to Failly was his removal and Wimpffen's succession to his post. In 'Campagne de 1870: Opérations et marche du 5ème Corps jusqu'au 31 août' (1871) he defended his conduct of operations.

FAILSWORTH, England, town in Lancashire, four miles north by east of Manchester, on the Lancashire and Yorkshire Railway. Cotton manufacturing is the principal industry. The electric-lighting and tramway services are supplied from Manchester. Pop. 15,098.

FAILURE. See BANKRUPT.

FAIN, fān', **Agathon Jean François,** BARON, French historian: b. Paris 1778; d. 1837. In 1806 he became secretary of the Imperial archives, three years later was created baron and in 1813 became private secretary to Napoleon I. He served the Emperor faithfully until 1815 and drew up the papers of abdication. In 1830 Fain was appointed first secretary of the Cabinet and served three years as deputy from Montargis in 1834–37. He published several memoirs, including 'Manuscrit de 1814, contenant l'histoire des six derniers mois du règne de Napoléon' (1823; 4th ed., 1906); 'Manuscrit de 1813' (2d ed., 1825); 'Manuscrit de 1812' (2 vols., 1827); 'Manuscrit de l'an III' (1828). His 'Mémoires' were published in 1908.

FAINÉANTS, fā-nā-āṅ, or **DO-NOTHING KINGS,** the name given in French history to some of the Merovingian sovereigns, who were the puppets of the mayors of the palace. The last of these kings was Childeric III.

FAINT (syncope), a peculiar form of sudden loss of consciousness. Impoverishment of the blood, lowered vitality from any cause, an overwrought nervous system and disease of the circulatory system predispose to such attacks. The immediate cause is an anæmia of the brain. This sudden cerebral anæmia is most frequently due to shocking sights, sickening smells, pains or fears. The attack may be ushered in by a period of nausea, sighing respiration, or "faint feeling." Immediate lowering of the head below the rest of the body will frequently ward off further trouble. Most commonly the attack is very sudden, the face becoming absolutely bloodless and having a death-like calm; the pulse is weak or imperceptible, the breathing very shallow. In true syncope spasms are not present, neither is voiding of the urine or fæces. Fatal termination is rare, consciousness ordinarily being restored in a few moments if prompt measures are taken. The patient must be placed in a recumbent position, with the head as low or lower than the rest of the body; constricting clothing should be loosened; and water may be slapped on exposed parts. Smelling-salts held to the nose are of value. Later mild stimulants may be used to restore normal condition; but resumption of vertical position should be postponed as long as practicable.

FAIOUM, or **FAYOUM.** See FAYUM.

FAIR, James Graham, American capitalist: b. near Belfast, Ireland, 3 Dec. 1831; d. San

Francisco, 28 Dec. 1894. He emigrated to America in 1843 and went to California in the famous '49 year. He amassed great wealth by mining in Nevada, to which he went in 1860. He served from 1881–85 as a Democratic representative from Nevada to the United States Senate.

FAIR GOD, Mexican traditional hero and culture god. See QUETZALCOATL; MEXICAN MYTHOLOGY; YUCATAN; UXMAL.

FAIR GOD, The, a romance by Lew Wallace 1873. It is a story of the conquest of Mexico by the Spaniards, its scene laid upon Aztec soil, in the early part of the 16th century. The title is derived from Quetzalcoatl, "the fair god," the Aztec deity of the air.

FAIR HAVEN, Mass., town in Bristol County on Buzzard's Bay, at the mouth of the Acushnet River and on the New York, New Haven and Hartford Railroad, 60 miles south of Boston and opposite New Bedford, with which it is connected by bridges. Here are the Millicent Public Library, the Academy of the Sacred Heart, several banks, churches and other public buildings. It has manufactories of glass, castings, nails, loom cranks, whale boats, oil casks and tacks. Many buildings of architectural merit, which render Fair Haven one of the most attractive towns of the State, were erected by Henry H. Rogers (q.v.) as memorials to members of his family. One architectural group, a fine example of Tudor architecture, consisting of a church and two other buildings, is considered a model of beauty. The town is a summer resort. The government is administered by town meetings. Fair Haven was separated from New Bedford and incorporated as a town in 1812. On 7 Sept. 1778, the militia, commanded by Maj. Israel Fearing, repulsed a British attack here. Pop. 7,291. Consult Ricketson, 'The History of New Bedford' (New Bedford 1858).

FAIR HAVEN, Vt., town of Rutland County, 30 miles east of Rutland, on the Delaware and Hudson Railroad. It has a Carnegie library and extensive slate manufactories. The town owns the waterworks and sewerage system. It received its charter in 1783, at which time it included West Haven. Pop. 3,095.

FAIR HAVENS (Gr. *Καλοὶ Λιμένες, Kaloi Limenes*), an anchorage on the southern coast of Crete, five miles east of Cape Litino. It is of small size and amply sheltered from western winds. The only mention of it by ancient writers is that by Paul (Acts xxvii, 8), whose well-known shipwreck occurred after departure from Fair Havens for Phenice or Phœnix. It is probable that there was no town at that point, although, as stated in Acts, Lasea was but a short distance away.

FAIR HEAD, or **BENMORE,** a precipitous promontory of the north coast of county Antrim, Ireland, opposite Rathlin Isle. It rises 636 feet above the sea and consists of carboniferous strata, overlaid by greenstone columns, 20 to 30 feet thick and 280 to 320 feet high.

FAIR ISLE, a solitary Shetland island lying midway between Shetland and Orkney, and 30 miles southwest of Lerwick. It is three miles long and two miles broad. The men employ themselves chiefly in fishing and the women in knitting the well-known Shetland hosiery. They are said to have acquired this art from the Spanish seamen whose ship, belonging to the Armada, was wrecked here in 1588. Pop. 139.

FAIR MAID. See SCUP.

FAIR MAID OF PERTH, The, a novel by Sir Walter Scott, published in 1828. The heroine is Catherine Glover.

FAIR OAKS AND DARBYTOWN ROAD, Engagement at (SECOND BATTLE OF FAIR OAKS). On 27 Oct. 1864, General Grant began a movement on the Petersburg lines to seize the South-side Railroad, and as a support to the movement had ordered General Butler to make a demonstration north of James River on Richmond. Parts of three divisions of the Tenth Corps under General Terry, six brigades of the Eighteenth Corps under General Weitzel and General Kautz's cavalry division, were designated for the movement. Terry was to make a demonstration along the Darbytown Road, under cover of which Weitzel was to push through White Oak Swamp to reach the Williamsburg road and seriously threaten Richmond. The columns started from camps, near Chaffin's farm, very early on 27 October. Terry reached the Darbytown Road, a part of his command crossed over to the Charles City Road and advancing on both roads, a little before 8 A.M. engaged the Confederates in their entrenchments from the New Market Road to the Charles City Road. Weitzel, after a march of 16 miles, crossing both the Darbytown Road and Charles City Road, at 1 P. M. reached the Williamsburg Road at Heintzelman's old works, on the battlefield of 31 May 1862, and pushed at once down the road one and a half miles toward Richmond, and came upon the Confederate works which appeared to be feebly held by a small body of dismounted cavalry and three guns. Weitzel prepared to attack, first sending a brigade of colored troops across the York River Railroad to find and turn the Confederates' left near the New Bridge Road. The defenses north of the James were held by General Longstreet, with the divisions of Generals Hoke and Field, some "local defense" troops under General Ewell, and General Gary's cavalry brigade. These were posted with reference to defense along the river roads. As soon as Longstreet detected Weitzel's movement he ordered Field's division to move to the left and it formed on either side of the Williamsburg Road. It was 3.30 P.M. when Weitzel, with two brigades and others in support, advanced on either side of the road, over open ground, and was met with an unexpected heavy fire of musketry and artillery. His troops almost reached the works, but were repulsed with a severe loss in killed, wounded and missing. Soon after dark Weitzel withdrew after losing over 1,000 men. While Weitzel was engaged, Terry, at 4 P. M., was ordered to press his demonstration and carry the entrenchments. He made the attempt and was repulsed. On the next day the expedition returned to camp. The Union loss was 905 killed and wounded and 698 missing. The Confederate loss was comparatively small; Field's division and Gray's brigade reported 64 killed, wounded and missing. The entire loss probably did not exceed 100. Consult Humphrey, 'The Virginia Campaign of 1864–65.'

E. A. CARMAN.

FAIR OAKS (SEVEN PINES), Battle of. After the battle of Williamsburg (5 May 1862) the Army of the Potomac, under General McClellan, advanced cautiously up the Peninsula, established a base at White House and 20 May his advance crossed the Chickahominy at Bottom's Bridge, and the entire Fourth Corps under Gen. E. D. Keyes crossed on the 23d, taking position 25 May at Seven Pines, on the main road to Richmond, about five miles distant. The Third Corps, under Gen. S. P. Heintzelman, crossed 25 May. This left on the north bank the Second, Fifth and Sixth Corps, commanded respectively by Gens. E. V. Sumner, Fitz John Porter and Wm. B. Franklin. McClellan began to rebuild destroyed bridges and to perfect communication between the two wings of his army astride the Chickahominy. The movements of McClellan north of the Chickahominy and information from his cavalry convinced Gen. Joseph E. Johnston, the Confederate commander, that General McDowell with a strong corps was about to join McClellan from Fredericksburg, upon which, 28 May, he ordered up General Huger's division from Petersburg and Drewry's Bluff and suggested to General Lee that every available command should be concentrated at Richmond. On 25 May General Casey's division of the Fourth Corps advanced from Seven Pines to Fair Oaks, about three-fourths of a mile, and threw up works covering the road, and on 30 May two brigades of Kearny's division, Third Corps, were advanced about a fourth of a mile in front of Savage Station to within supporting distance of Casey. General Couch's division, Fourth Corps, was at Seven Pines and General Hooker's division, Third Corps, on the border of White Oak Swamp. Johnston, from his works, three miles in front of Richmond, watched McClellan's cautious advance. A reconnoissance 30 May developed the fact that Keyes had advanced his lines to Fair Oaks; Johnston saw his opportunity and issued orders for an attack next day. The Army of the Potomac, 31 May, had 127,166 officers and men, of whom 98,008 were present for duty, and it had 280 guns. Johnston had about 63,000 effectives and was not well supplied with artillery. Johnston purposed to throw 23 of his 27 brigades against Keyes and Heintzelman and with four brigades along the line of the river from New Bridge to Meadow Bridge prevent the rest of McClellan's army from crossing the stream. He purposed to move the 23 brigades by the Charles City, Williamsburg and Nine Mile roads, crush Keyes' corps and drive it back in disorder on Heintzelman and capture or destroy those two corps before any assistance could reach them from the north bank of the stream. There was some misunderstanding of orders on the morning of the 31st and much consequent delay, but at noon Gen. D. H. Hill's division of four brigades deployed in double line on either side of the Williamsburg Road, advanced on Casey's division at Fair Oaks and after a severe fight of two hours drove it back upon Couch's division at Seven Pines. Hill now received a reinforcement of one brigade, and two brigades of Kearny's division came to the assistance of Couch and Keyes, and the struggle was renewed at Seven Pines, with the result that the entire Union force was driven back to a line of entrenchments about a mile in the rear, which position was held. Three Union divisions had been engaged and suffered severely, and a part of Couch's division had been cut off. Gen. G. W. Smith, with several Confederate brigades, was observing the Chickahominy, under orders to engage any troop that might cross the stream to assist Keyes and Heintzelman, or, if none came, he was to fall upon the right flanks of the Union lines engaged. After waiting some time and believing that no Union troops would cross to the south bank of the stream, Smith put some of his troops in motion to make the flank attack, but it miscarried from the timely arrival of Sumner on the south bank of the Chickahominy. Sumner, who was nearest Keyes and Heintzelman, heard the sound of battle at 1 o'clock and was at once in the saddle and ordered his troops under arms. A little later orders came from McClellan that he should be prepared to march at a moment's notice. Without waiting another moment he marched his two divisions to the Chickahominy and paused upon the two bridges, waiting orders to cross them. At 2.30 P.M. the order came to cross. Richardson could get but one brigade of his division over the lower bridge and was obliged to move up and follow Sedgwick's division over the Grapevine Bridge, which swayed and tossed in the river. But the solid colum of Sedgwick's infantry, loading it with a weight with which even the angry Chickahominy could not trifle, soon pressed and held it down among the stumps of the trees, which in turn prevented its lateral motion. Once across, Sumner pressed forward on the road, deep with mud, toward Fair Oaks, and came up to Couch, who with four regiments and a battery had been cut from his division and was holding ground about a half mile from Fair Oaks, with Smith approaching to make his flank attack. But four of Sumner's regiments had formed on Couch when Smith attacked, two more soon followed, and these six regiments, with Couch's checked all efforts of Smith's four brigades to dislodge them and saved the day at Fair Oaks. Richardson's division came up at nightfall and formed on Sedgwick's left extending toward a brigade of Heintzelman's corps, while Hooker coming to the support of the defeated troops on the Williamsburg road filled vacant spaces in the line. There were now three corps across the Chickahominy in continuous order, ready for action when day should dawn. Near the close of the day General Johnston, the Confederate commander, was severely wounded and relinquished command to Gen. G. W. Smith. On the morning of 1 June, the Union army awaited attack, which was delivered by the Confederates, and on some parts of the line the fighting was severe, but the advantage remained with the Union troops, who regained most of the ground lost the previous day. On 1 June Gen. R. E. Lee was placed in command of the Army of Northern Virginia, but did not take direction of affairs on the field until the fighting was over, and 2 June withdrew to the fortifications around Richmond from which Johnston had advanced 31 May. The Union forces engaged at Fair Oaks numbered about 36,000;

the Confederates about 32,000. The Union loss was 4,384 killed and wounded and 647 missing; the Confederate loss was 5,729 killed and wounded and 405 missing. Consult Alexander, 'Military Memoirs of a Confederate' (1907); Allan, 'The Army of Northern Virginia in 1862'; 'Battles and Leaders of the Civil War' (Vol. II); McClellan, 'My Own Story'; Michie, 'Life of General McClellan'; 'Official Records' (Vol. XI); Walker, 'History of the Second Army Corps'; Webb, 'The Peninsula.'

E. A. Carman.

FAIR ROSAMOND, the common appellation of the daughter of Lord Clifford, who became mistress of Henry II. A popular legend says she was kept by the king in a bower at Woodstock, which was reached by a labyrinthine passage, known only to the king. The legend adds that in 1173 Queen Eleanor discovered and poisoned the fair Rosamond.

FAIR SIDEA, The, a play of Jakob Ayrer, which by some is considered the source of Shakespeare's 'Tempest.'

FAIR TRADE, an expression used in Great Britain by those who, professing to be free traders and objecting to the free trade fiscal policy of that country as a one-sided business, would tax goods imported from any country which refuses to give reciprocal concessions to British exports. Free traders consider this view as protectionist. They hold that if they can import goods cheaper from a protectionist country than elsewhere, they should be free to reap that advantage even if they cannot export their own goods to that country free of duty. See Free-trade.

FAIRBAIRN, Andrew Martin, English theologian: b. near Edinburgh, 4 Nov. 1838; d. 9 Feb. 1912. After ministering in charges of the Scottish Evangelical Union, he was appointed in 1877 to the principalship of Airedale Independent College, Bradford; and was the first principal of Mansfield (Congregational) College, Oxford, 1886–1909. His most important works are 'Studies in the Philosophy of Religion and History' (1876); 'Studies in the Life of Christ' (1881): 'The City of God' (1882); 'Religion in History and in Modern Life' (1884); 'Christ in the Centuries' (1892); 'The Place of Christ in Modern Theology' (1893); 'The Philosophy of the Christian Religion' (1902).

FAIRBAIRN, Patrick, Scotch Presbyterian clergyman: b. Hallyburton, Berwickshire, 28 Jan. 1805; d. Glasgow, 6 Aug. 1874. He received his education at the University of Edinburgh. In 1826 he was licensed to preach and served as pastor in the Orkney Islands, Bridgeton in Glasgow and Salton. In 1843 he became minister of the Free Church, remaining in Salton. He was professor of divinity in the Free College of Aberdeen 1853–56, and from 1856 until his death principal of the Free Church College of Glasgow. He was moderator of the General Assembly in 1865 and a member of the Free Church delegation which visited the United States in 1867. He translated several works from the German and edited 'The Imperial Bible Dictionary' (2 vols., 1866). He was the author of several volumes including 'The Typology of Scripture' (1845–47; new ed., New York 1900); 'Ezekiel and the Book of His Prophecy' (1851); 'Prophecy viewed in its distinctive nature, its special functions and its proper interpretation' (1856); 'Hermeneutical Manual' (1858); 'Pastoral Theology,' with a biographical sketch of the author by J. Dodds (1875).

FAIRBAIRN, Sir William, Scottish engineer: b. Kelso, Scotland, 19 Feb. 1789; d. 18 Aug. 1874. His father was a farm servant. He entered business in Manchester, England, in 1817. He constructed the first iron ship in Great Britain, for traffic on the Forth and Clyde Canal, and afterward his firm built nearly 1,000 vessels. He was a friend of George Stephenson, made great improvements in cotton mill machinery, was the inventor of a rivetting machine which effected a revolution in the method of manufacturing boilers, and was associated with Robert Stephenson in designing and building the great tubular bridge over Menai Strait. He was created a baronet in 1869. He was the author of 'Mills and Millwork'; 'Iron, Its History and Manufacture'; 'Application of Iron to Building Purposes'; 'Iron Shipbuilding'; 'Useful Information for Engineers'; 'An Experimental Inquiry into the Strength, Elasticity, Ductility and other Properties of Steel,' etc. Consult his 'Life,' edited by Pole (London 1877).

FAIRBANK, Calvin, American clergyman: b. Pike, N. Y., 3 Nov. 1816; d. Angelica, N. Y., 12 Oct. 1898. He was an ardent abolitionist, and during 1837–39 aided 23 slaves to escape across the Ohio River. In 1843 he raised $2,275 to secure the liberty of a nearly white slave girl who was to be sold at auction at Lexington, Ky. In 1844 he opened the way for the escape of the Hayden family, for which offense he suffered five years' imprisonment. Later he was again detected in violation of the Fugitive Slave Law, and sentenced to 15 years' imprisonment at Frankfort, where he was cruelly treated, receiving about 35,000 lashes on his naked body. In 1864 he was set at liberty after spending more than 17 years in jail. He published 'How the Way Was Prepared' (in which he told the story of his own life).

FAIRBANKS, Arthur, American teacher and author: b. Hanover, N. H., 1864. He was graduated at Dartmouth College in 1886, and received a doctorate from Freiburg, Germany. He has taught at Dartmouth, Yale and Cornell, and from 1900 to 1906 professor of Greek literature in the State University of Iowa. In 1907 he was elected director of the Boston Museum of Fine Arts. Among his writings is an 'Introduction to Sociology' (1901), which has been translated into Japanese; 'First Philosophers of Greece' (1898); 'A Study of the Greek Pæan' (1900); 'The Mythology of Greece and Rome' (1907); 'Handbook of Greek Religion' (1910); 'Athenian White Lekythoi' (Vol. I, 1907; Vol. II, 1914).

FAIRBANKS, Charles Warren, American lawyer and statesman: b. near Unionville Centre, Union County, Ohio, 11 May 1852; d. Indianapolis, Ind., 4 June 1918. His father was a Vermonter and was one of the early pioneers who settled in the West in the middle, 30's and helped to hew out of the wilderness the great Buckeye State. The son's earliest life was spent in toil on the farm. He attended the public school in the neighborhood until his 15th year, when he entered the senior preparatory department of the Ohio Wesleyan University at Delaware, Ohio, where he was graduated in 1872. After leaving the university he went to Pittsburgh, Pa., as Associated Press agent, meanwhile studying law. He was later transferred to the Associated Press at Cleveland, Ohio, where he continued his legal studies in the Cleveland Law School, until he was admitted to the Supreme Court of Ohio in 1874, and in the same year removed to Indianapolis, Ind., where he began the practice of his profession. He took an active interest in politics but sought no public office until he was elected to the United States Senate in 1897. He was chairman of the Indiana State conventions in 1892, 1898 and 1914. In 1895 he had the unanimous complimentary vote of his party, which was in the minority, for the United States Senate. He was elected to the United States Senate 30 Jan. 1897, and at the expiration of his term was re-elected, but resigned 4 March 1905 to qualify as Vice-President of the United States, to which office he was elected on the ticket with Theodore Roosevelt in 1904. He was a delegate-at-large to the Republican National Convention at Saint Louis in 1896 and was temporary chairman of the convention; a delegate-at-large to the Republican National Convention at Philadelphia in 1900 and was chairman of the Committee on Resolutions; a delegate-at-large to the Republican National Convention at Chicago in 1904 and was chairman of the delegation; a delegate-at-large to the Republican National Convention at Chicago in 1912 and was chairman of the Committee on Resolutions. He was appointed by President McKinley a member of the United States and British Joint High Commission which met in Quebec in 1898 for the adjustment of the Alaskan, the Fur Seal and other questions growing out of our relations with Canada; he was chairman of the American commissioners. By appointment of President Roosevelt he represented the United States at the Tercentennary Celebration at Quebec in 1908. He was a candidate for the Republican nomination for President in 1908. At the close of his term as Vice-President in company with Mrs. Fairbanks he made a tour around the world. At the Republican National Convention at Chicago in June 1916 he was nominated for Vice-President of the United States on the ticket with Charles E. Hughes. He received the degree of LL.D. from Baker University, Ohio State University, Ohio Wesleyan University and Northwestern University. He was a member of the board of trustees of the Ohio Wesleyan, DePauw and American universities and president of the Methodist Hospital of Indiana and the Indiana Forestry Association. He was a member of the Board of Regents of the Smithsonian Institution.

FAIRBANKS, Henry, American inventor: b. Saint Johnsbury, Vt., 6 May 1830; d. 7 June 1918; son of Thaddeus Fairbanks (q.v.), he was graduated at Dartmouth College in 1853, and at Andover Theological Seminary in 1857. He was ordained in 1858; held pastorates in Burke and Barnet, Vt., and in 1859 was professor of physics, and later of history, at Dartmouth. He became identified with the manufacturing firm of E. and T. Fairbanks and Co., in 1868; and subsequently gave much of his time to mechanical experiments, and patented a scale for weighing grain and subsequently perfected and patented 34 additional inventions of various kinds. He was president of Saint Johnsbury Academy and was prominent in the work of the Congregational Church in Vermont.

FAIRBANKS, Thaddeus, American inventor: b. Brimfield, Mass., 17 Jan. 1796; d. Saint Johnsbury, Vt., 12 April 1886. He settled in Saint Johnsbury in 1815, and there worked with his father in a saw and grist mill, and also in the manufacture of carriages. In 1824 he and his brother Erastus began the manufacture of stoves and plows. In June 1831 he patented the platform scales bearing his name. Afterward about 50 different improvements were made on these scales, which have been sold in all parts of the world; his last patent being taken out when he was 90 years old. His donations to Saint Johnsbury Academy totaled $200,000.

FAIRBANKS, Alaska, city and capital of the fourth judicial district, on the Tanana River near the head of navigation, 160 miles west of Dawson, and 350 miles by stage north of Valdez. It is the commercial centre of the Fairbanks gold-mining region and is connected with Chena, 45 miles distant by the Tanana Valley Railroad. It is in all respects a modern city, with a centrally located steam-heating plant, schools, churches, electric light and power plants, etc. It is connected with Valdez by a stage route and in summer there is steamboat communication with Dawson to the east and to Saint Michael on the west. In the three years 1906–08, Fairbanks sent out $27,000,000 in gold. Lode mining has in recent years displaced the earlier placers. The government of the United States has undertaken the construction of a railroad to Fairbanks at a cost of over $14,000,000. Pop. 3,541.

FAIRBURY, Ill., city of Livingston County, on the Wabash and the Toledo, Peoria and Western railroads, 60 miles east of Peoria. Coal mining and farming are the leading industries. The city has grain elevators, flour mills, cement works and machine shops. It has a public library. Pop. 2,532.

FAIRBURY, Neb., city and county-seat of Jefferson County, on the Little Blue River, the Saint Joseph and other branches of the Chicago, Rock Island and Pacific System, about 60 miles southwest of Lincoln. It is situated in a good agricultural region, and its chief manufactures are flour and dairy products. A large nursery is just outside the city limits. The city contains a Carnegie library and fine post-office building. It owns its waterworks and electric-light plant. Pop. 5,454.

FAIRCHILD, Ashbel Green, American clergyman: b. Hanover, N. J., 1 May 1795; d. Smithfield, Pa., 1864. He wrote many contributions to the religious press. His most popular work, 'The Great Supper,' was translated into German and had an immense sale. He also published 'Baptism'; 'Faith and Works'; and 'Confession of Faith.'

FAIRCHILD, Charles Stebbins, American financier: b. Cazenovia, N. Y., 30 April 1842. He was graduated at Harvard University in

1863; admitted to the bar in 1865; became deputy attorney-general of New York in 1874 and attorney-general in 1876. After spending some time in Europe he settled in New York city in 1880, where he practised law till 1885. He was assistant Secretary of the Treasury 1885–87, and Secretary 1887–89. He was a member of the monetary commission appointed by the Indianapolis Monetary Conference in 1897. From 1879 to 1905 he was president of the New York Security and Trust Company and later he held high offices in other corporations.

FAIRCHILD, David Grandison, American botanist: b. East Lansing, Mich., 7 April 1869. He was graduated at the Kansas State Agricultural College in 1888 and made post-graduate studies in botany at Naples, Italy, in 1893, at the University of Breslau and Berlin in 1894, Münster and Bonn in 1895–96, and at Buitenzorg, Java, in 1896. Since 1889 he has been connected with the United States Department of Agriculture, since 1898 has been agricultural explorer and since 1903 has been in charge of foreign explorations. In 1897 he organized the work of seed and plant introduction of the Department, now the office of Seed and Plant Introduction, of which he has had charge since 1906. He has made special researches in botany since 1896 as assistant to Barbour Lathrop on four expeditions in search of economic plants for introduction into the United States. He is a member of the American Association for the Advancement of Science and of the International Society of Botanists.

FAIRCHILD, George Thompson, American educator: b. Brownhelm, Ohio, 6 Oct. 1838; d. 1901. He was graduated from Oberlin College 1862 and from Oberlin Theological School 1865; was professor of English literature, Michigan Agricultural College, 1879–97; and was vice-president of Berea College from 1898. He entered the Congregational ministry in 1871 and was the author of ‹Rural Wealth and Welfare› (1900).

FAIRCHILD, Herman Le Roy, American educator: b. Montrose, Pa., 29 April 1850. He was graduated at Cornell University in 1874; was secretary of the New York Academy of Science in 1885–88; president of the Rochester Academy of Science 1889–1902; secretary of the Geological Society of America 1890–1907 and president in 1912. In 1911 he was president of the New York State Commission Government Association. He has been professor of geology at the University of Rochester from 1888, and has published many articles, especially on the glacial geology of New York State.

FAIRCHILD, James Harris, American educator: b. Stockbridge, Mass., 25 Nov. 1817; d. 1902. He was president of Oberlin College from 1866–89 after a service of 26 years as tutor, professor of languages, professor of mathematics and professor of moral philosophy and theology. Besides editing the ‹Memoirs of Charles G. Finney› (1876) and Finney's ‹Systematic Theology› (1878), he was the author of ‹Moral Philosophy› (1869); ‹Oberlin, the Colony and the College› (1883); ‹Elements of Theology, Natural and Revealed›; and ‹Woman's Right to the Ballot› (1870).

FAIRCHILD, Lucius, American military officer: b. Kent, Ohio, 27 Dec. 1831; d. Madison, Wis., 23 May 1896. At the beginning of the Civil War he enlisted as a private in the Federal army, and in August 1861, was appointed a captain in the regular army and major in the volunteer army. He took part in the battles of Bull Run and Antietam, and led the charge up Seminary Hill at Gettysburg, where he lost his left arm. He was promoted brigadier-general in 1863, but resigned to serve as secretary of state of Wisconsin and was governor 1866–72. In 1886–87 he was commander-in-chief of the Grand Army of the Republic.

FAIRCLOUGH, Henry Rushton, American philologist: b. near Barrie, Ontario, Canada, 15 July 1862. He was graduated at Toronto University in 1883 and in 1896 received the degree of D.Ph. at Johns Hopkins. From 1893 to 1902 he was associate professor and professor of classical literature at Leland Stanford University. In the latter year he was made professor of Latin. He also taught Latin in the summer sessions of the University of Wisconsin 1906, Columbia 1908, Chicago 1910, Colorado 1913 and in 1910–11 was professor in the American School of Classical Studies, Rome. He was delegate to the centennial celebration of the University of Berlin in 1910. He is the author of ‹The Attitude of the Greek Tragedians Toward Nature› (1896); ‹The Andria of Terence› (1901); ‹The Connection between Music and Poetry in Early Greek Literature› (1902); ‹The Antigone of Sophocles, translated into English› (1903); ‹Virgil's Æneid,› with S. L. Brown (1908); ‹The Phormio of Terence,› with L. J. Richardson (1908); ‹The Trinummus of Plautus› (1909); also ‹Monograph on the Text of Terence› (in Transactions of the American Philological Association, 1900). He was editor-in-chief of the ‹Students' Series of Latin Classics› and edited Virgil in the ‹Loeb Classics.›

FAIRFAX, Donald McNeill, American naval officer: b. Virginia, 10 Aug. 1822; d. Hagerstown, Md., 10 Jan. 1894. During the Mexican War he participated in the capture of Mazatlan and Lower California. In 1861 he had personal charge of the transfer of Messrs. Mason and Slidell and their secretaries from the *Trent*, a British mail ship, to the *San Jacinto*. He later took part in the chief naval operations in Charleston harbor; was promoted rear-admiral in 1880 and retired in 1881.

FAIRFAX, Edward, English poet: b. Denton, England, about 1580; d. near Otley, England, January 1635. He made a metrical translation ‹Godfrey of Boulogne› (1600), of Tasso's ‹Jerusalem Delivered,› and dedicated it to Queen Elizabeth; it was highly esteemed by James I, and is still valued; and on this rather than on his own «Eclogues» the fame of Fairfax as a poet rests. He is also author of a ‹Discourse of Witchcraft,› in which he gives an account of the bewitching of his two daughters in 1621.

FAIRFAX, Thomas, Lord, English general: b. Denton, Yorkshire, 17 Jan. 1612; d. Nun Appleton, Yorkshire, 12 Nov. 1671. Fairfax warmly espoused the cause of Parliament, and in April 1642 presented to Charles a petition of the people imploring him to be reconciled to his subjects. The same year he was appointed general of the horse, and in 1644, together with Essex, Waller and Manchester, he held a chief command in the English army sent to co-operate with the Scots. The credit of the battle of Marston Moor has, by some authorities, been divided between Leslie and Cromwell, but, according to others, Fairfax is also entitled to share in it. On the Earl of Essex resigning the command of the parliamentary army in 1645, Fairfax was made commander-in-chief in his room. He insisted on the command of the horse being given to Cromwell. When he took Oxford the first thing he did was to set a guard upon the Bodleian Library, an act for which he deserves the gratitude of posterity. He subsequently, in November 1647, was engaged with Cromwell in putting down the levelers in the army, and in the following year captured Colchester, and caused Sir Charles Lucas and Sir George Lisle to be tried by court-martial and shot. He was one of the king's judges in 1649, and endeavored to prevent his execution. Being ordered to march against the Scottish Presbyterians, he positively declined the command and Cromwell was appointed (26 June 1650) to succeed him. He was appointed one of the lay church commissioners in 1654, and was a member of Cromwell's first Parliament. He assisted Monk against General Lambert, and co-operated in the restoration of Charles II, being one of the committee charged to secure his return.

FAIRFAX, Thomas, 6th Baron of Cameron: b. Yorkshire, 1692; d. Greenway Court, Frederick County, Va., 12 Dec. 1782. He was educated at Oxford and was a contributor to Addison's *Spectator*. He came to America and settled on a vast landed estate in Virginia, inherited from his mother, a daughter of Lord Culpeper. This property, the «Northern Neck of Virginia,» embraced the region lying between the Potomac and the Rappahannock and included the Shenandoah Valley (about 6,000,000 acres). William Fairfax, his cousin, acted as his agent, whose daughter Anne became married to Lawrence Washington, the elder brother of George Washington. It was at Greenway Court that Baron Fairfax became acquainted with George Washington, and between them a warm friendship sprang up. Fairfax gave Washington employment on survey work on his domain, and did everything he could to advance his interest with the provincial government. During the War of the Revolution, Fairfax, though an ardent loyalist, was permitted to live on his estate in perfect security. The surrender at Yorktown of Cornwallis, and the winning of American independence by the man he had «trained and moulded,» was a great mortification to Fairfax, and from this blow he never recovered.

The 12th Lord Fairfax and baron of Cameron, who succeeded in 1900 to the barony, has, like his American predecessors, made no claim to the title.

FAIRFIELD, Sumner Lincoln, American author: b. Warwick, Mass., 25 June 1803; d. New Orleans, La., 6 March 1844. He began the publication of the *North American Magazine* in 1833, and continued to edit and publish it for five years. His published volumes include ‹Lays of Melpomene› (1824); ‹Cities of the Plain› (1828); ‹Poems and Prose Writings› (1840) and ‹Select Poems› (1860).

FAIRFIELD, Conn., town, port of entry, in Fairfield County, three miles southwest of Bridgeport, on the Long Island Sound, the New York, New Haven and Hartford Railroad. A popular summer resort, it has a beautiful situation and one of the finest beaches on the Sound. The chief manufactures are paper, dog biscuit, aluminum ware, wire goods, ladies' underwear, rubber goods and machinery. It has good public buildings, two libraries and four buildings which date from Revolutionary times. The first settlement was made in 1639 and the town was incorporated the same year. Its town hall, originally built in 1720, contains records dating back to 1648. It was the scene of several Indian and Revolutionary battles, and in 1779 was almost wholly burned by the Hessians and Tories. Pop. 11,475. Consult Child, ‹An Old New England Town› (New York 1895); Osgood, ‹Centennial Commemoration of the Burning of Fairfield› (ib. 1879).

FAIRFIELD, Ill., city, county-seat of Wayne County; 123 miles southeast of Springfield, on the Southern and the Baltimore and Ohio Southwestern railroads. The city is the centre of a fruit-growing belt, especially noted for apples, and has a trade in grain, live stock, tobacco, etc. The manufactures are chiefly flour, lumber and dairy products. It is the site of the Hayward Collegiate Institute. The lighting plant is owned by the city. Pop. 2,754.

FAIRFIELD, Iowa, city, county-seat of Jefferson County, 48 miles northwest of Burlington, on the Chicago, R. I. & P. and the C., B. & Q. railroads. The principal manufactures are brooms, tile, agricultural implements, machinery, furniture, carriages, flour and dairy products. The electric-light plant and the waterworks are owned by the city. The Parsons College, under the auspices of the Presbyterian Church, was founded here in 1875. The first settlement was made in 1839. Pop. (1920) 5,948.

FAIRHOLT, Frederick William, English artist and author: b. London, 1814; d. there, 3 April 1866. He published ‹Costume in England: a History of Dress to the Close of the 18th Century› (1846); ‹The Home of Shakespeare Illustrated and Described› (1847); ‹Remarkable and Scientific Characters› (1849); ‹Dictionary of Terms in Art› (1854), etc.

FAIRLIE, John Archibald, American economist: b. Glasgow, Scotland, 30 Oct. 1872. In 1895 he was graduated at Harvard University and in 1898 received the degree of Ph.D. at Columbia University. He served one year as secretary to the New York State Canal Commission. In 1900 he became junior professor at the University of Michigan, and in 1909 became associate professor, and in 1911 full professor of political science at the University of Illinois. In 1907–08 he served on the Michigan Constitutional Convention and in 1908–09 was special agent of the United States Bureau of Corporations. He was also associate editor of the *National Municipal Review*. He has published ‹Municipal Administration› (1901); ‹National Administration of the United States› (1905); ‹Local Government in Counties, Towns and Villages› (1906); ‹Essays in Municipal Administration› (1908); ‹Taxation and Revenue System of Illinois' (1910); 'Commission Government in Illinois Cities' (1911); 'The President's Cabinet' (1913); 'Town and County Government in Illinois' (1913); 'Revenue and Financial Administration in Illinois' (1915), and contributions to technical journals on economic, legal and political subjects.

FAIRMONT, Minn., city and county-seat of Martin County, 65 miles southwest of Mankato, on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. The city has a Carnegie library, a cigar factory, gas engine works, flouring mills, packing-houses, and brick and tile yards. The water and electric-lighting systems are owned and operated by the municipality. Fairmont was first settled in 1855 and is governed by a mayor and council of one chamber. Pop. 4,630.

FAIRMONT, W. Va., county-seat of Marion County, at the head waters of Monongahela River navigable to this point; the Baltimore and Ohio Railroad, the Pennsylvania and the New York Central lines enter the city; 78 miles from Wheeling, 125 miles from Pittsburgh, 300 miles from Baltimore; the centre of one of the largest soft coal operations in the world; abundance of natural gas and oil; commission form of government; permanently improved roads in all directions from the city; model public school system and a State Normal for training of teachers. The principal manufactures are glass, of which there are two of the largest plants in the world, mining machinery, cigars, lumber and iron products. Fairmont has the largest trolley system in West Virginia, reaching from Fairmont to Fairview, Mannington, Clarksburg, Bridgeport and Weston; a healthy climate; fine water supply; beautiful homes and a splendid public spirit. Pop. 18,000.

FAIRMOUNT, Ind., town in Grant County, 60 miles northeast of Indianapolis, on the Cleveland, Cincinnati, Chicago and Saint Louis, and the Pittsburgh, Cincinnati, Chicago and Saint Louis railroads. Fairmount Academy and the Wesleyan Theological Institute are located here. It has extensive farming interests and has manufactories of catchup, sauce, bottles and tiles. The waterworks are the property of the municipality. Pop. 2,506.

FAIRMOUNT COLLEGE, coeducational institution, situated at Wichita, Kan., under the auspices of the Congregational Church. It was established in 1892, with assistance from the Boston Education Society. A collegiate department was added in 1895, and in 1896 the name of the institution was changed to Fairmount College. It offers courses leading to the B.A. and the corresponding M.A. degrees. The abolishment of the preparatory school was begun in 1912–13, dropping one year at a time. It has a sub-freshman department. In 1922 the college had an attendance of 456. In connection with the college there is a conservatory of music. The library numbers about 32,000 volumes, besides pamphlets.

FAIRMOUNT PARK. See PHILADELPHIA.

FAIRPORT, N. Y., village of Monroe County, 10 miles east of Rochester, on the New York Central and West Shore railroads. It has extensive farming and fruit-growing interests. It has a manufactory of cans. Pop. 4,626.

FAIRS AND SHOWS. A fair is a periodical meeting of merchants in an open market held at a particular place and generally for the transaction of a particular class of business. The origin of fairs is obviously to be traced to the convenience of bringing together at stated times the buyers and sellers of the stock-produce of a district. Fairs are generally held in or near towns, but from their nature are specially adapted to the convenience of country dealers and their customers. Two curious facts are to be noted in the history of fairs. In Europe the numerous festivals of the church afforded the most favorable opportunity for the establishment of these markets. This association is indicated in the German name of a fair, which is identical with that used for the ceremony of the mass. A fair generally brings a concourse of people into the town in which it is held, and gives it something of a holiday appearance. Advantage has frequently been taken of this concourse, either by the persons assembled themselves or by the purveyors of various amusements, to add entertainment to business, and as the business of a particular fair declined it has often, instead of being abandoned, been gradually converted into a periodical opportunity for a saturnalia of amusement. Thus religion, business and diversion have come to be associated in the idea of a fair.

In the Middle Ages fairs were specially privileged and chartered by princes and magistrates, special temporary tribunals were even established for their use. It was then the custom, which in some places still remains, to make a public proclamation of the commencement and duration of the fair. The goods sold at fairs were then of much greater value, as well as variety, than at present, embracing fabrics of all kinds, as well as jewelry. In some parts of the Continent the practice still prevails of purchasing clothing at fairs. Fairs existed in ancient as well as modern times, and are to be found in all parts of the world. In the East they are of great magnitude and importance. At Mecca, during the annual pilgrimages, and at Hardwar in Ajmir, a resort of pilgrims in Hindustan, two of the greatest fairs of the East, we find again the association between commerce and religion. According to Prescott fairs were regularly held in the principal cities of Mexico every fifth day, being the recognized substitute for shops. A fair for the sale of slaves was held at Azcapozales, near the capital. At the principal fair, held at the City of Mexico, the number of visitors reached 40,000 to 50,000. Here the same arrangement prevailed as in the European fairs of the Middle Ages. A court of 12 judges, clothed with absolute authority, maintained perfect order in this great concourse.

The Easter and Michaelmas fairs at Leipzig, the fairs of Frankfort-on-the-Main, of Lyons in France, and Nijnei-Novgorod in Russia, are among the most important fairs of the present day in Europe. The fairs of Great Britain now mostly consist of the weekly market-days of country towns and certain great agricultural meetings, or trysts, as they are called in Scotland, chiefly for the sale of cattle and horses, such as the Falkirk Tryst. There are also, especially in Scotland, a considerable number of the hiring fairs. Among the most celebrated of the fairs which have been turned into saturnalia are the celebrated Donnybrook fair in the county of Dublin; Bartholomew and Greenwich fairs, London; and Glasgow fair.

In America the State and county fairs have developed into periodical expositions of agriculture, horticulture, stock-raising, manufacturing, domestic science, education, transportation, good roads movement, etc. Most of the States have their State fairs, supported partially by legislative appropriation, and often with permanent buildings. Many county fairs are regularly incorporated companies, composed of farmers and merchants who make a little money out of them. There is now an American Association of Fairs and Expositions, comprising in its membership 52 organizations representing State, county and provincial fairs. The secretary is Charles Downing, of Indianapolis, Ind.

The National Corn Association holds expositions nearly every year and has members in 35 States. The 1913 exposition was at Columbia, S. C., and the 1914 at Dallas, Tex. The slogan of the Association is "The Betterment of Agriculture." It has three classes of exhibits: (1) educational exhibits from agricultural colleges and experiment stations; (2) competitive exhibits between the States; (3) educational exhibits from the Federal Department of Agriculture. Four trophies are awarded: Indiana 10-ear corn trophy, value $1,000; Colorado oat trophy, value $1,500; Kellogg single ear trophy, value $1,000; Farm and Fireside wheat trophy, $48,000 in cash premiums.

Business' Shows.— The fair is a country proposition, adapted to the display of agricultural products. To supply a similar demand in the cities for the display largely of manufactures and exploitation of new goods, the business show has developed. It seems to have been a growth from the poultry and horse shows. When the bicycle was in its prime regular bicycle shows were held annually in the large cities of the United States. With the disappearance of the bicycle show the automobile show developed, and this is perhaps the largest attended show now held annually at Madison Square Garden, New York. Business shows are also held for the display of business office conveniences, typewriters, desks, dictographs and the thousand and one appliances now found in counting-rooms and bookkeeping departments. Printing shows are held for the display of the machinery and products of the graphic arts. Each of the more prominent industries at times has its shows, conducted either by associations or by speculators who sell spaces to houses that desire to exhibit. See EXPOSITIONS, INDUSTRIAL.

FAIRVILLE, Canada, village of Saint John County, New Brunswick, on the Canadian Pacific Railway. It has pulp and saw mills, box factories, brickyards, breweries, woodenware works, etc., and a hospital for nervous diseases. An electric railway connects the village with the city of Saint John. Pop. 3,500.

FAIRWEATHER, Mount, in Alaska, in the Saint Elias range, 35 miles northeast of Cape Fairweather. It is 15,292 feet high and its steep declivities are covered with great glacial sheets.

FAIRY, an imaginary being or spirit of diminutive size, supposed generally to assume a human form, but appearing also in others and represented as both beneficent and malevolent toward mankind. In the latter case diseases of cattle were frequently attributed to their mischievous operations; and cattle that died suddenly without any apparent cause were commonly said to be elf-shot. Among the Irish peasantry they are termed "the good people" by way of placation. In Poole's 'Parnassus' are given the names of the fairy court: "Oberon, the emperor; Mab, the empress; Perriwiggin, Perriwinkle, Puck, Hobgoblin, Tomalin, Tom Thumb, courtiers; Hop Mop, Drop, Pip, Drip, Skip, Tub, Tib, Tick, Pink, Pin, Quick, Gill, Ion, Tit, Wap, Wim, Nit, the maids of honor; Nymphidia, the mother of the maids." Croker, in his 'Fairy Legends and Traditions of the south of Ireland,' describes them as beings "a few inches high, airy and almost transparent in body; so delicate in their form that a dewdrop, when they chance to dance on it, trembles, indeed, but never breaks." They are supposed to live in a distinct domain known as Fairyland, and their character and habits as represented in literature may best be learned from the Irish lore and such works as the 'Märchen of the Grimms'; Spenser's 'Faerie Queene,' and Shakespeare's 'Mid-summer Night's Dream.' The term is used somewhat loosely to include other beings of a similar nature, such as elf, fay, gnome, banshee, goblin, nymph, sprite, sylph, etc. Belief in fairies has existed from earliest times and formed part of the superstition of nearly all peoples. A study of fairy stories is instructive in this connection. Studies of the folklore of many peoples have been made by scholars and have shown valuable results in this field. See FOLK-LORE; MYTHOLOGY; PARACELSUS; also such titles as ELVES, KOBOLD and the like.

FAIRY BLUEBIRD, one of the bulbuls (q.v.) of the East Indian family *Pycnonotidæ* and genus *Irena,* familiar in Indian gardens, and justly admired. The commonest species is brilliant turquoise, with black wings, tail and under parts, and coral-red legs and beak. They make a rather rough little nest in a bush and lay two or three speckled eggs.

FAIRY QUEEN. See FAERIE QUEENE.

FAIRY RING, or **CIRCLE,** a ring occasionally observed in pasture, distinguished from surrounding vegetation by being either barer or more luxuriant and attributed by the peasantry of western Europe to the dancing of the fairies. They are now known to be occasioned by the growth of certain kinds of fungi, which, proceeding outward from a centre, render the soil for a time unfitted for the nourishment of grass, but later fertilize it by their decay.

FAIRY SHRIMP, a phyllopodous crustacean (*Chirocephalus diaphanus*), occasionally found in fresh-water ponds in the British Isles. It is about one inch in length and nearly transparent.

FAIRY-TALES, stories in which fairies play a part, or which contain other supernatural or magical elements such as mark the folk-tales of 'Puss in Boots'; 'Beauty and the Beast'; 'Hop o' My Thumb'; 'Sleeping Beauty'; and others. Actual fairies seldom appear in traditional fairy-tales, so called. Grimm and his successors showed by the study of comparative mythology that these tales are not restricted to Europe alone, but are to be found, in varying forms, among almost all nations. The survival of popular tales is due to their being unconscious growths, to the strict adherence to form shown by illiterate and savage people in recitals and to the laws of the permanence of culture. There are several theories in regard to the origin of folk-tales. The oldest is the Oriental theory, which traces all back to a common origin in the Vedas. It is true that the germs of most tales are found in Vedas, but proofs of the Indian origin of the stories are lacking; the discovery of tales in Egypt which were written in the early empire are objections to its acceptance, and the idea of diffusion will not account for similar tales found in Australia, New Zealand and America. The Aryan theory, supported by Max Müller, Grimm and others, gives as their origin the explanation of natural phenomena. These nature-myths must not be regarded as originally metaphors; they were primitive man's philosophy of nature in the days when every object was endowed with a personal life. The tales have enough likeness to show that they come from the same source and enough difference to show they were not copied from each other. Müller says "Nursery tales are generally the last things to be adopted by one nation from another." Another theory, supported by Tylor and Lang, traces the origin of folk-lore to a far earlier source than the Aryan — the customs and practices of early man: such as totemism, descent from animals or things, which were at last worshipped; and curious taboos or prohibitions, which can be explained by similar savage customs of the present. But late authorities declare that it is useless to seek any common origin of folk-tales; since the incidents, which are few, and the persons, who are types, are based on ideas that might occur to uncivilized races anywhere.

Our popular fairy-tales, or *contes*, have been, in the main, handed down orally. However, some of their elements or variants at least have come down through ancient Oriental literature. The 'Syntipas,' a Greek version, belongs to the 11th century. Then followed translations into several European languages. The earliest collection of European tales was made by Straparola, who published at Venice in 1550 his 'Notti Piacevola,' which was translated into French and was probably the origin of the 'Contes des Fées.' The best early collection is Basile's the 'Pentamerone,' published at Naples in 1637; reprinted at New York 1912. In 1696 there appeared in the *Recueil*, a magazine published by Moetjens at The Hague, the story 'La Belle au Bois Dormant' (our 'Sleeping Beauty'), by Charles Perrault; and in 1697 appeared seven others: 'Little Red Riding Hood'; 'Bluebeard'; 'Puss in Boots'; 'The Fairy'; 'Cinderella'; 'Riquet of the Tuft'; and 'Hop o' My Thumb.' These were published in 1697 under the title 'Contes du Temps Passé Avec des Moralités,' by P. Darmancour, Perrault's son, for whom he wrote them down from a nurse's stories. Within this century the investigations of Jacob and William Grimm, and their successors in this field, have reduced to written form the tales of nearly all nations. We must include in the comparison of stories the Greek myths; as the Odyssey is now conceded to be a mass of popular tales. To these we must add the tales of ancient Egypt; those narrated by Herodotus and other travelers and historians; the beautiful story of 'Cupid and Psyche,' given by Apuleius in his 'Metamorphoses' of the 2d century A.D., which also was taken from a popular myth. See BEAUTY AND THE BEAST; BLUEBEARD; ELVES; FAIRY; FAIRY TALES; FOLK-LORE, etc. Consult bibliography subjoined to article FAIRY.

FAIRY TALES OF HANS CHRISTIAN ANDERSEN. These 'Fairy Tales' have been read by thousands with delight, and have settled down to a place in the world's memory along with the traditional nursery tales of the race. The Ugly Duckling and The Constant Tin Soldier are remembered in company with Goody Two Shoes or Little Red Riding Hood. The 'Fairy Tales' are among the most original works of the 19th century. Fairy tales are usually stories of legend and tradition; they grow up in the lives of simple peoples without any one's knowing who originally thought of them or told them. They are told and retold by the old people to the children, and then somebody comes and writes them down as, for instance, Mr. Harris wrote down the negro stories of Brer Rabbit and Brer Fox. Of this kind are the famous 'Märchen' of the Brothers Grimm and the 'Contes' of Perrault and many others. These are old stories which have charmed generations put into literary form. Such also are some of the 'Eventyr' or Wonder-stories of Andersen. He was born and brought up at Odinse in the island of Funen, a place, which, as he says himself, was in those days a hundred years behind the times. The old women, who made something of a pet of him, used to tell him old stories which revealed to him "a world as rich as that of the Thousand and One Nights," as he said himself afterward, not only in complete stories, but in ways of story-telling. "In the volume which I first published I had like Musæus but in my own manner related old stories which I had heard as a child. The tone in which they still sounded in my ears seemed a very natural one to me." But much of his 'Tales,' and probably the most characteristic element, is something different; it is something of his own. Andersen was a man of a peculiarly childlike nature. He was not very fond of children but he was in simplicity, imagination and impulsiveness not unlike them. In all that he wrote he was an idealist, as children are apt to be, without overmuch concern about the actualities of the real world. So when he told stories to children as he often did he spoke naturally in the language and thought which they recognized as their own. "I had written my narrative down upon paper in exactly the language and with the expressions in which I had related them to the little ones." But he generally had in mind a larger audience and his tales were eagerly read by old as well as young. In fact a good many of them are not Fairy Tales at all, but little sketches or imaginations of life. One cannot read them with anything of a critical spirit without imagining that in his best stories he was always telling more or less directly of himself. So many of them are stories of travel — The Ugly Duckling, The Constant Tin Soldier, The Silver Shilling, Thumbelina — and so many of them are full of veiled comment on life, that one is continually reminded of the author who was himself always traveling and always seeing the world. The children, he says, were pleased generally with the story; older people, on the other hand, were interested in the deeper meaning. The 'Tales' were extraordinarily popular; they were known all over Europe and America and translated into a dozen languages. Andersen, himself, made friends everywhere and told his stories everywhere. He was really a poet, a novelist and a dramatist; he wrote much beside his 'Tales' and was, at first at least, inclined to value his deeper work more than his child's stories. But the world has found in his children's stories the peculiar thing it wanted and these slight matters as he originally thought them are the things that have made him immortal. There is nothing especially upon Andersen's 'Tales,' but a good deal about them will be found in his 'Story of My Life.'

EDWARD EVERETT HALE.

FAIT ACCOMPLI, fāt-āk-kôn-plē' (Fr., an accomplished fact), in diplomatic language, denotes an event that has happened and must be accepted or recognized as definite, however disagreeable.

FAITH, the state of mind which treats a certain proposition as true, independently of whether its truth is completely demonstrated. Faith thus partakes of the nature of will. Its most extreme form is found in the famous passage of Tertullian which ends, "Buried, He was raised from the dead; this is certain because it is impossible." While faith rarely goes to such extremes as this, it is of its very nature that even if its object is proved it totally disregards this proof.

Faith is not entirely confined to religious matters. It is inherent in the very nature of knowledge. The general form of all descriptive knowledge is the analysis of a situation. Thus the physicist analyzes his gross physical processes in terms of atoms or electrons, the psychologist reduces everything to atomic mental states, and so on throughout the sciences. Now, one of the most striking features of analysis is that up to the present, at any rate, it has rarely if ever been exhaustive. In the first place to record all the significant features of a situation is beyond the powers of the human mind. The total condition of a physical experiment includes every single event in the universe in exactly the unique temporal and spatial relations which it bears toward the experiment in question. But furthermore, the ultimate terms of analysis are continually receding. The physicist of yesterday thought in terms of atoms; the physicist of to-day thinks in terms of electrons; and what the terms of the physicist of to-morrow will be we cannot imagine. For these reasons an analysis is almost of necessity incomplete. From the standpoint of a strict yes or no logic, an incomplete analysis is a false analysis. However, the slightest application of a scientific law demands that we should act as if this analysis, which is probably false, and which at the best is not known to be true, were a demonstrated fact. At the very least, it demands that we should trust in the negligible character of the errors of the law, although nothing but our trust in the continuity of nature guarantees that these are negligible. This trust in the continuity of nature conforms in every respect to the definition of faith.

Analysis is not confined to matters of physics and the other natural sciences. A moral situation is susceptible to analysis, and indeed demands analysis before a reasonable course of action can ensue. In determining what to do when our motives lead us in opposite directions, we analyze the many bearings and consequences of our conduct. This analysis which precedes the appeal to conscience is imperfect for exactly the same reasons as those which render our physical analysis imperfect: the complete bearing and consequences of our deeds are never at our disposal. Again it requires an act of faith to treat the results of our incomplete analysis as a basis for conduct and to be confident that just those aspects of the deed which we have overlooked do not give it its dominant moral tone.

Faith is thus the necessary concomitant of analysis both in natural science and in conduct. Analysis makes the scope of faith recede further and further beyond any assignable limit, but the importance of faith remains just what it was in the beginning. To render this faith firm, especially in those matters that concern the moral conduct, has always been the task of religion. By allegory, by the emotional appeal of rite, mythology and creed, religion furnishes a scaffolding for the faith of those who cannot put an independent trust in the continuity of nature and the moral order itself. Just as Descartes and the Occasionalists founded their physics on the honesty of a God guaranteed by faith as well as by demonstration, the exponents of religion have always made some Divine dictum or example their chief moral sanction. Thus Paley based his entire ethics on a system of divinely established rewards and punishments. It is interesting to note that these religious attempts to mediate between faith and analysis leave the need for faith essentially unchanged, as is shown by the emphasis placed on faith by all religious teachers. What religion accomplishes is the transference of the need for faith to objects more easily grasped than abstractions by those of a mystical trend of mind. There are many non-mystical natures, however, to which it is more natural and simple to have faith directly in the continuities and laws of nature and morals rather than in those things worshiped by the religious, and in these the most vigorous faith is consistent with the entire absence of anything that can be called a religion.

In theistic religions faith naturally acquires as its principal meaning belief in existence of God and in certain dogmas concerning Him. The Jewish faith was primarily a faith in the moral order as personified in Jehovah. The Christian finds the embodiment of his moral order and accordingly the object of his faith in Christ the Redeemer as well as in the Jewish God. The Catholic definition of faith has been paraphrased by Cardinal Newman as «belief in certain doctrines because God has revealed them.» This faith is especially directed toward the Church and toward certain official dicta of the Church. The various Protestant sects differ as to their definition of faith, but all emphasize reliance in God. See BELIEF. Consult Harnack, 'History of Dogma' (Boston 1894–99); Inge, 'Faith and its Psychology' (London 1909); James, 'The Will to Believe' (New York 1911).

NORBERT WIENER.

FAITH, Act of. See AUTO DA FÉ.

FAITH, Rule of, in the early Church, the summary of doctrines taught to catechumens, and to which they were required to give their assent before baptism. From the ancient usage, the phrase has been adopted, not very aptly, in modern theology to denote (1) the true source of our knowledge of Christian truth; and (2) the criterion or standard of Christian doctrine. Protestants find this rule in the Scriptures alone; the Greek and Roman churches, and some Anglicans, find it not only in Scripture, but also in the Church, as the authorized interpreter of Scripture, whose interpretations are embodied in tradition. The Rationalists make reason the final arbiter, and the mind of man the measure of truth. See BIBLE; CREEDS; INFALLIBILITY.

FAITH HEALER, The. This play in three acts, by William Vaughn Moody, was first produced in New York, at the Savoy Theatre, on 24 Jan. 1910. Henry Miller and Laura Hope Crews were in the cast. It had been previously presented in Saint Louis, on 15 March 1909. The piece is not as definite in its theme nor as human in its story as 'The Great Divide.' But it was a sincere endeavor on the part of the dramatist to show the struggle that takes place between material and spiritual forces to the weakening of the latter. Moody, being a poet, here tried to write something mystical, and only partly suggested why the Faith Healer, endowed with the power of reviving the sick and raising the dead, suddenly lost that power through a lack of faith in himself. Being a dramatist, he was obliged to justify the human love of the Faith Healer for the heroine, and here he accomplished the one satisfactory stroke in the play — the establishment of the belief that love does not weaken the exercise of the spirit, but rather enhances it.

As an acting play, 'The Faith Healer' is misty, it is unconvincing. This may be due to the fact that it is treated almost realistically, whereas it is mystic; it takes for granted a theme rarely proven in human experience. The quickening of a paralyzed woman into life, the restoring of a sick baby and then the failure as the Faith Healer's power wanes, are difficult of externalizing. But Moody's art is sincere, and one feels his sincerity above his dramatic effectiveness. As in 'The Great Divide' he falls into the obvious, here contrasting the spiritual exaltation of a devout man with the science of a doctor and the conventional traditions of a minister.

MONTROSE J. MOSES.

FAITHFUL SHEPHERDESS, The, a pastoral drama by John Fletcher, published in 1609, and ranking with 'Comus,' which it partly inspired, as one of the finest specimens of this Italian form of poetry extant in English literature.

FAITHFULL, Emily, English philanthropist: b. Headley, Surrey, 1835; d. 31 May 1895. Out of pure philanthropy, she founded the Victoria *Press*, 1860, in which women alone were employed as operatives. Queen Victoria encouraged her by appointing her «printer-in-ordinary to the queen.» She started the *Victoria Magazine* as an advocate of women's right to lucrative employment, and in the United States lectured in 1872–73, and 1882. She was the author of 'Change Upon Change,' a novel (1868); 'Three Visits to America' (1884).

FAITHORNE, William, English engraver: b. London, 1616; d. 1691. He received most of his early training from Sir Robert Peake, and taking the side of the Royalists in the civil struggle of 1640 he was banished to France. In that country he studied under Nateuil and after his return to England in 1650 practised as an engraver and also marketed prints. He executed many portraits in crayon after 1680 and engraved several portraits by Lely, Van Dyke and other eminent masters. Consult Fagan, 'A Descriptive Catalogue of the Works of William Faithorne' (London 1888).

FAIZABAD. See FYZABAD.

FAJARDO, fā-här'dō, Porto Rico, a seaport on the northeast coast, on the Fajardo River. It has a good harbor and extensive sugar interests. Molasses, sugar and tortoise shell are exported. Pop. 6,086.

FAKHR-AD-DIN AR-RAZI fāk'r-ad-dēn ār-rā'zē, Mohammedan theologian: b. Rai, Tabaristan, 1149; d. 1209. He was educated at Merv and Maragha, where among his masters was the celebrated scholar, Al Majd al Jili. He wrote a famous commentary on the Koran, the well-known 'Mafatih-al-haib' and gave much time to all branches of learning. He spent huge sums on experiments in alchemy, then a favorite delusion among the learned. He was also professor at Rai and Ghasni and finally became president of the University of Herat. His commentary was issued at Cairo in eight volumes in 1890.

FAKIR, fā'kēr', or **DERVISH,** the name of a class of religious devotees of the Mohammedan faith, all leading a life of poverty and generally practising mendicancy. The Arabic word *Faqir* signifies «poor» used in a sense of «poor» in the sight of God. The Persian word *Darwesh* is derived from *dar*, i.e., those who beg from door to door. The observance of strict forms of fasting and acts of piety give them a character of sanctity among the people. They live partly in monasteries, partly alone, and from their number the imams are generally chosen. Throughout Turkey they are freely received, even at the tables of persons of the highest rank. There are, throughout Asia, multitudes of these devotees, monastic and ascetic, not ony among the Mohammedans, but also among the followers of Brahma. They trace their ultimate origin to Abu or Ali Bekr, and in Egypt all are under the rule of a supposed direct descendant of the latter. There are 32 religious orders now existing in the Turkish Empire, many of which are scarcely known beyond its limits: but others, such as the Nakshbendies and Mevlevies, are common in Persia and India and Morocco. All these communities are properly stationary, though some of them send out a portion of their members to collect alms. In fact, all religious faqirs are divided into two great classes, the *ba shar* (within the law) or those who govern their conduct according to the principles of Islâm; and the *be shar* (without the law), or those who do not live their lives according to the principles of any religious creed. All these orders, except the Nakshbendies, are considered as living in seclusion from the world; but that order is entirely composed of persons who, without quitting the world, bind themselves to a strict observance of certain forms of devotion, and meet once a week to perform them together. Each order has its peculiar statutes, exercises and habits. Since the orders are secret, it is impossible to discover the exact nature of these.

The numerous orders of dervishes are all divided by Europeans into two great classes, the dancing and the howling dervishes. The former are the Mevlevies, and are held in much higher estimation than the other class. They are the wealthiest of all the religious bodies of the Turkish Empire. The dancing of these dervishes is conducted to sounds of music. The movement at first is slow, but as the dervishes become excited it grows in animation, until at last the actors are exhausted, and are obliged to sit down. After a while they rise up again and resume their dancing, which is repeated several times. The whole is concluded by a sermon. The howling dervishes accompany their dancing with loud vociferations of the name of Allah, and violent contortions of the body such as are seen in persons seized with epileptic fits. In former times these dervishes, after working themselves up into a frenzy, used to cut and torture themselves in various ways with apparent delight. The sheiks of all orders have the credit of possessing miraculous powers. The interpretation of dreams, the cure of diseases and the removal of barrenness are the gifts for which the dervishes are most in repute. See SUFISM.

None of the fakirs are bound by oath to remain in any particular community. Return to the world is also permitted them, but this privilege is rarely used. The head of the convent is called shaikh, and he is appointed by the general of the order. They reside usually in the city which contains the ashes of the founders of their orders, and are subordinate to the Mufti of the capital who has jurisdiction over them. In Turkey the Shaikhu 'l Islam has the right of removing the generals of the various orders. The Mufti has also the right to confirm the shaikhs who may be nominated by any of the generals of the orders. Consult Lane, 'Modern Egyptians' (3d ed., New York 1908); Brown, J. P., 'The Dervishes or Oriental Spiritualism' (London 1868); Hughes, 'Dictionary of Islam' (London 1885).

FAKUMEN, Manchuria, town in the south about 40 miles north of Mukden and about 20 miles west of Tie Pass. On 18 March 1905 Fakumen was occupied by the Japanese.

FALAISE, fa'lāz', France, town in the department of Calvados, 20 miles south of Caen, on the Ante. It is located on a cliff and has two fine Gothic churches, a college, public library, a hospital and an ancient castle, in which was born William the Conqueror. It has also manufactories of cotton goods, hosiery, leather, dyes and chimes. Nearby at Guibray since the 11th century is held an annual fair in August. Consult Dodd, 'Falaise the Town of the Conqueror' (Boston 1900). Pop. (commune) 6,900.

FALASHAS, a Hamitic tribe of Abyssinia, supposed to be descended from Jewish immigrants of the time of Solomon. They claim to have come from Jerusalem and to belong to the tribe of Levi. They exhibit many Semitic traits, although their complexion is a reddish brown like that of the Abyssinians. They practise Israelitic worship although in a somewhat debased form. Contrary to the method of the Jews of other lands they despise commerce and devote their energies more freely to agriculture and practise minor trades. Their synagogues are always surmounted by a red earthen pot. They have a monastic system and education is in the hands of the monks. Estimates of the number of these people vary from 100,000 to 250,000. Consult Flad, 'The Falashas of Abyssinia' (London 1869); Faitlovitch, F., 'Notes d'un voyage chez les Falashas' (Paris 1905).

FALB, fālp, **Rudolf,** Austrian meteorologist: b. Obdach, Styria, 1838; d. 1903. He was educated at Gratz, where he studied theology and entered the priesthood. He soon afterward was converted to Protestantism and in 1869–72 studied mathematics, physics and astronomy at the universities of Prague and Vienna. In 1877–80 he traveled in North and South America, after which he settled in Berlin. His theories of earthquakes were unacceptable to the scientists of this day and have never been seriously considered. He founded the astronomical periodical *Sirius* in 1868. His published works are 'Von den Umwälzungen im Weltall' (3d ed., 1890); 'Das Wetter und der Mond' (2d ed., 1892); 'Kalender der kritischen Tage' (1892–).

FALCK, fālk, **Niels Nikolaus,** German jurist: b. Emmerlef, Schleswig, 1784; d. 1850. He received his education at the University of Kiel and in 1814 was appointed to the chair of law there. He was chosen president of the Schleswig-Holstein Assembly of the States in 1838, but his policy alienated the Liberal party. He published 'Handbuch des schleswig-holsteinischen Privatsrechts' (1825–48); 'Sammlungen zur nähern Kunde des Vaterlandes'

(1825); 'Juristische Encyklopädie' (5th ed., 1851). He was editor of the *Staatsbürgerliches Magazin* from 1821 to 1831, and continued it as the *Neues Staatsbürgerliches Magazin* from 1833 to 1841.

FALCKENSTEIN, Eduard Vogel von. See VOGEL VON FALCKENSTEIN, EDUARD.

FALCÓN, fal-kōn, **Juan Crisóstomo,** Venezuelan statesman: b. on the Peninsula of Paraguaná (now the state of Falcón), 1820; d. Martinique, 1870. He was a brilliant soldier in his youth and in 1858 was made leader of the Federalist revolutionary party. He was elected President of Venezuela in 1863, and in that year entered Carácas. The Constitution of 1864 was sanctioned by him, but on the overthrow of his government in 1867, he retired to Europe. Three years later a counter revolution brought him a call to again lead the nation, but he died en route at Martinique.

FALCÓN, Venezuela, a maritime state and the most northern, with an extensive coast line on the Caribbean Sea and the Gulf of Venezuela. Its adjoining states are Lara to the south and Zulia to the west. It has a much broken surface, with low mountains inland and sandy plains and swamps along the coast. The climate is healthful except in the swampy districts of the coast. The mountain valleys are very fertile, yielding crops of coffee, cacao, cotton, corn, sugar, tobacco and fruits. Stock raising is on the increase. The state is sparsely settled. Its area is 9,572 square miles, with a population of 139,110. Coro, the capital, is of interest historically and is the chief commercial centre. A railway connects Coro with La Vela de Coro, the state's only seaport, about six miles east of the capital. Coro has a population of 9,452.

FALCON, a term broadly given to any of many birds of the family *Falconidæ* (q.v.), but more narrowly to the species of the typical subfamily *Falconinæ*, whence are derived most of the hawks used in falconry. The falcons proper, for strength, symmetry and powers of flight, are the most perfectly developed of the feathered race. They are distinguished by having the beak hooked at the point, the upper mandible with a notch or tooth on its cutting edge. The wings are long and powerful, the second feather rather the longest; legs short and strong. The largest falcons are the three great Arctic ones represented by the circumpolar jerfalcon (*Hierofalco, gyrfalco*), and its congeners the Greenland, Iceland and Labrador falcons. (See JERFALCON). The type of its race, however, is the noble peregrine (*Falco peregrinus*), to the female of which the term "falcon" was alone given by falconers, and was most highly esteemed for the fierceness, dash and perfection with which she worked. The female is about 17 inches long and 3½ feet in extent of wing; the male is 2 or 3 inches less. The head, neck, a patch under the eye and the whole upper surface are dusky, with gray and brownish shades; the throat and under parts whitish or cream-colored, with dusky bars and arrowheads; legs and feet yellow, bill bluish. It chiefly inhabits wild districts, and preys on grouse, ducks, ptarmigans, pigeons, rabbits, sea-fowl, etc., pouncing upon them from above with terrific swiftness and force, and always showing the greatest courage in its encounters with rivals or in defense of its nest, which is usually placed on a ledge of some lofty cliff. This species is to be found in nearly all quarters of the globe, for the North American duck-hawk (variety *anatum*) and certain tropical forms are only sub-species.

Other American true falcons are the pigeon-hawk, sparrow-hawk (qq.v.) and some closely allied western and northern forms. Many of the Old World falcons are famous, and are elsewhere individually described, such as the European hobby, kestrel, merlin and lanner; the Asiatic shaheen, saker, luggur, turumti and other species trained by Eastern falconers; the Australasian quail-hawk; and the large African genus Baza, which has the peculiarity of possessing two "teeth" on the edge of the beak. Another interesting genus is Microhierax, containing the finch-falcons (q.v.). Falcons attain to a great age. One is said to have been found in France, about 1790, with a collar of gold dated 1610, showing it to have belonged to James I of England.

FALCON, a small light cannon in general use in the late Middle Ages. We know from a decree of Henry II of France that it discharged a ball weighing one pound. Some guns of this type are said to have thrown a projectile of six pounds. See ARTILLERY.

FALCONBRIDGE, SIR **Glenholme,** Canadian jurist: b. Drummondville, Ontaria, 12 May 1846. He is a graduate of Toronto University, and was called to the bar in 1871. He was appointed a senator of Toronto University in 1881; in 1887 became a judge of Queen's Bench of the Supreme Court of Judicature of Ontario; and in 1900 chief justice. He was knighted in 1908.

FALCONE, fäl-kō'nā, **Anielle,** Italian painter: b. Naples, 1600; d. there, 1665. He studied under de Ribera and through his numerous battle pieces came to be called "L'oracolo delle battaglie." When the Neapolitans rose against Spain, Falcone organized his pupils into a "Death Company," which never gave quarter to a Spaniard. The failure of the insurrection obliged Falcone to retire to Rome. Later he went to France, where he was graciously received by Louis XIV. Under the powerful protection of Colbert he was enabled to return to his native city, where he spent his last years. The Louvre has one of his battle pieces, the Naples Museum two and the Prado, Madrid, two.

FALCONER, fa'k'nėr, **Edmund** ("Edmund O'Rourke"), Irish playwright: b. Dublin, 1814; d. 29 Sept. 1879. He joined a provincial company in England, went to London and in 1858 became manager of the Lyceum Theatre. In 1862–66 he was manager of Drury Lane. In 1867–69 he was engaged at the Olympic Theatre, New York. He composed many plays and adapted others. 'Peep o'Day' (1861) was long very popular. Falconer excelled in his delineations of Irish peasant life.

FALCONER, Hugh, Scottish botanist and palæontologist: b. Forres, Morayshire, 29 Feb. 1808; d. London, 31 Jan. 1865. He was graduated in arts at Aberdeen University in 1826, and in medicine at Edinburgh in 1829. He was appointed assistant surgeon on the Bengal establishment of the East India Company. Arriving

FALCONS

1 Goshawk
2 Marsh Hawk
3 Pigeon Hawk or Merlin
4 Fish Hawk
5 Saker Falcon

in India (1830) he examined and reported on a collection of fossil bones from Ava, and won scientific standing in India. In 1832 he was made superintendent of the botanic garden at Saharanpur. He discovered and was the first to describe the assafœtida plant of commerce; and he discovered the geological character of the Sewalik Hills, and in order to study their ossiferous deposits he compared them with skeletons of extant species. For these researches he received the Wollaston medal of the Geological Society of England. He was appointed (1847) superintendent of the botanic garden at Calcutta and professor of botany at the Calcutta Medical College.

FALCONER, Sir Robert Alexander, Canadian educator: b. Charlottetown, Prince Edward Island, 10 Feb. 1867. He was educated at Queen's Royal College School, Trinidad, and at the universities of Edinburgh, Leipzig, Berlin and Marburg. From 1892 to 1907 he was lecturer and professor of New Testament Greek in Pine Hill College, Halifax, N. S., and also served as principal from 1904 to 1907. In the latter year he was chosen president of Toronto University. He received the degrees of Litt.D and LL.D. from the University of Glasgow, from Princeton, U. S. A., Toronto and other Canadian universities. He is Fellow of the Royal Society of Canada and was knighted in 1917. He published 'The Truth of the Apostolic Gospel' (1904); 'The German Tragedy and Its Meaning for Canada' (1915), also articles in professional journals, encyclopædias and dictionaries in Britain and America; articles on education and public questions, etc.

FALCONER, William, English poet: b. Edinburgh, 11 Feb. 1732; d. at sea off Mozambique, 1769. Having early shipped before the mast, he became before 1750 second mate of a ship trading to the Levant. The experience of a shipwreck off Cape Colonna, Greece, furnished material for the poem of 'The Shipwreck' (1762), by which he is best known. He was later appointed purser of the frigate *Aurora*, bound for India. The *Aurora* touched at the Cape of Good Hope in December 1769 and was shortly after lost with all hands. Falconer's 'Poetical Works,' with a biography by Gilfillan, appeared in 1854.

FALCONET, Etienne Maurice, ā-tē en mō-rēs fāl-cō-nā, French sculptor: b. Vevay, Switzerland, 1716; d. Paris, 4 Jan. 1791. Catharine II of Russia patronized him, and he was employed by her to execute the colossal statue of Peter the Great, erected at Saint Petersburg.

FALCONETTO, fal'kō-nĕt'tō, **Giovanni Maria,** Veronese architect and painter: b. 1458; d. 1534. He received his early instruction from his father, Jacopo Falconetto, an artist of note, and many are of the opinion that he studied also under Melozzo da Forli. Falconetto executed frescoes in the chapel of San Biagio, the church of San Nazaro, the Duomo and the church of San Pietro, Martire, all in Verona. His 'Augustus and the Sibyl' is in the Veronese Gallery, but is by no means his best work. His most noteworthy architectural work is the Palazzo Giustiniani (1524) at Padua. He also designed many of the Padua city gates.

FALCONIDÆ, a family of raptorial birds, comprising the sub-families *Gypaetinæ* (lammergeiers), *Polyborinæ* (carrion-hawks and kites), *Accipitrinæ* (hawks), *Buteoninæ* (buzzards), *Aquilinæ* (eagles), and *Falconinæ* (falcons). They are all remarkable for strong and sharply hooked bills, with a distinct cere, usually fleshy; and most of them have sharp and powerful talons, designed to seize, kill and tear to pieces the living prey upon which most of them subsist. In the eagles and falcons these characters are developed in the highest degree. The tarsus is usually more or less feathered, in some cases down to the very toes, which are arranged three in front and one behind and are exceedingly strong and tenacious. There is a projection over the eyebrows except in the ospreys, which gives an appearance to the eyes of being very deeply set in the orbits. These birds range in size from the mighty lammergeier to the falconets, hardly bigger than sparrows. The female is usually decidedly larger than the male and upon her falls the burden of the support of the young. The tribe is represented in all climates, even to the remote north, but is most numerous in the tropics, while some species are nearly cosmopolitan. Many migrate, but few show any tendency toward flocking. The color of the plumage frequently differs much in the young from that of the full-grown birds and as their first plumage is retained for some time, this has caused more species to be enumerated than really exist. Plain tints rule, but white and black are often strikingly displayed and a few species present a considerable variety of colors. Their voice is limited as a rule to screaming cries, but a few utter somewhat melodious notes. The nests of all are rude structures, placed in trees, on rock-cliffs, on the ground or in some hole. The eggs are few in number — one to five as a rule — and are laid much earlier in the year than is the case with birds generally; and they and the young are well cared for and ably defended by the parents. The sport of falconry (q.v.) took its name from employing certain of these birds in the chase.

FALCONIO, fal-kō'nēō, **Diomede,** Roman Catholic prelate: b. Pescocostanzo, Italy, 20 Sept. 1842; d. Rome, 8 Feb. 1917. He entered the Franciscan order 2 Sept. 1860, and upon completing his studies came to the United States as a missionary, reaching Allegany, N. Y., December 1865 and being ordained priest by Bishop Timon of Buffalo, 4 Jan. 1866. In 1868 he was named president of the College and Seminary of Saint Bonaventure, Allegany, N. Y., and on 29 Nov. 1871 was sent by his superiors to Harbor-Grace, Newfoundland, at the request of the bishop of that diocese, who appointed Father Falconio his secretary and chancellor and rector of the cathedral. In 1882 he came back to the United States, where he remained a year. Returning to Italy in 1883, he was elected provincial of the Franciscans in the Abruzzi, and in 1889 he was chosen procurator-general and later visitor-general in various provinces. He was preconized bishop of Lacedonia 11 July 1892, and on the 17th of that month was consecrated at Rome by Cardinal Monaco La Valletta. On 2 Feb. 1893, Monsignor Falconio assumed charge of his diocese. He was elevated to the United Archiepiscopal See of Accerenza and Matera in Basilicata, 29 Nov. 1895, but was called thence by Leo XIII, 3 Aug. 1899, and appointed first apostolic delegate to Canada, taking possession at Ottawa, 1 Oct. 1899. On 30 Sept. 1902 he was nominated apostolic delegate to the United States and assumed possession at Washington, D. C., 21 November of the same year. He was elevated to the cardinalate in 1911. A volume of 'Pastoral Letters' appeared in French in 1900.

FALCONRY, or **HAWKING,** the employment of falcons in the chase. This sport is of Oriental origin, and has been practised in the East since before the days of any record — in China at least 2,000 years before Christ; and it was probably followed at that date all over Asia and down into the Nile Valley, for falconers with their hawks are depicted in some of the oldest Egyptian mural paintings. The sport spread over Europe with the Roman domination, but seems not to have been introduced into England until the 9th century. Many laws and social customs regulated this pursuit in Great Britain and many terms and phrases remain in the language as an inheritance from the art and etiquette of this most elegant form of the chase. Thus the square frame on which hawks were carried to the field was named a «cadge,» and the servant who bore it a «cadger»; and a «cast» of hawks meant two taken on a chase together. To «man a hawk» was to tame it; and one so thoroughly trained as to be flown with young ones to show them how to work was called a «make hawk.» A hawk was said to «mew» when molting, and to «plume» when she pulls off feathers. A female of any species, but especially of the peregrine, is a «falcon»; a male a «tiercel»; one caught wild a «haggard» or «passage hawk»; one reared from the nest an «eyas,» and a young one is a «red hawk»; while a falcon's nest is an «eyry.» All the actions of a hawk in its work are named. A hawk «stoops» when she descends upon the «quarry» (prey) with closed wings, to kill it by a stroke of the beak; she «binds» when she seizes large prey in the air and clings to it in its fall, or «trusses» when the prey is of small size. A hawk is said to «clutch» when (as do short-winged hawks) she seizes it in her feet; to «carry,» when she tries to fly away with the prey; to «check» when she flies at a bird other than the one intended for her; to «foot well» when she kills successfully; to «make her point» when she rises and hovers over some quarry which has escaped to cover, as in thick hedges; to «ring» when she rises spirally in the air; to «take the air» when she tries to get above the fleeing quarry; to «wait on» when she hovers above her master at a certain «pitch» (height), waiting for quarry to be flushed. «Seeling» is closing the eyes with a fine thread (no longer done); «imping,» mending broken feathers; «mantling,» stretching out the wings or one wing and a leg; and «jarak» means keen, or in good condition for work.

The extensive agricultural changes which occurred in England during the 17th century, causing the enclosure and improvement of waste lands; the growth of towns and industry; the altered temper of the people preceding and during the Protectorate; and most of all the introduction of firearms, followed by the sports of shooting and the consequent preserving of game — all tended toward the decline of falconry, both in England and on the Continent; and game-keepers and peasants began to shoot as «vermin» the grand and valuable birds upon which their forefathers had doted. Nevertheless the sport is still followed by fanciers who keep alive its traditions.

The hawks used in falconry are all true falcons, and nearly or quite the whole list have at some time or place been regularly trained, except in the United States, although here the best of material exists, in our duck-hawk (the peregrine), pigeon, and sparrow-hawks, southwestern prairie-falcon and others. A few clubs here and there have flown their hawks, but the sport shows little sign of becoming general in North America. It is more frequent in Central and South America. In North Africa and the Orient the sport flourishes as much as formerly; and there eagles are often employed and quarry as large as gazelles and bustards is struck down.

Falconers divide their birds into «long-winged» or «dark-eyed» hawks, and «short-winged» or «yellow-eyed» hawks. The first class contains the true falcons, of which the great jerfalcon (q.v) was in old times reserved for royalty, the peregrine for an earl and the others for the nobility; hence these were known as «noble,» while the goshawk, kestrel, etc., on account of the inferiority of their masters as well as of their own powers, were styled «ignoble.»

Hawks are taken for training either as nestlings or when full-grown. They are trained by being hooded, made to wear bands of leather («jesses») about the legs, to which are attached «varvels» (rings, sometimes carrying bells hung by «bewits»), and a swiveled «leash»; and gradually are accustomed, at first in complete darkness, to being fed and handled, and later to feeding in the light and among spectators, and finally to take first live birds thrown toward it and finally wild quarry. During this process young birds are much at liberty and are then said to be «flying at hack.»

The sport was one in which women as well as men of all classes might indulge, going afield on foot and alone, or in mounted cavalcades, and often during mediæval times with royal pomp. The hawks, hooded, were carried by servants on frames suspended from their shoulders, but each sportsman was likely to hold a favorite bird upon his gauntleted wrist — in Europe on the left wrist, in the Orient on the right. Dogs, especially small greyhounds and pointers, were likely to accompany the falconer and were put to use in flushing birds, starting hares and the like. When the hunting scene was reached the hawks were prepared for flight, and some were freed to «wait on» until quarry was sighted; but others, trained differently, were kept hooded until the falconer himself started or perceived the game, when they were unhooded and sent after it. The sportsmen then followed, watched the chase and recovered prey and hawk as well as they could. Good falcons show a keen interest and great intelligence in their work.

Many books describe both the sport and the falcons in great detail. One of the best of the early works is 'The Booke of Faulconrie or Hawking,' by Turberville (1575). Recent British authors of repute are Brodrick, Salvin, Freeman ('Practical Falconry,' 1869), and J. E. Harting ('Hints on the Management of Hawks,' 1884). The latest general work is 'Coursing and Falconry,' by Cox and Lascelles, in the Badminton Library, 1892. Consult also the article «An Ancient Sport in the New World,» in *Outing* for March 1914.

FALDSTOOL, or **FOLDSTOOL,** the name of various pieces of English church furniture, the principal being a portable folding seat, also called faldistory, similar to a campstool used by a bishop when officiating in other than his own cathedral church; and a small desk at which the litany is read, the name dating from a period when folding lecterns were used.

FALEME, fä-lä'mē, a tributary of the Senegal River, in West Africa. It rises in Futa-Jallon and flows in a northerly direction for a total distance of about 300 miles.

FALERII. See FALISCI.

FALERNIAN WINE, one of the favorite wines of the Romans, so called from *Falernus Ager* (the Falernian Field), the district in which it was grown, in Campania, Italy. It is described by Horace as, in his time, surpassing all other wines then in repute. In the time of Pliny, however, as he himself informs us, Falernian wine had already, owing to a want of care in its cultivation, begun to decline in quality. See WINE.

FALERNUS AGER, a district of northern Campania, in ancient Italy, situated north of the river Volturnus. It was famed in classic days for its wine. In modern times the quality of the wine has declined. Consult Nissen, 'Italische Landeskunde' (Vol. II, Berlin 1902).

FALGUIÉRE, fä-gyär, **Jean Alexandre Joseph,** zhŏn ä-lex-zändr zhō-zy', French sculptor and figure painter: b. Toulouse, France, 7 Sept. 1831; d. Paris 1900. In sculpture his work is of very notable excellence, and displays originality and vigor and grace. The Luxembourg Gallery in Paris contains his sculptures: 'Christian Martyr' (1868); and 'Victor in the Cock Fight' (1870). 'Progress Abasing Error' is in the Pantheon, 'Poet Holding a Lyre' is in the Place de l'Opera, and among other works are statues of Balzac and Lamartine and one of Lafayette in Washington. His paintings are inferior to his sculptures.

FALIERI, Marino, mä-rē'nō fä-lē-ä'rē, Doge of Venice: b. 1278; d. Venice, 17 April 1355. He commanded the troops of the republic at the siege of Zara in Dalmatia. He there gained a brilliant victory over the King of Hungary, and was afterward Ambassador to Genoa and Rome. He was elected Doge of Venice on 11 Sept. 1354, but in the following year dissatisfaction with the light punishment imposed upon a noble who had insulted Falieri's young wife caused him to conspire with the lower orders to overthrow the republic and make himself sovereign of the state. His plot was discovered on the night before it was to have been consummated, and he was beheaded 17 April 1355. The last scenes of his life are depicted in Byron's tragedy of 'Marino Falieri.' Plays have been written on the same subject by Casimir Delavigne and Swinburne. Consult Brown, Horatius, 'Studies in Venetian History' (1907).

FALISCI, fä-lis'ī, a people of Etruria, said to have been originally a Macedonian colony. They occupied Falerii, one of the 12 Etruscan cities. When they were besieged by the Roman general Camillus, a schoolmaster offered to betray his pupils into the hands of the enemy, that, by such a possession, he might easily oblige the place to surrender. Camillus heard the proposal with indignation, and ordered the man whipped back to the town by the very pupils whom his perfidy would have betrayed. This instance of magnanimity operated upon the people so powerfully that they surrendered to the Romans.

FALK, fälk, **Johannes Daniel,** German author and philanthropist: b. Dantzic, Prussia, 28 Oct. 1768; d. 14 Feb. 1826. His capacity for satire was considerable. Among his works are 'A Pocket Book for Friends of Jest and Satire' (1797); 'Men and Heroes' (1796), a satire in verse, and 'Prometheus' (1804), a dramatic poem. He founded at Weimar in 1813 an organization called the «Society of Friends in Need,» and established there an institution for the care of orphan and neglected children, which later was taken over by the state, and which still bears his name.

FALK, falk, **Max,** Hungarian politician: b. Pest, 1828; d. 1908. He received his education at Pest and at the Polytechnic Institute, Vienna. In 1848 he was made a member of the Academic Legion, and became editor of the *Wanderer,* in which he advocated a restoration of the Hungarian constitution. Soon afterward he was made private lecturer on Hungarian history and literature to the empress. He wielded a powerful influence as editor of the *Pester Lloyd,* in 1869 became a member of the Hungarian Parliament and allied his fortunes with the party policies of Deák, Eötvös and Andrássy. He published 'Graf Stephan Széchenyi und seine Zeit' (1868, in German and Hungarian); 'Rückerinnerungen an die Königin Elisabeth' (1902); and, with Brachelli, the 12th edition of Gallettis' 'Allgemeine Weltkunde' (1860).

FALK, Paul Ludwig Adalbert, powl lood'-vĭн ä'däl-bĕrt fälk, Prussian statesman: b. Metschkau, Silesia, 10 Aug. 1827; d. 7 July 1900. He was appointed Minister of Public Worship and Education in 1872, and in this capacity was mainly instrumental in carrying the so-called May laws (because passed in May 1873–74–75), aimed at the restriction of the Roman Catholic Church in Germany, by limiting the influence of the clergy in the schools, by reorganizing the seminaries for the training of teachers and by defining in a stricter and more comprehensive manner the relations generally of the clergy to the state. (See KULTURKAMPF). When, however, Bismarck came to bid for the support of the clerical party, in order to carry out his later internal policy, Falk was compelled to resign. He was latterly president of the Supreme Court at Hamm. His biography by Fischer was published at Hamm in 1900.

FALKE, falke', **Gustav,** German poet: b. Lübeck, 1853. He received his education at the Lübeck Catharineum, engaged in business as a bookseller until 1878, when he began the teaching of music at Hamburg. In 1903, on his 50th birthday, the Hamburg Senate and Commonalty bestowed on him an annual grant of 3,000 marks. Falke's works include the novels 'Aus dem Durchschnitt' (1892); 'Landen und Stranden' (1895); and 'Der Mann im Nebel' (1899); and the volumes of verse 'Mynheer der Tod' (1892); 'Fanz und Andacht' (1893); 'Neue Fahrt' (1897); 'Mit dem Leben' (1899); 'Hohe Sommertage' (1902); 'Der gestiefelte Kater' (1904); 'Frohe Fracht' (1907); 'Hamburg' (in 'Städte und Landschaften Series,' 1908).

FALKENHAYN, falk'ĕn-hīn, **Erich G. A. S. von**, German general: b. 11 Sept. 1861. He passed from the War Academy in 1880, spent three years as military instructor in China and served as major in the German brigade of occupation in eastern Asia. He was on the staff of Count Waldersee during the Boxer Rebellion in 1900. In 1912 he became Prussian Minister of War, in which capacity he supported Lieutenant von Forstner of Zabern fame. At the outbreak of the European War General von Moltke was chief of the general staff; he was reported to have fallen ill in October 1914, and Falkenhayn took over his duties. As a matter of fact, von Moltke was superseded on account of disagreement with the Kaiser. He held that the main strategic object should be to break the Allied line at Verdun, while the Kaiser, unable to reach Paris, desired to strike for the Channel coast and attack England. See WAR, EUROPEAN.

FALKENSTEIN, falk'ĕn-stīn, **Julius August Ferdinand**, German explorer: b. Berlin, 1842. At the University of Berlin he studied medicine and geology and in 1873–76 was a member of an exploring expedition to Loango sent out by the African Society of Germany. On this trip Falkenstein made important discoveries and extensive and valuable collections. He brought home the first gorilla ever taken alive from Africa. About 1881 he founded the German General School Association which later exerted great influence on the educational systems of foreign countries. He wrote 'Die Loango-Küste in 72 Original-Photographien' (1876); 'Die Loango Expedition' (1879); 'Afrikans Westküste: Vom Ogowe bis zum Damara Land' (1885); 'Aerztlicher Reisebegleiter und Hausfreund' (10th ed., 1893).

FALKIRK, fal'kĕrk, Scotland, a parliamentary and municipal burgh of Stirlingshire, 10 miles southeast of Stirling and 25 miles from Edinburgh. Its port, Grangemouth, is three miles distant to the northeast and two canals pass close by the town which is a station on the North British railways. Falkirk includes the suburbs of Grahamston, Bainsford, Camelon and Laurieston. Notable features are the burgh buildings, the town hall, a free library, the Camelon fever hospital and the church. In the churchyard lie several persons once prominent in Scottish history. Falkirk is the principal seat of the iron-casting industry of Scotland, being conveniently situated in regard to supplies of coal and iron ore. Other industries are flour-milling, brewing, distilling, tanning, explosives and chemicals. Trysts, or cattle fairs, were long important but have been replaced by local auction sales, held weekly. Falkirk was an important town as early as the 11th century, being then known as *Eaglais breac* («church of speckled stone»), later transliterated as Egglesbreth. Near the town in 1298 was fought an important battle between the forces of Edward I and those of William Wallace, in which the Scots were worsted. In 1746 Prince Charles Edward with Highland forces defeated the English under General Hawley. Pop. 33,574.

FALKIRK, Battle of, (1) a contest in which Edward I of England gained a victory over Wallace, 22 July 1298. The king's army is said to have contained 7,000 to 8,000 mounted men and 80,000 footmen. Wallace's force amounted to about a third of the English army. His infantry was drawn up in circles, the men in the outer ring kneeling and holding their lances obliquely. The archers occupied the centre of the circles. The overwhelming superiority of the enemy's horse, however, decided the battle. Wallace retired with a small body to Stirling, but the bulk of his army was broken up and destroyed. (See WALLACE, SIR WILLIAM). (2) A battle between the forces of Prince Charles Edward (17 Jan. 1746) and the government troops commanded by General Hawley, whose army was completely routed and compelled to fall back on Edinburgh.

FALKLAND, fâk'land, **Lucius Cary**, VISCOUNT, English statesman and soldier: b. probably at Burford, Oxfordshire, 1610; d. Newbury, 20 Sept. 1643. He was educated at Trinity College, Dublin, and Saint John's College, Oxford, and in 1630 succeeded to the estates of his maternal grandfather. In 1633 he succeeded his father in the peerage and for some years after chiefly resided at his seat of Burford, near Oxford, where he lived in close intercourse with scholars from the neighboring universities. Here it was that Chillingworth composed his famous work against «Popery»; and questions of morals, theology and literature were discussed in a congenial circle with the utmost freedom. In 1639 he took part in the expedition against the Scots. At first he warmly supported the Parliament party, but a strong attachment, however, to establish forms and some doubts of the ultimate objects of the parliamentary leaders, caused him to retract. He became Secretary of State in January 1642, and took the Royalists' side in the civil war, attending the king at the battle of Edgehill and the siege of Gloucester. So dissatisfied was he with both parties that he courted death. At the first battle of Newbury he made for a gap in a hedge from which bullets were raining and so fell. His 'Poems,' edited by A. B. Grosart, were published in London in 1870. Consult Marriott, 'Life and Times of Lucius Cary, Viscount Falkland' (New York 1907).

FALKLAND, Scotland, a royal burgh in Fifeshire, 21 miles north of Edinburgh. It contains many ancient houses. The principal industries are brewing and linen-weaving. A noteworthy structure is the ancient royal palace of the Stuarts, which after centuries of neglect has been restored by the Marquis of Bute since 1888. Pop. 2,356. Consult Wood, 'Historical Description of Falkland' (Edinburgh 1888).

FALKLAND ISLANDS, two large islands, East Falkland (3,000 square miles) and West Falkland (2,300 square miles), with about 100 islands surrounding them, having a total area of 1,200 square miles, in the South Atlantic Ocean, about 300 miles east of the Strait of Magellan. The scenery bears a striking resemblance to parts of the Western Highlands of Scotland; the soil is light and but scanty crops are obtained. The highest elevation is Mount Adam, 2,297 feet in height. The coast is deeply indented and contains many safe anchorages. There are no roads. Sheep raising is the principal occupation, there being 2,325,000 acres devoted to pasturage. The climate is strictly oceanic, characterized by strong winds, equable temperature and moderate rainfall. The waters round the islands have within recent years become famous as a whale fishing ground, the exports of products being valued in 1914 at £1,300,978 (including South Georgia). Dependencies of the islands are South Georgia, the South Shetlands, South Sandwich Group, South Orkneys and Graham Land. Revenue, 1914, £42,923; expenditure, £36,046. Imports, £233,379; exports, £1,505,464. Vessels cleared (1914), 139, of 263,965 tons. Wireless telegraphy was installed in 1912 and cable communication established in 1915. There is monthly mail communication with Liverpool (28 days' sailing). The government is vested in a governor assisted by an executive council of four and a nominated legislative council. The capital is Port Stanley, on the east coast of East Falkland (pop. 905). Pop. 3,275, mainly Scottish, except for 980 Norse and Swedish. The islands were discovered by Davis in 1592. A settlement was founded by the French in 1764, but their rights were sold to Spain in 1765, who in turn relinquished them in 1771. A British colony which had been established in 1765 was withdrawn in 1774, but Great Britain maintained her claim from the date of her occupancy, and since 1833 has held uninterrupted occupancy of them. On 8 Dec. 1914 a British squadron, under Sir Frederick Sturdee, attacked and defeated a German squadron under Von Spee, sinking the cruisers *Scharnhorst, Gneisenau, Leipzic* and *Nürnberg*. Von Spee went down with his flagship, the *Scharnhorst*. See WAR, EUROPEAN.

FALKLAND ISLANDS, Battle of the. A naval engagement fought on 8 Dec. 1914 between a British squadron under Rear-Admiral Sir Frederick Sturdee (q.v.) and the German Pacific squadron under Admiral von Spee. Of the five German battleships four were sunk, also two transports. The *Dresden* escaped, but was sunk off Juan Fernandez on 14 March 1915. See WAR, EUROPEAN—NAVAL OPERATIONS.

FALKNER, fâk'nĕr, **Roland Post**, American statistician: b. Bridgeport, Conn., 14 April 1866. He was graduated at the University of Pennsylvania in 1885; studied economics at Berlin, Leipzig and Halle-on-Saale, Germany; was instructor in accounting and statistics in the University of Pennsylvania in 1888–91, and professor of statistics 1891–1900. He served also as statistician of the United States Senate Committee of Finance in 1891; as secretary of the United States delegation to the International Monetary Conference; and as secretary of the conference in 1892. He is author of numerous essays on criminology, sociology, etc.; and was editor of *Annals* of the American Academy of Political and Social Science 1890–1900. From 1904 to 1907 he served as commissioner of education in Porto Rico; from 1908 to 1911 he was statistician in charge of school inquiries for the United States Immigration Commission, and in 1911–12 was assistant director of the census. He has contributed essays on professional topics to economic, statistical and other journals, and has published a translation of August Meitzen's 'History, Theory, and Technique of Statistics' (1893).

FALKNER, Thomas, English Jesuit missionary: b. Manchester, 1707; d. 1784. Having studied medicine, he engaged as surgeon on a slave-ship of the South Sea Company, in which he sailed to the coast of Guinea in 1731. He next accompanied a cargo of slaves to Buenos Aires, and while there was taken dangerously ill and was carefully tended by the Jesuits. He was so impressed by the work of the order that he became a Catholic and entered the Jesuit order. He became a priest in 1732 and from that time until 1767 labored as a missionary in Paraguay and the Rio de la Plata region. The expulsion of his order from South America in 1767–68 caused him to return to England where he became a private chaplain. He wrote several works, including 'Botanical, Mineral and Like Observations on the Products of America' (1774); 'A Description of Patagonia and the Adjoining Parts of South America,' of which an uncritical and faulty edition was published by one of Falkner's friends.

FALKNER ISLAND, an island in Long Island Sound, nearly opposite Guilford, Conn. Its chief feature is a lighthouse, about 94 feet in height, with a white flash light.

FALKÖPING, fal'chę'pĭng, Sweden, town in Skaraborg. It is an important railroad junction and is important in Swedish history as the scene of the victory of Margaret of Denmark and Norway over the king of Sweden in 1389. The immediate result was the junction of Sweden with Denmark and Norway. Pop. 4,800.

FALL, Albert Bacon, American legislator: b. Frankfort, Ky., 26 Nov. 1861. He was educated in the country schools, but was principally self-taught. From 1879 to 1881 he taught school and read law, and from 1889 to 1904 was a practising lawyer. He worked on a farm, on a cattle ranch and as a miner. He became interested in mines, lumber, lands and railroads, and for many years has been engaged in farming, stock-raising and mining. He served in the legislature of New Mexico and also as associate justice of the Supreme Court of New Mexico, and member of the Constitutional Convention. On 27 March 1912 he was elected to the United States Senate for the short term expiring 4 March 1913. He was re-elected in June 1912, and his credentials not being signed he was re-elected 23 Jan. 1913 and again in 1918. From March 1921 to March 1923 he was Secretary of the Interior in President Harding's Cabinet.

FALL. See WATERFALL and CATARACTS.

FALL ARMY WORM, the caterpillar of a gregarious moth (*Laphygma frugiperda*). See GRASS WORM.

FALL-FISH, or SILVER CHUB, a cyprinodont fish, or «minnow» (*Semotilus corporalis*) of the eastern United States. It is very common cast of the Alleghanies in clear, swift streams and rocky pools, and has been known to reach 18 inches in length. It is steel blue above, sides and belly silvery, but in the breeding season the fins and lower surface of the males are rosy. The fins are of moderate size and unspotted.

FALL OF THE HOUSE OF USHER, The, one of the most famous of the prose tales of Edgar Allan Poe, is to be grouped among the author's stories of morbid psychology. The strange obsession which afflicts the chief character may be described as the fear of fear. The 'Fall of the House of Usher' conforms admirably to Poe's dictum that every word in a short story should tend toward a preconceived effect. The sense of gloom and depression produced in the opening sentence is maintained and if anything deepened to the close. The scene is laid "Out of space — out of time," yet it gives a thrilling impression of reality. The story also illustrates the author's skill in preparing for the end, both by minor details which explain later happenings, and by more elusive methods. Thus, the momentary repulsion which the visitor feels on meeting the physician is connected with the decision regarding the temporary entombment of Madeline, narrated pages later; and the picture painted by Usher inevitably suggests, though in no very tangible way, the vault in which the coffin is placed. The poem, 'The Haunted Palace,' recited by the chief character, is an allegory of a ruined mind. No story of Poe's shows better handling of atmosphere, and it is justly ranked as one of the most admirable of its class. It was first published in *Burton's Gentleman's Magazine* in 1839, and was revised for the collection of Poe's tales issued in 1845.

William B. Cairns.

FALL LINE. The boundary between the Atlantic Coastal Plain and the Piedmont Belt (q.v.) to the west is marked by falls or rapids on most of the streams, due to the fact that the rivers can cut more rapidly on the soft unconsolidated rocks of the coastal plain than on the harder crystalline rocks of the adjacent region. At an early date the falls marked the head of navigation for coastwise trade. Power is also largely developed along the fall line, which has been responsible for the location of numerous cities, among which are Trenton, Philadelphia, Baltimore, Washington, Richmond, Raleigh, Columbia, Macon and Montgomery.

FALL OF MAN, a commonly received doctrine of Christianity, founded upon the historical narrative contained in the third chapter of the book of Genesis, together with the allusions to the same matter in other parts of Scripture. The history of the fall, as given in Genesis, contains the following particulars: God having placed Adam and Eve in the garden of Eden and forbidden them under pain of death to eat of the fruit of the tree of the knowledge of good and evil, Eve, tempted by the serpent, first ate of the fruit herself, and afterward gave of it to her husband, who followed her example. Both were driven out of Eden. Punitive sentences were passed upon each of them, and upon the serpent, which is alluded to by Saint Paul as representing the devil. In the subsequent narrative the consequences of the fall significantly appear. The first man born of the original pair is a murderer, and his descendants grow in wickedness until a flood is sent to carry them away. As might be expected, this most suggestive narrative has given rise to inexhaustible controversy. The opinions on the fall may be divided into three classes: those which reject the narrative altogether; those which accept it as a mythical or allegorical account of the origin of evil; those which regard it as in the main historical. As a mere matter of literary criticism, the uninterrupted flow of the narrative down to times and events evidently historical, together with the uniformity and sobriety of its style, leave little ground for the supposition that the writer himself supposed he was dealing in allegory. The historical view of the fall, besides the theoretical controversies to which it gives rise as to its account of the origin of evil, encounters difficulties from two sources — the modern sciences of chronology and ethnology. In the meantime these remain difficulties only as these sciences are by no means in a state of sufficient maturity to allow their conclusions to be absolutely applied. It is remarkable that in most mythologies the serpent is worshiped as a beneficent being, though Tylor shows that Aji Dahaka of the Zarathustrians (Zoroastrians), which is a personification of evil, may have an historical connection with the serpent of Eden. With regard to the relation of man's fall to that of Adam, Saint Paul says "by one man's disobedience many were made sinners" (Rom. v, 19), and "as by one man sin entered into the world, and death by sin, and so death passed upon all men for that all have sinned" (ver. 12). It seems impossible to reconcile the constant appeals made in Scripture to the moral nature of man with the notion that that nature is inherently and radically corrupt. It would also appear that the statements of Scripture with regard to the actual moral condition of man, strong as they are, do not absolutely require this mode of accounting for them. Without supposing any radical change of man's moral nature, or even any change of it whatsoever it is only necessary to suppose a change in his relation to God to explain all that is said regarding him. It is supposed that man's moral nature consists of capabilities which are good or bad according as they are directed, and that God himself is the object of all its highest aspirations. The fall being supposed to consist in the alienation of man from God, it is easy to perceive that all these aspirations, being deprived of their proper objects, must apply themselves to improper ones, and become evil in their tendency; hence the sudden rise of pride, selfishness, ambition and all evil passions. In as far also as man's nature is affected by the hereditary transmission of qualities it might become actually vitiated in its tendencies and this, together with the accumulation of evil habits, would produce those climaxes of violence or corruption which have from time to time convulsed or disintegrated society, which have called forth the denunciations of prophets and by their very excesses have produced a reaction, which, however, has left human nature as incompetent to guide itself as ever and ready, after a period of repose, to progress toward another crisis. The fall, according to this view, consists in the moral inadequacy of man's nature when left to itself, and the actual evils flowing from this inadequacy. It is argued by theologians that in the original sentence pronounced on the transgressors there is contained the promise of a redemption and they maintain that the whole scope of Scripture is directed to the development of this promise and of the scheme of providence associated with it. It is from the New Testament, however, and not from the Old, that the whole doctrine of the fall has been built up. Milton seized on this as the groundwork of his two great poems. (See Adam; Original Sin). Consult Brown, 'Christian Theology in Outline' (New York 1906); Fisher, 'History of Christian Doctrine' (ib. 1896); Clarke, 'Outline of Christian Theology' (ib. 1899); Harnack, 'History of Dogma' (Boston 1899); Mackintosh, 'Christianity and Sin' (New York 1914).

FALL RIVER, Mass., city, port of entry, in Bristol County, on Mount Hope Bay at the mouth of the Taunton River; on the New York, New Haven and Hartford Railroad, 49 miles south of Boston. It is connected with New York by the Fall River line of steamers, with Philadelphia by the Merchants and Miners freight line and with New England seaports by passenger and freight lines of steamers. The area of the city is 41 square miles and it is 200 feet above sea-level. It has a good harbor, sufficiently commodious for the largest steamers and excellent water power, as the Fall River, the outlet of Watuppa Lake, has a fall of 129 feet in less than half a mile. The water for city uses comes from Lake Watuppa and the waterworks plant is owned by the municipality. The streets are well laid out; many of the buildings are constructed of the granite which is found in the vicinity. It has excellent public and parish schools, notably the B. M. C. Durfee public high school and the Academy La Ste. Union des Sacrés Cœurs; good circulating libraries, a State armory, over half a hundred churches and chapels, daily and weekly newspapers and electric street railway connections with neighboring cities and towns. Among educational and charitable institutions are Notre Dame College, the free textile school, free civil service school, the Conservatory of Music, Boys' Club, Home for the Aged. Five public parks have been laid out in various parts of the city, and there are beautiful drives to the suburbs.

Fall River is the largest cotton-milling city in the United States. According to the Federal census of 1910 the city had 288 manufacturing establishments, employing $82.086,000 capital and 37,139 persons; paying $16,853,000 for wages, and $35,524,000 for materials; and having a combined output valued at $64,146,000. The cotton industry, 42 establishments with $46,000,000 capital, and a combined output valued at $30,000,000. Next in value of output was the dyeing and finishing of textiles ($3,000,000). Other important manufactures were foundry and machine-shop products ($1,000,000); bakery products ($600,000). There are also manufactories of calico prints, ginghams, woolen goods, men's hats, fur goods, pianos, knit goods, yarn, thread, boots and shoes, spools and bobbins, carriages, rope and twine, rubber, soap, etc. Granite quarrying also employs a considerable number of men. The city has a number of national banks, with a capital of about $2,500,000 and several savings and co-operative banks. The exchanges at the United States clearing-house during the year ending 30 Sept. 1910 aggregated $61,031,300.

The United States census of manufactures for 1914 showed within the city limits 315 industrial establishments of factory grade, employing 38,097 persons; 36,834 being wage earners, receiving annually a total of $16,131,000 in wages. The capital invested aggregated $89,290,000 and the year's output was valued at $64,663,000: of this, $27,502,000 was the value added by manufacture.

The government, under a charter of 1902, is vested in a mayor, chosen annually, a board of aldermen, consisting of 27 members, and subordinate administrative officials. Of these, the school committee of nine members is chosen by popular election. Fall River has an excellent system of sewers, is lighted by gas and electricity. It was settled by grantees of the Plymouth Colony, along Mount Hope Bay upon land obtained by treaty with Massasoit, chief of the Wampanoags. Its inhabitants took a prominent part in the War of King Philip and the territory long remained the hunting ground of the tribe. An Indian reservation is still maintained. The village was included within the limits of Freetown until 1803, when it was incorporated as a separate town under its present name. It was called Troy from 1804 to 1834, when its old name was restored. In 1854 Fall River was chartered as a city and in 1862, on the readjustment of the Massachusetts-Rhode Island boundary, a part of the town of Tiverton, R. I., with a population of 3,590, was annexed. On 2 July 1843, a disastrous fire destroyed several buildings and other property. Consult Earl, 'A Centennial History of Fall River' (New York 1877). Pop. 120,485, including over 50,000 persons of foreign birth and about 400 of negro descent. The population includes also a great number of Canadian French.

FALL TRANK, a drink once reputed to cure the effects of falls; a vulnerary made from several aromatic and slightly astringent plants which grow chiefly on the Swiss Alps; hence the name *Vulneraire Suisse*, given to such dried plants cut into fragments. Within the 19th century, in England, a kind of vulnerary known as black beer was often prescribed in country practice for inward bruises.

FALL WEBWORM. See Webworms.

FALLACY, in logic, an argument used as decisive of a particular issue, which in reality it does not decide. Fallacies are variously classified by different logicians. A fallacy may either exist in the substance or in the form of the argument. If it exists in the substance it does not belong to logic, as commonly understood, to expose it; but logicians differ as to what constitutes the proper distinction between form and substance. J. S. Mill in particular extends the sphere of logic in respect to the treatment of fallacies beyond what has been usually assigned to it.

FALLEN TIMBERS, Battle of, 20 Aug. 1794, on the Maumee River, about 15 miles from Toledo, Ohio. The Indians had about 2,000 warriors, with 70 white rangers, French, English and renegade Americans; they were in a line some two miles long at right angles to the river, behind a forest blown down by a hurricane. Wayne had some 3,000 men; 2,000 regulars and 1,000 mounted volunteers from Kentucky, under Charles Scott, who were thrown to the left to turn the enemy's flank. The Indians began the attack and drove in the advance volunteers; then Wayne sent his regular cavalry to repel them, while his first line of infantry advanced with trailed arms, firing at close range and then charging with the bayonet. Both attacks were entirely successful. Less than 1,000 of the Americans were engaged. They chased the Indians up to the British fort some miles away. Their total loss was 33 killed and 100 wounded, the Indians and British probably losing two or three times as many killed. Eight Wyandot chiefs were slain. This defeat, the greatest ever suffered by the northwestern Indians, led in the following year to the treaty of Greenville (q.v.).

FALLIÈRES, fa'ly'ĕr, **Clément Armand,** French politician and statesman: b. Mézin in the department of Lot-et-Garonne, 6 Nov. 1841. He studied law and was admitted to the bar of Nérac and from 1871–75 was mayor of that city. In 1876, 1877 and 1878 he was elected as a Republican to the Chamber of Deputies, in the latter year being appointed Minister of the Interior, a position which he again occupied in 1882 and 1883. From 1883–85 and again from 1889–90 he was Minister of Public Instruction; in 1887 Minister of the Interior; and in 1887–88 and again from 1890–92 Minister of Justice. In 1890 he was elected senator, a position which he has held ever since. In 1899, when Loubet became President of the Republic, Fallières succeeded him as president of the Senate, a post to which he was elected in 1900 and on 11 Jan. 1906. On 17 Jan. 1906 the National Assembly elected him President of the Republic to succeed Loubet (q.v.).

FALLING BODIES. See ACCELERATION; FORCE; FORCE OF GRAVITY; GRAVITATION; GRAVITY; MECHANICS, etc.

FALLING-SICKNESS. See EPILEPSY.

FALLING STARS. See SHOOTING STARS.

FALLMERAYER, Jacob Philipp, yä'kŏp fē'lip fäl' mē-rī-ĕr, German author: b. Tschötsch, Austrian Tyrol, 10 Dec. 1790; d. Munich, 26 April 1861. He fought in the War of Liberation; in 1848 was appointed professor of history at Munich. As a scholar, especially linguist, and as an explorer of the Orient his fame is international and his work authoritative. He published 'Fragments from the Orient' (1845); 'History of the Peninsula of Morea in the Middle Ages' (1830), and other important writings.

FALLON, Michael Francis, Canadian Catholic prelate: b. Kingston, Ontario, 1867. He was educated at Ottawa College and at the Gregorian University, Rome, and was ordained to the priesthood in 1894. He became a member of the Oblates on his return to Canada and was appointed professor of English literature at Ottawa University of which he was subsequently vice-rector. In 1898–1901 he was rector of Saint Joseph's Church, Ottawa and from 1901 to 1904 of Holy Angels, Buffalo. From 1904 to 1909 he was provincial of the Oblates of Mary Immaculate and in the latter year was consecrated bishop of London, Ontario.

FALLOPIAN TUBES, two ducts or canals about five inches long and one-third of an inch in diameter, attached to the upper corners of the uterus. Within they are lined by a mucous membrane continuous with that of the uterine cavity, but differing in having cilia. Outside of the mucous membrane there is a thin layer of muscle-tissue. The outermost layer is from the peritoneum, in large part a fold of the "broad ligament." At the free end the tube flares out into fimbriæ, thus exposing a large surface to catch the ova given off from the surface of the adjacent ovary. Aided by the waving cilia, an ovum passes down this tube to the uterine cavity, there to undergo development or to be extruded with menstrual blood. Spermatozoa can pass up the Fallopian tubes and impregnate an ovum within the lumen. Development then becomes possible, giving rise to tubal pregnancy or ectopic gestation.

FALLOPIO, Gabriello, gä-brē-ä'lō fäl-lop'-pē-ō (usually known as FALLOPIUS), Italian anatomist: b. Modena, 1523; d. 9 Oct. 1562. He studied at Ferrara and at Padua, at which last place he is said to have attended the lectures of Vesalius. He became professor at Ferrara, whence, in 1548 he removed to Pisa. He continued there three years and was then made professor of surgery, anatomy and the materia medica at Padua, where he remained till his death. The principal work of Fallopius is his 'Observationes Anatomicæ' (1561, 8vo.), which, as well as his other writings, has been several times reprinted. He was the first anatomist who accurately described the vessels and bones of the fœtus and his account of the Fallopian tubes in females has perpetuated his name.

FALLOUX, Frédéric Alfred Pierre, frā-dā-rik āl-fred pē-ar fä-loo, French writer: b. Angers, France, 7 May 1811; d. there, 7 Jan. 1886. Legitimist and clerical sympathies influenced his career. He was one of the last survivors of the Liberal Catholic School, was for a time Minister of Education under Napoleon III and passed an act very acceptable to the clericals. He was elected to the Academy in 1857. His efforts to reconcile the Orleanist and Bourbon factions in 1876 recoiled upon himself. His typical writings are 'Madame Swetchine, Her Life and Works' (15th ed., 1884); 'Story of Louis XVI' (6th ed., 1881); and 'Political Speeches and Miscellany' (1882). His memoirs, edited by Veuillot, were issued in 1888.

FALLOW, land which, after being tilled, is left for a season or more without being planted or sown. The Roman system of wheat raising was a rotation of fallow and wheat alternately. Under the Romans Britain exported a great quantity of wheat, and for centuries afterward the same system was followed. The method presupposed a moderately fertile soil, and turned out best where clay was present. The object of fallowing is to liberate fertilizing elements from the mold, admitting air and destroying noxious plants and insects. Improvements in agricultural methods and the multiplication of fertilizing material has caused the abandonment of this resort to fallowing which, however, might in some cases be revived with advantage. For summer fallow the land should be ploughed at the end of May; for winter fallow the land should be ploughed in autumn.

Fallow crops is a term applied to green manuring crops which are of more advantage in moist than in dry climates, where injury is likely to be wrought by autumnal draughts. Bastard fallowing is the Scotch practice of ploughing hay-stubble at the end of summer. It is known in North America as short fallow and is very beneficial.

FALLOW DEER, a species (*Cervus dama*) of deer native in southern Europe, northern Africa and eastward of Persia, representing a group of Cervidæ in which the antlers, borne only by the bucks, are round at the base, but are more or less flattened at the extremities. These deer were introduced into northern Europe many centuries ago and now are one of the common park deers of Great Britain and elsewhere, while still remaining wild in their native regions. In size they are small (three feet tall at the withers) and in color vary from fawn to dark brown, the fine soft coat ornamented with large whitish spots, which in some varieties have almost disappeared except in the fawns. The under parts, and lower side of the rather long tail are white. The antlers do not reach their full development until the fifth year. These deer assemble in large herds when free, and feed mainly on herbage, but are fond of certain other foods, especially horse chestnuts, which the bucks knock off the trees with their antlers. They are favorites in parks because of their tameness approaching confidently the persons with whom they are familiar and their flesh is regarded as the best of venison. Two or three fossil species are known, from remains in recent deposits, indicating recent extinction. The most remarkable of these is the animal usually, but erroneously, called "Irish elk" described below.

Giant Fallow Deer.— In the peat-bogs of Ireland, and in caves and superficial deposits in Britain and on the Continent, have been found many skeletons of a fallow deer which surpassed even the moose in stature, standing six feet high at the shoulders, and carrying antlers that in some large specimens measure 11 feet from tip to tip. These antlers were broadly palmate, as in the moose, but their "points" curled upward. There is much evidence that these magnificent deer continued to exist after the beginning of the human occupation of Europe, and probably owes its extinction to extermination by prehistoric man. A similar extinct species, Ruff's deer, is found fossil in Germany.

FALLOWS, Samuel, American Reformed Episcopal bishop: b. Pendleton, Lancashire, England, 13 Dec. 1835. He came to America in 1848, was graduated at the University of Wisconsin in 1859, was minister in the Methodist Episcopal Church 1859–75 and later of the Reformed Episcopal Church. He served with distinction in the Civil War; was State superintendent of public instruction in Wisconsin 1871–74; regent of the University of Wisconsin in 1866–74, and president of Wesleyan University in 1874–75. He became rector of Saint Paul's Reformed Episcopal Church in Chicago in 1875 and bishop in 1876. He was chairman of the Educational Congress of the World's Columbian Exposition 1893; president of the board of managers of the Illinois State Reformatory 1891–1912; chaplain-in-chief of the Grand Army of the Republic 1907–08, and its national patriotic instructor 1908–09; commander Military Order of the Loyal Legion of the United States for Illinois 1907; department commander for Illinois of the Grand Army of the Republic 1914–15; president of the State Illinois Commission for the International Celebration of the 50th Anniversary of Negro Freedom and Conduct of the Lincoln Jubilee 1913–16. He is the author of numerous works, including 'Handbook of Abbreviations and Contractions'; 'Life of Samuel Adams'; 'Students' Biblical Dictionary'; 'Past Noon'; 'Splendid Deeds'; 'Supplemental Dictionary of the English Language'; 'Popular and Critical Biblical Encyclopedia' (1901); 'Health and Happiness' (1908).

FALLS CITY, Neb., city, county-seat of Richardson County, on the Chicago, Burlington and Quincy and the Missouri Pacific railroads, about 85 miles southeast of Lincoln. Its chief manufactures are flour, canned goods, cigars, foundry products, furniture, cement, stock powder, cider, vinegar and beer. The trade is chiefly in wheat, corn, cattle and manufactured articles. It has railroad shops, grain elevators and a poultry-packing plant. The electric-light and waterworks plants are owned by the city. It has a good public library. Pop. (1920) 4,930.

FALMOUTH, fal'muth, England, municipal borough and seaport in the county of Cornwall, at the mouth of the Fal River, 11 miles from Truro, and is an important point of call for steamer lines. It has a good harbor, the docks extending to 100 acres, and a fine and spacious roadstead. There are two castles on the coast, one of which, Pendennis, commands the entrance of the harbor on the west, and the other, on the opposite side, is Saint Mawes Castle. Its trade consists chiefly in engineering, shipbuilding and ropemaking. Great improvements have been made on the sea front, and Falmouth has risen into favor, owing to its beautiful surroundings and mild and equable climate, as a wintering resort. The borough forms part of the parliamentary borough of Penryn and Falmouth. Pop. 13,132.

FALMOUTH, Ky., city and county- seat of Pendleton County, 59 miles northeast of Lexington, on the Licking River and on the Louisville and Nashville Railroad. It is in an agricultural and dairying region, with a trade in tobacco, grain, clover seed and live stock, and has flour, lumber and woolen mills, tobacco warehouses, a creamery, distillery and cannery. It contains two banks with resources of $600,000 and the value of the taxable property is placed at $750,000. The waterworks and electric-light plant are owned by the municipality. The government is vested in a mayor and six councilmen. Pop. 1,600.

FALMOUTH, Mass., town in Barnstable County, on Buzzard's Bay, Vineyard Sound and on the New York, New Haven, and Hartford Railroad, at the extreme west end of Cape Cod, 50 miles northwest of Boston. It is the centre of an agricultural and cranberry region. It is best known as containing the Wood's Hole (q.v.) Station of the United States Fish Commission. It has a public library and is a popular summer resort. Falmouth was settled in 1636 and incorporated in 1686. The town owns the waterworks. Pop. 3,500.

FALSE ACACIA. See Locust Tree.

FALSE BAY, an inlet on the coast of Cape Colony, South Africa, circular in form, about 24 miles long, and so well protected from storms as to render it a good shelter harbor. Simonstown, a British naval base, is in the northwest angle.

FALSE CADENCE, a musical term. When the last chord of a phrase is other than the tonic chord and is preceded by that of the dominant, the cadence is said to be interrupted, false or deceptive. See Cadence.

FALSE CHINCH-BUG. See Wheat Insect Pests.

FALSE DECRETALS. See Decretals, False or Pseudo-Isidorian.

FALSE DEMETRIUS, The. See Demetrius.

FALSE IMPRISONMENT, the unlawful detention of a person, whether in a common prison or a private house, or even by forcibly detaining one in the streets or highways. The law punishes false imprisonment as a crime, besides giving reparation to the party injured through an action in tort.

FALSE INDIGO, a common name for some American species of the genus *Amorpha* of the pea family. The most widely known plant called by this name is *A. fruticosa,* a shrub growing from 5 to 20 feet in height along streams in Ohio, Minnesota and Manitoba, south to Florida, Colorado and Mexico. When found in the Middle States it is an escape from cultivation, its spike of purple flowers making an exceedingly ornamental shrub.

FALSE PERSONATION, for the purpose of obtaining property of others, was formerly a misdemeanor punishable by a fine or imprisonment, but is now made penal by special statute. The penalties for personation are frequently heavy. Thus to personate the owner of any share, stock or annuity, etc., is felony, and liable to a term of imprisonment. The false personation of voters at an election is a misdemeanor punishable with imprisonment.

FALSE POINT, a cape (with lighthouse) and harbor of Bengal, 43 miles east of Cuttack. The roadway in which ships anchor is somewhat exposed and loading and unloading can only be carried on in comparatively fair weather. Large rice shipments are made. The name was given because frequently this projection was mistaken for Point Palmyras.

FALSE POSITION, Rule of. An ancient method of reckoning indirectly, now superseded by the method of equations. In the ancient method a number for the unknown quantity was assumed; next a trial was made to see if the assumed number filled the conditions; it was then corrected by the method of simple proportion. For example, what number is that whose third exceeds its quarter by 5? Assuming 72 to be the number, we get $24 > 18 = 6$, which is too great. Now, by means of proportion we have $6:5::72:60$. Hence 60 is the number whose third (20) exceeds its quarter (15) by 5.

FALSE PRETENSES, for the purpose of obtaining property, is a misdemeanor at common law, and punishable by fine or imprisonment. Some kinds of it are now punishable by imprisonment not exceeding five years, the statutes, however, varying in different States.

FALSE SCORPION, or BOOK SCORPION, a diminutive spider-like creature of the order *Pseudoscorpionida* (see Arachnida), allied to the «harvestmen» and «false spiders.» They occur in all the warmer parts of the world, under bark, stones and rubbish, or hidden in deep moss; and one typical species, the «book scorpion» (*Chelifer cancroides*), infests museums, old libraries and dusty corners generally. Unlike the spiders these have no constricted «waist» separating the abdomen from the foreparts; and like the true scorpions the pedipalps are developed into relatively enormous chelate arms. The book scorpion thus resembles a minute crab. They are slow in their motions, feeling their way along with their pincers; and several blind species inhabit caverns. They have spinning glands, situated in the cephalothorax, but use the silk only for making small protective cells or cases into which they retreat when laying eggs (afterward carried about by the female), or molting, or during hibernation.

FALSE SPIDER. See Scorpion Spider.

FALSE SWEARING. See Perjury.

FALSE WEIGHTS AND MEASURES. See Weights and Measures.

FALSEN, fal'sĕn, **Christian Magnus,** Norwegian historian and statesman: b. Olso, near Christiania, 1782; d. 1830. He entered the legal profession and in 1808 was appointed circuit judge at Follo. He became interested in politics about 1814 and helped draw up a constitution for Norway after the separation of the latter from Denmark. He divided honors with Sverdrup in parliamentary leadership, became attorney-general in 1822, but lost much of his support among the liberal element through his administration of this office. He was made bailiff for Bergen in 1825 and two years later became chief of the Supreme Court. He wrote ‘Norges Historie’ (1824). Consult the lives by Daa (Christiania 1860) and Vullum (ib., 1881).

FALSETTO (Ital.), in singing, a term applied to the notes above the natural compass of the voice. It is also called a head or throat voice, in contradistinction to the chest voice, which is the natural one. The falsetto voice is produced by tightening the ligaments of the glottis. Its thin, constrained effect is most noticeable in men with deep-set voices the register of which it frequently extends more than an octave above the pure chest voice.
